Chapter 1

Namespace Index

1.1 Namespace List

Here is a list of all namespaces with brief descriptions:

activemq	
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements	65
activemq::cmsutil	66
activemq::commands	67
activemq::core	68
activemq::core::policies	69
activemq::exceptions	70
activemq::io	70
activemq::library	70
activemq::state	70
activemq::threads	71
activemq::transport	71
activemq::transport::correlator	72
activemq::transport::failover	72
activemq::transport::inactivity	73
activemq::transport::logging	73
activemq::transport::mock	73
activemq::transport::tcp	73
activemq::util	74
activemq::wireformat	75
activemq::wireformat::openwire	75
activemq::wireformat::openwire::marshal	75
activemq::wireformat::openwire::marshal::generated	76
activemq::wireformat::openwire::utils	79
activemq::wireformat::stomp	79
cms	
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements	80

decaf	
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements	83
decaf::internal	83
decaf::internal::io	84
decaf::internal::net	84
decaf::internal::net::ssl	85
decaf::internal::net::ssl::openssl	85
decaf::internal::net::tcp	86
decaf::internal::nio	86
decaf::internal::security	87

decaf::util::logging	101
decaf::util::zip	102
std	103

Chapter 2

Data Structure Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

decaf::util::concurrent::locks::AbstractOwnableSynchronizer	135
activemq::core::ActiveMQAckHandler	156
activemq::core::ActiveMQConstants	231
activemq::library::ActiveMQCPP	244
decaf::lang::Appendable	442
decaf::io::Writer	2908
decaf::io::OutputStreamWriter	2074
decaf::nio::CharBuffer	785
decaf::internal::nio::CharArrayBuffer	773
decaf::internal::AprPool	444
decaf::lang::ArrayPointer< T, REFCOUNTER >	462
decaf::util::Arrays	471
decaf::util::concurrent::atomic::AtomicBoolean	473
decaf::util::concurrent::atomic::AtomicRefCounter	481
decaf::util::concurrent::atomic::AtomicReference< T >	484
activemq::wireformat::openwire::utils::BooleanStream	552
decaf::nio::Buffer	582
decaf::nio::ByteBuffer	690
decaf::internal::nio::ByteBuffer	646
decaf::nio::CharBuffer	785
decaf::nio::DoubleBuffer	1259
decaf::internal::nio::DoubleArrayBuffer	1248
decaf::nio::FloatBuffer	1368
decaf::internal::nio::FloatArrayBuffer	1357
decaf::nio::IntBuffer	1488
decaf::internal::nio::IntArrayBuffer	1477
decaf::nio::LongBuffer	1752
decaf::internal::nio::LongArrayBuffer	1742

decaf::nio::ShortBuffer	2419
decaf::internal::nio::ShortArrayBuffer	2408
decaf::internal::nio::BufferFactory	597
decaf::internal::util::ByteArrayAdapter	624
decaf::util::concurrent::Callable< V >	746
decaf::security::cert::Certificate	751
decaf::security::cert::X509Certificate	2915
decaf::lang::CharSequence	803
decaf::lang::String	2620
decaf::nio::CharBuffer	785
decaf::util::zip::Checksum	810
decaf::util::zip::Adler32	439
decaf::util::zip::CRC32	1065
cms::Closeable	815
activemq::commands::ActiveMQTempDestination	379
activemq::commands::ActiveMQTempQueue	386
activemq::commands::ActiveMQTempTopic	396
cms::Connection	933
activemq::core::ActiveMQConnection	187
activemq::core::ActiveMQXAConnection	432
cms::XAConnection	2917
activemq::core::ActiveMQXAConnection	432
cms::MessageConsumer	1877
activemq::cmsutil::CachedConsumer	734
activemq::core::ActiveMQConsumer	234
cms::MessageProducer	1924
activemq::cmsutil::CachedProducer	738
activemq::core::ActiveMQProducer	308
cms::QueueBrowser	2227
activemq::core::ActiveMQQueueBrowser	326
cms::Session	2361
activemq::cmsutil::PooledSession	2092
activemq::core::ActiveMQSession	333
activemq::core::ActiveMQXASession	436
cms::XASession	2935
activemq::core::ActiveMQXASession	436
decaf::io::Closeable	816
activemq::transport::Transport	2790
activemq::transport::CompositeTransport	896
activemq::transport::failover::FailoverTransport	1305
activemq::transport::IOTransport	1548
activemq::transport::mock::MockTransport	1948
activemq::transport::TransportFilter	2800
activemq::transport::correlator::ResponseCorrelator	2303
activemq::transport::inactivity::InactivityMonitor	1425
activemq::transport::logging::LoggingTransport	1709
activemq::transport::tcp::TcpTransport	2693

activemq::transport::tcp::SslTransport	2525
activemq::wireformat::WireFormatNegotiator	2904
activemq::wireformat::openwire::OpenWireFormatNegotiator	2060
decaf::io::InputStream	1464
decaf::internal::io::StandardInputStream	2530
decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream	2040
decaf::internal::net::tcp::TcpSocketInputStream	2688
decaf::io::BlockingByteArrayInputStream	534
decaf::io::ByteArrayInputStream	679
decaf::io::FilterInputStream	1334
activemq::io::LoggingInputStream	1706
decaf::io::BufferedInputStream	589
decaf::io::DataInputStream	1094
decaf::io::PushbackInputStream	2214

Chapter 3

Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

decaf::util::concurrent::ThreadPoolExecutor::AbortPolicy	
Handler policy for tasks that are rejected upon a call to ThreadPool- Executor::execute (p. 2724) this class always throws a Rejected- ExecutionException (p. 2263)	105
decaf::util::AbstractCollection< E >	
This class provides a skeletal implementation of the Collection (p. 851) interface, to minimize the effort required to implement this interface	106
decaf::util::concurrent::AbstractExecutorService	
Provides a default implementation for the methods of the Executor- Service (p. 1302) interface	122
decaf::util::AbstractList< E >	
This class provides a skeletal implementation of the List (p. 1658) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array)	123
decaf::util::AbstractMap< K, V, COMPARATOR >	
This class provides a skeletal implementation of the Map (p. 1768) interface, to minimize the effort required to implement this interface	134
decaf::util::concurrent::locks::AbstractOwnableSynchronizer	
Base class for locks that provide the notion of Ownership, the types of locks that are implemented using this base class would be owned by one specific Thread at any given time	135
decaf::util::AbstractQueue< E >	
This class provides skeletal implementations of some Queue (p. 2222) operations	136
decaf::util::AbstractSequentialList< E >	
This class provides a skeletal implementation of the List (p. 1658) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list)	143

decaf::util::AbstractSet< E >	
This class provides a skeletal implementation of the Set (p. 2397) interface to minimize the effort required to implement this interface	152
activemq::transport::AbstractTransportFactory	
Abstract implementation of the TransportFactory (p. 2798) interface, providing the base functionality that's common to most of the TransportFactory (p. 2798) instances	154
activemq::core::ActiveMQAckHandler	
Interface class that is used to give CMS Messages an interface to Ack themselves with	156
activemq::commands::ActiveMQBlobMessage	157
activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQBlobMessageMarshaller (p. 161)	161
activemq::commands::ActiveMQBytesMessage	166
activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQBytesMessageMarshaller (p. 183)	183
activemq::core::ActiveMQConnection	
Concrete connection used for all connectors to the ActiveMQ broker	187
activemq::core::ActiveMQConnectionFactory	213
activemq::core::ActiveMQConnectionMetaData	
This class houses all the various settings and information that is used by an instance of an ActiveMQConnection (p. 187) class	227
activemq::core::ActiveMQConstants	
Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back an forth between string and enum values	231
activemq::core::ActiveMQConsumer	234
activemq::library::ActiveMQCPP	244
activemq::commands::ActiveMQDestination	246
activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller	
Marshaling code for Open Wire Format for ActiveMQDestinationMarshaller (p. 258)	258
activemq::exceptions::ActiveMQException	262
activemq::commands::ActiveMQMapMessage	264
activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQMapMessageMarshaller (p. 284)	284
activemq::commands::ActiveMQMessage	288
activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQMessageMarshaller (p. 291)	291
activemq::commands::ActiveMQMessageTemplate< T >	295
activemq::commands::ActiveMQObjectMessage	301

activemq::wireformat::openwire::marshal::generated::ActiveMQObject- MessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQObject- MessageMarshaller (p.304)	304
activemq::core::ActiveMQProducer	308
activemq::util::ActiveMQProperties	
Implementation of the CMSProperties interface that delegates to a decaf::util::Properties (p.2200) object	316
activemq::commands::ActiveMQQueue	321
activemq::core::ActiveMQQueueBrowser	326
activemq::wireformat::openwire::marshal::generated::ActiveMQQueue- Marshaller	
Marshaling code for Open Wire Format for ActiveMQQueue- Marshaller (p.329)	329
activemq::core::ActiveMQSession	333
activemq::core::ActiveMQSessionExecutor	
Delegate dispatcher for a single session	355
activemq::commands::ActiveMQStreamMessage	359
activemq::wireformat::openwire::marshal::generated::ActiveMQStream- MessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQStream- MessageMarshaller (p.375)	375
activemq::commands::ActiveMQTempDestination	379
activemq::wireformat::openwire::marshal::generated::ActiveMQTemp- DestinationMarshaller	
Marshaling code for Open Wire Format for ActiveMQTemp- DestinationMarshaller (p.382)	382
activemq::commands::ActiveMQTempQueue	386
activemq::wireformat::openwire::marshal::generated::ActiveMQTemp- QueueMarshaller	
Marshaling code for Open Wire Format for ActiveMQTempQueue- Marshaller (p.391)	391
activemq::commands::ActiveMQTempTopic	396
activemq::wireformat::openwire::marshal::generated::ActiveMQTemp- TopicMarshaller	
Marshaling code for Open Wire Format for ActiveMQTempTopic- Marshaller (p.401)	401
activemq::commands::ActiveMQTextMessage	405
activemq::wireformat::openwire::marshal::generated::ActiveMQText- MessageMarshaller	
Marshaling code for Open Wire Format for ActiveMQTextMessage- Marshaller (p.410)	410
activemq::commands::ActiveMQTopic	414
activemq::wireformat::openwire::marshal::generated::ActiveMQTopic- Marshaller	
Marshaling code for Open Wire Format for ActiveMQTopic- Marshaller (p.419)	419
activemq::core::ActiveMQTransactionContext	
Transaction Management class, hold messages that are to be rede- livered upon a request to roll-back	423

activemq::core::ActiveMQXAConnection	432
activemq::core::ActiveMQXAConnectionFactory	433
activemq::core::ActiveMQXASession	436
decaf::util::zip::Adler32	
Clas that can be used to compute an Adler-32 Checksum (p. 810) for a data stream	439
decaf::lang::Appendable	
An object to which char sequences and values can be appended	442
decaf::internal::AprPool	
Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made	444
decaf::util::ArrayList< E >	445
decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator	458
decaf::lang::ArrayPointer< T, REFCOUNTER >	
Decaf's implementation of a Smart Pointer (p. 2083) that is a tem- plate on a Type and is Thread (p. 2703) Safe if the default Reference Counter is used	462
decaf::lang::ArrayPointerComparator< T, R >	
This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this ArrayPointer (p. 462)	470
decaf::util::Arrays	471
decaf::util::concurrent::atomic::AtomicBoolean	
A boolean value that may be updated atomically	473
decaf::util::concurrent::atomic::AtomicInteger	
An int value that may be updated atomically	475
decaf::util::concurrent::atomic::AtomicRefCounter	481
decaf::util::concurrent::atomic::AtomicReference< T >	
An Pointer reference that may be updated atomically	484
activemq::transport::failover::BackupTransport	486
activemq::transport::failover::BackupTransportPool	489
activemq::commands::BaseCommand	491
activemq::wireformat::openwire::marshal::generated::BaseCommand- Marshaller	
Marshaling code for Open Wire Format for BaseCommand- Marshaller (p. 499)	499
activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller	
Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol	507
activemq::commands::BaseDataStructure	528
decaf::net::BindException	532
decaf::io::BlockingByteArrayInputStream	
This is a blocking version of a byte buffer stream	534
decaf::util::concurrent::BlockingQueue< E >	
A decaf::util::Queue (p. 2222) that additionally supports operations that wait for the queue to become non-empty when retrieving an el- ement, and wait for space to become available in the queue when storing an element	538

decaf::lang::Boolean	545
activemq::commands::BooleanExpression	551
activemq::wireformat::openwire::utils::BooleanStream	
Manages the writing and reading of boolean data streams to and from a data source such as a <code>DataInputStream</code> or <code>DataOutputStream</code>	552
decaf::util::concurrent::BrokenBarrierException	556
activemq::commands::BrokerError	
This class represents an Exception sent from the Broker	558
activemq::exceptions::BrokerException	563
activemq::commands::BrokerId	564
activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller	
Marshaling code for Open Wire Format for BrokerIdMarshaller (p. 567)	567
activemq::commands::BrokerInfo	572
activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller	
Marshaling code for Open Wire Format for BrokerInfoMarshaller (p. 578)	578
decaf::nio::Buffer	
A container for data of a specific primitive type	582
decaf::io::BufferedInputStream	
A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream	589
decaf::io::BufferedOutputStream	
Wrapper around another output stream that buffers output before writing to the target output stream	595
decaf::internal::nio::BufferFactory	
Factory class used by static methods in the decaf::nio (p. 94) package to create the various default version of the NIO interfaces	597
decaf::nio::BufferOverflowException	609
decaf::nio::BufferUnderflowException	611
decaf::lang::Byte	614
decaf::internal::util::ByteArrayAdapter	
This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data	624
decaf::internal::nio::ByteArrayBuffer	
This class defines six categories of operations upon byte buffers:	646
decaf::io::ByteArrayInputStream	
A ByteArrayInputStream (p. 679) contains an internal buffer that contains bytes that may be read from the stream	679
decaf::io::ByteArrayOutputStream	687
decaf::nio::ByteBuffer	
This class defines six categories of operations upon byte buffers:	690
cms::BytesMessage	
A BytesMessage (p. 718) object is used to send a message containing a stream of unsigned bytes	718
activemq::cmsutil::CachedConsumer	
A cached message consumer contained within a pooled session	734

activemq::cmsutil::CachedProducer	
A cached message producer contained within a pooled session . . .	738
decaf::util::concurrent::Callable< V >	
A task that returns a result and may throw an exception	746
decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy	
Handler policy for tasks that are rejected upon a call to ThreadPoolExecutor::execute (p. 2724) this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed	747
decaf::util::concurrent::CancellationException	748
decaf::security::cert::Certificate	
Base interface for all identity certificates	751
decaf::security::cert::CertificateEncodingException	755
decaf::security::cert::CertificateException	757
decaf::security::cert::CertificateExpiredException	759
decaf::security::cert::CertificateNotYetValidException	761
decaf::security::cert::CertificateParsingException	763
decaf::lang::Character	765
decaf::internal::nio::CharArrayBuffer	773
decaf::nio::CharBuffer	
This class defines four categories of operations upon character buffers:	785
decaf::lang::CharSequence	
A CharSequence (p. 803) is a readable sequence of char values . .	803
decaf::util::zip::CheckedInputStream	
An implementation of a FilterInputStream that will maintain a - Checksum (p. 810) of the bytes read, the Checksum (p. 810) can then be used to verify the integrity of the input stream	805
decaf::util::zip::CheckedOutputStream	
An implementation of a FilterOutputStream that will maintain a - Checksum (p. 810) of the bytes written, the Checksum (p. 810) can then be used to verify the integrity of the output stream	808
decaf::util::zip::Checksum	
An interface used to represent Checksum (p. 810) values in the Zip package	810
decaf::lang::exceptions::ClassCastException	813
cms::Closeable	
Interface for a class that implements the close method	815
decaf::io::Closeable	
Interface for a class that implements the close method	816
activemq::transport::failover::CloseTransportsTask	818
activemq::cmsutil::CmsAccessor	
Base class for activemq::cmsutil::CmsTemplate (p. 836) and other CMS-accessing gateway helpers, defining common properties such as the CMS cms.ConnectionFactory (p. 955) to operate on	819
activemq::cmsutil::CmsDestinationAccessor	
Extends the CmsAccessor (p. 819) to add support for resolving destination names	823

cms::CMSException	
CMS API Exception that is the base for all exceptions thrown from CMS classes	826
activemq::util::CMSExceptionSupport	829
cms::CMSProperties	
Interface for a Java-like properties object	830
cms::CMSSecurityException	
This exception must be thrown when a provider rejects a user name/-password submitted by a client	835
activemq::cmsutil::CmsTemplate	
CmsTemplate (p. 836) simplifies performing synchronous CMS operations	836
code	851
decaf::util::Collection< E >	
The root interface in the collection hierarchy	851
activemq::commands::Command	866
activemq::state::CommandVisitor	
Interface for an Object that can visit the various Command Objects that are sent from and to this client	872
activemq::state::CommandVisitorAdapter	
Default Implementation of a CommandVisitor (p. 872) that returns NULL for all calls	878
decaf::lang::Comparable< T >	
This interface imposes a total ordering on the objects of each class that implements it	885
decaf::util::Comparator< T >	
A comparison function, which imposes a total ordering on some collection of objects	888
activemq::util::CompositeData	
Represents a Composite URI	890
activemq::threads::CompositeTask	
Represents a single task that can be part of a set of Tasks that are contained in a CompositeTaskRunner (p. 893)	892
activemq::threads::CompositeTaskRunner	
A Task (p. 2676) Runner that can contain one or more Composite-Tasks that are each checked for pending work and run if any is present in the order that the tasks were added	893
activemq::transport::CompositeTransport	
A Composite Transport (p. 2790) is a Transport (p. 2790) implementation that is composed of several Transports	896
decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >	
Interface for a Map (p. 1768) type that provides additional atomic put-IfAbsent, remove, and replace methods alongside the already available Map (p. 1768) interface	898
decaf::util::ConcurrentModificationException	902
decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >	
Map (p. 1768) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map	905

decaf::util::concurrent::locks::Condition	
Condition (p. 921) factors out the Mutex (p. 1960) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary Lock (p. 1684) implementations	921
decaf::util::concurrent::ConditionHandle	928
decaf::internal::util::concurrent::ConditionImpl	929
decaf::net::ConnectException	931
cms::Connection	
The client's connection to its provider	933
activemq::commands::ConnectionControl	938
activemq::wireformat::openwire::marshal::generated::Connection- ControlMarshaller	
Marshaling code for Open Wire Format for ConnectionControl- Marshaller (p. 943)	943
activemq::commands::ConnectionError	948
activemq::wireformat::openwire::marshal::generated::ConnectionError- Marshaller	
Marshaling code for Open Wire Format for ConnectionError- Marshaller (p. 951)	951
cms::ConnectionFactory	
Defines the interface for a factory that creates connection objects, the Connection (p. 933) objects returned implement the CMS - Connection (p. 933) interface and hide the CMS Provider specific implementation details behind that interface	955
activemq::exceptions::ConnectionFailedException	958
activemq::commands::ConnectionId	960
activemq::wireformat::openwire::marshal::generated::ConnectionId- Marshaller	
Marshaling code for Open Wire Format for ConnectionIdMarshaller (p. 963)	963
activemq::commands::ConnectionInfo	968
activemq::wireformat::openwire::marshal::generated::ConnectionInfo- Marshaller	
Marshaling code for Open Wire Format for ConnectionInfo- Marshaller (p. 974)	974
cms::ConnectionMetaData	
A ConnectionMetaData (p. 978) object provides information describing the Connection (p. 933) object	978
activemq::state::ConnectionState	982
activemq::state::ConnectionStateTracker	984
decaf::util::logging::ConsoleHandler	
This Handler (p. 1401) publishes log records to System.err	990
activemq::commands::ConsumerControl	992
activemq::wireformat::openwire::marshal::generated::Consumer- ControlMarshaller	
Marshaling code for Open Wire Format for ConsumerControl- Marshaller (p. 996)	996
activemq::commands::ConsumerId	1000

activemq::wireformat::openwire::marshal::generated::ConsumerId- Marshaller	
Marshaling code for Open Wire Format for ConsumerIdMarshaller (p. 1005)	1005
activemq::commands::ConsumerInfo	1009
activemq::wireformat::openwire::marshal::generated::ConsumerInfo- Marshaller	
Marshaling code for Open Wire Format for ConsumerInfo- Marshaller (p. 1017)	1017
activemq::state::ConsumerState	1022
activemq::commands::ControlCommand	1022
activemq::wireformat::openwire::marshal::generated::ControlCommand- Marshaller	
Marshaling code for Open Wire Format for ControlCommand- Marshaller (p. 1025)	1025
decaf::util::concurrent::CopyOnWriteArrayList< E >	1030
decaf::util::concurrent::CopyOnWriteArraySet< E >	
Since the CopyOnWriteArraySet (p. 1050) and the CopyOnWrite- ArrayList (p. 1030) share much of the same operational semantics this class uses the CopyOnWriteArrayList (p. 1030) for all its un- derlying operations	1050
decaf::util::concurrent::CountDownLatch	1062
decaf::util::zip::CRC32	
Class that can be used to compute a CRC-32 checksum for a data stream	1065
ct_data_s	1068
activemq::commands::DataArrayResponse	1069
activemq::wireformat::openwire::marshal::generated::DataArrayResponse- Marshaller	
Marshaling code for Open Wire Format for DataArrayResponse- Marshaller (p. 1072)	1072
decaf::util::zip::DataFormatException	1076
decaf::net::DatagramPacket	
Class that represents a single datagram packet	1078
decaf::io::DataInput	
The DataInput (p. 1086) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types	1086
decaf::io::DataInputStream	
A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way	1094
decaf::io::DataOutput	
The DataOutput (p. 1103) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream	1103
decaf::io::DataOutputStream	
A data output stream lets an application write primitive Java data types to an output stream in a portable way	1109
activemq::commands::DataResponse	1112

activemq::wireformat::openwire::marshal::generated::DataResponse-Marshaller	
Marshaling code for Open Wire Format for DataResponse-Marshaller (p. 1115)	1115
activemq::wireformat::openwire::marshal::DataStreamMarshaller	
Base class for all classes that marshal commands for Openwire	1119
activemq::commands::DataStructure	1133
decaf::util::Date	
Wrapper class around a time value in milliseconds	1139
decaf::internal::DecafRuntime	
Handles APR initialization and termination	1143
activemq::threads::DedicatedTaskRunner	1144
activemq::core::policies::DefaultPrefetchPolicy	1146
activemq::core::policies::DefaultRedeliveryPolicy	1150
decaf::internal::net::DefaultServerSocketFactory	
Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options	1155
decaf::internal::net::DefaultSocketFactory	
SocketFactory implementation that is used to create Sockets	1159
decaf::internal::net::ssl::DefaultSSLContext	
Default SSLContext manager for the Decaf library	1164
decaf::internal::net::ssl::DefaultSSLServerSocketFactory	
Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds	1165
decaf::internal::net::ssl::DefaultSSLSocketFactory	
Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds	1170
activemq::transport::DefaultTransportListener	
A Utility class that create empty implementations for the Transport-Listener (p. 2810) interface so that a subclass only needs to override the one's its interested	1178
decaf::util::zip::Deflater	
This class compresses data using the <i>DEFLATE</i> algorithm (see <i>specification</i>)	1180
decaf::util::zip::DeflaterOutputStream	
Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream	1189
decaf::util::concurrent::Delayed	
A mix-in style interface for marking objects that should be acted upon after a given delay	1194
cms::DeliveryMode	
This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages	1195
decaf::util::Deque< E >	
Defines a 'Double ended Queue (p. 2222)' interface that allows for insertion and removal of elements from both ends	1196

cms::Destination	
A Destination (p. 1210) object encapsulates a provider-specific address	1210
activemq::commands::ActiveMQDestination::DestinationFilter	1213
activemq::commands::DestinationInfo	1213
activemq::wireformat::openwire::marshal::generated::DestinationInfo-Marshaller	
Marshaling code for Open Wire Format for DestinationInfo-Marshaller (p. 1218)	1218
activemq::cmsutil::DestinationResolver	
Resolves a CMS destination name to a Destination	1222
decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy	
Handler policy for tasks that are rejected upon a call to ThreadPoolExecutor::execute (p. 2724) this class always destroys the oldest unexecuted task in the Queue (p. 2222) and then attempts to execute the rejected task using the passed in executor	1224
decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardPolicy	
Handler policy for tasks that are rejected upon a call to ThreadPoolExecutor::execute (p. 2724) this class always destroys the rejected task and returns quietly	1225
activemq::commands::DiscoveryEvent	1226
activemq::wireformat::openwire::marshal::generated::DiscoveryEvent-Marshaller	
Marshaling code for Open Wire Format for DiscoveryEvent-Marshaller (p. 1230)	1230
activemq::core::DispatchData	
Simple POCO that contains the information necessary to route a message to a specified consumer	1234
activemq::core::Dispatcher	
Interface for an object responsible for dispatching messages to consumers	1234
decaf::lang::Double	1235
decaf::internal::nio::DoubleArrayBuffer	1248
decaf::nio::DoubleBuffer	
This class defines four categories of operations upon double buffers:	1259
decaf::lang::DYNAMIC_CAST_TOKEN	1271
activemq::cmsutil::DynamicDestinationResolver	
Resolves a CMS destination name to a Destination	1272
decaf::util::Map< K, V, COMPARATOR >::Entry	1274
decaf::io::EOFException	1275
decaf::util::logging::ErrorManager	
ErrorManager (p. 1277) objects can be attached to Handlers to process any error that occur on a Handler (p. 1401) during Logging	1277
decaf::lang::Exception	1279
cms::ExceptionListener	
If a CMS provider detects a serious problem, it notifies the client application through an ExceptionListener (p. 1286) that is registered with the Connection (p. 933)	1286

activemq::commands::ExceptionResponse	1287
activemq::wireformat::openwire::marshal::generated::ExceptionResponse-Marshaller	
Marshaling code for Open Wire Format for ExceptionResponse-Marshaller (p. 1290)	1290
decaf::util::concurrent::ExecutionException	1294
decaf::util::concurrent::Executor	
An object that executes submitted decaf.lang Runnable (p. 2312) tasks	1297
decaf::util::concurrent::Executors	
Implements a set of utilities for use with Executors (p. 1299), ExecutorService (p. 1302), ThreadFactory (p. 2714), and Callable (p. 746) types, as well as providing factory methods for instance of these types configured for the most common use cases	1299
decaf::util::concurrent::ExecutorService	
An Executor (p. 1297) that provides methods to manage termination and methods that can produce a Future (p. 1390) for tracking progress of one or more asynchronous tasks	1302
activemq::transport::failover::FailoverTransport	1305
activemq::transport::failover::FailoverTransportFactory	
Creates an instance of a FailoverTransport (p. 1305)	1318
activemq::transport::failover::FailoverTransportListener	
Utility class used by the Transport (p. 2790) to perform the work of responding to events from the active Transport (p. 2790)	1320
activemq::core::FifoMessageDispatchChannel	1322
decaf::io::FileDescriptor	
This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files	1330
decaf::util::logging::Filter	
A Filter (p. 1333) can be used to provide fine grain control over what is logged, beyond the control provided by log levels	1333
decaf::io::FilterInputStream	
A FilterInputStream (p. 1334) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality	1334
decaf::io::FilterOutputStream	
This class is the superclass of all classes that filter output streams	1341
decaf::lang::Float	1344
decaf::internal::nio::FloatArrayBuffer	1357
decaf::nio::FloatBuffer	
This class defines four categories of operations upon float buffers:	1368
decaf::io::Flushable	
A Flushable (p. 1380) is a destination of data that can be flushed	1380
activemq::commands::FlushCommand	1381
activemq::wireformat::openwire::marshal::generated::FlushCommand-Marshaller	
Marshaling code for Open Wire Format for FlushCommand-Marshaller (p. 1383)	1383

decaf::util::logging::Formatter	
A Formatter (p. 1387) provides support for formatting LogRecords	1387
decaf::util::concurrent::Future< V >	
A Future (p. 1390) represents the result of an asynchronous computation	1390
activemq::transport::correlator::FutureResponse	
A container that holds a response object	1393
decaf::security::GeneralSecurityException	1395
decaf::internal::util::GenericResource< T >	
A Generic Resource (p. 2293) wraps some type and will delete it when the Resource (p. 2293) itself is deleted	1397
gz_header_s	1398
gz_state	1400
decaf::util::logging::Handler	
A Handler (p. 1401) object takes log messages from a Logger (p. 1693) and exports them	1401
decaf::internal::util::HexStringParser	1406
activemq::wireformat::openwire::utils::HexTable	
Maps hexadecimal strings to the value of an index into the table, i.e	1407
decaf::net::HttpRetryException	1408
activemq::util::IdGenerator	1411
decaf::lang::exceptions::IllegalArgumentException	1413
decaf::lang::exceptions::IllegalMonitorStateException	1416
cms::IllegalStateException	
This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation	1419
decaf::lang::exceptions::IllegalStateException	1420
decaf::lang::exceptions::IllegalThreadStateException	1423
activemq::transport::inactivity::InactivityMonitor	1425
decaf::lang::exceptions::IndexOutOfBoundsException	1429
decaf::net::Inet4Address	1431
decaf::net::Inet6Address	1435
decaf::net::InetAddress	
Represents an IP address	1437
decaf::net::InetSocketAddress	1445
inflate_state	1445
decaf::util::zip::Inflater	
This class uncompresses data that was compressed using the <i>DEFLATE</i> algorithm (see <i>specification</i>)	1448
decaf::util::zip::InflaterInputStream	
A FilterInputStream that decompresses data read from the wrapped InputStream instance	1456
decaf::io::InputStream	
A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes	1464
decaf::io::InputStreamReader	
An InputStreamReader (p. 1475) is a bridge from byte streams to character streams	1475
decaf::internal::nio::IntArrayBuffer	1477

decaf::nio::IntBuffer	
This class defines four categories of operations upon int buffers:	1488
decaf::lang::Integer	1500
activemq::commands::IntegerResponse	1516
activemq::wireformat::openwire::marshal::generated::IntegerResponse- Marshaller	
Marshaling code for Open Wire Format for IntegerResponse- Marshaller (p. 1519)	1519
internal_state	1523
activemq::transport::mock::InternalCommandListener	
Listens for Commands sent from the MockTransport (p. 1948)	1527
decaf::lang::exceptions::InterruptedException	1529
decaf::io::InterruptedException	1531
cms::InvalidClientIdException	
This exception must be thrown when a client attempts to set a con- nection's client ID to a value that is rejected by a provider	1534
cms::InvalidDestinationException	
This exception must be thrown when a destination either is not un- derstood by a provider or is no longer valid	1535
decaf::security::InvalidKeyException	1536
decaf::nio::InvalidMarkException	1539
cms::InvalidSelectorException	
This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax	1541
decaf::lang::exceptions::InvalidStateException	1543
decaf::io::IOException	1545
activemq::transport::IOTransport	
Implementation of the Transport (p. 2790) interface that performs marshaling of commands to IO streams	1548
decaf::lang::Iterable< E >	
Implementing this interface allows an object to be cast to an Iterable (p. 1556) type for generic collections API calls	1556
decaf::util::Iterator< E >	
Defines an object that can be used to iterate over the elements of a collection	1559
activemq::commands::JournalQueueAck	1561
activemq::wireformat::openwire::marshal::generated::JournalQueue- AckMarshaller	
Marshaling code for Open Wire Format for JournalQueueAck- Marshaller (p. 1564)	1564
activemq::commands::JournalTopicAck	1568
activemq::wireformat::openwire::marshal::generated::JournalTopicAck- Marshaller	
Marshaling code for Open Wire Format for JournalTopicAck- Marshaller (p. 1572)	1572
activemq::commands::JournalTrace	1577
activemq::wireformat::openwire::marshal::generated::JournalTrace- Marshaller	
Marshaling code for Open Wire Format for JournalTraceMarshaller (p. 1579)	1579

activemq::commands::JournalTransaction	1583
activemq::wireformat::openwire::marshal::generated::JournalTransaction- Marshaller	
Marshaling code for Open Wire Format for JournalTransaction- Marshaller (p. 1587)	1587
activemq::commands::KeepAliveInfo	1591
activemq::wireformat::openwire::marshal::generated::KeepAliveInfo- Marshaller	
Marshaling code for Open Wire Format for KeepAliveInfo- Marshaller (p. 1594)	1594
decaf::security::Key	
The Key (p. 1598) interface is the top-level interface for all keys . . .	1598
decaf::security::KeyException	1600
decaf::security::KeyManagementException	1603
activemq::commands::LastPartialCommand	1606
activemq::wireformat::openwire::marshal::generated::LastPartial- CommandMarshaller	
Marshaling code for Open Wire Format for LastPartialCommand- Marshaller (p. 1608)	1608
decaf::util::comparators::Less< E >	
Simple Less (p. 1612) Comparator (p. 888) that compares to ele- ments to determine if the first is less than the second	1612
std::less< decaf::lang::ArrayPointer< T > >	
An override of the less function object so that the Pointer objects can be stored in STL Maps, etc	1614
std::less< decaf::lang::Pointer< T > >	
An override of the less function object so that the Pointer objects can be stored in STL Maps, etc	1615
decaf::util::logging::Level	
Defines a set of standard logging levels that can be used to control logging output	1616
decaf::util::concurrent::LinkedBlockingQueue< E >	
A BlockingQueue (p. 538) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time	1621
decaf::util::LinkedList< E >	
A complete implementation of the List (p. 1658) interface using a doubly linked list data structure	1633
decaf::util::List< E >	
An ordered collection (also known as a sequence)	1658
decaf::util::ListIterator< E >	
An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the itera- tor's current position in the list	1671
activemq::commands::LocalTransactionId	1674
activemq::wireformat::openwire::marshal::generated::LocalTransaction- IdMarshaller	
Marshaling code for Open Wire Format for LocalTransactionId- Marshaller (p. 1678)	1678

decaf::util::concurrent::Lock	
A wrapper class around a given synchronization mechanism that provides automatic release upon destruction	1682
decaf::util::concurrent::locks::Lock	
Lock (p. 1684) implementations provide more extensive locking operations than can be obtained using synchronized statements	1684
decaf::util::concurrent::locks::LockSupport	
Basic thread blocking primitives for creating locks and other synchronization classes	1690
decaf::util::logging::Logger	
A Logger (p. 1693) object is used to log messages for a specific system or application component	1693
decaf::util::logging::LoggerHierarchy	1706
activemq::io::LoggingInputStream	1706
activemq::io::LoggingOutputStream	
OutputStream filter that just logs the data being written	1707
activemq::transport::logging::LoggingTransport	
A transport filter that logs commands as they are sent/received . . .	1709
decaf::util::logging::LogManager	
There is a single global LogManager (p. 1712) object that is used to maintain a set of shared state about Loggers and log services . . .	1712
decaf::util::logging::LogRecord	
LogRecord (p. 1719) objects are used to pass logging requests between the logging framework and individual log Handlers	1719
decaf::util::logging::LogWriter	1724
decaf::lang::Long	1726
decaf::internal::nio::LongArrayBuffer	1742
decaf::nio::LongBuffer	
This class defines four categories of operations upon long long buffers:	1752
activemq::util::LongSequenceGenerator	
This class is used to generate a sequence of long long values that are incremented each time a new value is requested	1765
decaf::net::MalformedURLException	1766
decaf::util::Map< K, V, COMPARATOR >	
Map (p. 1768) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map	1768
cms::MapMessage	
A MapMessage (p. 1779) object is used to send a set of name-value pairs	1779
decaf::util::logging::MarkBlockLogger	
Defines a class that can be used to mark the entry and exit from scoped blocks	1791
activemq::wireformat::MarshalAware	1792
activemq::wireformat::openwire::marshal::generated::MarshallerFactory	
Used to create marshallers for a specific version of the wire protocol	1795
activemq::util::MarshallingSupport	1796

decaf::lang::Math	
The class Math (p. 1800) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions	1800
activemq::util::MemoryUsage	1818
activemq::commands::Message	1821
cms::Message	
Root of all messages	1839
activemq::commands::MessageAck	1867
activemq::wireformat::openwire::marshal::generated::MessageAck-Marshaller	
Marshaling code for Open Wire Format for MessageAckMarshaller (p. 1873)	1873
cms::MessageConsumer	
A client uses a MessageConsumer (p. 1877) to received messages from a destination	1877
activemq::cmsutil::MessageCreator	
Creates the user-defined message to be sent by the Cms-Template (p. 836)	1880
activemq::commands::MessageDispatch	1881
activemq::core::MessageDispatchChannel	1886
activemq::wireformat::openwire::marshal::generated::MessageDispatch-Marshaller	
Marshaling code for Open Wire Format for MessageDispatch-Marshaller (p. 1890)	1890
activemq::commands::MessageDispatchNotification	1894
activemq::wireformat::openwire::marshal::generated::MessageDispatch-NotificationMarshaller	
Marshaling code for Open Wire Format for MessageDispatch-NotificationMarshaller (p. 1899)	1899
cms::MessageEnumeration	
Defines an object that enumerates a collection of Messages	1903
cms::MessageEOFException	
This exception must be thrown when an unexpected end of stream has been reached when a StreamMessage (p. 2606) or Bytes-Message (p. 718) is being read	1905
cms::MessageFormatException	
This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type	1906
activemq::commands::Messageld	1908
activemq::wireformat::openwire::marshal::generated::Messageld-Marshaller	
Marshaling code for Open Wire Format for MessageldMarshaller (p. 1912)	1912
cms::MessageListener	
A MessageListener (p. 1916) object is used to receive asynchronously delivered messages	1916

activemq::wireformat::openwire::marshal::generated::MessageMarshaller	
Marshaling code for Open Wire Format for MessageMarshaller	
(p. 1917)	1917
cms::MessageNotReadableException	
This exception must be thrown when a CMS client attempts to read	
a write-only message	1922
cms::MessageNotWriteableException	
This exception must be thrown when a CMS client attempts to write	
to a read-only message	1923
cms::MessageProducer	
A client uses a MessageProducer (p. 1924) object to send	
messages to a Destination (p. 1210)	1924
activemq::wireformat::openwire::utils::MessagePropertyInterceptor	
Used the base ActiveMQMessage class to intercept calls to get and	
set properties in order to capture the calls that use the reserved JMS	
properties and get and set them in the OpenWire Message proper-	
ties	1933
activemq::commands::MessagePull	1939
activemq::wireformat::openwire::marshal::generated::MessagePull-	
Marshaller	
Marshaling code for Open Wire Format for MessagePullMarshaller	
(p. 1944)	1944
activemq::transport::mock::MockTransport	
The MockTransport (p. 1948) defines a base level Transport	
(p. 2790) class that is intended to be used in place of an a regular	
protocol Transport (p. 2790) such as TCP	1948
activemq::transport::mock::MockTransportFactory	
Manufactures MockTransports, which are objects that read from in-	
put streams and write to output streams	1958
decaf::util::concurrent::Mutex	
Mutex (p. 1960) object that offers recursive support on all platforms	
as well as providing the ability to use the standard wait / notify pattern	
used in languages like Java	1960
decaf::util::concurrent::MutexHandle	1965
decaf::internal::util::concurrent::MutexImpl	1966
decaf::internal::net::Network	
Internal class used to manage Networking related resources and	
hide platform dependent calls from the higher level API	1968
activemq::commands::NetworkBridgeFilter	1971
activemq::wireformat::openwire::marshal::generated::NetworkBridge-	
FilterMarshaller	
Marshaling code for Open Wire Format for NetworkBridgeFilter-	
Marshaller (p. 1974)	1974
decaf::net::NoRouteToHostException	1978
decaf::security::NoSuchAlgorithmException	1981
decaf::util::NoSuchElementException	1984
decaf::security::NoSuchProviderException	1986
decaf::lang::exceptions::NullPointerException	1989

decaf::lang::Number	
The abstract class Number (p. 1992) is the superclass of classes - Byte (p. 614), Double (p. 1235), Float (p. 1344), Integer (p. 1500), Long (p. 1726), and Short (p. 2398)	1992
decaf::lang::exceptions::NumberFormatException	1994
cms::ObjectMessage	
Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object	1997
decaf::internal::net::ssl::openssl::OpenSSLContextSpi	
Provides an SSLContext that wraps the OpenSSL API	1998
decaf::internal::net::ssl::openssl::OpenSSLParameters	
Container class for parameters that are Common to OpenSSL socket classes	2001
decaf::internal::net::ssl::openssl::OpenSSLServerSocket	
SSLServerSocket based on OpenSSL library code	2003
decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory	
SSLServerSocketFactory that creates Server Sockets that use - OpenSSL	2009
decaf::internal::net::ssl::openssl::OpenSSLSocket	
Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API	2014
decaf::internal::net::ssl::openssl::OpenSSLSocketException	
Subclass of the standard SocketException that knows how to pro- duce an error message from the OpenSSL error stack	2029
decaf::internal::net::ssl::openssl::OpenSSLSocketFactory	
Client Socket Factory that creates SSL based client sockets using the OpenSSL library	2032
decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream	
An output stream for reading data from an OpenSSL Socket instance	2040
decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream	
OutputStream implementation used to write data to an OpenSSL- Socket (p. 2014) instance	2043
activemq::wireformat::openwire::OpenWireFormat	2045
activemq::wireformat::openwire::OpenWireFormatFactory	2059
activemq::wireformat::openwire::OpenWireFormatNegotiator	2060
activemq::wireformat::openwire::OpenWireResponseBuilder	
Used to allow a MockTransport to generate response commands to OpenWire Commands	2064
decaf::io::OutputStream	
Base interface for any class that wants to represent an output stream of bytes	2066
decaf::io::OutputStreamWriter	
A class for turning a character stream into a byte stream	2074
activemq::commands::PartialCommand	2076
activemq::wireformat::openwire::marshal::generated::PartialCommand- Marshaller	
Marshaling code for Open Wire Format for PartialCommand- Marshaller (p. 2079)	2079

decaf::lang::Pointer< T, REFCOUNTER >	
Decaf's implementation of a Smart Pointer (p.2083) that is a template on a Type and is Thread (p.2703) Safe if the default Reference Counter is used	2083
decaf::lang::PointerComparator< T, R >	
This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the Pointer (p.2083) instance	2091
activemq::cmsutil::PooledSession	
A pooled session object that wraps around a delegate session	2092
decaf::net::PortUnreachableException	2107
activemq::core::PrefetchPolicy	
Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP	2110
activemq::util::PrimitiveList	
List of primitives	2114
activemq::util::PrimitiveMap	
Map of named primitives	2125
activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller	
This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire	2135
activemq::util::PrimitiveValueNode::PrimitiveValue	
Define a union type comprised of the various types	2142
activemq::util::PrimitiveValueConverter	
Class controls the conversion of data contained in a PrimitiveValueNode (p.2145) from one type to another	2144
activemq::util::PrimitiveValueNode	
Class that wraps around a single value of one of the many types . . .	2145
decaf::security::Principal	
Base interface for a principal, which can represent an individual or organization	2159
decaf::util::PriorityQueue< E >	
An unbounded priority queue based on a binary heap algorithm . . .	2160
activemq::commands::ProducerAck	2171
activemq::wireformat::openwire::marshal::generated::ProducerAck-Marshaller	
Marshaling code for Open Wire Format for ProducerAckMarshaller (p.2175)	2175
activemq::cmsutil::ProducerCallback	
Callback for sending a message to a CMS destination	2179
activemq::cmsutil::CmsTemplate::ProducerExecutor	2180
activemq::commands::ProducerId	2182
activemq::wireformat::openwire::marshal::generated::ProducerId-Marshaller	
Marshaling code for Open Wire Format for ProducerIdMarshaller (p.2186)	2186
activemq::commands::ProducerInfo	2190

activemq::wireformat::openwire::marshal::generated::ProducerInfo- Marshaller	
Marshaling code for Open Wire Format for ProducerInfoMarshaller (p. 2195)	2195
activemq::state::ProducerState	2199
decaf::util::Properties	
Java-like properties class for mapping string names to string values	2200
decaf::util::logging::PropertiesChangeListener	
Defines the interface that classes can use to listen for change events on Properties (p. 2200)	2210
decaf::net::ProtocolException	2211
decaf::security::PublicKey	
A public key	2213
decaf::io::PushbackInputStream	
A PushbackInputStream (p. 2214) adds functionality to another in- put stream, namely the ability to "push back" or "unread" one byte	2214
cms::Queue	
An interface encapsulating a provider-specific queue name	2221
decaf::util::Queue< E >	
A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection	2222
cms::QueueBrowser	
This class implements in interface for browsing the messages in a Queue (p. 2221) without removing them	2227
decaf::util::Random	
Random (p. 2229) Value Generator which is used to generate a stream of pseudorandom numbers	2229
decaf::lang::Readable	
A Readable (p. 2235) is a source of characters	2235
activemq::transport::inactivity::ReadChecker	
Runnable class that is used by the {	2236
decaf::io::Reader	2237
decaf::nio::ReadOnlyBufferException	2244
decaf::util::concurrent::locks::ReadWriteLock	
A ReadWriteLock (p. 2246) maintains a pair of associated locks, one for read-only operations and one for writing	2246
activemq::cmsutil::CmsTemplate::ReceiveExecutor	2248
activemq::core::RedeliveryPolicy	
Interface for a RedeliveryPolicy (p. 2250) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transac- tion is rolled back	2250
decaf::util::concurrent::locks::ReentrantLock	
A reentrant mutual exclusion Lock (p. 1684) with extended capabili- ties	2256
decaf::util::concurrent::RejectedExecutionException	2263
decaf::util::concurrent::RejectedExecutionHandler	
A handler for tasks that cannot be executed by a ThreadPool- Executor (p. 2715)	2266
activemq::commands::RemoveInfo	2267

activemq::wireformat::openwire::marshal::generated::RemoveInfo- Marshaller	
Marshaling code for Open Wire Format for RemoveInfoMarshaller (p. 2271)	2271
activemq::commands::RemoveSubscriptionInfo	2275
activemq::wireformat::openwire::marshal::generated::RemoveSubscription- InfoMarshaller	
Marshaling code for Open Wire Format for RemoveSubscription- InfoMarshaller (p. 2280)	2280
activemq::commands::ReplayCommand	2284
activemq::wireformat::openwire::marshal::generated::ReplayCommand- Marshaller	
Marshaling code for Open Wire Format for ReplayCommand- Marshaller (p. 2287)	2287
activemq::cmsutil::CmsTemplate::ResolveProducerExecutor	2291
activemq::cmsutil::CmsTemplate::ResolveReceiveExecutor	2292
decaf::internal::util::Resource	
Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown	2293
activemq::cmsutil::ResourceLifecycleManager	
Manages the lifecycle of a set of CMS resources	2293
decaf::internal::util::ResourceLifecycleManager	2297
activemq::commands::Response	2298
activemq::transport::mock::ResponseBuilder	
Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol	2301
activemq::transport::correlator::ResponseCorrelator	
This type of transport filter is responsible for correlating asyn- chronous responses with requests	2303
activemq::wireformat::openwire::marshal::generated::ResponseMarshaller	
Marshaling code for Open Wire Format for ResponseMarshaller (p. 2307)	2307
decaf::lang::Runnable	
Interface for a runnable object - defines a task that can be run by a thread	2312
decaf::lang::Runtime	2313
decaf::lang::exceptions::RuntimeException	2315
activemq::threads::Scheduler	
Scheduler (p. 2317) class for use in executing Runnable Tasks either periodically or one time only with optional delay	2317
activemq::threads::SchedulerTimerTask	
Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task	2319
decaf::security::SecureRandom	2320
decaf::internal::security::SecureRandomImpl	
Secure Random Number Generator for Unix based platforms that at- tempts to obtain secure bytes with high entropy from known sources .	2325
decaf::security::SecureRandomSpi	
Interface class used by Security Service Providers to implement a source of secure random bytes	2329

decaf::util::concurrent::Semaphore	
A counting semaphore	2331
activemq::cmsutil::CmsTemplate::SendExecutor	2341
decaf::net::ServerSocket	
This class implements server sockets	2342
decaf::net::ServerSocketFactory	
Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies .	2352
activemq::util::Service	
Base interface for all classes that run as a Service (p. 2355) inside the application	2355
activemq::util::ServiceListener	
Listener interface for observers of Service (p. 2355) related events .	2356
activemq::util::ServiceStopper	2358
activemq::util::ServiceSupport	
Provides a base class for Service (p. 2355) implementations	2358
cms::Session	
A Session (p. 2361) object is a single-threaded context for producing and consuming messages	2361
activemq::cmsutil::SessionCallback	
Callback for executing any number of operations on a provided CMS Session	2377
activemq::commands::SessionId	2378
activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller	
Marshaling code for Open Wire Format for SessionIdMarshaller (p. 2382)	2382
activemq::commands::SessionInfo	2386
activemq::wireformat::openwire::marshal::generated::SessionInfo- Marshaller	
Marshaling code for Open Wire Format for SessionInfoMarshaller (p. 2390)	2390
activemq::cmsutil::SessionPool	
A pool of CMS sessions from the same connection and with the same acknowledge mode	2394
activemq::state::SessionState	2395
decaf::util::Set< E >	
A collection that contains no duplicate elements	2397
decaf::lang::Short	2398
decaf::internal::nio::ShortArrayBuffer	2408
decaf::nio::ShortBuffer	
This class defines four categories of operations upon short buffers: .	2419
activemq::commands::ShutdownInfo	2431
activemq::wireformat::openwire::marshal::generated::ShutdownInfo- Marshaller	
Marshaling code for Open Wire Format for ShutdownInfo- Marshaller (p. 2434)	2434
decaf::security::SignatureException	2438
decaf::util::logging::SimpleFormatter	
Print a brief summary of the LogRecord (p. 1719) in a human read- able format	2441

decaf::util::logging::SimpleLogger	2442
activemq::core::SimplePriorityMessageDispatchChannel	2444
decaf::net::Socket	2452
decaf::net::SocketAddress	
Base class for protocol specific Socket (p. 2452) addresses	2470
decaf::net::SocketError	
Static utility class to simplify handling of error codes for socket operations	2470
decaf::net::SocketException	
Exception for errors when manipulating sockets	2471
decaf::net::SocketFactory	
The SocketFactory (p. 2473) is used to create Socket (p. 2452) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations	2473
decaf::internal::net::SocketFileDescriptor	
File Descriptor type used internally by Decaf Socket objects	2478
decaf::net::SocketImpl	
Acts as a base class for all physical Socket (p. 2452) implementations	2479
decaf::net::SocketImplFactory	
Factory class interface for a Factory that creates SocketImpl objects	2487
decaf::net::SocketOptions	2488
decaf::net::SocketTimeoutException	2493
decaf::net::ssl::SSLContext	
Represents on implementation of the Secure Socket (p. 2452) Layer for streaming based sockets	2495
decaf::net::ssl::SSLContextSpi	
Defines the interface that should be provided by an SSLContext (p. 2495) provider	2498
decaf::net::ssl::SSLParameters	2501
decaf::net::ssl::SSLServerSocket	
Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol	2504
decaf::net::ssl::SSLServerSocketFactory	
Factory class interface that provides methods to create SSL Server Sockets	2510
decaf::net::ssl::SSLSocket	2513
decaf::net::ssl::SSLSocketFactory	
Factory class interface for a SocketFactory (p. 2473) that can create SSLSocket (p. 2513) objects	2522
activemq::transport::tcp::SslTransport	
Transport (p. 2790) for connecting to a Broker using an SSL Socket	2525
activemq::transport::tcp::SslTransportFactory	2527
activemq::commands::BrokerError::StackTraceElement	2527
decaf::internal::io::StandardErrorOutputStream	
Wrapper Around the Standard error Output facility on the current platform	2528
decaf::internal::io::StandardInputStream	2530
decaf::internal::io::StandardOutputStream	2532

cms::Startable	
Interface for a class that implements the start method	2534
decaf::lang::STATIC_CAST_TOKEN	2535
activemq::core::ActiveMQConstants::StaticInitializer	2535
decaf::util::StlList< E >	
List (p. 1658) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type	2536
decaf::util::StlMap< K, V, COMPARATOR >	
Map (p. 1768) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map	2552
decaf::util::StlQueue< T >	
The Queue (p. 2222) class accepts messages with an psuh(m) command where m is the message to be queued	2565
decaf::util::StlSet< E >	
Set (p. 2397) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set	2574
activemq::wireformat::stomp::StompCommandConstants	2581
activemq::wireformat::stomp::StompFrame	
A Stomp-level message frame that encloses all messages to and from the broker	2587
activemq::wireformat::stomp::StompHelper	
Utility Methods used when marshaling to and from StompFrame (p. 2587)'s	2592
activemq::wireformat::stomp::StompWireFormat	2597
activemq::wireformat::stomp::StompWireFormatFactory	
Factory used to create the Stomp Wire Format instance	2601
cms::Stoppable	
Interface for a class that implements the stop method	2602
decaf::util::logging::StreamHandler	
Stream based logging Handler (p. 1401)	2603
cms::StreamMessage	
Interface for a StreamMessage (p. 2606)	2606
decaf::lang::String	
Immutable sequence of chars	2620
decaf::util::StringTokenizer	
Class that allows for parsing of string based on Tokens	2627
activemq::commands::SubscriptionInfo	2631
activemq::wireformat::openwire::marshal::generated::SubscriptionInfo-Marshaller	
Marshaling code for Open Wire Format for SubscriptionInfo-Marshaller (p. 2635)	2635
decaf::util::concurrent::Synchronizable	
The interface for all synchronizable objects (that is, objects that can be locked and unlocked)	2639
decaf::internal::util::concurrent::SynchronizableImpl	
A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance	2650

activemq::core::Synchronization	
Transacted Object Synchronization (p.2654), used to sync the events of a Transaction with the items in the Transaction	2654
decaf::util::concurrent::SynchronousQueue< E >	
A blocking queue (p.538) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa	2655
decaf::lang::System	
Static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays	2665
activemq::threads::Task	
Represents a unit of work that requires one or more iterations to complete	2676
activemq::threads::TaskRunner	2677
decaf::internal::net::tcp::TcpSocket	
Platform-independent implementation of the socket interface	2678
decaf::internal::net::tcp::TcpSocketInputStream	
Input stream for performing reads on a socket	2688
decaf::internal::net::tcp::TcpSocketOutputStream	
Output stream for performing write operations on a socket	2691
activemq::transport::tcp::TcpTransport	
Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an IOTransport (p.1548)	2693
activemq::transport::tcp::TcpTransportFactory	
Factory Responsible for creating the TcpTransport (p.2693)	2696
cms::TemporaryQueue	
Defines a Temporary Queue (p.2221) based Destination (p.1210)	2698
cms::TemporaryTopic	
Defines a Temporary Topic (p.2764) based Destination (p.1210)	2700
cms::TextMessage	
Interface for a text message	2701
decaf::lang::Thread	
A Thread (p.2703) is a concurrent unit of execution	2703
decaf::util::concurrent::ThreadFactory	
Public interface ThreadFactory (p.2714)	2714
decaf::lang::ThreadGroup	2715
decaf::util::concurrent::ThreadPoolExecutor	
Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks	2715
decaf::lang::Throwable	
This class represents an error that has occurred	2732
decaf::util::concurrent::TimeoutException	2737
decaf::util::Timer	
A facility for threads to schedule tasks for future execution in a background thread	2739
decaf::util::TimerTask	
A Base class for a task object that can be scheduled for one-time or repeated execution by a Timer (p.2739)	2751

decaf::internal::util::TimerTaskHeap	
A Binary Heap implemented specifically for the Timer class in Decaf	
Util	2753
decaf::util::concurrent::TimeUnit	
A TimeUnit (p. 2756) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units	2756
cms::Topic	
An interface encapsulating a provider-specific topic name	2764
activemq::state::Tracked	2765
activemq::commands::TransactionId	2766
activemq::wireformat::openwire::marshal::generated::TransactionId-Marshaller	
Marshaling code for Open Wire Format for TransactionIdMarshaller (p. 2770)	2770
activemq::commands::TransactionInfo	2774
activemq::wireformat::openwire::marshal::generated::TransactionInfo-Marshaller	
Marshaling code for Open Wire Format for TransactionInfo-Marshaller (p. 2778)	2778
cms::TransactionInProgressException	
This exception is thrown when an operation is invalid because a transaction is in progress	2782
cms::TransactionRolledBackException	
This exception must be thrown when a call to Session.commit (p. 2366) results in a rollback of the current transaction	2783
activemq::state::TransactionState	2785
decaf::internal::util::concurrent::Transferer< E >	
Shared internal API for dual stacks and queues	2786
decaf::internal::util::concurrent::TransferQueue< E >	
This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers	2787
decaf::internal::util::concurrent::TransferStack< E >	2789
activemq::transport::Transport	
Interface for a transport layer for command objects	2790
activemq::transport::TransportFactory	
Defines the interface for Factories that create Transports or - TransportFilters	2798
activemq::transport::TransportFilter	
A filter on the transport layer	2800
activemq::transport::TransportListener	
A listener of asynchronous exceptions from a command transport object	2810
activemq::transport::TransportRegistry	
Registry of all Transport (p. 2790) Factories that are available to the client at runtime	2812
tree_desc_s	2815

decaf::lang::Thread::UncaughtExceptionHandler	
Interface for handlers invoked when a Thread (p. 2703) abruptly terminates due to an uncaught exception	2815
decaf::net::UnknownHostException	2816
decaf::net::UnknownServiceException	2819
decaf::io::UnsupportedEncodingException	
Thrown when the the Character Encoding is not supported	2821
decaf::lang::exceptions::UnsupportedOperationException	2824
cms::UnsupportedOperationException	
This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use	2827
decaf::net::URI	
This class represents an instance of a URI (p. 2828) as defined by RFC 2396	2828
decaf::internal::net::URLEncoderDecoder	2841
decaf::internal::net::URIHelper	
Helper class used by the URI classes in encoding and decoding of URI's	2844
activemq::transport::failover::URIPool	2851
activemq::util::URISupport	2854
decaf::net::URISyntaxException	2856
decaf::internal::net::URIType	
Basic type object that holds data that composes a given URI	2860
decaf::net::URL	
Class URL (p. 2868) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web	2868
decaf::net::URLDecoder	2870
decaf::net::URLEncoder	2871
activemq::util::Usage	2872
decaf::io::UTFDataFormatException	
Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered	2874
decaf::util::UUID	
A class that represents an immutable universally unique identifier (- UUID (p. 2877))	2877
activemq::wireformat::WireFormat	
Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams	2884
activemq::wireformat::WireFormatFactory	
The WireFormatFactory (p. 2888) is the interface that all WireFormatFactory (p. 2888) classes must extend	2888
activemq::commands::WireFormatInfo	2889
activemq::wireformat::openwire::marshal::generated::WireFormatInfo-Marshaller	
Marshaling code for Open Wire Format for WireFormatInfo-Marshaller (p. 2900)	2900
activemq::wireformat::WireFormatNegotiator	
Defines a WireFormatNegotiator (p. 2904) which allows a WireFormat (p. 2884) to	2904

activemq::wireformat::WireFormatRegistry	
Registry of all WireFormat (p. 2884) Factories that are available to the client at runtime	2905
activemq::transport::inactivity::WriteChecker	
Runnable class used by the {	2907
decaf::io::Writer	2908
decaf::security::auth::x500::X500Principal	2914
decaf::security::cert::X509Certificate	
Base interface for all identity certificates	2915
cms::XAConnection	
The XAConnection (p. 2917) interface defines an extended - Connection (p. 933) type that is used to create XASession (p. 2935) objects	2917
cms::XAConnectionFactory	
The XAConnectionFactory (p. 2918) interface is specialized interface that defines an ConnectionFactory (p. 955) that creates - Connection (p. 933) instance that will participate in XA Transactions	2918
cms::XAException	
The XAException (p. 2921) is thrown by the Resource Manager (R-M) to inform the Transaction Manager of an error encountered by the involved transaction	2921
cms::XAResource	
The XAResource (p. 2926) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification)	2926
cms::XASession	
The XASession (p. 2935) interface extends the capability of - Session (p. 2361) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional)	2935
activemq::commands::XATransactionId	2936
activemq::wireformat::openwire::marshal::generated::XATransactionId-Marshaller	
Marshaling code for Open Wire Format for XATransactionId-Marshaller (p. 2942)	2942
cms::Xid	
An interface which provides a mapping for the X/Open XID transaction identifier structure	2946
decaf::util::logging::XMLFormatter	
Format a LogRecord (p. 1719) into a standard XML format	2950
z_stream_s	2952
decaf::util::zip::ZipException	2953

Chapter 4

File Index

4.1 File List

Here is a list of all files with brief descriptions:

src/main/activemq/cmsutil/ CachedConsumer.h	2957
src/main/activemq/cmsutil/ CachedProducer.h	2957

5.2 activemq::cmsutil Namespace Reference

Data Structures

- class **CachedConsumer**
A cached message consumer contained within a pooled session.
- class **CachedProducer**
A cached message producer contained within a pooled session.
- class **CmsAccessor**
*Base class for **activemq.cmsutil.CmsTemplate** (p. 836) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 955) to operate on.*
- class **CmsDestinationAccessor**
*Extends the **CmsAccessor** (p. 819) to add support for resolving destination names.*
- class **CmsTemplate**
***CmsTemplate** (p. 836) simplifies performing synchronous CMS operations.*
- class **DestinationResolver**
*Resolves a CMS destination name to a *Destination*.*
- class **DynamicDestinationResolver**
*Resolves a CMS destination name to a *Destination*.*
- class **MessageCreator**
*Creates the user-defined message to be sent by the **CmsTemplate** (p. 836).*
- class **PooledSession**
A pooled session object that wraps around a delegate session.
- class **ProducerCallback**
Callback for sending a message to a CMS destination.
- class **ResourceLifecycleManager**
Manages the lifecycle of a set of CMS resources.
- class **SessionCallback**
Callback for executing any number of operations on a provided CMS Session.
- class **SessionPool**
A pool of CMS sessions from the same connection and with the same acknowledge mode.

5.3 activemq::commands Namespace Reference

Data Structures

- class **ActiveMQBlobMessage**
- class **ActiveMQBytesMessage**
- class **ActiveMQDestination**
- class **ActiveMQMapMessage**

- class **XATransactionId**

5.4 activemq::core Namespace Reference

Namespaces

- namespace **policies**

Data Structures

- class **ActiveMQAckHandler**
Interface class that is used to give CMS Messages an interface to Ack themselves with.
- class **ActiveMQConnection**
Concrete connection used for all connectors to the ActiveMQ broker.
- class **ActiveMQConnectionFactory**
- class **ActiveMQConnectionMetaData**
*This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 187) class.*

- class **ActiveMQConstants**
Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back and forth between string and enum values.
- class **ActiveMQConsumer**
- class **ActiveMQProducer**
- class **ActiveMQQueueBrowser**
- class **ActiveMQSession**
- class **ActiveMQSessionExecutor**
Delegate dispatcher for a single session.
- class **ActiveMQTransactionContext**
Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.
- class **ActiveMQXAConnection**
- class **ActiveMQXAConnectionFactory**
- class **ActiveMQXASession**
- class **DispatchData**
Simple POCO that contains the information necessary to route a message to a specified consumer.
- class **Dispatcher**
Interface for an object responsible for dispatching messages to consumers.
- class **FifoMessageDispatchChannel**
- class **MessageDispatchChannel**
- class **PrefetchPolicy**
Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.
- class **RedeliveryPolicy**
*Interface for a **RedeliveryPolicy** (p.2250) object that controls how message - Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.*
- class **SimplePriorityMessageDispatchChannel**
- class **Synchronization**
*Transacted Object **Synchronization** (p.2654), used to sync the events of a - Transaction with the items in the Transaction.*

5.5 activemq::core::policies Namespace Reference

Data Structures

- class **DefaultPrefetchPolicy**
- class **DefaultRedeliveryPolicy**

5.6 activemq::exceptions Namespace Reference

Data Structures

- class **ActiveMQException**
- class **BrokerException**
- class **ConnectionFailedException**

5.7 activemq::io Namespace Reference

Data Structures

- class **LoggingInputStream**
- class **LoggingOutputStream**
OutputStream filter that just logs the data being written.

5.8 activemq::library Namespace Reference

Data Structures

- class **ActiveMQCPP**

5.9 activemq::state Namespace Reference

Data Structures

- class **CommandVisitor**
Interface for an Object that can visit the various Command Objects that are sent from and to this client.
- class **CommandVisitorAdapter**
*Default Implementation of a **CommandVisitor** (p. 872) that returns NULL for all calls.*
- class **ConnectionState**
- class **ConnectionStateTracker**
- class **ConsumerState**
- class **ProducerState**
- class **SessionState**
- class **Tracked**
- class **TransactionState**

5.10 activemq::threads Namespace Reference

Data Structures

- class **CompositeTask**
*Represents a single task that can be part of a set of Tasks that are contained in a **CompositeTaskRunner** (p. 893).*
- class **CompositeTaskRunner**
*A **Task** (p. 2676) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.*
- class **DedicatedTaskRunner**
- class **Scheduler**
***Scheduler** (p. 2317) class for use in executing Runnable Tasks either periodically or one time only with optional delay.*
- class **SchedulerTimerTask**
Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.
- class **Task**
Represents a unit of work that requires one or more iterations to complete.
- class **TaskRunner**

5.11 activemq::transport Namespace Reference

Namespaces

- namespace **correlator**
- namespace **failover**
- namespace **inactivity**
- namespace **logging**
- namespace **mock**
- namespace **tcp**

Data Structures

- class **AbstractTransportFactory**
*Abstract implementation of the **TransportFactory** (p. 2798) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 2798) instances.*
- class **CompositeTransport**
*A Composite **Transport** (p. 2790) is a **Transport** (p. 2790) implementation that is composed of several Transports.*
- class **DefaultTransportListener**
*A Utility class that create empty implementations for the **TransportListener** (p. 2810) interface so that a subclass only needs to override the one's its interested.*

- class **IOTransport**
*Implementation of the **Transport** (p. 2790) interface that performs marshaling of commands to IO streams.*
- class **Transport**
Interface for a transport layer for command objects.
- class **TransportFactory**
Defines the interface for Factories that create Transports or TransportFilters.
- class **TransportFilter**
A filter on the transport layer.
- class **TransportListener**
A listener of asynchronous exceptions from a command transport object.
- class **TransportRegistry**
*Registry of all **Transport** (p. 2790) Factories that are available to the client at runtime.*

5.12 activemq::transport::correlator Namespace Reference

Data Structures

- class **FutureResponse**
A container that holds a response object.
- class **ResponseCorrelator**
This type of transport filter is responsible for correlating asynchronous responses with requests.

5.13 activemq::transport::failover Namespace Reference

Data Structures

- class **BackupTransport**
- class **BackupTransportPool**
- class **CloseTransportsTask**
- class **FailoverTransport**
- class **FailoverTransportFactory**
*Creates an instance of a **FailoverTransport** (p. 1305).*
- class **FailoverTransportListener**
*Utility class used by the **Transport** (p. 2790) to perform the work of responding to events from the active **Transport** (p. 2790).*
- class **URIPool**

5.14 activemq::transport::inactivity Namespace Reference

Data Structures

- class **InactivityMonitor**
- class **ReadChecker**
Runnable class that is used by the {}.
- class **WriteChecker**
Runnable class used by the {}.

5.15 activemq::transport::logging Namespace Reference

Data Structures

- class **LoggingTransport**
A transport filter that logs commands as they are sent/received.

5.16 activemq::transport::mock Namespace Reference

Data Structures

- class **InternalCommandListener**
*Listens for Commands sent from the **MockTransport** (p. 1948).*
- class **MockTransport**
*The **MockTransport** (p. 1948) defines a base level **Transport** (p. 2790) class that is intended to be used in place of an a regular protocol **Transport** (p. 2790) such as TCP.*
- class **MockTransportFactory**
Manufactures MockTransports, which are objects that read from input streams and write to output streams.
- class **ResponseBuilder**
Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

5.17 activemq::transport::tcp Namespace Reference

Data Structures

- class **SslTransport**
***Transport** (p. 2790) for connecting to a Broker using an SSL Socket.*
- class **SslTransportFactory**
- class **TcpTransport**

*Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1548).*

- class **TcpTransportFactory**

*Factory Responsible for creating the **TcpTransport** (p. 2693).*

5.18 activemq::util Namespace Reference

Data Structures

- class **ActiveMQProperties**

*Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2200) object.*

- class **CMSExceptionSupport**

- class **CompositeData**

Represents a Composite URI.

- class **IdGenerator**

- class **LongSequenceGenerator**

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

- class **MarshallingSupport**

- class **MemoryUsage**

- class **PrimitiveList**

List of primitives.

- class **PrimitiveMap**

Map of named primitives.

- class **PrimitiveValueConverter**

*Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2145) from one type to another.*

- class **PrimitiveValueNode**

Class that wraps around a single value of one of the many types.

- class **Service**

*Base interface for all classes that run as a **Service** (p. 2355) inside the application.*

- class **ServiceListener**

*Listener interface for observers of **Service** (p. 2355) related events.*

- class **ServiceStopper**

- class **ServiceSupport**

*Provides a base class for **Service** (p. 2355) implementations.*

- class **URISupport**

- class **Usage**

5.19 activemq::wireformat Namespace Reference

Namespaces

- namespace **openwire**
- namespace **stomp**

Data Structures

- class **MarshalAware**
- class **WireFormat**
Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.
- class **WireFormatFactory**
*The **WireFormatFactory** (p.2888) is the interface that all **WireFormatFactory** (p.2888) classes must extend.*
- class **WireFormatNegotiator**
*Defines a **WireFormatNegotiator** (p.2904) which allows a **WireFormat** (p.2884) to.*
- class **WireFormatRegistry**
*Registry of all **WireFormat** (p.2884) Factories that are available to the client at run-time.*

5.20 activemq::wireformat::openwire Namespace Reference

Namespaces

- namespace **marshal**
- namespace **utils**

Data Structures

- class **OpenWireFormat**
- class **OpenWireFormatFactory**
- class **OpenWireFormatNegotiator**
- class **OpenWireResponseBuilder**
Used to allow a MockTransport to generate response commands to OpenWire - Commands.

5.21 activemq::wireformat::openwire::marshal Namespace Reference

Namespaces

- namespace **generated**

Data Structures

- class **BaseDataStreamMarshaller**
Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.
- class **DataStreamMarshaller**
Base class for all classes that marshal commands for Openwire.
- class **PrimitiveTypesMarshaller**
This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

5.22 activemq::wireformat::openwire::marshal::generated Namespace Reference

Data Structures

- class **ActiveMQBlobMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 161).*
- class **ActiveMQBytesMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 183).*
- class **ActiveMQDestinationMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQDestinationMarshaller** (p. 258).*
- class **ActiveMQMapMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 284).*
- class **ActiveMQMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQMessageMarshaller** (p. 291).*
- class **ActiveMQObjectMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 304).*
- class **ActiveMQQueueMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 329).*
- class **ActiveMQStreamMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p. 375).*
- class **ActiveMQTempDestinationMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p. 382).*

5.22 activemq::wireformat::openwire::marshal::generated Namespace Reference

- class **ActiveMQTempQueueMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 391).*
- class **ActiveMQTempTopicMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 401).*
- class **ActiveMQTextMessageMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 410).*
- class **ActiveMQTopicMarshaller**
*Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 419).*
- class **BaseCommandMarshaller**
*Marshaling code for Open Wire Format for **BaseCommandMarshaller** (p. 499).*
- class **BrokerIdMarshaller**
*Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 567).*
- class **BrokerInfoMarshaller**
*Marshaling code for Open Wire Format for **BrokerInfoMarshaller** (p. 578).*
- class **ConnectionControlMarshaller**
*Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 943).*
- class **ConnectionErrorMarshaller**
*Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p. 951).*
- class **ConnectionIdMarshaller**
*Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 963).*
- class **ConnectionInfoMarshaller**
*Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 974).*
- class **ConsumerControlMarshaller**
*Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p. 996).*
- class **ConsumerIdMarshaller**
*Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1005).*
- class **ConsumerInfoMarshaller**
*Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1017).*
- class **ControlCommandMarshaller**
*Marshaling code for Open Wire Format for **ControlCommandMarshaller** (p. 1025).*
- class **DataArrayResponseMarshaller**
*Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1072).*
- class **DataResponseMarshaller**
*Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1115).*
- class **DestinationInfoMarshaller**
*Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1218).*
- class **DiscoveryEventMarshaller**
*Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1230).*
- class **ExceptionResponseMarshaller**
*Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1290).*
- class **FlushCommandMarshaller**
*Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1383).*

- class **IntegerResponseMarshaller**
*Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p. 1519).*
- class **JournalQueueAckMarshaller**
*Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1564).*
- class **JournalTopicAckMarshaller**
*Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p. 1572).*
- class **JournalTraceMarshaller**
*Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 1579).*
- class **JournalTransactionMarshaller**
*Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p. 1587).*
- class **KeepAliveInfoMarshaller**
*Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1594).*
- class **LastPartialCommandMarshaller**
*Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1608).*
- class **LocalTransactionIdMarshaller**
*Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1678).*
- class **MarshallerFactory**
Used to create marshallers for a specific version of the wire protocol.
- class **MessageAckMarshaller**
*Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 1873).*
- class **MessageDispatchMarshaller**
*Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 1890).*
- class **MessageDispatchNotificationMarshaller**
*Marshaling code for Open Wire Format for **MessageDispatchNotificationMarshaller** (p. 1899).*
- class **MessageIdMarshaller**
*Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 1912).*
- class **MessageMarshaller**
*Marshaling code for Open Wire Format for **MessageMarshaller** (p. 1917).*
- class **MessagePullMarshaller**
*Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 1944).*
- class **NetworkBridgeFilterMarshaller**
*Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 1974).*
- class **PartialCommandMarshaller**
*Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2079).*
- class **ProducerAckMarshaller**
*Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2175).*
- class **ProducerIdMarshaller**
*Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2186).*
- class **ProducerInfoMarshaller**
*Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2195).*
- class **RemoveInfoMarshaller**

*Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2271).*

- class **RemoveSubscriptionInfoMarshaller**

*Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2280).*

- class **ReplayCommandMarshaller**

*Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2287).*

- class **ResponseMarshaller**

*Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2307).*

- class **SessionIdMarshaller**

*Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2382).*

- class **SessionInfoMarshaller**

*Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 2390).*

- class **ShutdownInfoMarshaller**

*Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2434).*

- class **SubscriptionInfoMarshaller**

*Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2635).*

- class **TransactionIdMarshaller**

*Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 2770).*

- class **TransactionInfoMarshaller**

*Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2778).*

- class **WireFormatInfoMarshaller**

*Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2900).*

- class **XATransactionIdMarshaller**

*Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2942).*

5.23 activemq::wireformat::openwire::utils Namespace Reference

Data Structures

- class **BooleanStream**

Manages the writing and reading of boolean data streams to and from a data source such as a `DataStream` or `DataOutputStream`.

- class **HexTable**

*The **HexTable** (p. 1407) class maps hexadecimal strings to the value of an index into the table, i.e.*

- class **MessagePropertyInterceptor**

Used the base `ActiveMQMessage` class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the `OpenWire` Message properties.

5.24 activemq::wireformat::stomp Namespace Reference

Data Structures

- class **StompCommandConstants**
- class **StompFrame**

A Stomp-level message frame that encloses all messages to and from the broker.
- class **StompHelper**

*Utility Methods used when marshaling to and from **StompFrame** (p. 2587)'s.*
- class **StompWireFormat**
- class **StompWireFormatFactory**

Factory used to create the Stomp Wire Format instance.

5.25 cms Namespace Reference

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

Data Structures

- class **BytesMessage**

*A **BytesMessage** (p. 718) object is used to send a message containing a stream of unsigned bytes.*
- class **Closeable**

Interface for a class that implements the close method.
- class **CMSException**

CMS API Exception that is the base for all exceptions thrown from CMS classes.
- class **CMSProperties**

Interface for a Java-like properties object.
- class **CMSSecurityException**

This exception must be thrown when a provider rejects a user name/password submitted by a client.
- class **Connection**

The client's connection to its provider.
- class **ConnectionFactory**

*Defines the interface for a factory that creates connection objects, the **Connection** (p. 933) objects returned implement the CMS **Connection** (p. 933) interface and hide the CMS Provider specific implementation details behind that interface.*
- class **ConnectionMetaData**

*A **ConnectionMetaData** (p. 978) object provides information describing the **Connection** (p. 933) object.*
- class **DeliveryMode**

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

- class **Destination**
*A **Destination** (p. 1210) object encapsulates a provider-specific address.*
- class **ExceptionListener**
*If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1286) that is registered with the **Connection** (p. 933).*
- class **IllegalStateException**
This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.
- class **InvalidClientIdException**
This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.
- class **InvalidDestinationException**
This exception must be thrown when a destination either is not understood by a provider or is no longer valid.
- class **InvalidSelectorException**
This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.
- class **MapMessage**
*A **MapMessage** (p. 1779) object is used to send a set of name-value pairs.*
- class **Message**
Root of all messages.
- class **MessageConsumer**
*A client uses a **MessageConsumer** (p. 1877) to receive messages from a destination.*
- class **MessageEnumeration**
Defines an object that enumerates a collection of Messages.
- class **MessageEOFException**
*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2606) or **BytesMessage** (p. 718) is being read.*
- class **MessageFormatException**
This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.
- class **MessageListener**
*A **MessageListener** (p. 1916) object is used to receive asynchronously delivered messages.*
- class **MessageNotReadableException**
This exception must be thrown when a CMS client attempts to read a write-only message.
- class **MessageNotWriteableException**
This exception must be thrown when a CMS client attempts to write to a read-only message.
- class **MessageProducer**
*A client uses a **MessageProducer** (p. 1924) object to send messages to a **Destination** (p. 1210).*
- class **ObjectMessage**

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

- class **Queue**

An interface encapsulating a provider-specific queue name.

- class **QueueBrowser**

*This class implements in interface for browsing the messages in a **Queue** (p. 2221) without removing them.*

- class **Session**

*A **Session** (p. 2361) object is a single-threaded context for producing and consuming messages.*

- class **Startable**

Interface for a class that implements the start method.

- class **Stoppable**

Interface for a class that implements the stop method.

- class **StreamMessage**

*Interface for a **StreamMessage** (p. 2606).*

- class **TemporaryQueue**

*Defines a Temporary **Queue** (p. 2221) based **Destination** (p. 1210).*

- class **TemporaryTopic**

*Defines a Temporary **Topic** (p. 2764) based **Destination** (p. 1210).*

- class **TextMessage**

Interface for a text message.

- class **Topic**

An interface encapsulating a provider-specific topic name.

- class **TransactionInProgressException**

This exception is thrown when an operation is invalid because a transaction is in progress.

- class **TransactionRolledBackException**

*This exception must be thrown when a call to **Session.commit** (p. 2366) results in a rollback of the current transaction.*

- class **UnsupportedOperationException**

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

- class **XAConnection**

*The **XAConnection** (p. 2917) interface defines an extended **Connection** (p. 933) type that is used to create **XASession** (p. 2935) objects.*

- class **XAConnectionFactory**

*The **XAConnectionFactory** (p. 2918) interface is specialized interface that defines an **ConnectionFactory** (p. 955) that creates **Connection** (p. 933) instance that will participate in XA Transactions.*

- class **XAException**

*The **XAException** (p. 2921) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.*

- class **XAResource**

The **XAResource** (p. 2926) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).

- class **XASession**

The **XASession** (p. 2935) interface extends the capability of **Session** (p. 2361) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).

- class **Xid**

An interface which provides a mapping for the X/Open XID transaction identifier structure.

5.27 decaf::internal Namespace Reference

Namespaces

- namespace **io**
- namespace **net**
- namespace **nio**
- namespace **security**
- namespace **util**

Data Structures

- class **AprPool**
Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.
- class **DecafRuntime**
Handles APR initialization and termination.

5.28 decaf::internal::io Namespace Reference

Data Structures

- class **StandardErrorOutputStream**
Wrapper Around the Standard error Output facility on the current platform.
- class **StandardInputStream**
- class **StandardOutputStream**

5.29 decaf::internal::net Namespace Reference

Namespaces

- namespace **ssl**
- namespace **tcp**

Data Structures

- class **DefaultServerSocketFactory**
Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.
- class **DefaultSocketFactory**
SocketFactory implementation that is used to create Sockets.
- class **Network**
Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.
- class **SocketFileDescriptor**
File Descriptor type used internally by Decaf Socket objects.
- class **URIEncoderDecoder**
- class **URIHelper**
Helper class used by the URI classes in encoding and decoding of URI's.
- class **URIType**
Basic type object that holds data that composes a given URI.

5.30 decaf::internal::net::ssl Namespace Reference

Namespaces

- namespace **openssl**

Data Structures

- class **DefaultSSLContext**
Default SSLContext manager for the Decaf library.
- class **DefaultSSLServerSocketFactory**
Default implementation of the SSLServerSocketFactory, this factory throws an - Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.
- class **DefaultSSLSocketFactory**
Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

5.31 decaf::internal::net::ssl::openssl Namespace Reference

Data Structures

- class **OpenSSLContextSpi**
Provides an SSLContext that wraps the OpenSSL API.

- class **OpenSSLParameters**
Container class for parameters that are Common to OpenSSL socket classes.
- class **OpenSSLServerSocket**
SSLServerSocket based on OpenSSL library code.
- class **OpenSSLServerSocketFactory**
SSLServerSocketFactory that creates Server Sockets that use OpenSSL.
- class **OpenSSLSocket**
Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.
- class **OpenSSLSocketException**
Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.
- class **OpenSSLSocketFactory**
Client Socket Factory that creates SSL based client sockets using the OpenSSL library.
- class **OpenSSLSocketInputStream**
An output stream for reading data from an OpenSSL Socket instance.
- class **OpenSSLSocketOutputStream**
*OutputStream implementation used to write data to an **OpenSSLSocket** (p. 2014) instance.*

5.32 decaf::internal::net::tcp Namespace Reference

Data Structures

- class **TcpSocket**
Platform-independent implementation of the socket interface.
- class **TcpSocketInputStream**
Input stream for performing reads on a socket.
- class **TcpSocketOutputStream**
Output stream for performing write operations on a socket.

5.33 decaf::internal::nio Namespace Reference

Data Structures

- class **BufferFactory**
*Factory class used by static methods in the **decaf::nio** (p. 94) package to create the various default version of the NIO interfaces.*
- class **ByteArrayBuffer**
This class defines six categories of operations upon byte buffers:
- class **CharArrayBuffer**
- class **DoubleArrayBuffer**

- class **FloatArrayBuffer**
- class **IntArrayBuffer**
- class **LongArrayBuffer**
- class **ShortArrayBuffer**

5.34 decaf::internal::security Namespace Reference

Data Structures

- class **SecureRandomImpl**
Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

5.35 decaf::internal::util Namespace Reference

Namespaces

- namespace **concurrent**

Data Structures

- class **ByteArrayAdapter**
This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.
- class **GenericResource**
*A Generic **Resource** (p. 2293) wraps some type and will delete it when the **Resource** (p. 2293) itself is deleted.*
- class **HexStringParser**
- class **Resource**
Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown.
- class **ResourceLifecycleManager**
- class **TimerTaskHeap**
A Binary Heap implemented specifically for the Timer class in Decaf Util.

5.36 decaf::internal::util::concurrent Namespace Reference

Data Structures

- class **ConditionImpl**
- class **MutexImpl**
- class **SynchronizableImpl**

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

- class **Transferer**

Shared internal API for dual stacks and queues.

- class **TransferQueue**

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers.

- class **TransferStack**

5.37 decaf::io Namespace Reference

Data Structures

- class **BlockingByteArrayInputStream**

This is a blocking version of a byte buffer stream.

- class **BufferedInputStream**

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

- class **BufferedOutputStream**

Wrapper around another output stream that buffers output before writing to the target output stream.

- class **ByteArrayInputStream**

*A **ByteArrayInputStream** (p. 679) contains an internal buffer that contains bytes that may be read from the stream.*

- class **ByteArrayOutputStream**

- class **Closeable**

Interface for a class that implements the close method.

- class **DataInput**

*The **DataInput** (p. 1086) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.*

- class **DataInputStream**

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

- class **DataOutput**

*The **DataOutput** (p. 1103) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.*

- class **DataOutputStream**

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

- class **EOFException**

- class **FileDescriptor**

This class serves as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

- class **FilterInputStream**

A **FilterInputStream** (p. 1334) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

- class **FilterOutputStream**

This class is the superclass of all classes that filter output streams.

- class **Flushable**

A **Flushable** (p. 1380) is a destination of data that can be flushed.

- class **InputStream**

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

- class **InputStreamReader**

An **InputStreamReader** (p. 1475) is a bridge from byte streams to character streams.

- class **InterruptedIOException**

- class **IOException**

- class **OutputStream**

Base interface for any class that wants to represent an output stream of bytes.

- class **OutputStreamWriter**

A class for turning a character stream into a byte stream.

- class **PushbackInputStream**

A **PushbackInputStream** (p. 2214) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

- class **Reader**

- class **UnsupportedEncodingException**

Thrown when the the Character Encoding is not supported.

- class **UTFDataFormatException**

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

- class **Writer**

5.38 decaf::lang Namespace Reference

- namespace **exceptions**

Data Structures

- class **Appendable**

An object to which char sequences and values can be appended.

- class **ArrayPointer**

*Decaf's implementation of a Smart **Pointer** (p. 2083) that is a template on a Type and is **Thread** (p. 2703) Safe if the default Reference Counter is used.*

- class **ArrayPointerComparator**

*This implementation of **Comparator** is designed to allows objects in a **Collection** to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 462).*

- class **Boolean**
- class **Byte**
- class **Character**
- class **CharSequence**

*A **CharSequence** (p. 803) is a readable sequence of char values.*

- class **Comparable**

This interface imposes a total ordering on the objects of each class that implements it.

- class **Double**
- class **Exception**
- class **Float**
- class **Integer**
- class **Iterable**

*Implementing this interface allows an object to be cast to an **Iterable** (p. 1556) type for generic collections API calls.*

- class **Long**
- class **Math**

*The class **Math** (p. 1800) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.*

- class **Number**

*The abstract class **Number** (p. 1992) is the superclass of classes **Byte** (p. 614), - **Double** (p. 1235), **Float** (p. 1344), **Integer** (p. 1500), **Long** (p. 1726), and **Short** (p. 2398).*

- struct **STATIC_CAST_TOKEN**
- struct **DYNAMIC_CAST_TOKEN**
- class **Pointer**

*Decaf's implementation of a Smart **Pointer** (p. 2083) that is a template on a **Type** and is **Thread** (p. 2703) Safe if the default Reference Counter is used.*

- class **PointerComparator**

*This implementation of **Comparator** is designed to allows objects in a **Collection** to be sorted or tested for equality based on the value of the **Object** being **Pointed** to and not the value of the contained pointer in the **Pointer** (p. 2083) instance.*

- class **Readable**

*A **Readable** (p. 2235) is a source of characters.*

- class **Runnable**

Interface for a runnable object - defines a task that can be run by a thread.

- class **Runtime**
- class **Short**
- class **String**

*The **String** (p. 2620) class represents an immutable sequence of chars.*

- class **System**

*The **System** (p. 2665) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.*

- class **Thread**

*A **Thread** (p. 2703) is a concurrent unit of execution.*

- class **ThreadGroup**
- class **Throwable**

This class represents an error that has occurred.

Data Structures

- class **ClassCastException**
- class **IllegalArgumentException**
- class **IllegalMonitorStateException**
- class **IllegalStateException**
- class **IllegalThreadStateException**
- class **IndexOutOfBoundsException**
- class **InterruptedException**
- class **InvalidStateException**
- class **NullPointerException**
- class **NumberFormatException**
- class **RuntimeException**
- class **UnsupportedOperationException**

5.40 decaf::net Namespace Reference

Namespaces

- namespace **ssl**

Data Structures

- class **BindException**
- class **ConnectException**
- class **DatagramPacket**
Class that represents a single datagram packet.
- class **HttpRetryException**
- class **Inet4Address**
- class **Inet6Address**
- class **InetAddress**
Represents an IP address.
- class **InetSocketAddress**
- class **MalformedURLException**
- class **NoRouteToHostException**
- class **PortUnreachableException**
- class **ProtocolException**
- class **ServerSocket**
This class implements server sockets.
- class **ServerSocketFactory**
Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.
- class **Socket**
- class **SocketAddress**
*Base class for protocol specific **Socket** (p. 2452) addresses.*
- class **SocketError**
Static utility class to simplify handling of error codes for socket operations.
- class **SocketException**
Exception for errors when manipulating sockets.
- class **SocketFactory**
*The **SocketFactory** (p. 2473) is used to create **Socket** (p. 2452) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.*
- class **SocketImpl**
*Acts as a base class for all physical **Socket** (p. 2452) implementations.*
- class **SocketImplFactory**
Factory class interface for a Factory that creates SocketImpl objects.
- class **SocketOptions**
- class **SocketTimeoutException**
- class **UnknownHostException**

- class **UnknownServiceException**
- class **URI**

*This class represents an instance of a **URI** (p. 2828) as defined by RFC 2396.*

- class **URISyntaxException**
- class **URL**

*Class **URL** (p. 2868) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.*

- class **URLDecoder**
- class **URLEncoder**

5.41 decaf::net::ssl Namespace Reference

Data Structures

- class **SSLContext**
*Represents an implementation of the Secure **Socket** (p. 2452) Layer for streaming based sockets.*
- class **SSLContextSpi**
*Defines the interface that should be provided by an **SSLContext** (p. 2495) provider.*
- class **SSLParameters**
- class **SSLServerSocket**
Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.
- class **SSLServerSocketFactory**
Factory class interface that provides methods to create SSL Server Sockets.
- class **SSLSocket**
- class **SSLSocketFactory**
*Factory class interface for a **SocketFactory** (p. 2473) that can create **SSLSocket** (p. 2513) objects.*

5.42 decaf::nio Namespace Reference

Data Structures

- class **Buffer**
A container for data of a specific primitive type.
- class **BufferOverflowException**
- class **BufferUnderflowException**
- class **ByteBuffer**
This class defines six categories of operations upon byte buffers:
- class **CharBuffer**
This class defines four categories of operations upon character buffers:
- class **DoubleBuffer**

This class defines four categories of operations upon double buffers:

- class **FloatBuffer**

This class defines four categories of operations upon float buffers:

- class **IntBuffer**

This class defines four categories of operations upon int buffers:

- class **InvalidMarkException**
- class **LongBuffer**

This class defines four categories of operations upon long long buffers:

- class **ReadOnlyBufferException**
- class **ShortBuffer**

This class defines four categories of operations upon short buffers:

- class **Certificate**
Base interface for all identity certificates.
- class **CertificateEncodingException**
- class **CertificateException**
- class **CertificateExpiredException**
- class **CertificateNotYetValidException**
- class **CertificateParsingException**
- class **X509Certificate**
Base interface for all identity certificates.

5.47 decaf::util Namespace Reference

Namespaces

- namespace **comparators**
- namespace **concurrent**
- namespace **logging**
- namespace **zip**

Data Structures

- class **AbstractCollection**
*This class provides a skeletal implementation of the **Collection** (p. 851) interface, to minimize the effort required to implement this interface.*
- class **AbstractList**
*This class provides a skeletal implementation of the **List** (p. 1658) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array).*
- class **AbstractMap**
*This class provides a skeletal implementation of the **Map** (p. 1768) interface, to minimize the effort required to implement this interface.*
- class **AbstractQueue**
*This class provides skeletal implementations of some **Queue** (p. 2222) operations.*

- class **AbstractSequentialList**
*This class provides a skeletal implementation of the **List** (p. 1658) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).*
- class **AbstractSet**
*This class provides a skeletal implementation of the **Set** (p. 2397) interface to minimize the effort required to implement this interface.*
- class **ArrayList**
- class **Arrays**
- class **Collection**
The root interface in the collection hierarchy.
- class **Comparator**
A comparison function, which imposes a total ordering on some collection of objects.
- class **ConcurrentModificationException**
- class **Date**
Wrapper class around a time value in milliseconds.
- class **Deque**
*Defines a 'Double ended **Queue** (p. 2222)' interface that allows for insertion and removal of elements from both ends.*
- class **Iterator**
Defines an object that can be used to iterate over the elements of a collection.
- class **LinkedList**
*A complete implementation of the **List** (p. 1658) interface using a doubly linked list data structure.*
- class **List**
An ordered collection (also known as a sequence).
- class **ListIterator**
An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.
- class **Map**
***Map** (p. 1768) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.*
- class **NoSuchElementException**
- class **PriorityQueue**
An unbounded priority queue based on a binary heap algorithm.
- class **Properties**
Java-like properties class for mapping string names to string values.
- class **Queue**
A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.
- class **Random**
***Random** (p. 2229) Value Generator which is used to generate a stream of pseudorandom numbers.*
- class **Set**
A collection that contains no duplicate elements.

- class **StlList**
***List** (p. 1658) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.*
- class **StlMap**
***Map** (p. 1768) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.*
- class **StlQueue**
*The **Queue** (p. 2222) class accepts messages with an `psuh(m)` command where `m` is the message to be queued.*
- class **StlSet**
***Set** (p. 2397) template that wraps around a `std::set` to provide a more user-friendly interface and to provide common functions that do not exist in `std::set`.*
- class **StringTokenizer**
Class that allows for parsing of string based on Tokens.
- class **Timer**
A facility for threads to schedule tasks for future execution in a background thread.
- class **TimerTask**
*A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 2739).*
- class **UUID**
*A class that represents an immutable universally unique identifier (**UUID** (p. 2877)).*

5.48 decaf::util::comparators Namespace Reference

Data Structures

- class **Less**
*Simple **Less** (p. 1612) **Comparator** (p. 888) that compares to elements to determine if the first is less than the second.*

5.49 decaf::util::concurrent Namespace Reference

Namespaces

- namespace **atomic**
- namespace **locks**

Data Structures

- class **ConditionHandle**
- class **MutexHandle**
- class **AbstractExecutorService**

*Provides a default implementation for the methods of the **ExecutorService** (p. 1302) interface.*

- class **BlockingQueue**

*A **decaf::util::Queue** (p. 2222) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.*

- class **BrokenBarrierException**

- class **Callable**

A task that returns a result and may throw an exception.

- class **CancellationException**

- class **ConcurrentMap**

*Interface for a **Map** (p. 1768) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1768) interface.*

- class **ConcurrentStlMap**

***Map** (p. 1768) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.*

- class **CopyOnWriteArrayList**

- class **CopyOnWriteArraySet**

*Since the **CopyOnWriteArraySet** (p. 1050) and the **CopyOnWriteArrayList** (p. 1030) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 1030) for all its underlying operations.*

- class **CountDownLatch**

- class **Delayed**

A mix-in style interface for marking objects that should be acted upon after a given delay.

- class **ExecutionException**

- class **Executor**

*An object that executes submitted **decaf.lang Runnable** (p. 2312) tasks.*

- class **Executors**

*Implements a set of utilities for use with **Executors** (p. 1299), **ExecutorService** (p. 1302), **ThreadFactory** (p. 2714), and **Callable** (p. 746) types, as well as providing factory methods for instance of these types configured for the most common use cases.*

- class **ExecutorService**

*An **Executor** (p. 1297) that provides methods to manage termination and methods that can produce a **Future** (p. 1390) for tracking progress of one or more asynchronous tasks.*

- class **Future**

*A **Future** (p. 1390) represents the result of an asynchronous computation.*

- class **LinkedBlockingQueue**

*A **BlockingQueue** (p. 538) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time.*

- class **Lock**

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

- class **Mutex**

Mutex (p. 1960) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.

- class **RejectedExecutionException**
- class **RejectedExecutionHandler**

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 2715).

- class **Semaphore**

A counting semaphore.

- class **Synchronizable**

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

- class **SynchronousQueue**

A **blocking queue** (p. 538) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.

- class **ThreadFactory**

public interface **ThreadFactory** (p. 2714)

- class **ThreadPoolExecutor**

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

- class **TimeoutException**
- class **TimeUnit**

A **TimeUnit** (p. 2756) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.

5.50 decaf::util::concurrent::atomic Namespace Reference

Data Structures

- class **AtomicBoolean**

A boolean value that may be updated atomically.

- class **AtomicInteger**

An int value that may be updated atomically.

- class **AtomicRefCounter**

- class **AtomicReference**

An Pointer reference that may be updated atomically.

5.51 decaf::util::concurrent::locks Namespace Reference

Data Structures

- class **AbstractOwnableSynchronizer**

Base class for locks that provide the notion of Ownership, the types of locks that are implemented using this base class would be owned by one specific Thread at any given time.

- class **Condition**
***Condition** (p. 921) factors out the **Mutex** (p. 1960) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1684) implementations.*
- class **Lock**
***Lock** (p. 1684) implementations provide more extensive locking operations than can be obtained using synchronized statements.*
- class **LockSupport**
Basic thread blocking primitives for creating locks and other synchronization classes.
- class **ReadWriteLock**
*A **ReadWriteLock** (p. 2246) maintains a pair of associated locks, one for read-only operations and one for writing.*
- class **ReentrantLock**
*A reentrant mutual exclusion **Lock** (p. 1684) with extended capabilities.*

5.52 decaf::util::logging Namespace Reference

Data Structures

- class **ConsoleHandler**
*This **Handler** (p. 1401) publishes log records to System.err.*
- class **ErrorManager**
***ErrorManager** (p. 1277) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 1401) during Logging.*
- class **Filter**
*A **Filter** (p. 1333) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.*
- class **Formatter**
*A **Formatter** (p. 1387) provides support for formatting LogRecords.*
- class **Handler**
*A **Handler** (p. 1401) object takes log messages from a **Logger** (p. 1693) and exports them.*
- class **Level**
*The **Level** (p. 1616) class defines a set of standard logging levels that can be used to control logging output.*
- class **Logger**
*A **Logger** (p. 1693) object is used to log messages for a specific system or application component.*
- class **LoggerHierarchy**
- class **LogManager**
*There is a single global **LogManager** (p. 1712) object that is used to maintain a set of shared state about Loggers and log services.*
- class **LogRecord**
***LogRecord** (p. 1719) objects are used to pass logging requests between the logging framework and individual log Handlers.*

- class **LogWriter**
- class **MarkBlockLogger**
 - Defines a class that can be used to mark the entry and exit from scoped blocks.*
- class **PropertiesChangeListener**
 - Defines the interface that classes can use to listen for change events on **Properties** (p. 2200).*
- class **SimpleFormatter**
 - Print a brief summary of the **LogRecord** (p. 1719) in a human readable format.*
- class **SimpleLogger**
- class **StreamHandler**
 - Stream based logging **Handler** (p. 1401).*
- class **XMLFormatter**
 - Format a **LogRecord** (p. 1719) into a standard XML format.*

Enumerations

- enum **Levels** { **Off**, **Null**, **Markblock**, **Debug**, **Info**, **Warn**, **Error**, **Fatal**, **Throwing** }
 - Defines an enumeration for logging levels.*

5.52.1 Enumeration Type Documentation

5.52.1.1 enum decaf::util::logging::Levels

Defines an enumeration for logging levels.

Enumerator:

Off
Null
Markblock
Debug
Info
Warn
Error
Fatal
Throwing

5.53 decaf::util::zip Namespace Reference

Data Structures

- class **Adler32**

Class that can be used to compute an Adler-32 **Checksum** (p. 810) for a data stream.

- class **CheckedInputStream**

An implementation of a *FilterInputStream* that will maintain a **Checksum** (p. 810) of the bytes read, the **Checksum** (p. 810) can then be used to verify the integrity of the input stream.

- class **CheckedOutputStream**

An implementation of a *FilterOutputStream* that will maintain a **Checksum** (p. 810) of the bytes written, the **Checksum** (p. 810) can then be used to verify the integrity of the output stream.

- class **Checksum**

An interface used to represent **Checksum** (p. 810) values in the Zip package.

- class **CRC32**

Class that can be used to compute a CRC-32 checksum for a data stream.

- class **DataFormatException**

- class **Deflater**

This class compresses data using the DEFLATE algorithm (see specification).

- class **DeflaterOutputStream**

Provides a *FilterOutputStream* instance that compresses the data before writing it to the wrapped *OutputStream*.

- class **Inflater**

This class uncompresses data that was compressed using the DEFLATE algorithm (see specification).

- class **InflaterInputStream**

A *FilterInputStream* that decompresses data read from the wrapped *InputStream* instance.

- class **ZipException**

5.54 std Namespace Reference

Data Structures

- struct **less< decaf::lang::ArrayPointer< T > >**

An override of the *less* function object so that the *Pointer* objects can be stored in STL Maps, etc.

- struct **less< decaf::lang::Pointer< T > >**

An override of the *less* function object so that the *Pointer* objects can be stored in STL Maps, etc.

Chapter 6

Data Structure Documentation

6.1 decaf::util::concurrent::ThreadPoolExecutor::AbortPolicy - Class Reference

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2724) this class always throws a **RejectedExecutionException** (p. 2263).

```
#include <src/main/decaf/util/concurrent/ThreadPoolExecutor.h>
```

Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor::AbortPolicy:

Public Member Functions

- **AbortPolicy** ()
- virtual **~AbortPolicy** ()

6.2 decaf::util::AbstractCollection< E > Class Template - Reference

This class provides a skeletal implementation of the **Collection** (p. 851) interface, to minimize the effort required to implement this interface.

```
#include <src/main/decaf/util/AbstractCollection.h>
```

Inheritance diagram for decaf::util::AbstractCollection< E >:

Public Member Functions

- **AbstractCollection ()**
- virtual **~AbstractCollection ()**
- **AbstractCollection< E > & operator= (const AbstractCollection< E > &collection)**

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

- virtual void **clear ()**

Removes all of the elements from this collection (optional operation).

- virtual bool **contains** (const E &value) const

Returns true if this collection contains the specified element.

*More formally, returns true if and only if this collection contains at least one element *e* such that (value == NULL ? e == NULL : value == e).*

Parameters

value	<i>The value to check for presence in the collection.</i>
-------	---

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	<i>if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).</i>
----------------------	--

- virtual bool **containsAll** (const **Collection**< E > &collection) const

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	<i>The Collection (p. 851) to compare to this one.</i>
------------	---

Exceptions

NullPointerException	<i>if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).</i>
----------------------	--

- virtual bool **equals** (const **Collection**< E > &collection) const

*Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.*

- virtual void **copy** (const **Collection**< E > &collection)

*Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).*

- virtual bool **isEmpty** () const

Returns true if this collection contains no elements.

- virtual bool **add** (const E &value **DECAF_UNUSED**)

- virtual bool **addAll** (const **Collection**< E > &collection)

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	<i>The Collection (p. 851) whose elements are added to this one.</i>
------------	---

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of an element prevents it from being added to this collection</i>
IllegalStateException	<i>if an element cannot be added at this time due to insertion restrictions.</i>

- virtual bool **remove** (const E &value)

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection

contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this Collection (p. 851).
-------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

- virtual bool **removeAll** (const **Collection**< E > &collection)

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The Collection (p. 851) whose elements are to be removed from this one.
------------	--

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

- virtual bool **retainAll** (const **Collection**< E > &collection)

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

collection	The Collection (p. 851) whose elements are to be retained.
------------	---

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

- virtual std::vector< E > **toArray** () const

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 851).

- virtual void **lock** ()
Locks the object.
- virtual bool **tryLock** ()
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** ()
Unlocks the object.
- virtual void **wait** ()
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()
Signals the waiters on this object that it can now wake up and continue.

Protected Attributes

- **util::concurrent::Mutex mutex**

6.2.1 Detailed Description

`template<typename E>class decaf::util::AbstractCollection< E >`

This class provides a skeletal implementation of the **Collection** (p.851) interface, to minimize the effort required to implement this interface.

To implement an unmodifiable collection, the programmer needs only to extend this class and provide implementations for the iterator and size methods. (The iterator returned by the iterator method must implement hasNext and next.)

To implement a modifiable collection, the programmer must additionally override this class's add method (which otherwise throws an UnsupportedOperationException), and the iterator returned by the iterator method must additionally implement its remove method.

The programmer should generally provide a void (no argument) and **Collection** (p. 851) constructor, as per the recommendation in the **Collection** (p.851) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Since

1.0

6.2.2 Constructor & Destructor Documentation

6.2.2.1 `template<typename E> decaf::util::AbstractCollection< E
>::AbstractCollection () [inline]`

6.2.2.2 `template<typename E> virtual decaf::util::AbstractCollection< E
>::~~AbstractCollection () [inline, virtual]`

6.2.3 Member Function Documentation

6.2.3.1 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::add (
const E &value DECAF_UNUSED) [inline, virtual]`

This implementation always throws an `UnsupportedOperationException`.

Referenced by `decaf::util::AbstractCollection< cms::Connection * >::addAll()`, `decaf::util::AbstractCollection< cms::Connection * >::copy()`, and `decaf::util::AbstractCollection< cms::Connection * >::operator=()`.

6.2.3.2 `template<typename E> virtual bool decaf::util::AbstractCollection< E
>::addAll (const Collection< E > &collection) [inline, virtual]`

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are added to this one.
-------------------	--

Returns

true if this collection changed as a result of the call

Exceptions

<i>Unsupported- OperationExceptio</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgument- Exception</i>	if some property of an element prevents it from being added to this collection
<i>IllegalStateException</i>	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

Implements **decaf::util::Collection< E >** (p. 855).

Reimplemented in **decaf::util::StlList< E >** (p. 2543), **decaf::util::ArrayList< E >** (p. 450), **decaf::util::LinkedList< E >** (p. 1641), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1641), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1641), **decaf::util::LinkedList< CompositeTask * >** (p. 1641), **decaf::util::LinkedList< URI >** (p. 1641), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1641), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1641), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1641), **decaf::util::LinkedList< Pointer< Command > >** (p. 1641), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1641), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1641), **decaf::util::LinkedList< cms::Destination * >** (p. 1641), **decaf::util::LinkedList< cms::Session * >** (p. 1641), **decaf::util::LinkedList< cms::Connection * >** (p. 1641), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1055), and **decaf::util::AbstractQueue< E >** (p. 140).

6.2.3.3 `template<typename E> virtual void decaf::util::AbstractCollection< E >::clear () [inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the `remove` method and this collection is non-empty.

Exceptions

<i>Unsupported- OperationException</i>	if the clear operation is not supported by this collection
--	--

Implements **decaf::util::Collection< E >** (p. 856).

Reimplemented in **decaf::util::AbstractList< E >** (p. 127), **decaf::util::AbstractList< Pointer< Transport > >** (p. 127), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 127), **decaf::util::AbstractList< CompositeTask * >** (p. 127), **decaf::util::AbstractList< URI >** (p. 127), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 127), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 127), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 127), **decaf::util::AbstractList< Pointer< Command > >** (p. 127), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 127), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 127), **decaf::util::AbstractList< cms::Destination * >** (p. 127), **decaf::util::AbstractList< cms::Session * >** (p. 127), **decaf::util::AbstractList< cms::Connection * >** (p. 127), **decaf::util::StlList< E >** (p. 2545),

`decaf::util::PriorityQueue< E >` (p. 2166), `decaf::util::concurrent::SynchronousQueue< E >` (p. 2658), `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1624), `decaf::util::LinkedList< E >` (p. 1644), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1644), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1644), `decaf::util::LinkedList< CompositeTask * >` (p. 1644), `decaf::util::LinkedList< URI >` (p. 1644), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1644), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1644), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1644), `decaf::util::LinkedList< Pointer< Command > >` (p. 1644), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1644), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1644), `decaf::util::LinkedList< cms::Destination * >` (p. 1644), `decaf::util::LinkedList< cms::Session * >` (p. 1644), `decaf::util::LinkedList< cms::Connection * >` (p. 1644), `decaf::util::StlSet< E >` (p. 2578), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2578), `decaf::util::StlSet< Resource * >` (p. 2578), `decaf::util::ArrayList< E >` (p. 452), `decaf::util::AbstractQueue< E >` (p. 141), and `decaf::util::concurrent::CopyOnWriteArraySet< E >` (p. 1056).

Referenced by `decaf::util::AbstractCollection< cms::Connection * >::copy()`, and `decaf::util::AbstractCollection< cms::Connection * >::operator=()`.

6.2.3.4 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::contains (const E & value) const` [`inline`, `virtual`]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element `e` such that `(value == NULL ? e == NULL : value == e)`.

Parameters

<i>value</i>	The value to check for presence in the collection.
--------------	--

Returns

true if there is at least one of the elements in the collection

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Implements `decaf::util::Collection< E >` (p. 857).

Reimplemented in `decaf::util::StlList< E >` (p. 2545), `decaf::util::ArrayList< E >` (p. 452), `decaf::util::LinkedList< E >` (p. 1644), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1644), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1644), `decaf::util::LinkedList< CompositeTask * >` (p. 1644), `decaf::util::LinkedList< URI >` (p. 1644), `decaf::util::LinkedList< Pointer< MessageDispatch`

> > (p. 1644), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1644), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1644), **decaf::util::LinkedList< Pointer< Command > >** (p. 1644), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1644), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1644), **decaf::util::LinkedList< cms::Destination * >** (p. 1644), **decaf::util::LinkedList< cms::Session * >** (p. 1644), **decaf::util::LinkedList< cms::Connection * >** (p. 1644), **decaf::util::StlSet< E >** (p. 2578), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2578), **decaf::util::StlSet< Resource * >** (p. 2578), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1056).

Referenced by **decaf::util::AbstractCollection< cms::Connection * >::containsAll()**.

```
6.2.3.5  template<typename E> virtual bool decaf::util::AbstractCollection< E
        >::containsAll ( const Collection< E > & collection ) const  [inline,
        virtual]
```

Returns true if this collection contains all of the elements in the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) to compare to this one.
-------------------	--

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Implements **decaf::util::Collection< E >** (p. 858).

Reimplemented in **decaf::util::concurrent::SynchronousQueue< E >** (p. 2658), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1057).

Referenced by **decaf::util::AbstractCollection< cms::Connection * >::equals()**.

```
6.2.3.6  template<typename E> virtual void decaf::util::AbstractCollection< E >::copy
        ( const Collection< E > & collection )  [inline, virtual]
```

Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 851)'s clear method.

Parameters

<i>collection</i>	The collection to mirror.
-------------------	---------------------------

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>IllegalStateException</i>	if the elements cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection**< **E** > (p. 859).

Reimplemented in **decaf::util::StlList**< **E** > (p. 2546), **decaf::util::LinkedList**< **E** > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1645), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1645), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1645), **decaf::util::LinkedList**< **URI** > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1645), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1645), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1645), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1645), **decaf::util::LinkedList**< **cms::Session** * > (p. 1645), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1645), **decaf::util::StlSet**< **E** > (p. 2579), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 2579), **decaf::util::StlSet**< **Resource** * > (p. 2579), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1057).

```
6.2.3.7  template<typename E> virtual bool decaf::util::AbstractCollection< E
>::equals ( const Collection< E > & collection ) const  [inline,
virtual]
```

Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.

Parameters

<i>collection</i>	- The Collection (p. 851) to be compared to this one.
-------------------	--

Returns

true if this **Collection** (p. 851) is equal to the one given.

Implements **decaf::util::Collection**< **E** > (p. 860).

Reimplemented in **decaf::util::StlList**< **E** > (p. 2546), **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2660), **decaf::util::StlSet**< **E** > (p. 2580), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 2580), **decaf::util::StlSet**< **Resource** * > (p. 2580), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1058).

```
6.2.3.8  template<typename E> virtual bool decaf::util::AbstractCollection< E
>::isEmpty ( ) const  [inline, virtual]
```

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 864) == 0.

Returns

true if the size method return 0.

Implements **decaf::util::Collection< E >** (p. 860).

Reimplemented in **decaf::util::StlList< E >** (p. 2548), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2660), **decaf::util::LinkedList< E >** (p. 1648), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1648), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1648), **decaf::util::LinkedList< CompositeTask * >** (p. 1648), **decaf::util::LinkedList< URI >** (p. 1648), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1648), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1648), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1648), **decaf::util::LinkedList< Pointer< Command > >** (p. 1648), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1648), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1648), **decaf::util::LinkedList< cms::Destination * >** (p. 1648), **decaf::util::LinkedList< cms::Session * >** (p. 1648), **decaf::util::LinkedList< cms::Connection * >** (p. 1648), **decaf::util::StlSet< E >** (p. 2580), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2580), **decaf::util::StlSet< Resource * >** (p. 2580), **decaf::util::ArrayList< E >** (p. 454), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1058).

Referenced by **decaf::util::AbstractQueue< E >::clear()**, **decaf::util::PriorityQueue< E >::peek()**, **decaf::util::PriorityQueue< E >::poll()**, and **decaf::util::PriorityQueue< E >::remove()**.

6.2.3.9 `template<typename E> virtual void decaf::util::AbstractCollection< E >::lock () [inline, virtual]`

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2640).

Referenced by **decaf::util::concurrent::LinkedBlockingQueue< E >::clear()**, **decaf::util::concurrent::LinkedBlockingQueue< E >::remove()**, and **decaf::util::concurrent::LinkedBlockingQueue< E >::toArray()**.

6.2.3.10 `template<typename E> virtual void decaf::util::AbstractCollection< E >::notify () [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2641).

6.2.3.11 `template<typename E> virtual void decaf::util::AbstractCollection< E >::notifyAll() [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2642).

6.2.3.12 `template<typename E> AbstractCollection<E>& decaf::util::AbstractCollection< E >::operator=(const AbstractCollection< E > & collection) [inline]`

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters

<i>collection</i>	- the collection to copy
-------------------	--------------------------

Returns

a reference to this collection

6.2.3.13 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::remove(const E & value) [inline, virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (*value* == NULL ? *e* == NULL : *value* == *e*), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	The reference to the element to remove from this Collection (p. 851).
--------------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Implements **decaf::util::Collection< E >** (p. 861).

Reimplemented in **decaf::util::StlList< E >** (p. 2550), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1631), **decaf::util::PriorityQueue< E >** (p. 2170), **decaf::util::ArrayList< E >** (p. 455), **decaf::util::StlSet< E >** (p. 2580), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2580), **decaf::util::StlSet< Resource * >** (p. 2580), **decaf::util::LinkedList< E >** (p. 1654), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1654), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1654), **decaf::util::LinkedList< CompositeTask * >** (p. 1654), **decaf::util::LinkedList< URI >** (p. 1654), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1654), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1654), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1654), **decaf::util::LinkedList< Pointer< Command > >** (p. 1654), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1654), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1654), **decaf::util::LinkedList< cms::Destination * >** (p. 1654), **decaf::util::LinkedList< cms::Session * >** (p. 1654), **decaf::util::LinkedList< cms::Connection * >** (p. 1654), and **decaf::util::concurrent::Copy-OnWriteArraySet< E >** (p. 1059).

```
6.2.3.14 template<typename E> virtual bool decaf::util::AbstractCollection<
        E >::removeAll( const Collection< E > & collection ) [inline,
        virtual]
```

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are to be removed from this one.
-------------------	--

Returns

true if the collection changed as a result of this call.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

Implements **decaf::util::Collection**< **E** > (p. 862).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1059), **decaf::util::AbstractSet**< **E** > (p. 153), **decaf::util::AbstractSet**< **Pointer**< **Synchronization** > > (p. 153), and **decaf::util::AbstractSet**< **Resource** * > (p. 153).

6.2.3.15 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::retainAll(const Collection< E > & collection) [inline, virtual]`

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are to be retained.
-------------------	---

Returns

true if the collection changed as a result of this call.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
--------------------------------------	--

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Implements **decaf::util::Collection< E >** (p. 863).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1061).

6.2.3.16 `template<typename E> virtual std::vector<E> decaf::util::-`
AbstractCollection< E >::toArray () const `[inline,`
`virtual]`

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 851).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 851)

Implements **decaf::util::Collection< E >** (p. 865).

Reimplemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1632), **decaf::util::ArrayList< E >** (p. 457), **decaf::util::LinkedList< E >** (p. 1658), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1658), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1658), **decaf::util::LinkedList< CompositeTask * >** (p. 1658), **decaf::util::LinkedList< URI >** (p. 1658), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1658), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1658), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1658), **decaf::util::LinkedList< Pointer< Command > >** (p. 1658), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1658), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1658), **decaf::util::LinkedList< cms::Destination * >** (p. 1658), **decaf::util::LinkedList< cms::Session * >** (p. 1658), **decaf::util::LinkedList< cms::Connection * >** (p. 1658), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2665), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1062).

6.2.3.17 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::tryLock() [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2643).

6.2.3.18 `template<typename E> virtual void decaf::util::AbstractCollection< E >::unlock() [inline, virtual]`

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2645).

6.2.3.19 `template<typename E> virtual void decaf::util::AbstractCollection< E >::wait() [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2646).

6.2.3.20 `template<typename E> virtual void decaf::util::AbstractCollection< E >::wait(long long millisecs) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>milliseconds</i>	the time in milliseconds to wait, or <code>WAIT_INFINITE</code>
---------------------	---

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2647).

6.2.3.21 `template<typename E> virtual void decaf::util::AbstractCollection< E >::wait
(long long milliseconds, int nanos) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>milliseconds</i>	the time in milliseconds to wait, or <code>WAIT_INFINITE</code>
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2648).

6.2.4 Field Documentation

6.4.1 Detailed Description

```
template<typename E>class decaf::util::AbstractList< E >
```

This class provides a skeletal implementation of the **List** (p. 1658) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array).

For sequential access data (such as a linked list), **AbstractSequentialList** (p. 143) should be used in preference to this class.

To implement an unmodifiable list, the programmer needs only to extend this class and provide implementations for the **get(int)** and **size()** (p. 864) methods.

To implement a modifiable list, the programmer must additionally override the **set(int, E)** method (which otherwise throws an `UnsupportedOperationException`). If the list is variable-size the programmer must additionally override the **add(int, E)** and **remove(int)** methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 851) interface specification.

Unlike the other abstract collection implementations, the programmer does not have to provide an iterator implementation; the iterator and list iterator are implemented by this class, on top of the "random access" methods: **get(int)**, **set(int, E)**, **add(int, E)** and **remove(int)**.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Since

6.4.2 Constructor & Destructor Documentation

6.4.2.1 `template<typename E> decaf::util::AbstractList< E >::AbstractList ()`
`[inline]`

6.4.2.2 `template<typename E> virtual decaf::util::AbstractList< E >::~~AbstractList ()`
`[inline, virtual]`

6.4.3 Member Function Documentation

6.4.3.1 `template<typename E> virtual bool decaf::util::AbstractList< E >::add (const E & value)`
`[inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 853).

Reimplemented in **decaf::util::StlList< E >** (p. 2542), **decaf::util::ArrayList< E >** (p. 448), **decaf::util::LinkedList< E >** (p. 1639), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1639), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1639), **decaf::util::LinkedList< CompositeTask * >** (p. 1639), **decaf::util::LinkedList< URI >** (p. 1639), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1639), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1639), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1639), **decaf::util::LinkedList< Pointer< Command > >** (p. 1639), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1639), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1639), **decaf::util::LinkedList< cms::Destination * >** (p. 1639), **decaf::util::LinkedList< cms::Session * >** (p. 1639), and **decaf::util::LinkedList< cms::Connection * >** (p. 1639).

Referenced by **decaf::util::AbstractList< cms::Connection * >::add()**, and **decaf::util::AbstractList< cms::Connection * >::addAll()**.

6.4.3.2 `template<typename E> virtual void decaf::util::AbstractList< E >::add
(int index DECAF_UNUSED, const E &element DECAF_UNUSED) [inline,
virtual]`

6.4.3.3 `template<typename E> virtual bool decaf::util::AbstractList< E >::addAll(int
index, const Collection< E > &source) [inline, virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

<i>index</i>	The index at which to insert the first element from the specified collection
<i>source</i>	The Collection (p. 851) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1661).

Reimplemented in **decaf::util::StlList< E >** (p. 2544), **decaf::util::ArrayList< E >** (p. 451), **decaf::util::LinkedList< E >** (p. 1642), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1642), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1642), **decaf::util::LinkedList< CompositeTask * >** (p. 1642), **decaf::util::LinkedList< URI >** (p. 1642), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1642), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1642), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1642), **decaf::util::LinkedList< Pointer< Command > >** (p. 1642), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1642), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1642), **decaf::util::LinkedList< cms::Destination * >** (p. 1642), **decaf::util::LinkedList< cms::Session * >** (p. 1642), **decaf::util::LinkedList< cms::Connection * >** (p. 1642), **decaf::util::AbstractSequentialList< E >** (p. 147), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 147), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 147), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 147), **decaf::util::AbstractSequentialList< URI >** (p. 147), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 147), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 147), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 147), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 147), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 147), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 147), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 147), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 147), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 147).

6.4.3.4 `template<typename E> virtual void decaf::util::AbstractList< E >::clear ()`
`[inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>UnsupportedOperationException</i>	if the clear operation is not supported by this collection
--------------------------------------	--

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 111).

Reimplemented in `decaf::util::StlList< E >` (p. 2545), `decaf::util::LinkedList< E >` (p. 1644), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1644), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1644), `decaf::util::LinkedList< CompositeTask * >` (p. 1644), `decaf::util::LinkedList< URI >` (p. 1644), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1644), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1644), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1644), `decaf::util::LinkedList< Pointer< Command > >` (p. 1644), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1644), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1644), `decaf::util::LinkedList< cms::Destination * >` (p. 1644), `decaf::util::LinkedList< cms::Session * >` (p. 1644), `decaf::util::LinkedList< cms::Connection * >` (p. 1644), and `decaf::util::ArrayList< E >` (p. 452).

6.4.3.5 `template<typename E> virtual int decaf::util::AbstractList< E >::indexOf (const E & value) const` [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

<i>value</i>	The element to search for in this List (p. 1658).
--------------	--

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

Implements `decaf::util::List< E >` (p. 1663).

Reimplemented in `decaf::util::StlList< E >` (p. 2547), `decaf::util::ArrayList< E >` (p. 453), `decaf::util::LinkedList< E >` (p. 1647), `decaf::util::LinkedList< Pointer<`

Transport > > (p. 1647), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1647), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1647), **decaf::util::LinkedList**< **URI** > (p. 1647), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1647), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1647), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1647), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1647), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1647), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1647), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1647), **decaf::util::LinkedList**< **cms::Session** * > (p. 1647), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1647).

6.4.3.6 `template<typename E> virtual Iterator<E>* decaf::util::AbstractList< E >::iterator() [inline, virtual]`

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable**< **E** > (p. 1557).

Reimplemented in **decaf::util::StlList**< **E** > (p. 2548), **decaf::util::AbstractSequentialList**< **E** > (p. 148), **decaf::util::AbstractSequentialList**< **Pointer**< **Transport** > > (p. 148), **decaf::util::AbstractSequentialList**< **cms::MessageConsumer** * > (p. 148), **decaf::util::AbstractSequentialList**< **CompositeTask** * > (p. 148), **decaf::util::AbstractSequentialList**< **URI** > (p. 148), **decaf::util::AbstractSequentialList**< **Pointer**< **MessageDispatch** > > (p. 148), **decaf::util::AbstractSequentialList**< **Pointer**< **DestinationInfo** > > (p. 148), **decaf::util::AbstractSequentialList**< **PrimitiveValueNode** > (p. 148), **decaf::util::AbstractSequentialList**< **Pointer**< **Command** > > (p. 148), **decaf::util::AbstractSequentialList**< **Pointer**< **BackupTransport** > > (p. 148), **decaf::util::AbstractSequentialList**< **cms::MessageProducer** * > (p. 148), **decaf::util::AbstractSequentialList**< **cms::Destination** * > (p. 148), **decaf::util::AbstractSequentialList**< **cms::Session** * > (p. 148), and **decaf::util::AbstractSequentialList**< **cms::Connection** * > (p. 148).

Referenced by **decaf::util::ArrayList**< **E** >::ArrayList().

6.4.3.7 `template<typename E> virtual Iterator<E>* decaf::util::AbstractList< E >::iterator() const [inline, virtual]`

Implements **decaf::lang::Iterable**< **E** > (p. 1558).

Reimplemented in **decaf::util::StlList**< **E** > (p. 2548), **decaf::util::AbstractSequentialList**< **E** > (p. 149), **decaf::util::AbstractSequentialList**< **Pointer**< **Transport** > > (p. 149), **decaf::util::AbstractSequentialList**< **cms::MessageConsumer** * > (p. 149), **decaf::util::AbstractSequentialList**< **CompositeTask** * > (p. 149), **decaf::util::AbstractSequentialList**< **URI** > (p. 149), **decaf::util::AbstractSequentialList**< **Pointer**< **MessageDispatch** > > (p. 149), **decaf::util::AbstractSequentialList**< **Pointer**< **DestinationInfo** > > (p. 149), **decaf::util::AbstractSequentialList**< **PrimitiveValueNode** > (p. 149), **decaf::util::AbstractSequentialList**< **Pointer**< **Command** > > (p. 149), **decaf::util::AbstractSequentialList**<

Pointer< **BackupTransport** > > (p. 149), **decaf::util::AbstractSequentialList**< **cms::MessageProducer** * > (p. 149), **decaf::util::AbstractSequentialList**< **cms::Destination** * > (p. 149), **decaf::util::AbstractSequentialList**< **cms::Session** * > (p. 149), and **decaf::util::AbstractSequentialList**< **cms::Connection** * > (p. 149).

6.4.3.8 `template<typename E> virtual int decaf::util::AbstractList< E >::lastIndexOf (const E & value) const [inline, virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index *i* such that `get(i) == value` or -1 if there is no such index.

Parameters

<i>value</i>	The element to search for in this List (p. 1658).
--------------	--

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

Implements **decaf::util::List**< **E** > (p. 1664).

Reimplemented in **decaf::util::StlList**< **E** > (p. 2548), **decaf::util::ArrayList**< **E** > (p. 454), **decaf::util::LinkedList**< **E** > (p. 1648), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1648), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1648), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1648), **decaf::util::LinkedList**< **URI** > (p. 1648), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1648), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1648), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1648), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1648), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1648), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1648), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1648), **decaf::util::LinkedList**< **cms::Session** * > (p. 1648), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1648).

6.4.3.9 `template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator () [inline, virtual]`

Returns

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 1665).

Reimplemented in **decaf::util::StlList< E >** (p. 2549), **decaf::util::AbstractSequentialList< E >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 149), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 149), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 149), **decaf::util::AbstractSequentialList< URI >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 149), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 149), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 149), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 149), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 149), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 149).

6.4.3.10 `template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator() const [inline, virtual]`

Implements **decaf::util::List< E >** (p. 1666).

Reimplemented in **decaf::util::StlList< E >** (p. 2549), **decaf::util::AbstractSequentialList< E >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 149), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 149), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 149), **decaf::util::AbstractSequentialList< URI >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 149), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 149), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 149), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 149), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 149), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 149).

6.4.3.11 `template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator(int index) [inline, virtual]`

Parameters

<i>index</i>	index of first element to be returned from the list iterator (by a call to the next method).
--------------	--

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index is out of range (index < 0 index > size()) (p. 864)
----------------------------------	---

Implements **decaf::util::List< E >** (p. 1666).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1649), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1649), **decaf::util::LinkedList< CompositeTask * >** (p. 1649), **decaf::util::LinkedList< URI >** (p. 1649), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1649), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1649), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1649), **decaf::util::LinkedList< Pointer< Command > >** (p. 1649), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1649), **decaf::util::LinkedList< cms::Destination * >** (p. 1649), **decaf::util::LinkedList< cms::Session * >** (p. 1649), **decaf::util::LinkedList< cms::Connection * >** (p. 1649), **decaf::util::StlList< E >** (p. 2549), **decaf::util::AbstractSequentialList< E >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 149), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 149), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 149), **decaf::util::AbstractSequentialList< URI >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 149), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 149), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 149), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 149), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 149), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 149), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 149).

```
6.4.3.12 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E
>::listIterator ( int index ) const [inline, virtual]
```

Implements **decaf::util::List< E >** (p. 1668).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1649), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1649), **decaf::util::LinkedList< CompositeTask * >** (p. 1649), **decaf::util::LinkedList< URI >** (p. 1649), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1649), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1649), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1649),

decaf::util::LinkedList< Pointer< Command > > (p. 1649), decaf::util::LinkedList< Pointer< BackupTransport > > (p. 1649), decaf::util::LinkedList< cms::MessageProducer * > (p. 1649), decaf::util::LinkedList< cms::Destination * > (p. 1649), decaf::util::LinkedList< cms::Session * > (p. 1649), decaf::util::LinkedList< cms::Connection * > (p. 1649), decaf::util::StlList< E > (p. 2550), decaf::util::AbstractSequentialList< E > (p. 150), decaf::util::AbstractSequentialList< Pointer< Transport > > (p. 150), decaf::util::AbstractSequentialList< cms::MessageConsumer * > (p. 150), decaf::util::AbstractSequentialList< CompositeTask * > (p. 150), decaf::util::AbstractSequentialList< URI > (p. 150), decaf::util::AbstractSequentialList< Pointer< MessageDispatch > > (p. 150), decaf::util::AbstractSequentialList< Pointer< DestinationInfo > > (p. 150), decaf::util::AbstractSequentialList< PrimitiveValueNode > (p. 150), decaf::util::AbstractSequentialList< Pointer< Command > > (p. 150), decaf::util::AbstractSequentialList< Pointer< BackupTransport > > (p. 150), decaf::util::AbstractSequentialList< cms::MessageProducer * > (p. 150), decaf::util::AbstractSequentialList< cms::Destination * > (p. 150), decaf::util::AbstractSequentialList< cms::Session * > (p. 150), and decaf::util::AbstractSequentialList< cms::Connection * > (p. 150).

6.4.3.13 `template<typename E> virtual E decaf::util::AbstractList< E >::removeAt (int index index) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

<i>index</i>	- the index of the element to be removed.
--------------	---

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.

Implements **decaf::util::List< E >** (p. 1668).

Reimplemented in **decaf::util::StlList< E >** (p. 2550), **decaf::util::ArrayList< E >** (p. 456), **decaf::util::AbstractSequentialList< E >** (p. 150), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 150), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 150), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 150), **decaf::util::AbstractSequentialList< URI >** (p. 150), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >**

> (p. 150), `decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >` (p. 150), `decaf::util::AbstractSequentialList< PrimitiveValueNode >` (p. 150), `decaf::util::AbstractSequentialList< Pointer< Command > >` (p. 150), `decaf::util::AbstractSequentialList< Pointer< BackupTransport > >` (p. 150), `decaf::util::AbstractSequentialList< cms::MessageProducer * >` (p. 150), `decaf::util::AbstractSequentialList< cms::Destination * >` (p. 150), `decaf::util::AbstractSequentialList< cms::Session * >` (p. 150), and `decaf::util::AbstractSequentialList< cms::Connection * >` (p. 150).

6.5 `decaf::util::AbstractMap< K, V, COMPARATOR >` Class - Template Reference

This class provides a skeletal implementation of the **Map** (p. 1768) interface, to minimize the effort required to implement this interface.

```
#include <src/main/decaf/util/AbstractMap.h>
```

Inheritance diagram for `decaf::util::AbstractMap< K, V, COMPARATOR >`:

Public Member Functions

- `virtual ~AbstractMap ()`

6.5.1 Detailed Description

```
template<typename K, typename V, typename COMPARTOR>class decaf::util::AbstractMap<
K, V, COMPARTOR >
```

This class provides a skeletal implementation of the **Map** (p. 1768) interface, to minimize the effort required to implement this interface.

To implement an unmodifiable map, the programmer needs only to extend this class and provide an implementation for the `entrySet` method, which returns a set-view of the map's mappings. Typically, the returned set will, in turn, be implemented atop **AbstractSet** (p. 152). This set should not support the `add` or `remove` methods, and its iterator should not support the `remove` method.

To implement a modifiable map, the programmer must additionally override this class's `put` method (which otherwise throws an `UnsupportedOperationException`), and the iterator returned by `entrySet().iterator()` must additionally implement its `remove` method.

The programmer should generally provide a void (no argument) and map constructor, as per the recommendation in the **Map** (p. 1768) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the map being implemented admits a more efficient implementation.

6.6 decaf::util::concurrent::locks::AbstractOwnableSynchronizer - Class Reference

Base class for locks that provide the notion of Ownership, the types of locks that are implemented using this base class would be owned by one specific Thread at any given time.

```
#include <src/main/decaf/util/concurrent/locks/Abstract-
OwnableSynchronizer.h>
```

Public Member Functions

- virtual **~AbstractOwnableSynchronizer** ()

Protected Member Functions

- **AbstractOwnableSynchronizer** ()
- **decaf::lang::Thread * getExclusiveOwnerThread** () const
Gets the Thread that was last set using the setExclusiveOwnerThread method, or NULL if no Thread has been made the exclusive owner.
- void **setExclusiveOwnerThread** (decaf::lang::Thread *thread)
Sets the Thread that has exclusive ownership of this Synchronizer, can be NULL to indicate that no Thread now owns this Synchronizer.

6.6.1 Detailed Description

Base class for locks that provide the notion of Ownership, the types of locks that are implemented using this base class would be owned by one specific Thread at any given time.

Since

1.0

6.6.2 Constructor & Destructor Documentation

6.6.2.1 **virtual decaf::util::concurrent::locks::AbstractOwnableSynchronizer::~AbstractOwnableSynchronizer** ()
[virtual]

6.6.2.2 **decaf::util::concurrent::locks::AbstractOwnableSynchronizer::AbstractOwnableSynchronizer** ()
[protected]

6.6.3 Member Function Documentation

6.6.3.1 **decaf::lang::Thread* decaf::util::concurrent::locks::AbstractOwnableSynchronizer::getExclusiveOwnerThread** () const
[protected]

Gets the Thread that was last set using the setExclusiveOwnerThread method, or NULL if no Thread has been made the exclusive owner.

Returns

pointer to the owner Thread or NULL if not set.

```
6.6.3.2 void decaf::util::concurrent::locks::AbstractOwnableSynchronizer-
::setExclusiveOwnerThread ( decaf::lang::Thread * thread )
[protected]
```

Sets the Thread that has exclusive ownership of this Synchronizer, can be NULL to indicate that no Thread now owns this Synchronizer.

Parameters

<i>thread</i>	The Thread that now has ownership, or NULL if ownership is released.

6.7 decaf::util::AbstractQueue< E > Class Template Reference

This class provides skeletal implementations of some **Queue** (p. 2222) operations.

```
#include <src/main/decaf/util/AbstractQueue.h>
```

Inheritance diagram for decaf::util::AbstractQueue< E >:

Public Member Functions

- **AbstractQueue** ()
- virtual ~**AbstractQueue** ()
- virtual bool **add** (const E &value)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added.

Collection (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this Collection (p. 851).
-------	---

Returns

*true if the element was added to this **Collection** (p. 851).*

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of the element prevents it from being added to this collection</i>
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions.</i>

- virtual bool **addAll** (const **Collection**< E > &collection)

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	<i>The Collection (p. 851) whose elements are added to this one.</i>
------------	---

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of an element prevents it from being added to this collection</i>
IllegalStateException	<i>if an element cannot be added at this time due to insertion restrictions.</i>

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual E **remove** ()

Gets and removes the element in the head of the queue.

*Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.*

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	<i>if there is no element in the queue.</i>
--	---

- virtual E **element** () const

Gets but not removes the element in the head of the queue.

*Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.*

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	<i>if there is no element in the queue.</i>
--	---

- virtual void **clear** ()

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

*This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.*

*Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

Exceptions

UnsupportedOperationException	<i>if the clear operation is not supported by this collection</i>
--------------------------------------	---

6.7.1 Detailed Description

```
template<typename E>class decaf::util::AbstractQueue< E >
```

This class provides skeletal implementations of some **Queue** (p. 2222) operations.

Methods add, remove, and element are based on offer, poll, and peek, respectively.

A **Queue** (p. 2222) implementation that extends this class must minimally define a method **Queue** (p. 2222). **offer(E)** which does not permit insertion of null elements, along with methods **Queue** (p. 2222). **peek()** (p. 2225), **Queue.poll()** (p. 2225), **Collection.size()** (p. 864), and a **Collection.iterator()** (p. 1557) supporting **Iterator.remove()** (p. 1560). Typically, additional methods will be overridden as well. If these requirements cannot be met, consider instead subclassing **AbstractCollection** (p. 106).

Since

1.0

6.7.2 Constructor & Destructor Documentation

```
6.7.2.1 template<typename E > decaf::util::AbstractQueue< E >::AbstractQueue ( )  
[inline]
```

```
6.7.2.2 template<typename E > virtual decaf::util::AbstractQueue< E  
>::~~AbstractQueue ( ) [inline, virtual]
```

6.7.3 Member Function Documentation

6.7.3.1 `template<typename E> virtual bool decaf::util::AbstractQueue< E >::add (const E & value) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an `IllegalStateException`.

Implements `decaf::util::Collection< E >` (p. 853).

Reimplemented in `decaf::util::PriorityQueue< E >` (p. 2165).

References `decaf::util::Queue< E >::offer()`.

6.7.3.2 `template<typename E > virtual bool decaf::util::AbstractQueue< E >::addAll (const Collection< E > & collection) [inline, virtual]`

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are added to this one.
-------------------	--

Returns

true if this collection changed as a result of the call

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of an element prevents it from being added to this collection
<i>IllegalStateException</i>	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

This implementation checks to see if the **Queue** (p. 2222) is being added to itself and throws an IllegalArgumentException if so, otherwise it delegates the add to the **AbstractCollection** (p. 106)'s addAll implementation.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 110).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::operator=().

6.7.3.3 `template<typename E > virtual void decaf::util::AbstractQueue< E >::clear () [inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>Unsupported- OperationException</i>	if the clear operation is not supported by this collection
--	--

This implementation repeatedly invokes poll until it returns false.

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 111).

Reimplemented in `decaf::util::PriorityQueue< E >` (p. 2166), `decaf::util::concurrent::SynchronousQueue< E >` (p. 2658), and `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1624).

References `decaf::util::AbstractCollection< E >::isEmpty()`, and `decaf::util::Queue< E >::poll()`.

6.7.3.4 `template<typename E> virtual E decaf::util::AbstractQueue< E >::element () const [inline, virtual]`

Gets but not removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	if there is no element in the queue.
--	--------------------------------------

This implementation returns the result of peek unless the queue is empty otherwise it throws a **NoSuchElementException** (p. 1984).

Implements `decaf::util::Queue< E >` (p. 2223).

References `decaf::util::Queue< E >::peek()`.

Referenced by `decaf::util::concurrent::SynchronousQueue< E >::drainTo()`.

6.7.3.5 `template<typename E> virtual E decaf::util::AbstractQueue< E >::remove () [inline, virtual]`

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	if there is no element in the queue.
--	--------------------------------------

This implementation returns the result of poll unless the queue is empty.

Implements **decaf::util::Queue< E >** (p. 2226).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 2169).

References **decaf::util::Queue< E >::poll()**.

- virtual **Iterator< E > * iterator** () const
- virtual **ListIterator< E > * listIterator** ()
- virtual **ListIterator< E > * listIterator** () const
- virtual **ListIterator< E > * listIterator** (int index **DECAF_UNUSED**)
- virtual **ListIterator< E > * listIterator** (int index **DECAF_UNUSED**) const
- virtual **E get** (int index) const

Gets the element contained at position passed.

Parameters

index	The position to get.
-------	----------------------

Returns

value at index specified.

Exceptions

IndexOutOfBoundsException	<i>if the index given is less than zero or greater than the List (p. 1658) size.</i>
---------------------------	---

- virtual **E set** (int index, const E &element)

Replaces the element at the specified position in this list with the specified element.

Parameters

index	<i>The index of the element to replace.</i>
element	<i>The element to be stored at the specified position.</i>

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBoundsException	<i>if the index given is less than zero or greater than the List (p. 1658) size.</i>
UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of the element prevents it from being added to this collection</i>
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions.</i>

- virtual void **add** (int index, const E &element)

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	<i>The index at which the specified element is to be inserted.</i>
element	<i>The element to be inserted in this List (p. 1658).</i>

Exceptions

IndexOutOfBoundsException	<i>if the index is greater than size of the List (p. 1658).</i>
UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of the element prevents it from being added to this collection</i>
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions.</i>

- virtual bool **addAll** (int index, const **Collection**< E > &source)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation

is undefined if the specified collection is modified while the operation is in progress.
(Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The Collection (p. 851) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException	if the index given is less than zero or greater than the List (p. 1658) size.
UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

- virtual E **removeAt** (int index)

Removes the element at the specified position in this list.
Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.
-------	---

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBoundsException	if the index given is less than zero or greater than the List (p. 1658) size.
UnsupportedOperationException	if this is an unmodifiable collection.

6.8.1 Detailed Description

```
template<typename E>class decaf::util::AbstractSequentialList< E >
```

This class provides a skeletal implementation of the **List** (p. 1658) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).

For random access data (such as an array), **AbstractList** (p. 123) should be used in preference to this class.

This class is the opposite of the **AbstractList** (p. 123) class in the sense that it implements the "random access" methods (get(int index), set(int index, E element), add(int index, E element) and remove(int index)) on top of the list's list iterator, instead of the other way around.

To implement a list the programmer needs only to extend this class and provide implementations for the `listIterator` and `size` methods. For an unmodifiable list, the programmer need only implement the list iterator's `hasNext`, `next`, `hasPrevious`, `previous` and `index` methods.

For a modifiable list the programmer should additionally implement the list iterator's `set` method. For a variable-size list the programmer should additionally implement the list iterator's `remove` and `add` methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 851) interface specification.

Since

1.0

6.8.2 Constructor & Destructor Documentation

6.8.2.1 `template<typename E> virtual decaf::util::AbstractSequentialList< E
>::~AbstractSequentialList() [inline, virtual]`

6.8.3 Member Function Documentation

6.8.3.1 `template<typename E> virtual void decaf::util::AbstractSequentialList< E
>::add(int index , const E & element) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

<i>index</i>	The index at which the specified element is to be inserted.
<i>element</i>	The element to be inserted in this List (p. 1658).

Exceptions

<i>IndexOutOfBoundsException</i>	if the index is greater than size of the List (p. 1658).
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with list-

Iterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1672).

Implements **decaf::util::List< E >** (p. 1660).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1640), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1640), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1640), **decaf::util::LinkedList< CompositeTask * >** (p. 1640), **decaf::util::LinkedList< URI >** (p. 1640), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1640), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1640), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1640), **decaf::util::LinkedList< Pointer< Command > >** (p. 1640), **decaf::util::LinkedList< BackupTransport > >** (p. 1640), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1640), **decaf::util::LinkedList< cms::Destination * >** (p. 1640), **decaf::util::LinkedList< cms::Session * >** (p. 1640), and **decaf::util::LinkedList< cms::Connection * >** (p. 1640).

```
6.8.3.2 template<typename E> virtual bool decaf::util::AbstractSequentialList<
    E>::addAll ( int index, const Collection< E > & source ) [inline,
    virtual]
```

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

<i>index</i>	The index at which to insert the first element from the specified collection
<i>source</i>	The Collection (p. 851) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with `listIterator(index)`). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using `ListIterator.add` (p. 1672) (to skip over the added element).

Reimplemented from `decaf::util::AbstractList< E >` (p. 126).

Reimplemented in `decaf::util::LinkedList< E >` (p. 1642), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1642), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1642), `decaf::util::LinkedList< CompositeTask * >` (p. 1642), `decaf::util::LinkedList< URI >` (p. 1642), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1642), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1642), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1642), `decaf::util::LinkedList< Pointer< Command > >` (p. 1642), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1642), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1642), `decaf::util::LinkedList< cms::Destination * >` (p. 1642), `decaf::util::LinkedList< cms::Session * >` (p. 1642), and `decaf::util::LinkedList< cms::Connection * >` (p. 1642).

6.8.3.3 `template<typename E> virtual E decaf::util::AbstractSequentialList< E >::get (int index) const [inline, virtual]`

Gets the element contained at position passed.

Parameters

<i>index</i>	The position to get.
--------------	----------------------

Returns

value at index specified.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
----------------------------------	--

This implementation first gets a list iterator pointing to the indexed element (with `listIterator(index)`). Then, it gets the element using `ListIterator.next` (p. 1560) and returns it.

Implements `decaf::util::List< E >` (p. 1662).

Reimplemented in `decaf::util::LinkedList< E >` (p. 1646), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1646), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1646), `decaf::util::LinkedList< CompositeTask * >` (p. 1646), `decaf::util::LinkedList< URI >` (p. 1646), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1646), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1646), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1646), `decaf::util::LinkedList< Pointer< Command > >` (p. 1646), `decaf::util::LinkedList`

List< **Pointer**< **BackupTransport** > > (p. 1646), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1646), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1646), **decaf::util::LinkedList**< **cms::Session** * > (p. 1646), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1646).

```
6.8.3.4 template<typename E> virtual Iterator<E>* decaf::util::-
    AbstractSequentialList< E >::iterator ( ) [inline,
        virtual]
```

Returns

an iterator over a set of elements of type T.

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 128).

Referenced by **decaf::util::LinkedList**< **cms::Connection** * >::removeFirstOccurrence().

```
6.8.3.5 template<typename E> virtual Iterator<E>* decaf::util::-
    AbstractSequentialList< E >::iterator ( ) const [inline,
        virtual]
```

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 129).

```
6.8.3.6 template<typename E> virtual ListIterator<E>* decaf::util::-
    AbstractSequentialList< E >::listIterator ( ) [inline,
        virtual]
```

Returns

a list iterator over the elements in this list (in proper sequence).

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 130).

Referenced by **decaf::util::AbstractSequentialList**< **cms::Connection** * >::add(), **decaf::util::AbstractSequentialList**< **cms::Connection** * >::addAll(), **decaf::util::AbstractSequentialList**< **cms::Connection** * >::get(), **decaf::util::AbstractSequentialList**< **cms::Connection** * >::iterator(), **decaf::util::AbstractSequentialList**< **cms::Connection** * >::listIterator(), **decaf::util::AbstractSequentialList**< **cms::Connection** * >::removeAt(), and **decaf::util::AbstractSequentialList**< **cms::Connection** * >::set().

```
6.8.3.7 template<typename E> virtual ListIterator<E>* decaf::util::-
    AbstractSequentialList< E >::listIterator ( ) const [inline,
        virtual]
```

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 131).

```
6.8.3.8 template<typename E> virtual ListIterator<E>* decaf::util::Abstract-
SequentialList< E >::listIterator ( int index index ) [inline,
virtual]
```

Parameters

<i>index</i>	index of first element to be returned from the list iterator (by a call to the next method).
--------------	--

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index is out of range ($\text{index} < 0 \parallel \text{index} > \text{size}()$ (p. 864))
----------------------------------	--

Reimplemented from **decaf::util::AbstractList< E >** (p. 131).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1649), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1649), **decaf::util::LinkedList< CompositeTask * >** (p. 1649), **decaf::util::LinkedList< URI >** (p. 1649), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1649), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1649), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1649), **decaf::util::LinkedList< Pointer< Command > >** (p. 1649), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1649), **decaf::util::LinkedList< cms::Destination * >** (p. 1649), **decaf::util::LinkedList< cms::Session * >** (p. 1649), and **decaf::util::LinkedList< cms::Connection * >** (p. 1649).

```
6.8.3.9 template<typename E> virtual ListIterator<E>* decaf::util::Abstract-
SequentialList< E >::listIterator ( int index DECAF_UNUSED ) const
[inline, virtual]
```

Reimplemented from **decaf::util::AbstractList< E >** (p. 132).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1649), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1649), **decaf::util::LinkedList< CompositeTask * >** (p. 1649), **decaf::util::LinkedList< URI >** (p. 1649), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1649), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1649), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1649), **decaf::util::LinkedList< Pointer< Command > >** (p. 1649), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1649), **decaf::util::LinkedList< cms::Destination * >**

(p. 1649), **decaf::util::LinkedList**< **cms::Session** * > (p. 1649), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1649).

6.8.3.10 `template<typename E> virtual E decaf::util::AbstractSequentialList< E
>::removeAt (int index) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

<i>index</i>	- the index of the element to be removed.
--------------	---

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.

This implementation first gets a list iterator pointing to the indexed element (with `listIterator(index)`). Then, it removes the element with **ListIterator.remove** (p. 1560).

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 133).

6.8.3.11 `template<typename E> virtual E decaf::util::AbstractSequentialList< E
>::set (int index , const E & element) [inline, virtual]`

Replaces the element at the specified position in this list with the specified element.

Parameters

<i>index</i>	The index of the element to replace.
<i>element</i>	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
----------------------------------	--

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with `listIterator(index)`). Then, it gets the current element using **ListIterator.next** (p. 1560) and replaces it with **ListIterator.set** (p. 1674).

Implements **decaf::util::List< E >** (p. 1669).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1657), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1657), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1657), **decaf::util::LinkedList< CompositeTask * >** (p. 1657), **decaf::util::LinkedList< URI >** (p. 1657), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1657), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1657), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1657), **decaf::util::LinkedList< Pointer< Command > >** (p. 1657), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1657), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1657), **decaf::util::LinkedList< cms::Destination * >** (p. 1657), **decaf::util::LinkedList< cms::Session * >** (p. 1657), and **decaf::util::LinkedList< cms::Connection * >** (p. 1657).

6.9 decaf::util::AbstractSet< E > Class Template Reference

This class provides a skeletal implementation of the **Set** (p. 2397) interface to minimize the effort required to implement this interface.

```
#include <src/main/decaf/util/AbstractSet.h>
```

Inheritance diagram for **decaf::util::AbstractSet< E >**:

Public Member Functions

- virtual **~AbstractSet** ()
- virtual bool **removeAll** (const **Collection**< E > &collection)
Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The Collection (p. 851) whose elements are to be removed from this one.
------------	--

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

6.9.1 Detailed Description

template<typename E>class decaf::util::AbstractSet< E >

This class provides a skeletal implementation of the **Set** (p. 2397) interface to minimize the effort required to implement this interface.

The process of implementing a set by extending this class is identical to that of implementing a **Collection** (p. 851) by extending **AbstractCollection** (p. 106), except that all of the methods and constructors in subclasses of this class must obey the additional constraints imposed by the **Set** (p. 2397) interface (for instance, the add method must not permit addition of multiple instances of an object to a set).

Since

1.0

6.9.2 Constructor & Destructor Documentation

6.9.2.1 template<typename E> virtual decaf::util::AbstractSet< E >::~~AbstractSet () [inline, virtual]

6.9.3 Member Function Documentation

6.9.3.1 template<typename E> virtual bool decaf::util::AbstractSet< E >::removeAll (const Collection< E > & collection) [inline, virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are to be removed from this one.
-------------------	--

Returns

true if the collection changed as a result of this call.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 117).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1059).

6.10.3 Member Function Documentation

6.10.3.1 `virtual Pointer< wireformat::WireFormat > activemq::transport::AbstractTransportFactory::createWireFormat (const decaf::util::Properties & properties) [protected, virtual]`

Creates the WireFormat that is configured for this **Transport** (p. 2790) and returns it.

The default WireFormat is Openwire.

Parameters

<i>properties</i>	The properties that were configured on the URI.
-------------------	---

Returns

a pointer to a WireFormat instance that the caller then owns.

Exceptions

<i>NoSuchElementException</i>	if the configured WireFormat is not found.
-------------------------------	--

```

Inheritance diagram for activemq::commands::ActiveMQBlobMessage:

Public Member Functions

- **ActiveMQBlobMessage** ()
- virtual **~ActiveMQBlobMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQBlobMessage** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- std::string **getRemoteBlobUrl** () const
Get the Remote URL of the Blob.
- void **setRemoteBlobUrl** (const std::string &remoteURL)
Set the Remote URL of the Blob.

- `std::string getMimeType () const`
Get the Mime Type of the Blob.
- `void setMimeType (const std::string &mimeType)`
Set the Mime Type of the Blob.
- `std::string getName () const`
Gets the Name of the Blob.
- `void setName (const std::string &name)`
Sets the Name of the Blob.
- `bool isDeletedByBroker () const`
Gets if this Blob is deleted by the Broker.
- `void setDeletedByBroker (bool value)`
Sets the Deleted By Broker flag.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQBLOBMESSAGE** = 29
- static const std::string **BINARY_MIME_TYPE**

6.12.1 Constructor & Destructor Documentation

6.12.1.1 `activemq::commands::ActiveMQBlobMessage::ActiveMQBlobMessage ()`

6.12.1.2 `virtual activemq::commands::ActiveMQBlobMessage-
::~~ActiveMQBlobMessage () throw () [inline,
virtual]`

6.12.2 Member Function Documentation

6.12.2.1 `virtual cms::Message* activemq::commands::Active-
MQBlobMessage::clone () const [inline,
virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements `cms::Message` (p. 1844).

6.12.2.2 `virtual ActiveMQBlobMessage* activemq::commands::-
ActiveMQBlobMessage::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.12.2.3 `virtual void activemq::commands::ActiveMQBlobMessage::copyDataStructure (const DataStructure * src)`
[virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.12.2.4 `virtual bool activemq::commands::ActiveMQBlobMessage::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 297).

6.12.2.5 `virtual unsigned char activemq::commands::ActiveMQBlobMessage::getDataStructureType () const`
[virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.12.2.6 `std::string activemq::commands::ActiveMQBlobMessage::getMimeType () const [inline]`

Get the Mime Type of the Blob.

Returns

string holding the MIME Type.

6.12.2.7 `std::string activemq::commands::ActiveMQBlobMessage::getName () const [inline]`

Gets the Name of the Blob.

Returns

string name of the Blob.

6.12.2.8 `std::string activemq::commands::ActiveMQBlobMessage::getRemoteBlobUrl () const [inline]`

Get the Remote URL of the Blob.

Returns

string from of the Remote Blob URL.

6.12.2.9 `bool activemq::commands::ActiveMQBlobMessage::isDeletedByBroker () const [inline]`

Gets if this Blob is deleted by the Broker.

Returns

true if the Blob is deleted by the Broker.

6.12.2.10 `void activemq::commands::ActiveMQBlobMessage::setDeletedByBroker (bool value) [inline]`

Sets the Deleted By Broker flag.

Parameters

<i>value</i>	- set the Delete by broker flag to value.
--------------	---

6.12.2.11 `void activemq::commands::ActiveMQBlobMessage::setMimeType (const std::string & mimeType) [inline]`

Set the Mime Type of the Blob.

Parameters

<i>mimeType</i>	- String holding the MIME Type.
-----------------	---------------------------------

6.12.2.12 `void activemq::commands::ActiveMQBlobMessage::setName (const std::string & name) [inline]`

Sets the Name of the Blob.

Parameters

<i>name</i>	- Name of the Blob.
-------------	---------------------

6.12.2.13 `void activemq::commands::ActiveMQBlobMessage::setRemoteBlobUrl (const std::string & remoteURL) [inline]`

Set the Remote URL of the Blob.

Parameters

<i>remoteURL</i>	- String form of the Remote URL.
------------------	----------------------------------

6.12.2.14 `virtual std::string activemq::commands::ActiveMQBlobMessage::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.12.3 Field Documentation

6.12.3.1 `const std::string activemq::commands::ActiveMQBlobMessage::BINARY_MIME_TYPE [static]`

```
6.12.3.2  const unsigned char activemq::commands::ActiveMQ-
          BlobMessage::ID_ACTIVEMQBLOBMESSAGE = 29
          [static]
```

6.13 activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 161).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-
ActiveMQBlobMessageMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller:

Public Member Functions

- **ActiveMQBlobMessageMarshaller** ()
- virtual **~ActiveMQBlobMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marhsal to the given stream.

6.13 activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller Class

Reference

163

6.13.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 161).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.13.2 Constructor & Destructor Documentation

6.13.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::ActiveMQBlobMessageMarshaller ()**
[inline]

6.13.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::~~ActiveMQBlobMessageMarshaller ()**
[inline, virtual]

6.13.3 Member Function Documentation

6.13.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::createObject () const** [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.13.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::getDataStructureType () const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.13.3.3 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)` [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1919).

6.13.3.4 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)` [virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1919).

6.13.3.5 virtual int `activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs)` [virtual]

Tight Marshal to the given stream.

6.13 activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller Class

Reference

165

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.13.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

6.13.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i> if an error occurs.
--

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

The documentation for this class was generated from the following file:

6.14 activemq::commands::ActiveMQBytesMessage Class - Reference

```
#include <src/main/activemq/commands/ActiveMQBytesMessage.h>
```

Inheritance diagram for **activemq::commands::ActiveMQBytesMessage**:

Public Member Functions

- **ActiveMQBytesMessage** ()
- virtual **~ActiveMQBytesMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQBytesMessage * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual **cms::BytesMessage * clone** () const
Clones this message.
- virtual void **clearBody** ()
Clears out the body of the message.
- virtual void **onSend** ()
*Allows derived **Message** (p. 1821) classes to perform tasks before a message is sent.*

- virtual void **setBodyBytes** (const unsigned char *buffer, int numBytes)
sets the bytes given to the message body.
- virtual unsigned char * **getBodyBytes** () const
Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.
- virtual int **getBodyLength** () const
Returns the number of bytes contained in the body of this message.
- virtual void **reset** ()
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const
Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)
Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () const
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)
Writes a byte to the bytes message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) const
Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)
Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) const
Reads a portion of the bytes message stream.
- virtual void **writeBytes** (const unsigned char *value, int offset, int length)
Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () const
Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value)
Writes a char to the bytes message stream as a 1-byte value.
- virtual float **readFloat** () const
Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value)
Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () const
Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value)
Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () const
Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value)
Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const

Reads a 16 bit unsigned short from the Bytes message stream.

- virtual void **writeUnsignedShort** (unsigned short value)

Writes a unsigned short to the bytes message stream as a 2 byte value.

- virtual int **readInt** () const

Reads a 32 bit signed integer from the Bytes message stream.

- virtual void **writeInt** (int value)

Writes a signed int to the bytes message stream as a 4 byte value.

- virtual long long **readLong** () const

Reads a 64 bit long from the Bytes message stream.

- virtual void **writeLong** (long long value)

Writes a long long to the bytes message stream as a 8 byte value.

- virtual std::string **readString** () const

Reads an ASCII String from the Bytes message stream.

- virtual void **writeString** (const std::string &value)

Writes an ASCII String to the Bytes message stream.

- virtual std::string **readUTF** () const

Reads an UTF String from the BytesMessage stream.

- virtual void **writeUTF** (const std::string &value)

Writes an UTF String to the BytesMessage stream.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQBYTESMESSAGE** = 24

6.14.1 Constructor & Destructor Documentation

6.14.1.1 **activemq::commands::ActiveMQBytesMessage::ActiveMQBytesMessage ()**

6.14.1.2 **virtual activemq::commands::ActiveMQBytesMessage::~~ActiveMQBytesMessage () throw ()** *[virtual]*

6.14.2 Member Function Documentation

6.14.2.1 **virtual void activemq::commands::ActiveMQBytesMessage::clearBody ()**
[virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

<i>CMSException</i>	- if an internal error occurs.
---------------------	--------------------------------

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::-**

BytesMessage > (p. 296).

6.14.2.2 `virtual cms::BytesMessage* activemq::commands::ActiveMQBytesMessage::clone () const [inline, virtual]`

Clones this message.

Returns

a deep copy of this message.

Exceptions

<i>CMSException</i>	- if an internal error occurs while cloning the Message (p. 1821).
---------------------	---

Implements **cms::BytesMessage** (p. 720).

6.14.2.3 `virtual ActiveMQBytesMessage* activemq::commands::ActiveMQBytesMessage::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.14.2.4 `virtual void activemq::commands::ActiveMQBytesMessage::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.14.2.5 `virtual bool activemq::commands::ActiveMQBytesMessage::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::BytesMessage** > (p. 297).

6.14.2.6 `virtual unsigned char* activemq::commands::ActiveMQBytesMessage::getBodyBytes () const [virtual]`

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>MessageNotReadableException</i>	- If the message is in Write Only Mode.

Implements **cms::BytesMessage** (p. 721).

6.14.2.7 `virtual int activemq::commands::ActiveMQBytesMessage::getBodyLength () const [virtual]`

Returns the number of bytes contained in the body of this message.

Returns

number of bytes.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>MessageNotReadableException</i>	- If the message is in Write Only Mode.

Implements **cms::BytesMessage** (p. 721).

6.14.2.8 virtual unsigned char **activemq::commands::ActiveMQBytesMessage::getDataStructureType** () const
[virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.14.2.9 virtual void **activemq::commands::ActiveMQBytesMessage::onSend** ()
[virtual]

Allows derived **Message** (p. 1821) classes to perform tasks before a message is sent.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 299).

6.14.2.10 virtual bool **activemq::commands::ActiveMQBytesMessage::readBoolean** () const [virtual]

Reads a Boolean from the Bytes message stream.

Returns

boolean value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 722).

6.14.2.11 `virtual unsigned char activemq::commands::ActiveMQBytesMessage::readByte () const` `[virtual]`

Reads a Byte from the Bytes message stream.

Returns

unsigned char value from stream

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i>	- if the message is in write-only mode.

Implements `cms::BytesMessage` (p. 722).

6.14.2.12 `virtual int activemq::commands::ActiveMQBytesMessage::readBytes (std::vector< unsigned char > & value) const` `[virtual]`

Reads a byte array from the bytes message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

<i>value</i>	buffer to place data in
--------------	-------------------------

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNotReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 723).

6.14.2.13 `virtual int activemq::commands::ActiveMQBytesMessage::readBytes (unsigned char * buffer, int length) const` `[virtual]`

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters

<i>buffer</i>	the buffer into which the data is read
<i>length</i>	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 723).

6.14.2.14 `virtual char activemq::commands::ActiveMQBytesMessage::readChar () const` `[virtual]`

Reads a Char from the Bytes message stream.

Returns

char value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 724).

6.14.2.15 virtual double **activemq::commands::ActiveMQBytesMessage::readDouble () const** [virtual]

Reads a 64 bit double from the Bytes message stream.

Returns

double value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 725).

6.14.2.16 virtual float **activemq::commands::ActiveMQBytesMessage::readFloat () const** [virtual]

Reads a 32 bit float from the Bytes message stream.

Returns

double value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 725).

6.14.2.17 `virtual int activemq::commands::ActiveMQBytesMessage::readInt ()
const [virtual]`

Reads a 32 bit signed integer from the Bytes message stream.

Returns

int value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 725).

6.14.2.18 `virtual long long activemq::commands::ActiveMQBytesMessage::read-
Long () const [virtual]`

Reads a 64 bit long from the Bytes message stream.

Returns

long long value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 726).

6.14.2.19 `virtual short activemq::commands::ActiveMQBytesMessage::readShort () const [virtual]`

Reads a 16 bit signed short from the Bytes message stream.

Returns

short value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 726).

6.14.2.20 `virtual std::string activemq::commands::ActiveMQBytesMessage::readString () const [virtual]`

Reads an ASCII String from the Bytes message stream.

Returns

String from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 727).

6.14.2.21 `virtual unsigned short activemq::commands::ActiveMQBytesMessage::readUnsignedShort () const [virtual]`

Reads a 16 bit unsigned short from the Bytes message stream.

Returns

unsigned short value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 727).

6.14.2.22 virtual std::string activemq::commands::ActiveMQBytesMessage::readUTF() const [virtual]

Reads an UTF String from the BytesMessage stream.

Returns

String from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 728).

6.14.2.23 virtual void activemq::commands::ActiveMQBytesMessage::reset() [virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions

<i>CMSException</i>	- If the provider fails to perform the reset operation.
<i>MessageFormatException</i>	- If the Message (p. 1821) has an invalid format.

Implements **cms::BytesMessage** (p. 728).

6.14.2.24 `virtual void activemq::commands::ActiveMQBytesMessage::setBodyBytes (const unsigned char * buffer, int numBytes)`
`[virtual]`

sets the bytes given to the message body.

Parameters

<i>buffer</i>	Byte Buffer to copy
<i>numBytes</i>	Number of bytes in Buffer to copy

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>MessageNotWriteableException</i>	- if in Read Only Mode.

Implements **cms::BytesMessage** (p. 729).

6.14.2.25 `virtual std::string activemq::commands::ActiveMQBytesMessage::toString () const` `[virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.14.2.26 `virtual void activemq::commands::ActiveMQBytesMessage::writeBoolean (bool value)` `[virtual]`

Writes a boolean to the bytes message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

<i>value</i>	boolean to write to the stream
--------------	--------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 729).

6.14.2.27 `virtual void activemq::commands::ActiveMQBytesMessage::writeByte (unsigned char value) [virtual]`

Writes a byte to the bytes message stream as a 1-byte value.

Parameters

<i>value</i>	byte to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 729).

6.14.2.28 `virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const std::vector< unsigned char > & value) [virtual]`

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
--------------	------------------------------

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 730).

6.14.2.29 `virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const unsigned char * value, int offset, int length) [virtual]`

Writes a portion of a byte array to the bytes message stream.

size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
<i>offset</i>	the initial offset within the byte array
<i>length</i>	the number of bytes to use

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 730).

6.14.2.30 `virtual void activemq::commands::ActiveMQBytesMessage::writeChar (char value) [virtual]`

Writes a char to the bytes message stream as a 1-byte value.

Parameters

<i>value</i>	char to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 731).

6.14.2.31 `virtual void activemq::commands::ActiveMQBytesMessage::writeDouble (double value) [virtual]`

Writes a double to the bytes message stream as a 8 byte value.

Parameters

<i>value</i>	double to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 731).

6.14.2.32 `virtual void activemq::commands::ActiveMQBytesMessage::writeFloat (float value) [virtual]`

Writes a float to the bytes message stream as a 4 byte value.

Parameters

<i>value</i>	float to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 732).

6.14.2.33 `virtual void activemq::commands::ActiveMQBytesMessage::writeInt (int value) [virtual]`

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters

<i>value</i>	signed int to write to the stream
--------------	-----------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 732).

6.14.2.34 `virtual void activemq::commands::ActiveMQBytesMessage::writeLong (long long value) [virtual]`

Writes a long long to the bytes message stream as a 8 byte value.

Parameters

<i>value</i>	signed long long to write to the stream
--------------	---

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 732).

6.14.2.35 `virtual void activemq::commands::ActiveMQBytesMessage::writeShort (short value) [virtual]`

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	signed short to write to the stream
--------------	-------------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 733).

6.14.2.36 `virtual void activemq::commands::ActiveMQBytesMessage::writeString (const std::string & value) [virtual]`

Writes an ASCII String to the Bytes message stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 733).

6.14.2.37 `virtual void activemq::commands::ActiveMQBytesMessage::writeUnsignedShort (unsigned short value)`
`[virtual]`

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	unsigned short to write to the stream
--------------	---------------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 734).

6.14.2.38 `virtual void activemq::commands::ActiveMQBytesMessage::writeUTF (const std::string & value)`
`[virtual]`

Writes an UTF String to the BytesMessage stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 734).

6.14.3 Field Documentation

6.14.3.1 `const unsigned char activemq::commands::ActiveMQBytesMessage::ID_ACTIVEMQBYTESMESSAGE = 24`
`[static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQBytesMessage.h`

6.15 activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 183).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQBytesMessageMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller:

Public Member Functions

- **ActiveMQBytesMessageMarshaller** ()
- virtual **~ActiveMQBytesMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**)
Tight Marhsal to the given stream.

6.15.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 183).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.15 activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller Class

Reference

185

6.15.2 Constructor & Destructor Documentation

6.15.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::ActiveMQBytesMessageMarshaller ()**
[inline]

6.15.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::~~ActiveMQBytesMessageMarshaller ()**
[inline, virtual]

6.15.3 Member Function Documentation

6.15.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::createObject () const** [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.15.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::getDataStructureType () const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.15.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.15.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)** [virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.15.3.5 **virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs)** [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.15 activemq::wireformat::openwire::marshal::generated::ActiveMQBytes-MessageMarshaller Class

Reference

187

6.15.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

6.15.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQBytes-MessageMarshaller.h**

6.16 activemq::core::ActiveMQConnection Class Reference

Concrete connection used for all connectors to the ActiveMQ broker.

```
#include <src/main/activemq/core/ActiveMQConnection.h>
```

Inheritance diagram for activemq::core::ActiveMQConnection:

Public Member Functions

- **ActiveMQConnection** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)
Constructor.
- virtual **~ActiveMQConnection** () throw ()
- virtual void **addSession** (**ActiveMQSession** *session)
Adds the session resources for the given session instance.
- virtual void **removeSession** (**ActiveMQSession** *session)
Removes the session resources for the given session instance.
- virtual void **addProducer** (**ActiveMQProducer** *producer)
Adds an active Producer to the Set of known producers.
- virtual void **removeProducer** (const **Pointer**< **commands::ProducerId** > &producerId)
Removes an active Producer to the Set of known producers.
- virtual void **addDispatcher** (const **Pointer**< **commands::ConsumerId** > &consumer, **Dispatcher** *dispatcher)
Adds a dispatcher for a consumer.
- virtual void **removeDispatcher** (const **Pointer**< **commands::ConsumerId** > &consumer)
Removes the dispatcher for a consumer.
- virtual void **sendPullRequest** (const **commands::ConsumerInfo** *consumer, long long timeout)
If supported sends a message pull request to the service provider asking for the delivery of a new message.
- bool **isClosed** () const
Checks if this connection has been closed.
- bool **isStarted** () const
Check if this connection has been started.
- bool **isTransportFailed** () const
Checks if the Connection's Transport has failed.
- virtual void **destroyDestination** (const **commands::ActiveMQDestination** *destination)
Requests that the Broker removes the given Destination.
- virtual void **destroyDestination** (const **cms::Destination** *destination)

Requests that the Broker removes the given Destination.

- virtual const **cms::ConnectionMetaData** * **getMetaData** () const

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

CMSEException (p. 826)	<i>if the provider fails to get the connection metadata for this connection.</i>
-------------------------------	--

See also

ConnectionMetaData (p. 978)

Since

2.0

- virtual **cms::Session** * **createSession** ()

*Creates an AUTO_ACKNOWLEDGE **Session** (p. 2361).*

Exceptions

CMSEException (p. 826)	
-------------------------------	--

- virtual std::string **getClientID** () const

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns

*Client Id String for this **Connection** (p. 933).*

Exceptions

CMSEException (p. 826)	<i>if the provider fails to return the client id or an internal error occurs.</i>
-------------------------------	---

- virtual void **setClientID** (const std::string &clientID)

Sets the client identifier for this connection.

*The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 955) object and transparently assigned to the **Connection** (p. 933) object it creates.*

*If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1419).*

Parameters

clientID	<i>The unique client identifier to assign to the Connection (p. 933).</i>
----------	--

Exceptions

CMSEException (p. 826)	<i>if the provider fails to set the client id due to some internal error.</i>
InvalidClientID-Exception	<i>if the id given is somehow invalid or is a duplicate.</i>
IllegalStateException (p. 1419)	<i>if the client tries to set the id after a Connection (p. 933) method has been called.</i>

- virtual **cms::Session** * **createSession** (**cms::Session::AcknowledgeMode** ackMode)

*Creates a new **Session** (p. 2361) to work for this **Connection** (p. 933) using the spec-*

ified acknowledgment mode.

Parameters

ackMode	<i>the Acknowledgment Mode to use.</i>
---------	--

Exceptions

CMSEException (p. 826)

- virtual void **close** ()

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

CMSEException (p. 826)

- virtual void **start** ()

Starts the service.

Exceptions

CMSEException (p. 826)	<i>if an internal error occurs while starting.</i>
-------------------------------	--

- virtual void **stop** ()

Stops this service.

Exceptions

CMSEException (p. 826)	<i>- if an internal error occurs while stopping the Service.</i>
-------------------------------	--

- virtual **cms::ExceptionListener * getExceptionListener** () const

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

- virtual void **setExceptionListener** (**cms::ExceptionListener *listener**)

Sets the registered Exception Listener for this connection.

Parameters

listener	<i>pointer to and ExceptionListener (p. 1286)</i>
----------	--

- void **setUsername** (const std::string &username)

Sets the username that should be used when creating a new connection.

- const std::string & **getUsername** () const

Gets the username that this factory will use when creating a new connection instance.

- void **setPassword** (const std::string &password)

Sets the password that should be used when creating a new connection.

- const std::string & **getPassword** () const

Gets the password that this factory will use when creating a new connection instance.

- void **setDefaultClientId** (const std::string &clientId)

Sets the Client Id.

- void **setBrokerURL** (const std::string &brokerURL)

Sets the Broker URL that should be used when creating a new connection instance.

- const std::string & **getBrokerURL** () const

Gets the Broker URL that this factory will use when creating a new connection instance.

- void **setPrefetchPolicy** (**PrefetchPolicy** *policy)

*Sets the **PrefetchPolicy** (p. 2110) instance that this factory should use when it creates new Connection instances.*

- **PrefetchPolicy** * **getPrefetchPolicy** () const

*Gets the pointer to the current **PrefetchPolicy** (p.2110) that is in use by this - ConnectionFactory.*

- void **setRedeliveryPolicy** (**RedeliveryPolicy** *policy)

*Sets the **RedeliveryPolicy** (p. 2250) instance that this factory should use when it creates new Connection instances.*

- **RedeliveryPolicy** * **getRedeliveryPolicy** () const

*Gets the pointer to the current **RedeliveryPolicy** (p. 2250) that is in use by this - ConnectionFactory.*

- bool **isDispatchAsync** () const

- void **setDispatchAsync** (bool value)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

- bool **isAlwaysSyncSend** () const

Gets if the Connection should always send things Synchronously.

- void **setAlwaysSyncSend** (bool value)

Sets if the Connection should always send things Synchronously.

- bool **isUseAsyncSend** () const

Gets if the useAsyncSend option is set.

- void **setUseAsyncSend** (bool value)

Sets the useAsyncSend option.

- bool **isUseCompression** () const

Gets if the Connection is configured for Message body compression.

- void **setUseCompression** (bool value)

Sets whether Message body compression is enabled.

- void **setCompressionLevel** (int value)

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

- int **getCompressionLevel** () const

Gets the currently configured Compression level for Message bodies.

- unsigned int **getSendTimeout** () const

Gets the assigned send timeout for this Connector.

- void **setSendTimeout** (unsigned int timeout)

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

- unsigned int **getCloseTimeout** () const

Gets the assigned close timeout for this Connector.

- void **setCloseTimeout** (unsigned int timeout)

Sets the close timeout to use when sending the disconnect request.

- unsigned int **getProducerWindowSize** () const
Gets the configured producer window size for Producers that are created from this connector.
- void **setProducerWindowSize** (unsigned int windowSize)
Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.
- bool **isMessagePrioritySupported** () const
- void **setMessagePrioritySupported** (bool value)
Set whether or not this factory should create Connection objects with the Message priority support function enabled.
- long long **getNextTempDestinationId** ()
Get the Next Temporary Destination Id.
- long long **getNextLocalTransactionId** ()
Get the Next Temporary Destination Id.
- void **addTransportListener** (transport::TransportListener *transport-Listener)
Adds a transport listener so that a client can be notified of events in the underlying transport, client's are always notified after the event has been processed by the - Connection class.
- void **removeTransportListener** (transport::TransportListener *transport-Listener)
Removes a registered TransportListener from the Connection's set of Transport listeners, this listener will no longer receive any Transport related events.
- virtual void **onCommand** (const Pointer< commands::Command > &command)
Event handler for the receipt of a non-response command from the transport.
- virtual void **onException** (const decaf::lang::Exception &ex)
Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
The transport has resumed after an interruption.
- const commands::ConnectionInfo & **getConnectionInfo** () const
Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.
- const commands::ConnectionId & **getConnectionId** () const
Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.
- transport::Transport & **getTransport** () const
Gets a reference to this object's Transport instance.
- Pointer< threads::Scheduler > **getScheduler** () const
Gets a reference to the Connection objects built in Scheduler instance.
- std::string **getResourceManagerId** () const
Returns the Id of the Resource Manager that this client will use should it be entered into an XA Transaction.

- void **cleanup** ()
*Clean up this connection object, resetting it back to a state that mirrors what a newly created **ActiveMQConnection** (p. 187) object has.*
- void **oneway** (**Pointer**< **commands::Command** > command)
Sends a message without request that the broker send a response to indicate that it was received.
- **Pointer**< **commands::Response** > **syncRequest** (**Pointer**< **commands::Command** > command, unsigned int timeout=0)
Sends a synchronous request and returns the response from the broker.
- virtual void **fire** (const **exceptions::ActiveMQException** &ex)
Notify the exception listener.
- void **setTransportInterruptionProcessingComplete** ()
Indicates that a Connection resource that is processing the transportInterrupted event has completed.
- **decaf::lang::Exception** * **getFirstFailureError** () const
Gets the pointer to the first exception that caused the Connection to become failed.
- void **onAsyncException** (const **decaf::lang::Exception** &ex)
Event handler for dealing with async exceptions.
- void **checkClosed** () const
Check for Closed State and Throw an exception if true.
- void **checkClosedOrFailed** () const
Check for Closed State and Failed State and Throw an exception if either is true.
- void **ensureConnectionInfoSent** ()
If its not been sent, then send the ConnectionInfo to the Broker.

Protected Member Functions

- virtual **Pointer** < **commands::SessionId** > **getNextSessionId** ()
- void **disconnect** (long long lastDeliveredSequenceId)
- void **waitForTransportInterruptionProcessingToComplete** ()
- void **signalInterruptionProcessingComplete** ()
- const **decaf::util::Properties** & **getProperties** () const

6.16.1 Detailed Description

Concrete connection used for all connectors to the ActiveMQ broker.

Since

2.0

6.16.2 Constructor & Destructor Documentation

6.16.2.1 `activemq::core::ActiveMQConnection::ActiveMQConnection (const Pointer< transport::Transport > & transport, const Pointer< decaf::util::Properties > & properties)`

Constructor.

Parameters

<i>transport</i>	The Transport requested for this connection to the Broker.
<i>properties</i>	The Properties that were defined for this connection

6.16.2.2 `virtual activemq::core::ActiveMQConnection::~~ActiveMQConnection () throw () [virtual]`

6.16.3 Member Function Documentation

6.16.3.1 `virtual void activemq::core::ActiveMQConnection::addDispatcher (const Pointer< commands::ConsumerId > & consumer, Dispatcher * dispatcher) [virtual]`

Adds a dispatcher for a consumer.

Parameters

<i>consumer</i>	- The consumer for which to register a dispatcher.
<i>dispatcher</i>	- The dispatcher to handle incoming messages for the consumer.

Exceptions

<i>CMSEException</i>	if an error occurs while removing performing the operation.
----------------------	---

6.16.3.2 `virtual void activemq::core::ActiveMQConnection::addProducer (ActiveMQProducer * producer) [virtual]`

Adds an active Producer to the Set of known producers.

Parameters

<i>producer</i>	The Producer to add from the the known set.
-----------------	---

Exceptions

<i>CMSEException</i>	if an error occurs while removing performing the operation.
----------------------	---

6.16.3.3 virtual void activemq::core::ActiveMQConnection::addSession (ActiveMQSession * session) [virtual]

Adds the session resources for the given session instance.

Parameters

<i>session</i>	The session to be added to this connection.
----------------	---

Exceptions

<i>CMSEException</i>	if an error occurs while removing performing the operation.
----------------------	---

6.16.3.4 void activemq::core::ActiveMQConnection::addTransportListener (transport::TransportListener * transportListener)

Adds a transport listener so that a client can be notified of events in the underlying transport, client's are always notified after the event has been processed by the Connection class.

Client's should ensure that the registered listener does not block or take a long amount of time to execute in order to not degrade performance of this Connection.

Parameters

<i>transport-Listener</i>	The TransportListener instance to add to this Connection's set of listeners to notify of Transport events.
---------------------------	--

6.16.3.5 void activemq::core::ActiveMQConnection::checkClosed () const

Check for Closed State and Throw an exception if true.

Exceptions

<i>CMSEException</i>	if the Connection is closed.
----------------------	------------------------------

6.16.3.6 void activemq::core::ActiveMQConnection::checkClosedOrFailed () const

Check for Closed State and Failed State and Throw an exception if either is true.

Exceptions

<i>CMSEException</i>	if the Connection is closed or failed.
----------------------	--

6.16.3.7 void activemq::core::ActiveMQConnection::cleanup ()

Clean up this connection object, reseting it back to a state that mirrors what a newly created **ActiveMQConnection** (p. 187) object has.

6.16.3.8 virtual void activemq::core::ActiveMQConnection::close () [virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

CMSException (p. 826)

Implements **cms::Connection** (p. 935).

6.16.3.9 virtual cms::Session* activemq::core::ActiveMQConnection::createSession () [virtual]

Creates an AUTO_ACKNOWLEDGE **Session** (p. 2361).

Exceptions

CMSException (p. 826)

Implements **cms::Connection** (p. 935).

6.16.3.10 virtual cms::Session* activemq::core::ActiveMQConnection::createSession (cms::Session::AcknowledgeMode ackMode) [virtual]

Creates a new **Session** (p. 2361) to work for this **Connection** (p. 933) using the specified acknowledgment mode.

Parameters

<i>ackMode</i>	the Acknowledgment Mode to use.
----------------	---------------------------------

Exceptions

CMSException (p. 826)

Implements **cms::Connection** (p. 936).

Reimplemented in **activemq::core::ActiveMQXAConnection** (p. 433).

6.16.3.11 virtual void **activemq::core::ActiveMQConnection::destroyDestination** (
const **commands::ActiveMQDestination** * *destination*) [virtual]

Requests that the Broker removes the given Destination.

Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters

<i>destination</i>	The Destination the Broker will be requested to remove.
--------------------	---

Exceptions

<i>NullPointerException</i>	If the passed Destination is Null
<i>IllegalStateException</i>	If the connection is closed.
<i>UnsupportedOperationException</i>	If the wire format in use does not support this operation.
<i>ActiveMQException</i>	If any other error occurs during the attempt to destroy the destination.

6.16.3.12 virtual void **activemq::core::ActiveMQConnection::destroyDestination** (
const **cms::Destination** * *destination*) [virtual]

Requests that the Broker removes the given Destination.

Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters

<i>destination</i>	The CMS Destination the Broker will be requested to remove.
--------------------	---

Exceptions

<i>NullPointerException</i>	If the passed Destination is Null
<i>IllegalStateException</i>	If the connection is closed.
<i>UnsupportedOperationException</i>	If the wire format in use does not support this operation.
<i>ActiveMQException</i>	If any other error occurs during the attempt to destroy the destination.

6.16.3.13 void **activemq::core::ActiveMQConnection::disconnect** (long long
lastDeliveredSequenceId) [protected]

6.16.3.14 `void activemq::core::ActiveMQConnection::ensureConnectionInfoSent ()`

If its not been sent, then send the ConnectionInfo to the Broker.

6.16.3.15 `virtual void activemq::core::ActiveMQConnection::fire (const exceptions::ActiveMQException & ex) [virtual]`

Notify the exception listener.

Parameters

<code>ex</code>	the exception to fire
-----------------	-----------------------

6.16.3.16 `const std::string& activemq::core::ActiveMQConnection::getBrokerURL () const`

Gets the Broker URL that this factory will use when creating a new connection instance.

Returns

brokerURL string

6.16.3.17 `virtual std::string activemq::core::ActiveMQConnection::getClientID () const [virtual]`

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns

Client Id String for this **Connection** (p. 933).

Exceptions

<i>CMSException</i> (p. 826)	if the provider fails to return the client id or an internal error occurs.
--	--

Implements **cms::Connection** (p. 936).

6.16.3.18 `unsigned int activemq::core::ActiveMQConnection::getCloseTimeout () const`

Gets the assigned close timeout for this Connector.

Returns

the close timeout configured in the connection uri

6.16.3.19 `int activemq::core::ActiveMQConnection::getCompressionLevel ()`
`const`

Gets the currently configured Compression level for Message bodies.

Returns

the int value of the current compression level.

6.16.3.20 `const commands::ConnectionId& activemq::core-
 ::ActiveMQConnection::getConnectionId ()`
`const`

Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing this operation.
--------------------------	---

6.16.3.21 `const commands::ConnectionInfo& activemq::core-
 ::ActiveMQConnection::getConnectionInfo ()`
`const`

Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing this operation.
--------------------------	---

6.16.3.22 `virtual cms::ExceptionListener* activemq::core:-
 ActiveMQConnection::getExceptionListener () const`
`[virtual]`

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

Implements **cms::Connection** (p. 936).

6.16.3.23 `decaf::lang::Exception* activemq::core::ActiveMQConnection::getFirstFailureError () const`

Gets the pointer to the first exception that caused the Connection to become failed.

Returns

pointer to and Exception instance or NULL if none is set.

6.16.3.24 `virtual const cms::ConnectionMetaData* activemq::core::ActiveMQConnection::getMetaData () const [inline, virtual]`

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

CMSException (p. 826)	if the provider fails to get the connection metadata for this connection.
---------------------------------	---

See also

ConnectionMetaData (p. 978)

Since

2.0

Implements **cms::Connection** (p. 937).

6.16.3.25 `long long activemq::core::ActiveMQConnection::getNextLocalTransactionId ()`

Get the Next Temporary Destination Id.

Returns

the next id in the sequence.

6.16.3.26 `virtual Pointer<commands::SessionId> activemq::core::ActiveMQConnection::getNextSessionId () [protected, virtual]`

Returns

the next available Session Id.

6.16.3.27 long long activemq::core::ActiveMQConnection::getNextTempDestinationId ()

Get the Next Temporary Destination Id.

Returns

the next id in the sequence.

6.16.3.28 const std::string& activemq::core::ActiveMQConnection::getPassword () const

Gets the password that this factory will use when creating a new connection instance.

Returns

password string, "" for default credentials

6.16.3.29 PrefetchPolicy* activemq::core::ActiveMQConnection::getPrefetchPolicy () const

Gets the pointer to the current **PrefetchPolicy** (p.2110) that is in use by this - ConnectionFactory.

Returns

a pointer to this objects **PrefetchPolicy** (p. 2110).

6.16.3.30 unsigned int activemq::core::ActiveMQConnection::getProducerWindowSize () const

Gets the configured producer window size for Producers that are created from this connector.

This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.16.3.31 `const decaf::util::Properties& activemq::core::ActiveMQConnection::getProperties () const` [protected]

6.16.3.32 `RedeliveryPolicy* activemq::core::ActiveMQConnection::getRedeliveryPolicy () const`

Gets the pointer to the current **RedeliveryPolicy** (p.2250) that is in use by this - ConnectionFactory.

Returns

a pointer to this objects **RedeliveryPolicy** (p. 2250).

6.16.3.33 `std::string activemq::core::ActiveMQConnection::getResourceManagerId () const`

Returns the Id of the Resource Manager that this client will use should it be entered into an XA Transaction.

Returns

a string containing the resource manager Id for XA Transactions.

6.16.3.34 `Pointer<threads::Scheduler> activemq::core::ActiveMQConnection::getScheduler () const`

Gets a reference to the Connection objects built in Scheduler instance.

Returns

a reference to a Scheduler instance owned by this Connection.

6.16.3.35 `unsigned int activemq::core::ActiveMQConnection::getSendTimeout () const`

Gets the assigned send timeout for this Connector.

Returns

the send timeout configured in the connection uri

6.16.3.36 `transport::Transport& activemq::core::ActiveMQConnection::getTransport () const`

Gets a reference to this object's Transport instance.

Returns

a reference to the Transport that is in use by this Connection.

6.16.3.37 `const std::string& activemq::core::ActiveMQConnection::getUsername () const`

Gets the username that this factory will use when creating a new connection instance.

Returns

username string, "" for default credentials

6.16.3.38 `bool activemq::core::ActiveMQConnection::isAlwaysSyncSend () const`

Gets if the Connection should always send things Synchronously.

Returns

true if sends should always be Synchronous.

6.16.3.39 `bool activemq::core::ActiveMQConnection::isClosed () const`
`[inline]`

Checks if this connection has been closed.

Returns

true if the connection is closed

6.16.3.40 `bool activemq::core::ActiveMQConnection::isDispatchAsync () const`

Returns

The value of the dispatch asynchronously option sent to the broker.

6.16.3.41 `bool activemq::core::ActiveMQConnection::isMessagePriority-Supported () const`

Returns

true if the Connections that this factory creates should support the message based priority settings.

6.16.3.42 `bool activemq::core::ActiveMQConnection::isStarted () const`
[inline]

Check if this connection has been started.

Returns

true if the start method has been called.

6.16.3.43 `bool activemq::core::ActiveMQConnection::isTransportFailed () const`
[inline]

Checks if the Connection's Transport has failed.

Returns

true if the Connection's Transport has failed.

6.16.3.44 `bool activemq::core::ActiveMQConnection::isUseAsyncSend () const`

Gets if the useAsyncSend option is set.

Returns

true if on false if not.

6.16.3.45 `bool activemq::core::ActiveMQConnection::isUseCompression () const`

Gets if the Connection is configured for Message body compression.

Returns

if the Message body will be Compressed or not.

6.16.3.46 `void activemq::core::ActiveMQConnection::onAsyncException (const`
`decaf::lang::Exception & ex)`

Event handler for dealing with async exceptions.

Parameters

<code>ex</code>	The exception that caused the error condition.
-----------------	--

6.16.3.47 `virtual void activemq::core::ActiveMQConnection::onCommand (const Pointer< commands::Command > & command) [virtual]`

Event handler for the receipt of a non-response command from the transport.

Parameters

<i>command</i>	the received command object.
----------------	------------------------------

Implements **activemq::transport::TransportListener** (p.2811).

6.16.3.48 `void activemq::core::ActiveMQConnection::oneway (Pointer< commands::Command > command)`

Sends a message without request that the broker send a response to indicate that it was received.

Parameters

<i>command</i>	The Command object to send to the Broker.
----------------	---

Exceptions

<i>ActiveMQException</i>	if not currently connected, or if the operation fails for any reason.
--------------------------	---

6.16.3.49 `virtual void activemq::core::ActiveMQConnection::onException (const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

<i>ex</i>	The exception.
-----------	----------------

Implements **activemq::transport::TransportListener** (p.2811).

6.16.3.50 `virtual void activemq::core::ActiveMQConnection::removeDispatcher (const Pointer< commands::ConsumerId > & consumer) [virtual]`

Removes the dispatcher for a consumer.

Parameters

<i>consumer</i>	- The consumer for which to remove the dispatcher.
-----------------	--

Exceptions

<i>CMSEException</i>	if an error occurs while removing performing the operation.
----------------------	---

6.16.3.51 **virtual void activemq::core::ActiveMQConnection::removeProducer (**
const Pointer< commands::ProducerId > & producerId) [virtual]

Removes an active Producer to the Set of known producers.

Parameters

<i>producerId</i>	- The ProducerId to remove from the the known set.
-------------------	--

Exceptions

<i>CMSEException</i>	if an error occurs while removing performing the operation.
----------------------	---

6.16.3.52 **virtual void activemq::core::ActiveMQConnection::removeSession (**
ActiveMQSession * session) [virtual]

Removes the session resources for the given session instance.

Parameters

<i>session</i>	The session to be unregistered from this connection.
----------------	--

Exceptions

<i>CMSEException</i>	if an error occurs while removing performing the operation.
----------------------	---

6.16.3.53 **void activemq::core::ActiveMQConnection::removeTransportListener (**
transport::TransportListener * transportListener)

Removes a registered TransportListener from the Connection's set of Transport listeners, this listener will no longer receive any Transport related events.

The caller is responsible for freeing the listener in all cases.

Parameters

<i>transport-Listener</i>	The pointer to the TransportListener to remove from the set of listeners.
---------------------------	---

6.16.3.54 `virtual void activemq::core::ActiveMQConnection::sendPullRequest
(const commands::ConsumerInfo * consumer, long long timeout)
[virtual]`

If supported sends a message pull request to the service provider asking for the delivery of a new message.

This is used in the case where the service provider has been configured with a zero prefetch or is only capable of delivering messages on a pull basis.

Parameters

<i>consumer</i>	- the ConsumerInfo for the requesting Consumer.
<i>timeout</i>	- the time that the client is willing to wait.

Exceptions

<i>ActiveMQException</i>	if an error occurs while removing performing the operation.
--------------------------	---

6.16.3.55 `void activemq::core::ActiveMQConnection::setAlwaysSyncSend (bool
value)`

Sets if the Connection should always send things Synchronously.

Parameters

<i>value</i>	true if sends should always be Synchronous.
--------------	---

6.16.3.56 `void activemq::core::ActiveMQConnection::setBrokerURL (const
std::string & brokerURL)`

Sets the Broker URL that should be used when creating a new connection instance.

Parameters

<i>brokerURL</i>	string
------------------	--------

6.16.3.57 `virtual void activemq::core::ActiveMQConnection::setClientID (const
std::string & clientID) [virtual]`

Sets the client identifier for this connection.

The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 955) object and transparently assigned to the **Connection** (p. 933) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates

the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1419).

Parameters

<i>clientId</i>	The unique client identifier to assign to the Connection (p. 933).
-----------------	---

Exceptions

CMSException (p. 826)	if the provider fails to set the client id due to some internal error.
<i>InvalidClientID-Exception</i>	if the id given is somehow invalid or is a duplicate.
IllegalStateException (p. 1419)	if the client tries to set the id after a Connection (p. 933) method has been called.

Implements **cms::Connection** (p. 937).

6.16.3.58 **void activemq::core::ActiveMQConnection::setCloseTimeout (unsigned int timeout)**

Sets the close timeout to use when sending the disconnect request.

Parameters

<i>timeout</i>	- The time to wait for a close message.
----------------	---

6.16.3.59 **void activemq::core::ActiveMQConnection::setCompressionLevel (int value)**

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

The range of compression levels is [0..9] where 0 indicates best speed and 9 indicates best compression.

Parameters

<i>value</i>	A signed int value that controls the compression level.
--------------	---

6.16.3.60 **void activemq::core::ActiveMQConnection::setDefaultClientId (const std::string & clientId)**

Sets the Client Id.

Parameters

<i>clientId</i>	- The new clientId value.
-----------------	---------------------------

6.16.3.61 void **activemq::core::ActiveMQConnection::setDispatchAsync** (bool *value*)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

For slow consumers set it to true so that dispatching will not block fast consumers. .

Parameters

<i>value</i>	The value of the dispatch asynchronously option sent to the broker.
--------------	---

6.16.3.62 virtual void **activemq::core::ActiveMQConnection::setExceptionListener** (cms::ExceptionListener * *listener*) [virtual]

Sets the registered Exception Listener for this connection.

Parameters

<i>listener</i>	pointer to and ExceptionListener (p. 1286)
-----------------	---

Implements **cms::Connection** (p. 938).

6.16.3.63 void **activemq::core::ActiveMQConnection::setMessagePriority-Supported** (bool *value*)

Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Parameters

<i>value</i>	Boolean indicating if Message priority should be enabled.
--------------	---

6.16.3.64 void **activemq::core::ActiveMQConnection::setPassword** (const std::string & *password*)

Sets the password that should be used when creating a new connection.

Parameters

<i>password</i>	string
-----------------	--------

6.16.3.65 void activemq::core::ActiveMQConnection::setPrefetchPolicy (PrefetchPolicy * *policy*)

Sets the **PrefetchPolicy** (p. 2110) instance that this factory should use when it creates new Connection instances.

The **PrefetchPolicy** (p. 2110) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

<i>policy</i>	The new PrefetchPolicy (p. 2110) that the ConnectionFactory should clone for Connections.
---------------	--

6.16.3.66 void activemq::core::ActiveMQConnection::setProducerWindowSize (unsigned int *windowSize*)

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters

<i>windowSize</i>	- The size in bytes of the Producers memory window.
-------------------	---

6.16.3.67 void activemq::core::ActiveMQConnection::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 2250) instance that this factory should use when it creates new Connection instances.

The **RedeliveryPolicy** (p. 2250) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

<i>policy</i>	The new RedeliveryPolicy (p. 2250) that the ConnectionFactory should clone for Connections.
---------------	--

6.16.3.68 void activemq::core::ActiveMQConnection::setSendTimeout (unsigned int *timeout*)

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters

<i>timeout</i>	- The time to wait for a response.
----------------	------------------------------------

6.16.3.69 void activemq::core::ActiveMQConnection::setTransportInterruption-ProcessingComplete ()

Indicates that a Connection resource that is processing the transportInterrupted event has completed.

6.16.3.70 void activemq::core::ActiveMQConnection::setUseAsyncSend (bool *value*)

Sets the useAsyncSend option.

Parameters

<i>value</i>	- true to activate, false to disable.
--------------	---------------------------------------

6.16.3.71 void activemq::core::ActiveMQConnection::setUseCompression (bool *value*)

Sets whether Message body compression is enabled.

Parameters

<i>value</i>	Boolean indicating if Message body compression is enabled.
--------------	--

6.16.3.72 void activemq::core::ActiveMQConnection::setUsername (const std::string & *username*)

Sets the username that should be used when creating a new connection.

Parameters

<i>username</i>	string
-----------------	--------

6.16.3.73 void activemq::core::ActiveMQConnection::signalInterruption-ProcessingComplete () [protected]**6.16.3.74 virtual void activemq::core::ActiveMQConnection::start () [virtual]**

Starts the service.

Exceptions

<i>CMSException</i> (p. 826)	if an internal error occurs while starting.
--	---

Implements **cms::Startable** (p. 2534).

6.16.3.75 **virtual void activemq::core::ActiveMQConnection::stop ()** [virtual]

Stops this service.

Exceptions

<i>CMSException</i> (p. 826)	- if an internal error occurs while stopping the Service.
--	---

Implements **cms::Stoppable** (p. 2602).

6.16.3.76 **Pointer<commands::Response> activemq::core::ActiveMQConnection::syncRequest (Pointer< commands::Command > command, unsigned int timeout = 0)**

Sends a synchronous request and returns the response from the broker.

This method converts any error responses it receives into an exception.

Parameters

<i>command</i>	The Command object that is to be sent to the broker.
<i>timeout</i>	The time in milliseconds to wait for a response, default is zero or infinite.

Returns

a Pointer instance to the Response object sent from the Broker.

Exceptions

<i>BrokerException</i>	if the response from the broker is of type ExceptionResponse.
<i>ActiveMQException</i>	if any other error occurs while sending the Command.

6.16.3.77 **virtual void activemq::core::ActiveMQConnection::transportInterrupted ()** [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2812).

6.16.3.78 `virtual void activemq::core::ActiveMQConnection::transportResumed ()`
`[virtual]`

The transport has resumed after an interruption.

Implements `activemq::transport::TransportListener` (p. 2812).

6.16.3.79 `void activemq::core::ActiveMQConnection::waitFor-`
`TransportInterruptionProcessingToComplete ()`
`[protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQConnection.h`

6.17 activemq::core::ActiveMQConnectionFactory Class Reference

```
#include <src/main/activemq/core/ActiveMQConnectionFactory.h>
```

Inheritance diagram for `activemq::core::ActiveMQConnectionFactory`:

Public Member Functions

- **ActiveMQConnectionFactory** ()
- **ActiveMQConnectionFactory** (const std::string &uri, const std::string &username="", const std::string &password="")
Constructor.
- **ActiveMQConnectionFactory** (const **decaf::net::URI** &uri, const std::string &username="", const std::string &password="")
Constructor.
- virtual **~ActiveMQConnectionFactory** () throw ()
- virtual **cms::Connection** * **createConnection** ()
Creates a connection with the default user identity.
- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password)
Creates a connection with the specified user identity.
- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password, const std::string &clientId)
Creates a connection with the specified user identity.
- void **setUsername** (const std::string &username)
Sets the username that should be used when creating a new connection.
- const std::string & **getUsername** () const

- Gets the username that this factory will use when creating a new connection instance.*

 - void **setPassword** (const std::string &password)

Sets the password that should be used when creating a new connection.
- const std::string & **getPassword** () const

Gets the password that this factory will use when creating a new connection instance.
- std::string **getClientId** () const

Gets the Configured Client Id.
- void **setClientId** (const std::string &clientId)

Sets the Client Id.
- void **setBrokerURI** (const std::string &uri)

Sets the Broker URI that should be used when creating a new connection instance.
- void **setBrokerURI** (const decaf::net::URI &uri)

Sets the Broker URI that should be used when creating a new connection instance.
- const decaf::net::URI & **getBrokerURI** () const

Gets the Broker URI that this factory will use when creating a new connection instance.
- void **setExceptionHandler** (cms::ExceptionHandler *listener)

Set an CMS ExceptionListener that will be set on eat connection once it has been created.
- cms::ExceptionHandler * **getExceptionHandler** () const

Returns the currently set ExceptionListener that will be set on any new Connection instance that is created by this factory.
- void **setPrefetchPolicy** (PrefetchPolicy *policy)

*Sets the **PrefetchPolicy** (p. 2110) instance that this factory should use when it creates new Connection instances.*
- PrefetchPolicy * **getPrefetchPolicy** () const

*Gets the pointer to the current **PrefetchPolicy** (p. 2110) that is in use by this - ConnectionFactory.*
- void **setRedeliveryPolicy** (RedeliveryPolicy *policy)

*Sets the **RedeliveryPolicy** (p. 2250) instance that this factory should use when it creates new Connection instances.*
- RedeliveryPolicy * **getRedeliveryPolicy** () const

*Gets the pointer to the current **RedeliveryPolicy** (p. 2250) that is in use by this - ConnectionFactory.*
- bool **isDispatchAsync** () const
- void **setDispatchAsync** (bool value)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.
- bool **isAlwaysSyncSend** () const

Gets if the Connection should always send things Synchronously.
- void **setAlwaysSyncSend** (bool value)

Sets if the Connection should always send things Synchronously.
- bool **isUseAsyncSend** () const

Gets if the useAsyncSend option is set.
- void **setUseAsyncSend** (bool value)

Sets the useAsyncSend option.

- bool **isUseCompression** () const
Gets if the Connection is configured for Message body compression.
- void **setUseCompression** (bool value)
Sets whether Message body compression is enabled.
- void **setCompressionLevel** (int value)
Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.
- int **getCompressionLevel** () const
Gets the currently configured Compression level for Message bodies.
- unsigned int **getSendTimeout** () const
Gets the assigned send timeout for this Connector.
- void **setSendTimeout** (unsigned int timeout)
Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.
- unsigned int **getCloseTimeout** () const
Gets the assigned close timeout for this Connector.
- void **setCloseTimeout** (unsigned int timeout)
Sets the close timeout to use when sending the disconnect request.
- unsigned int **getProducerWindowSize** () const
Gets the configured producer window size for Producers that are created from this connector.
- void **setProducerWindowSize** (unsigned int windowSize)
Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.
- bool **isMessagePrioritySupported** () const
- void **setMessagePrioritySupported** (bool value)
Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Static Public Member Functions

- static **cms::Connection * createConnection** (const std::string &uri, const std::string &username, const std::string &password, const std::string &clientId="")
Creates a connection with the specified user identity.

Static Public Attributes

- static const std::string **DEFAULT_URI**

Protected Member Functions

- virtual **ActiveMQConnection** * **createActiveMQConnection** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)

Create a new **ActiveMQConnection** (p. 187) instance using the provided *Transport* and *Properties*.

6.17.1 Constructor & Destructor Documentation

6.17.1.1 **activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory** ()

6.17.1.2 **activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory** (const std::string & *uri*, const std::string & *username* = " ", const std::string & *password* = " ")

Constructor.

Parameters

<i>uri</i>	the URI of the Broker we are connecting to.
<i>username</i>	to authenticate with, defaults to ""
<i>password</i>	to authenticate with, defaults to ""

6.17.1.3 **activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory** (const **decaf::net::URI** & *uri*, const std::string & *username* = " ", const std::string & *password* = " ")

Constructor.

Parameters

<i>uri</i>	the URI of the Broker we are connecting to.
<i>username</i>	to authenticate with, defaults to ""
<i>password</i>	to authenticate with, defaults to ""

6.17.1.4 virtual **activemq::core::ActiveMQConnectionFactory::~~ActiveMQConnectionFactory** () throw () [virtual]

6.17.2 Member Function Documentation

6.17.2.1 `virtual ActiveMQConnection* activemq::core::ActiveMQConnectionFactory::createActiveMQConnection (const Pointer< transport::Transport > & transport, const Pointer< decaf::util::Properties > & properties)` [protected, virtual]

Create a new **ActiveMQConnection** (p. 187) instance using the provided Transport and Properties.

Subclasses can override this to control the actual type of **ActiveMQConnection** (p. 187) that is created.

Parameters

<i>transport</i>	The Transport that the Connection should use to communicate with the Broker.
<i>properties</i>	The Properties that are assigned to the new Connection instance.

Returns

a new **ActiveMQConnection** (p. 187) pointer instance.

Reimplemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 435).

6.17.2.2 `virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection ()` [virtual]

Creates a connection with the default user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Returns

a Connection Pointer

Exceptions

<i>CMSException</i>	
---------------------	--

Implements **cms::ConnectionFactory** (p. 957).

6.17.2.3 `virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & username, const std::string & password)` [virtual]

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values

passed here do not change the defaults, subsequent calls to the parameterless create-Connection will continue to use the default values that were set in the Constructor.

Parameters

<i>username</i>	to authenticate with
<i>password</i>	to authenticate with

Returns

a Connection Pointer

Exceptions

<i>CMSException</i>	
---------------------	--

Implements **cms::ConnectionFactory** (p. 957).

6.17.2.4 `virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & username, const std::string & password, const std::string & clientId) [virtual]`

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless create-Connection will continue to use the default values that were set in the Constructor.

Parameters

<i>username</i>	to authenticate with
<i>password</i>	to authenticate with
<i>clientId</i>	to assign to connection if "" then a random client Id is created for this connection.

Returns

a Connection Pointer

Exceptions

<i>CMSException</i>	
---------------------	--

Implements **cms::ConnectionFactory** (p. 958).

6.17.2.5 `static cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & uri, const std::string & username, const std::string & password, const std::string & clientId = " ") [static]`

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Parameters

<i>uri</i>	The URI of the Broker we are connecting to.
<i>username</i>	The name of the user to authenticate with.
<i>password</i>	The password for the user to authenticate with.
<i>clientId</i>	The unique client id to assign to connection, defaults to "".

Exceptions

<i>CMSException.</i>	
----------------------	--

6.17.2.6 `const decaf::net::URI& activemq::core::ActiveMQConnectionFactory::getBrokerURI () const`

Gets the Broker URI that this factory will use when creating a new connection instance.

Returns

brokerURI string

6.17.2.7 `std::string activemq::core::ActiveMQConnectionFactory::getClientId () const`

Gets the Configured Client Id.

Returns

the clientId.

6.17.2.8 `unsigned int activemq::core::ActiveMQConnectionFactory::getCloseTimeout () const`

Gets the assigned close timeout for this Connector.

Returns

the close timeout configured in the connection uri

6.17.2.9 `int activemq::core::ActiveMQConnectionFactory::getCompressionLevel () const`

Gets the currently configured Compression level for Message bodies.

Returns

the int value of the current compression level.

6.17.2.10 `cms::ExceptionListener* activemq::core::ActiveMQConnectionFactory::getExceptionListener () const`

Returns the currently set ExceptionListener that will be set on any new Connection instance that is created by this factory.

Returns

a pointer to a CMS ExceptionListener instance or NULL if not set.

6.17.2.11 `const std::string& activemq::core::ActiveMQConnectionFactory::getPassword () const`

Gets the password that this factory will use when creating a new connection instance.

Returns

password string, "" for default credentials

6.17.2.12 `PrefetchPolicy* activemq::core::ActiveMQConnectionFactory::getPrefetchPolicy () const`

Gets the pointer to the current **PrefetchPolicy** (p.2110) that is in use by this - ConnectionFactory.

Returns

a pointer to this objects **PrefetchPolicy** (p. 2110).

6.17.2.13 `unsigned int activemq::core::ActiveMQConnectionFactory::getProducerWindowSize () const`

Gets the configured producer window size for Producers that are created from this connector.

This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.17.2.14 RedeliveryPolicy* activemq::core::ActiveMQConnectionFactory::getRedeliveryPolicy () const

Gets the pointer to the current **RedeliveryPolicy** (p.2250) that is in use by this - ConnectionFactory.

Returns

a pointer to this objects **RedeliveryPolicy** (p. 2250).

6.17.2.15 unsigned int activemq::core::ActiveMQConnectionFactory::getSendTimeout () const

Gets the assigned send timeout for this Connector.

Returns

the send timeout configured in the connection uri

6.17.2.16 const std::string& activemq::core::ActiveMQConnectionFactory::getUsername () const

Gets the username that this factory will use when creating a new connection instance.

Returns

username string, "" for default credentials

6.17.2.17 bool activemq::core::ActiveMQConnectionFactory::isAlwaysSyncSend () const

Gets if the Connection should always send things Synchronously.

Returns

true if sends should always be Synchronous.

6.17.2.18 **bool activemq::core::ActiveMQConnectionFactory::isDispatchAsync ()**
const

Returns

The value of the dispatch asynchronously option sent to the broker.

6.17.2.19 **bool activemq::core::ActiveMQConnectionFactory::isMessagePriority-Supported ()** const

Returns

true if the Connections that this factory creates should support the message based priority settings.

6.17.2.20 **bool activemq::core::ActiveMQConnectionFactory::isUseAsyncSend ()**
const

Gets if the useAsyncSend option is set.

Returns

true if on false if not.

6.17.2.21 **bool activemq::core::ActiveMQConnectionFactory::isUseCompression ()** const

Gets if the Connection is configured for Message body compression.

Returns

if the Message body will be Compressed or not.

6.17.2.22 **void activemq::core::ActiveMQConnectionFactory::setAlwaysSyncSend (bool value)**

Sets if the Connection should always send things Synchronously.

Parameters

<i>value</i>	true if sends should always be Synchronous.
--------------	---

6.17.2.23 `void activemq::core::ActiveMQConnectionFactory::setBrokerURI (const std::string & uri)`

Sets the Broker URI that should be used when creating a new connection instance.

Parameters

<i>brokerURI</i>	The string form of the Broker URI, this will be converted to a URI object.
------------------	--

6.17.2.24 `void activemq::core::ActiveMQConnectionFactory::setBrokerURI (const decaf::net::URI & uri)`

Sets the Broker URI that should be used when creating a new connection instance.

Parameters

<i>brokerURI</i>	The URI of the broker that this client will connect to.
------------------	---

6.17.2.25 `void activemq::core::ActiveMQConnectionFactory::setClientId (const std::string & clientId)`

Sets the Client Id.

Parameters

<i>clientId</i>	- The new clientId value.
-----------------	---------------------------

6.17.2.26 `void activemq::core::ActiveMQConnectionFactory::setCloseTimeout (unsigned int timeout)`

Sets the close timeout to use when sending the disconnect request.

Parameters

<i>timeout</i>	- The time to wait for a close message.
----------------	---

6.17.2.27 `void activemq::core::ActiveMQConnectionFactory::setCompressionLevel (int value)`

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

The range of compression levels is [0..9] where 0 indicates best speed and 9 indicates best compression.

Parameters

<i>value</i>	A signed int value that controls the compression level.
--------------	---

6.17.2.28 `void activemq::core::ActiveMQConnectionFactory::setDispatchAsync (bool value)`

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

For slow consumers set it to true so that dispatching will not block fast consumers. .

Parameters

<i>value</i>	The value of the dispatch asynchronously option sent to the broker.
--------------	---

6.17.2.29 `void activemq::core::ActiveMQConnectionFactory::set-ExceptionListener (cms::ExceptionListener * listener)`

Set an CMS ExceptionListener that will be set on eat connection once it has been created.

The factory does not take ownership of this pointer, the client must ensure that its lifetime is scoped to the connection that it is applied to.

Parameters

<i>listener</i>	The listener to set on the connection or NULL for no listener.
-----------------	--

6.17.2.30 `void activemq::core::ActiveMQConnectionFactory::setMessagePriority-Supported (bool value)`

Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Parameters

<i>value</i>	Boolean indicating if Message priority should be enabled.
--------------	---

6.17.2.31 `void activemq::core::ActiveMQConnectionFactory::setPassword (const std::string & password)`

Sets the password that should be used when creating a new connection.

Parameters

<i>password</i>	string
-----------------	--------

6.17.2.32 void activemq::core::ActiveMQConnectionFactory::setPrefetchPolicy (PrefetchPolicy * policy)

Sets the **PrefetchPolicy** (p. 2110) instance that this factory should use when it creates new Connection instances.

The **PrefetchPolicy** (p. 2110) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

<i>policy</i>	The new PrefetchPolicy (p. 2110) that the ConnectionFactory should clone for Connections.
---------------	--

6.17.2.33 void activemq::core::ActiveMQConnectionFactory::setProducerWindowSize (unsigned int windowSize)

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters

<i>windowSize</i>	- The size in bytes of the Producers memory window.
-------------------	---

6.17.2.34 void activemq::core::ActiveMQConnectionFactory::setRedeliveryPolicy (RedeliveryPolicy * policy)

Sets the **RedeliveryPolicy** (p. 2250) instance that this factory should use when it creates new Connection instances.

The **RedeliveryPolicy** (p. 2250) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

<i>policy</i>	The new RedeliveryPolicy (p. 2250) that the ConnectionFactory should clone for Connections.
---------------	--

6.17.2.35 `void activemq::core::ActiveMQConnectionFactory::setSendTimeout (unsigned int timeout)`

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters

<i>timeout</i>	- The time to wait for a response.
----------------	------------------------------------

6.17.2.36 `void activemq::core::ActiveMQConnectionFactory::setUseAsyncSend (bool value)`

Sets the useAsyncSend option.

Parameters

<i>value</i>	- true to activate, false to disable.
--------------	---------------------------------------

6.17.2.37 `void activemq::core::ActiveMQConnectionFactory::setUseCompression (bool value)`

Sets whether Message body compression is enabled.

Parameters

<i>value</i>	Boolean indicating if Message body compression is enabled.
--------------	--

6.17.2.38 `void activemq::core::ActiveMQConnectionFactory::setUsername (const std::string & username)`

Sets the username that should be used when creating a new connection.

Parameters

<i>username</i>	string
-----------------	--------

6.17.3 Field Documentation

6.17.3.1 `const std::string activemq::core::ActiveMQConnectionFactory::DEFAULT_URI [static]`

The documentation for this class was generated from the following file:

6.18 activemq::core::ActiveMQConnectionMetaData Class - Reference

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 187) class.

```
#include <src/main/activemq/core/ActiveMQConnectionMeta-Data.h>
```

Inheritance diagram for `activemq::core::ActiveMQConnectionMetaData`:

Public Member Functions

- **ActiveMQConnectionMetaData** ()
- virtual **~ActiveMQConnectionMetaData** () throw ()
- virtual std::string **getCMSVersion** () const
Gets the CMS API version.
- virtual int **getCMSMajorVersion** () const
Gets the CMS major version number.
- virtual int **getCMSMinorVersion** () const
Gets the CMS minor version number.
- virtual std::string **getCMSProviderName** () const
Gets the CMS provider name.
- virtual std::string **getProviderVersion** () const
Gets the CMS provider version.
- virtual int **getProviderMajorVersion** () const
Gets the CMS provider major version number.
- virtual int **getProviderMinorVersion** () const
Gets the CMS provider minor version number.
- virtual std::vector< std::string > **getCMSXPropertyNames** () const
Gets an Vector of the CMSX property names.

6.18.1 Detailed Description

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 187) class.

Since

3.0

6.18.2 Constructor & Destructor Documentation

6.18.2.1 `activemq::core::ActiveMQConnectionMetaData::ActiveMQConnectionMetaData ()`

6.18.2.2 `virtual activemq::core::ActiveMQConnectionMetaData::~ActiveMQConnectionMetaData () throw ()`
[virtual]

6.18.3 Member Function Documentation

6.18.3.1 `virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMajorVersion () const` [virtual]

Gets the CMS major version number.

Returns

the CMS API major version number

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements `cms::ConnectionMetaData` (p. 979).

6.18.3.2 `virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMinorVersion () const` [virtual]

Gets the CMS minor version number.

Returns

the CMS API minor version number

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements `cms::ConnectionMetaData` (p. 979).

6.18.3.3 `virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSProviderName () const` [virtual]

Gets the CMS provider name.

Returns

the CMS provider name

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements **cms::ConnectionMetaData** (p. 980).

6.18.3.4 `virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSVersion () const [virtual]`

Gets the CMS API version.

Returns

the CMS API Version in String form.

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements **cms::ConnectionMetaData** (p. 980).

6.18.3.5 `virtual std::vector<std::string> activemq::core::ActiveMQConnectionMetaData::getCMSXPropertyNames () const [virtual]`

Gets an Vector of the CMSX property names.

Returns

an Vector of CMSX property names

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements **cms::ConnectionMetaData** (p. 980).

6.18.3.6 `virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMajorVersion () const` [virtual]

Gets the CMS provider major version number.

Returns

the CMS provider major version number

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements **cms::ConnectionMetaData** (p. 981).

6.18.3.7 `virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMinorVersion () const` [virtual]

Gets the CMS provider minor version number.

Returns

the CMS provider minor version number

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements **cms::ConnectionMetaData** (p. 981).

6.18.3.8 `virtual std::string activemq::core::ActiveMQConnectionMetaData::getProviderVersion () const` [virtual]

Gets the CMS provider version.

Returns

the CMS provider version

Exceptions

<i>CMSException</i>	If the CMS Provider fails to retrieve the metadata due to some internal error.
---------------------	--

Implements **cms::ConnectionMetaData** (p. 981).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConnectionMetaData.h**

6.19 activemq::core::ActiveMQConstants Class Reference

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back and forth between string and enum values.

```
#include <src/main/activemq/core/ActiveMQConstants.h>
```

Data Structures

- class **StaticInitializer**

Public Types

- enum **TransactionState** { TRANSACTION_STATE_BEGIN = 0, TRANSACTION_STATE_PREPARE = 1, TRANSACTION_STATE_COMMITONEPHASE = 2, TRANSACTION_STATE_COMMITTWO PHASE = 3, TRANSACTION_STATE_ROLLBACK = 4, TRANSACTION_STATE_RECOVER = 5, TRANSACTION_STATE_FORGET = 6, TRANSACTION_STATE_END = 7 }
- enum **DestinationActions** { DESTINATION_ADD_OPERATION = 0, DESTINATION_REMOVE_OPERATION = 1 }
- enum **AckType** { ACK_TYPE_DELIVERED = 0, ACK_TYPE_POISON = 1, ACK_TYPE_CONSUMED = 2, ACK_TYPE_REDELIVERED = 3, ACK_TYPE_INDIVIDUAL = 4 }
- enum **DestinationOption** { CONSUMER_PREFETCHSIZE, CONSUMER_MAXPENDINGMSGLIMIT, CONSUMER_NOLOCAL, CONSUMER_DISPATCHASYNC, CONSUMER_RETROACTIVE, CONSUMER_SELECTOR, CONSUMER_EXCLUSIVE, CONSUMER_PRIORITY, NUM_OPTIONS }

These values represent the options that can be appended to an Destination name, i.e.

- enum **URIParam** { CONNECTION_SENDTIMEOUT, CONNECTION_PRODUCERWINDOWSIZE, CONNECTION_CLOSETIMEOUT, CONNECTION_ALWAYSSEND, CONNECTION_USEASYNCSEND, CONNECTION_USECOMPRESSION, CONNECTION_DISPATCHASYNC, PARAM_USERNAME, PARAM_PASSWORD, PARAM_CLIENTID, NUM_PARAMS }

These values represent the parameters that can be added to the connection URI that affect the ActiveMQ Core API.

Static Public Member Functions

- static const std::string & **toString** (const **DestinationOption** option)
- static **DestinationOption** **toDestinationOption** (const std::string &option)

- static const std::string & **toString** (const **URIParam** option)
- static **URIParam toURIOption** (const std::string &option)

6.19.1 Detailed Description

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back and forth between string and enum values.

6.19.2 Member Enumeration Documentation

6.19.2.1 enum activemq::core::ActiveMQConstants::AckType

Enumerator:

ACK_TYPE_DELIVERED
ACK_TYPE_POISON
ACK_TYPE_CONSUMED
ACK_TYPE_REDELIVERED
ACK_TYPE_INDIVIDUAL

6.19.2.2 enum activemq::core::ActiveMQConstants::DestinationActions

Enumerator:

DESTINATION_ADD_OPERATION
DESTINATION_REMOVE_OPERATION

6.19.2.3 enum activemq::core::ActiveMQConstants::DestinationOption

These values represent the options that can be appended to an Destination name, i.e.

/topic/foo?consumer.exclusive=true

Enumerator:

CONSUMER_PREFETCHSIZE
CUNSUMER_MAXPENDINGMSGLIMIT
CONSUMER_NOLOCAL
CONSUMER_DISPATCHASYNC
CONSUMER_RETROACTIVE
CONSUMER_SELECTOR
CONSUMER_EXCLUSIVE
CONSUMER_PRIORITY
NUM_OPTIONS

6.19.2.4 enum activemq::core::ActiveMQConstants::TransactionState

Enumerator:

TRANSACTION_STATE_BEGIN
TRANSACTION_STATE_PREPARE
TRANSACTION_STATE_COMMITONEPHASE
TRANSACTION_STATE_COMMITTWOPHASE
TRANSACTION_STATE_ROLLBACK
TRANSACTION_STATE_RECOVER
TRANSACTION_STATE_FORGET
TRANSACTION_STATE_END

6.19.2.5 enum activemq::core::ActiveMQConstants::URIParam

These values represent the parameters that can be added to the connection URI that affect the ActiveMQ Core API.

Enumerator:

CONNECTION_SENDTIMEOUT
CONNECTION_PRODUCERWINDOWSIZE
CONNECTION_CLOSETIMEOUT
CONNECTION_ALWAYSASYNCSEND
CONNECTION_USEASYNCSEND
CONNECTION_USECOMPRESSION
CONNECTION_DISPATCHASYNC
PARAM_USERNAME
PARAM_PASSWORD
PARAM_CLIENTID
NUM_PARAMS

6.19.3 Member Function Documentation

6.20 activemq::core::ActiveMQConsumer Class Reference

```
#include <src/main/activemq/core/ActiveMQConsumer.h>
```

Inheritance diagram for `activemq::core::ActiveMQConsumer`:

Public Member Functions

- **ActiveMQConsumer** (**ActiveMQSession** *session, const **Pointer**< **commands::ConsumerId** > &id, const **Pointer**< **commands::ActiveMQDestination** > &destination, const std::string &name, const std::string &selector, int prefetch, int maxPendingMessageCount, bool noLocal, bool browser, bool dispatchAsync, **cms::MessageListener** *listener)
Constructor.
- virtual **~ActiveMQConsumer** () throw ()
- virtual void **start** ()
Starts the service.
- virtual void **stop** ()
Stops this service.
- virtual void **close** ()
Closes this object and deallocates the appropriate resources.
- virtual **cms::Message** * **receive** ()
Synchronously Receive a Message.
- virtual **cms::Message** * **receive** (int millisecs)
Synchronously Receive a Message, time out after defined interval.
- virtual **cms::Message** * **receiveNoWait** ()
Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void **setMessageListener** (**cms::MessageListener** *listener)
Sets the MessageListener that this class will send notifs on.
- virtual **cms::MessageListener** * **getMessageListener** () const
Gets the MessageListener that this class will send mew Message notification events to.
- virtual std::string **getMessageSelector** () const
Gets this message consumer's message selector expression.

- virtual void **acknowledge** (const **Pointer**< **commands::MessageDispatch** > &**dispatch**)
- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)
Dispatches a message to a particular consumer.
- void **acknowledge** ()
Method called to acknowledge all messages that have been received so far.
- void **commit** ()
Called to Commit the current set of messages in this Transaction.
- void **rollback** ()
Called to Roll back the current set of messages in this Transaction.
- void **doClose** ()
Performs the actual close operation on this consumer.
- void **dispose** ()
Cleans up this objects internal resources.
- const **Pointer** < **commands::ConsumerInfo** > &**getConsumerInfo** () const
Get the Consumer information for this consumer.
- const **Pointer** < **commands::ConsumerId** > &**getConsumerId** () const
Get the Consumer Id for this consumer.
- bool **isClosed** () const
- bool **isSynchronizationRegistered** () const
*Has this Consumer Transaction **Synchronization** (p. 2654) been added to the transaction.*
- void **setSynchronizationRegistered** (bool value)
*Sets the **Synchronization** (p. 2654) Registered state of this consumer.*
- bool **iterate** ()
Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.
- void **deliverAcks** ()
Forces this consumer to send all pending acks to the broker.
- void **clearMessagesInProgress** ()
Called on a Failover to clear any pending messages.
- void **inProgressClearRequired** ()
Signals that a Failure occurred and that anything in-progress in the consumer should be cleared.
- long long **getLastDeliveredSequenceId** () const
Gets the currently set Last Delivered Sequence Id.
- void **setLastDeliveredSequenceId** (long long value)
Sets the value of the Last Delivered Sequence Id.
- int **getMessageAvailableCount** () const
- void **setRedeliveryPolicy** (**RedeliveryPolicy** *policy)
*Sets the **RedeliveryPolicy** (p. 2250) this Consumer should use when a rollback is performed on a transacted Consumer.*
- **RedeliveryPolicy** * **getRedeliveryPolicy** () const

Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

- void **setFailureError** (**decaf::lang::Exception** *error)

Sets the Exception that has caused this Consumer to be in a failed state.

- **decaf::lang::Exception** * **getFailureError** () const

Gets the error that caused this Consumer to be in a Failed state, or NULL if there is no Error.

Protected Member Functions

- **Pointer< MessageDispatch > dequeue** (long long timeout)

Used by synchronous receive methods to wait for messages to come in.

- void **beforeMessagesConsumed** (const **Pointer< commands::MessageDispatch > &dispatch**)

Pre-consume processing.

- void **afterMessagesConsumed** (const **Pointer< commands::MessageDispatch > &dispatch**, bool messageExpired)

Post-consume processing.

6.20.1 Constructor & Destructor Documentation

- 6.20.1.1 **activemq::core::ActiveMQConsumer::ActiveMQConsumer** (**ActiveMQSession** * session, const **Pointer< commands::ConsumerId > &id**, const **Pointer< commands::ActiveMQDestination > &destination**, const std::string & name, const std::string & selector, int prefetch, int maxPendingMessageCount, bool noLocal, bool browser, bool dispatchAsync, cms::MessageListener * listener)

Constructor.

- 6.20.1.2 **virtual activemq::core::ActiveMQConsumer::~~ActiveMQConsumer** ()
throw () [virtual]

6.20.2 Member Function Documentation

- 6.20.2.1 **virtual void activemq::core::ActiveMQConsumer::acknowledge** (const **Pointer< commands::MessageDispatch > &dispatch**) [virtual]

- 6.20.2.2 **void activemq::core::ActiveMQConsumer::acknowledge** ()

Method called to acknowledge all messages that have been received so far.

Exceptions

CMSException	if an error occurs while ack'ing the message.
---------------------	---

6.20.2.3 `void activemq::core::ActiveMQConsumer::afterMessagesConsumed
(const Pointer< commands::MessageDispatch > & dispatch, bool
messageExpired) [protected]`

Post-consume processing.

Parameters

<i>dispatch</i>	- the consumed message
<i>message-Expired</i>	- flag indicating if the message has expired.

6.20.2.4 `void activemq::core::ActiveMQConsumer::beforeMessagesConsumed
(const Pointer< commands::MessageDispatch > & dispatch)
[protected]`

Pre-consume processing.

Parameters

<i>dispatch</i>	- the message being consumed.
-----------------	-------------------------------

6.20.2.5 `void activemq::core::ActiveMQConsumer::clearMessagesInProgress ()`

Called on a Failover to clear any pending messages.

6.20.2.6 `virtual void activemq::core::ActiveMQConsumer::close () [virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>CMSException</i>	- If an error occurs while the resource is being closed.
---------------------	--

Implements **cms::Closeable** (p. 816).

6.20.2.7 `void activemq::core::ActiveMQConsumer::commit ()`

Called to Commit the current set of messages in this Transaction.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing the operation.
--------------------------	--

6.20.2.8 void activemq::core::ActiveMQConsumer::deliverAcks ()

Forces this consumer to send all pending acks to the broker.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing the operation.
--------------------------	--

6.20.2.9 Pointer<MessageDispatch> activemq::core::ActiveMQConsumer::dequeue (long long timeout) [protected]

Used by synchronous receive methods to wait for messages to come in.

Parameters

<i>timeout</i>	- The maximum number of milliseconds to wait before returning.
----------------	--

If -1, it will block until a messages is received or this consumer is closed. If 0, will not block at all. If > 0, will wait at a maximum the specified number of milliseconds before returning.

Returns

the message, if received within the allotted time. Otherwise NULL.

Exceptions

<i>InvalidStateException</i>	if this consumer is closed upon entering this method.
------------------------------	---

6.20.2.10 virtual void activemq::core::ActiveMQConsumer::dispatch (const Pointer< MessageDispatch > & message) [virtual]

Dispatches a message to a particular consumer.

Parameters

<i>message</i>	The message to be dispatched to a waiting consumer.
----------------	---

Implements **activemq::core::Dispatcher** (p. 1235).

6.20.2.11 void activemq::core::ActiveMQConsumer::dispose ()

Cleans up this objects internal resources.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing the operation.
--------------------------	--

6.20.2.12 void **activemq::core::ActiveMQConsumer::doClose** ()

Performs the actual close operation on this consumer.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing the operation.
--------------------------	--

6.20.2.13 const **Pointer<commands::ConsumerId>& activemq-
::core::ActiveMQConsumer::getConsumerId** ()
const

Get the Consumer Id for this consumer.

Returns

Reference to a Consumer Id Object

6.20.2.14 const **Pointer<commands::ConsumerInfo>& activemq-
::core::ActiveMQConsumer::getConsumerInfo** ()
const

Get the Consumer information for this consumer.

Returns

Reference to a Consumer Info Object

6.20.2.15 **decaf::lang::Exception* activemq::core::ActiveMQConsumer::get-
FailureError** () const

Gets the error that caused this Consumer to be in a Failed state, or NULL if there is no Error.

Returns

pointer to the error that faulted this Consumer or NULL.

6.20.2.16 `long long activemq::core::ActiveMQConsumer::getLastDeliveredSequenceId () const`

Gets the currently set Last Delivered Sequence Id.

Returns

long long containing the sequence id of the last delivered Message.

6.20.2.17 `int activemq::core::ActiveMQConsumer::getMessageAvailableCount () const`

Returns

the number of Message's this consumer is waiting to Dispatch.

6.20.2.18 `virtual cms::MessageListener* activemq::core::ActiveMQConsumer::getMessageListener () const [virtual]`

Gets the MessageListener that this class will send new Message notification events to.

Returns

The listener of messages received by this consumer

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1878).

6.20.2.19 `virtual std::string activemq::core::ActiveMQConsumer::getMessageSelector () const [virtual]`

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1878).

6.20.2.20 RedeliveryPolicy* activemq::core::ActiveMQConsumer::getRedeliveryPolicy () const

Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

Returns

a Pointer to a **RedeliveryPolicy** (p. 2250) that is in use by this Consumer.

6.20.2.21 void activemq::core::ActiveMQConsumer::inProgressClearRequired ()

Signals that a Failure occurred and that anything in-progress in the consumer should be cleared.

6.20.2.22 bool activemq::core::ActiveMQConsumer::isClosed () const**Returns**

if this Consumer has been closed.

6.20.2.23 bool activemq::core::ActiveMQConsumer::isSynchronizationRegistered () const

Has this Consumer Transaction **Synchronization** (p. 2654) been added to the transaction.

Returns

true if the synchronization has been added.

6.20.2.24 bool activemq::core::ActiveMQConsumer::iterate ()

Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.

**6.20.2.25 virtual cms::Message* activemq::core::ActiveMQConsumer::receive ()
[virtual]**

Synchronously Receive a Message.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1879).

6.20.2.26 `virtual cms::Message* activemq::core::ActiveMQConsumer::receive (int
milliseconds) [virtual]`

Synchronously Receive a Message, time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1879).

6.20.2.27 `virtual cms::Message* activemq::core::ActiveMQConsumer::receiveNo-
Wait () [virtual]`

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1880).

6.20.2.28 `void activemq::core::ActiveMQConsumer::rollback ()`

Called to Roll back the current set of messages in this Transaction.

Exceptions

<i>ActiveMQException</i>	if an error occurs while performing the operation.
--------------------------	--

6.20.2.29 void **activemq::core::ActiveMQConsumer::setFailureError** (
 decaf::lang::Exception * error)

Sets the Exception that has caused this Consumer to be in a failed state.

Parameters

<i>error</i>	The error that is to be thrown when a Receive call is made.
--------------	---

6.20.2.30 void **activemq::core::ActiveMQConsumer::setLastDeliveredSequenceId** (
 long long value)

Sets the value of the Last Delivered Sequence Id.

Parameters

<i>value</i>	The new value to assign to the Last Delivered Sequence Id property.
--------------	---

6.20.2.31 virtual void **activemq::core::ActiveMQConsumer::setMessageListener** (
 cms::MessageListener * listener) [virtual]

Sets the MessageListener that this class will send notifs on.

Parameters

<i>listener</i>	The listener of messages received by this consumer.
-----------------	---

Exceptions

<i>CMSException</i>	- If an internal error occurs.
---------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1880).

6.20.2.32 void **activemq::core::ActiveMQConsumer::setRedeliveryPolicy** (
 RedeliveryPolicy * policy)

Sets the **RedeliveryPolicy** (p. 2250) this Consumer should use when a rollback is performed on a transacted Consumer.

The Consumer takes ownership of the passed pointer. The Consumer's redelivery policy can never be null, a call to this method with a NULL pointer is ignored.

Parameters

<i>policy</i>	Pointer to a Redelivery Policy object that his Consumer will use.
---------------	---

6.20.2.33 `void activemq::core::ActiveMQConsumer::setSynchronization-Registered (bool value)`

Sets the **Synchronization** (p. 2654) Registered state of this consumer.

Parameters

<i>value</i>	- true if registered false otherwise.
--------------	---------------------------------------

6.20.2.34 `virtual void activemq::core::ActiveMQConsumer::start () [virtual]`

Starts the service.

Exceptions

<i>CMSEException</i>	if an internal error occurs while starting.
----------------------	---

Implements **cms::Startable** (p. 2534).

6.20.2.35 `virtual void activemq::core::ActiveMQConsumer::stop () [virtual]`

Stops this service.

Exceptions

<i>CMSEException</i>	- if an internal error occurs while stopping the Service.
----------------------	---

Implements **cms::Stoppable** (p. 2602).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQConsumer.h`

6.21 `activemq::library::ActiveMQCPP` Class Reference

```
#include <src/main/activemq/library/ActiveMQCPP.h>
```

Public Member Functions

- `virtual ~ActiveMQCPP ()`

Static Public Member Functions

- `static void initializeLibrary ()`

Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal - Registry objects and initialize the Decaf library.

- static void **initializeLibrary** (int argc, char **argv)

Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf library.

- static void **shutdownLibrary** ()

Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point.

Protected Member Functions

- **ActiveMQCPP** ()
- **ActiveMQCPP** (const **ActiveMQCPP** &)
- **ActiveMQCPP** & **operator=** (const **ActiveMQCPP** &)

6.21.1 Constructor & Destructor Documentation

6.21.1.1 **activemq::library::ActiveMQCPP::ActiveMQCPP** () [inline, protected]

6.21.1.2 **activemq::library::ActiveMQCPP::ActiveMQCPP** (const **ActiveMQCPP** &) [protected]

6.21.1.3 **virtual activemq::library::ActiveMQCPP::~~ActiveMQCPP** () [inline, virtual]

6.21.2 Member Function Documentation

6.21.2.1 **static void activemq::library::ActiveMQCPP::initializeLibrary** () [static]

Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal - Registry objects and initialize the Decaf library.

Exceptions

<i>runtime_error</i>	if an error occurs while initializing this library.
----------------------	---

6.21.2.2 **static void activemq::library::ActiveMQCPP::initializeLibrary** (int argc, char ** argv) [static]

Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf library.

This method takes the args passed to the main method of process for use is setting system properties and configuring the ActiveMQ-CPP Library.

Parameters

<i>argc</i>	- the count of arguments passed to this Process.
<i>argv</i>	- the array of string arguments passed to this process.

Exceptions

<i>runtime_error</i>	if an error occurs while initializing this library.
----------------------	---

6.21.2.3 **ActiveMQCPP& activemq::library::ActiveMQCPP::operator= (const ActiveMQCPP &)** *[protected]*

6.21.2.4 **static void activemq::library::ActiveMQCPP::shutdownLibrary ()** *[static]*

Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point.

All the user created ActiveMQ-CPP objects and Decaf Library objects should have been destroyed by the time this method is called.

The documentation for this class was generated from the following file:

6.22.1 Constructor & Destructor Documentation

6.22.1.1 `activemq::commands::ActiveMQDestination::ActiveMQDestination ()`

6.22.1.2 `activemq::commands::ActiveMQDestination::ActiveMQDestination (const std::string & physicalName)`

6.22.1.3 `virtual activemq::commands::ActiveMQDestination::~~ActiveMQDestination () throw ()` `[virtual]`

6.22.2 Member Function Documentation

6.22.2.1 `virtual ActiveMQDestination* activemq::commands::ActiveMQDestination::cloneDataStructure () const` `[inline, virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1133).

Reimplemented in `activemq::commands::ActiveMQTempDestination` (p. 380), `activemq::commands::ActiveMQQueue` (p. 322), `activemq::commands::ActiveMQTopic` (p. 416), `activemq::commands::ActiveMQTempQueue` (p. 388), and `activemq::commands::ActiveMQTempTopic` (p. 397).

6.22.2.2 `virtual void activemq::commands::ActiveMQDestination::copyDataStructure (const DataStructure * src)` `[virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1134).

Reimplemented in `activemq::commands::ActiveMQTempDestination` (p. 380), `activemq::commands::ActiveMQQueue` (p. 323), `activemq::commands::ActiveMQTopic` (p. 416), `activemq::commands::ActiveMQTempQueue` (p. 388), and `activemq::commands::ActiveMQTempTopic` (p. 398).

Referenced by `activemq::commands::ActiveMQTempDestination::copyDataStructure()`.

6.22.2.3 `static Pointer<ActiveMQDestination> activemq::commands::ActiveMQDestination::createDestination (int type, const std::string & name)`
`[static]`

Creates a Destination given the String Name to use and a Type.

Parameters

<i>type</i>	- The Type of Destination to Create
<i>name</i>	- The Name to use in the creation of the Destination

Returns

Pointer to a new **ActiveMQDestination** (p. 246) instance.

6.22.2.4 `static std::string activemq::commands::ActiveMQDestination::createTemporaryName (const std::string & clientId)` `[inline, static]`

Create a temporary name from the clientId.

Parameters

<i>clientId</i>	
-----------------	--

Returns

6.22.2.5 `virtual bool activemq::commands::ActiveMQDestination::equals (const DataStructure * value) const` `[virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 1135).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 381), **activemq::commands::ActiveMQQueue** (p. 323), **activemq::commands::ActiveMQTopic** (p. 416), **activemq::commands::ActiveMQTempQueue** (p. 389), and **activemq::commands::ActiveMQTempTopic** (p. 398).

Referenced by `activemq::commands::ActiveMQTempDestination::equals()`.

6.22.2.6 `static std::string activemq::commands::ActiveMQDestination::getClientId (const ActiveMQDestination * destination) [static]`

From a temporary destination find the clientId of the Connection that created it.

Parameters

<i>destination</i>	
--------------------	--

Returns

the clientId or null if not a temporary destination

6.22.2.7 `virtual const cms::Destination* activemq::commands::ActiveMQDestination::getCMSDestination () const [inline, virtual]`

Returns

the **cms::Destination** (p. 1210) interface pointer that the objects that derive from this class implement.

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 324), **activemq::commands::ActiveMQTopic** (p. 417), **activemq::commands::ActiveMQTempQueue** (p. 389), and **activemq::commands::ActiveMQTempTopic** (p. 399).

6.22.2.8 `virtual unsigned char activemq::commands::ActiveMQDestination::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 381), **activemq::commands::ActiveMQQueue** (p. 324), **activemq::commands::ActiveMQTopic** (p. 417), **activemq::commands::ActiveMQTempQueue** (p. 390), and **activemq::commands::ActiveMQTempTopic** (p. 399).

6.22.2.9 `virtual cms::Destination::DestinationType activemq::commands::ActiveMQDestination::getDestinationType () const [pure virtual]`

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implemented in `activemq::commands::ActiveMQQueue` (p. 325), `activemq::commands::ActiveMQTopic` (p. 418), `activemq::commands::ActiveMQTempQueue` (p. 390), and `activemq::commands::ActiveMQTempTopic` (p. 400).

6.22.2.10 `const activemq::util::ActiveMQProperties& activemq::commands::ActiveMQDestination::getOptions () const` `[inline]`

Returns

a reference (const) to the options properties for this Destination.

6.22.2.11 `virtual std::string activemq::commands::ActiveMQDestination::getOrderedTarget () const` `[inline, virtual]`

Returns

Returns the orderedTarget.

6.22.2.12 `virtual const std::string& activemq::commands::ActiveMQDestination::getPhysicalName () const` `[inline, virtual]`

Fetch this destination's physical name.

Returns

const string containing the name

6.22.2.13 `virtual std::string& activemq::commands::ActiveMQDestination::getPhysicalName ()` `[inline, virtual]`

6.22.2.14 `virtual bool activemq::commands::ActiveMQDestination::isAdvisory () const` `[inline, virtual]`

Returns

Returns the advisory.

6.22.2.15 `virtual bool activemq::commands::ActiveMQDestination::isComposite () const [inline, virtual]`

Returns true if this destination represents a collection of destinations; allowing a set of destinations to be published to or subscribed from in one CMS operation.

Returns

true if this destination represents a collection of child destinations.

6.22.2.16 `virtual bool activemq::commands::ActiveMQDestination::isConnectionAdvisory () const [inline, virtual]`

Returns

true if this is a destination for Connection advisories

6.22.2.17 `virtual bool activemq::commands::ActiveMQDestination::isConsumerAdvisory () const [inline, virtual]`

Returns

true if this is a destination for Consumer advisories

6.22.2.18 `virtual bool activemq::commands::ActiveMQDestination::isExclusive () const [inline, virtual]`

Returns

Returns the exclusive.

6.22.2.19 `virtual bool activemq::commands::ActiveMQDestination::isOrdered () const [inline, virtual]`

Returns

Returns the ordered.

6.22.2.20 `virtual bool activemq::commands::ActiveMQDestination::isProducerAdvisory () const [inline, virtual]`

Returns

true if this is a destination for Producer advisories

6.22.2.21 `virtual bool activemq::commands::ActiveMQDestination::isQueue ()`
`const [inline, virtual]`

Returns true if a Queue Destination.

Returns

true/false

6.22.2.22 `virtual bool activemq::commands::ActiveMQDestination::isTemporary ()`
`const [inline, virtual]`

Returns true if a temporary Destination.

Returns

true/false

References cms::Destination::TEMPORARY_QUEUE, and cms::Destination::TEMPORARY_TOPIC.

6.22.2.23 `virtual bool activemq::commands::ActiveMQDestination::isTopic () const`
`[inline, virtual]`

Returns true if a Topic Destination.

Returns

true/false

References cms::Destination::TEMPORARY_TOPIC, and cms::Destination::TOPIC.

6.22.2.24 `virtual bool activemq::commands::ActiveMQDestination::isWildcard ()`
`const [inline, virtual]`

Returns

true if the destination matches multiple possible destinations

6.22.2.25 `virtual void activemq::commands::ActiveMQDestination::setAdvisory (`
`bool advisory) [inline, virtual]`

Parameters

<i>advisory</i>	The advisory to set.
-----------------	----------------------

6.22.2.26 `virtual void activemq::commands::ActiveMQDestination::setExclusive (bool exclusive) [inline, virtual]`

Parameters

<i>exclusive</i>	The exclusive to set.
------------------	-----------------------

6.22.2.27 `virtual void activemq::commands::ActiveMQDestination::setOrdered (bool ordered) [inline, virtual]`

Parameters

<i>ordered</i>	The ordered to set.
----------------	---------------------

6.22.2.28 `virtual void activemq::commands::ActiveMQDestination::setOrderedTarget (const std::string & orderedTarget) [inline, virtual]`

Parameters

<i>ordered-Target</i>	The orderedTarget to set.
-----------------------	---------------------------

6.22.2.29 `virtual void activemq::commands::ActiveMQDestination::setPhysicalName (const std::string & physicalName) [virtual]`

Set this destination's physical name.

Returns

const string containing the name

6.22.2.30 `virtual std::string activemq::commands::ActiveMQDestination::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 531).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 382), **activemq::commands::ActiveMQQueue** (p. 325), **activemq::commands::ActiveMQTopic** (p. 418), **activemq::commands::ActiveMQTempQueue** (p. 391), and **activemq::commands::ActiveMQTempTopic** (p. 400).

6.22.3 Field Documentation

6.22.3.1 **bool activemq::commands::ActiveMQDestination::advisory**
[protected]

6.22.3.2 **const std::string activemq::commands::ActiveMQDestination::ADVISORY_PREFIX** [static, protected]

prefix for Advisory message destinations

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marhsal to the given stream.

6.23.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQDestinationMarshaller** (p. 258).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.23.2 Constructor & Destructor Documentation

6.23 activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller Class

Reference

259

6.23.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::ActiveMQDestinationMarshaller ()**
[inline]

6.23.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::~~ActiveMQDestinationMarshaller ()**
[inline, virtual]

6.23.3 Member Function Documentation

6.23.3.1 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1123).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 331), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 393), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 403), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 421), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 384).

6.23.3.2 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)**
[virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i> if an error occurs.
--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1125).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 331), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 394), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 403), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 421), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 384).

6.23.3.3 **virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)**
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i> if an error occurs.
--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 331), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 394), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 403), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 421), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 385).

6.23.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*)** [virtual]

Tight Marshal to the given stream.

6.23 activemq::wireformat::openwire::marshal::generated::ActiveMQ-DestinationMarshaller Class

Reference

261

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 332), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 395), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 404), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 422), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 385).

6.23.3.5 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 332), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 395), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 404), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 422), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 386).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQDestination-Marshaller.h`

6.24 activemq::exceptions::ActiveMQException Class Reference

```
#include <src/main/activemq/exceptions/ActiveMQException.h>
```

Inheritance diagram for `activemq::exceptions::ActiveMQException`:

Public Member Functions

- **ActiveMQException** () throw ()
Default Constructor.
- **ActiveMQException** (const **ActiveMQException** &ex) throw ()
Copy Constructor.
- **ActiveMQException** (const **decaf::lang::Exception** &ex) throw ()
Copy Constructor.
- **ActiveMQException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual ~**ActiveMQException** () throw ()
- virtual **ActiveMQException** * **clone** () const
Clones this exception.
- virtual **cms::CMSException** **convertToCMSException** () const
Converts this exception to a new CMSException.

6.24.1 Constructor & Destructor Documentation

6.24.1.1 `activemq::exceptions::ActiveMQException::ActiveMQException ()`
throw ()

Default Constructor.

6.24.1.2 `activemq::exceptions::ActiveMQException::ActiveMQException (const ActiveMQException & ex)` throw ()

Copy Constructor.

Parameters

<i>ex</i>	The Exception whose internal data is copied into this instance.
-----------	---

6.24.1.3 **activemq::exceptions::ActiveMQException::ActiveMQException** (const **decaf::lang::Exception** & *ex*) throw ()

Copy Constructor.

Parameters

<i>ex</i>	The Exception whose internal data is copied into this instance.
-----------	---

6.24.1.4 **activemq::exceptions::ActiveMQException::ActiveMQException** (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

Parameters

<i>file</i>	The file name where exception occurs.
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report.
...	The list of primitives that are formatted into the message.

6.24.1.5 **virtual activemq::exceptions::ActiveMQException::~ActiveMQException** () throw () [virtual]

6.24.2 Member Function Documentation

6.24.2.1 **virtual ActiveMQException* activemq::exceptions::ActiveMQException::clone** () const [virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this Exception object

Reimplemented from **decaf::lang::Exception** (p. 1282).

Reimplemented in **activemq::exceptions::BrokerException** (p. 564), and **activemq::exceptions::ConnectionFailedException** (p. 959).

```
6.24.2.2 virtual cms::CMSException activemq::exceptions::-
ActiveMQException::convertToCMSException ( ) const
[virtual]
```

Converts this exception to a new CMSException.

Returns

a CMSException with the data from this exception

The documentation for this class was generated from the following file:

- src/main/activemq/exceptions/**ActiveMQException.h**

6.25 activemq::commands::ActiveMQMapMessage Class Reference

```
#include <src/main/activemq/commands/ActiveMQMapMessage.h>
```

Inheritance diagram for activemq::commands::ActiveMQMapMessage:

Public Member Functions

- **ActiveMQMapMessage** ()
- virtual **~ActiveMQMapMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual **ActiveMQMapMessage** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat)
Called before marshaling is started to prepare the object to be marshaled.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*

- virtual void **clearBody** () throw (cms::CMSException)
Clears out the body of the message.
- virtual **cms::MapMessage * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual bool **isEmpty** () const
*Returns true if there are no values stored in the **MapMessage** (p. 1779) body.*
Returns
*true if the body of the **MapMessage** (p. 1779) contains no elements.*

Exceptions

CMSException (p. 826)	<i>if the operation fails due to an internal error.</i>
------------------------------	---

- virtual std::vector< std::string > **getMapNames** () const
*Returns an Enumeration of all the names in the **MapMessage** (p. 1779) object.*
Returns
*STL Vector of String values, each of which is the name of an item in the **Map-Message** (p. 1779)*

Exceptions

CMSException (p. 826)	<i>- if the operation fails due to an internal error.</i>
------------------------------	---

- virtual bool **itemExists** (const std::string &name) const
*Indicates whether an item exists in this **MapMessage** (p. 1779) object.*

Parameters

name	<i>String name of the Object in question</i>
------	--

Returns

boolean value indicating if the name is in the map

Exceptions

CMSException (p. 826)	<i>- if the operation fails due to an internal error.</i>
------------------------------	---

- virtual bool **getBoolean** (const std::string &name) const
Returns the Boolean value of the Specified name.

Parameters

name	<i>Name of the value to fetch from the map</i>
------	--

Exceptions

CMSException (p. 826)	<i>- if the operation fails due to an internal error.</i>
MessageFormatException (p. 1906)	<i>- if this type conversion is invalid.</i>

- virtual void **setBoolean** (const std::string &name, bool value)
Sets a boolean value with the specified name into the Map.

Parameters

name	<i>the name of the boolean</i>
value	<i>the boolean value to set in the Map</i>

Exceptions

CMSEException (p. 826)	- if the operation fails due to an internal error.
MessageNotWritable-Exception	- if the Message (p. 1839) is in Read-only Mode.

- virtual unsigned char **getByte** (const std::string &name) const

Returns the Byte value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSEException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setByte** (const std::string &name, unsigned char value)

Sets a Byte value with the specified name into the Map.

Parameters

name	the name of the Byte
value	the Byte value to set in the Map

Exceptions

CMSEException (p. 826)	- if the operation fails due to an internal error.
MessageNotWritableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual std::vector< unsigned char > **getBytes** (const std::string &name) const

Returns the Bytes value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSEException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setBytes** (const std::string &name, const std::vector< unsigned char > &value)

Sets a Bytes value with the specified name into the Map.

Parameters

name	The name of the Bytes
value	The Bytes value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual char **getChar** (const std::string &name) const

Returns the Char value of the Specified name.

Parameters

name	<i>name of the value to fetch from the map</i>
------	--

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setChar** (const std::string &name, char value)

Sets a Char value with the specified name into the Map.

Parameters

name	<i>the name of the Char</i>
value	<i>the Char value to set in the Map</i>

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual double **getDouble** (const std::string &name) const

Returns the Double value of the Specified name.

Parameters

name	<i>Name of the value to fetch from the map</i>
------	--

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setDouble** (const std::string &name, double value)

Sets a Double value with the specified name into the Map.

Parameters

name	<i>The name of the Double</i>
value	<i>The Double value to set in the Map</i>

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual float **getFloat** (const std::string &name) const

Returns the Float value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setFloat** (const std::string &name, float value)

Sets a Float value with the specified name into the Map.

Parameters

name	The name of the Float
value	The Float value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual int **getInt** (const std::string &name) const

Returns the Int value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setInt** (const std::string &name, int value)

Sets a Int value with the specified name into the Map.

Parameters

name	The name of the Int
value	The Int value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual long long **getLong** (const std::string &name) const

Returns the Long value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setLong** (const std::string &name, long long value)

Sets a Long value with the specified name into the Map.

Parameters

name	The name of the Long
value	The Long value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual short **getShort** (const std::string &name) const

Returns the Short value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setShort** (const std::string &name, short value)

Sets a Short value with the specified name into the Map.

Parameters

name	The name of the Short
value	The Short value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

- virtual std::string **getString** (const std::string &name) const

Returns the String value of the Specified name.

Parameters

name	Name of the value to fetch from the map
------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

- virtual void **setString** (const std::string &name, const std::string &value)

Sets a String value with the specified name into the Map.

Parameters

name	The name of the String
value	The String value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQMAPMESSAGE** = 25

Protected Member Functions

- **util::PrimitiveMap & getMap** ()

Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.

- const **util::PrimitiveMap & getMap** () const
- virtual void **checkMapIsUnmarshalled** () const

Performs the unmarshal on the Map if needed, otherwise just returns.

6.25.1 Constructor & Destructor Documentation

6.25.1.1 activemq::commands::ActiveMQMapMessage::ActiveMQMapMessage ()

6.25.1.2 virtual **activemq::commands::ActiveMQMapMessage::~ActiveMQMapMessage**() **throw**() [virtual]

6.25.2 Member Function Documentation

6.25.2.1 virtual void **activemq::commands::ActiveMQMapMessage::beforeMarshal**(**wireformat::WireFormat** * *wireFormat*) [virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

<i>wireFormat</i>	The wireformat object to control marshaling
-------------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

Implements **activemq::wireformat::MarshalAware** (p. 1794).

6.25.2.2 virtual void **activemq::commands::ActiveMQMapMessage::checkMapsUnmarshalled**() **const** [protected, virtual]

Performs the unmarshal on the Map if needed, otherwise just returns.

Exceptions

<i>NullPointerException</i>	if the internal Map is Null.
-----------------------------	------------------------------

6.25.2.3 virtual void **activemq::commands::ActiveMQMapMessage::clearBody**() **throw**(**cms::CMSEException**) [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::MapMessage** > (p. 296).

6.25.2.4 `virtual cms::MapMessage* activemq::commands::-`
`ActiveMQMapMessage::clone () const [inline,`
`virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1844).

6.25.2.5 `virtual ActiveMQMapMessage* activemq::commands::-`
`ActiveMQMapMessage::cloneDataStructure () const`
`[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.25.2.6 `virtual void activemq::commands::ActiveMQMapMessage-`
`::copyDataStructure (const DataStructure * src)`
`[virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.25.2.7 `virtual bool activemq::commands::ActiveMQMapMessage::equals (const`
`DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::MapMessage** > (p. 297).

6.25.2.8 virtual bool **activemq::commands::ActiveMQMapMessage::getBoolean** (const std::string & *name*) const [virtual]

Returns the Boolean value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1782).

6.25.2.9 virtual unsigned char **activemq::commands::ActiveMQMapMessage::getBytes** (const std::string & *name*) const [virtual]

Returns the Byte value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1782).

6.25.2.10 `virtual std::vector<unsigned char> activemq::commands::ActiveMQMapMessage::getBytes (const std::string & name) const`
`[virtual]`

Returns the Bytes value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

<i>CMSException</i> (p. 826)	- if the operation fails due to an internal error.
<i>MessageFormatException</i> (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1783).

6.25.2.11 `virtual char activemq::commands::ActiveMQMapMessage::getChar (const std::string & name) const` `[virtual]`

Returns the Char value of the Specified name.

Parameters

<i>name</i>	name of the value to fetch from the map
-------------	---

Exceptions

<i>CMSException</i> (p. 826)	- if the operation fails due to an internal error.
<i>MessageFormatException</i> (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1783).

6.25.2.12 `virtual unsigned char activemq::commands::ActiveMQMapMessage::getDataStructureType () const`
`[virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.25.2.13 virtual double **activemq::commands::ActiveMQMapMessage::getDouble** (
const std::string & *name*) const [virtual]

Returns the Double value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1783).

6.25.2.14 virtual float **activemq::commands::ActiveMQMapMessage::getFloat** (
const std::string & *name*) const [virtual]

Returns the Float value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1784).

6.25.2.15 `virtual int activemq::commands::ActiveMQMapMessage::getInt (const std::string & name) const` [virtual]

Returns the Int value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements `cms::MapMessage` (p. 1784).

6.25.2.16 `virtual long long activemq::commands::ActiveMQMapMessage::getLong (const std::string & name) const` [virtual]

Returns the Long value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements `cms::MapMessage` (p. 1785).

6.25.2.17 `util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap ()` [protected]

Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.

Returns

reference to a PrimitiveMap;

Exceptions

<i>NullPointerException</i>	if the internal Map is Null.
-----------------------------	------------------------------

6.25.2.18 `const util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap () const` [protected]

6.25.2.19 `virtual std::vector< std::string > activemq::commands::ActiveMQMapMessage::getMapNames () const`
[virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 1779) object.

Returns

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 1779)

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
---------------------------------	--

Implements **cms::MapMessage** (p. 1785).

6.25.2.20 `virtual short activemq::commands::ActiveMQMapMessage::getShort (const std::string & name) const` [virtual]

Returns the Short value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageFormatException (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1785).

6.25.2.21 `virtual std::string activemq::commands::ActiveMQMapMessage::getString
(const std::string & name) const [virtual]`

Returns the String value of the Specified name.

Parameters

<i>name</i>	Name of the value to fetch from the map
-------------	---

Exceptions

<i>CMSException</i> (p. 826)	- if the operation fails due to an internal error.
<i>MessageFormatException</i> (p. 1906)	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1786).

6.25.2.22 `virtual bool activemq::commands::ActiveMQMapMessage::isEmpty ()
const [virtual]`

Returns true if there are no values stored in the **MapMessage** (p. 1779) body.

Returns

true if the body of the **MapMessage** (p. 1779) contains no elements.

Exceptions

<i>CMSException</i> (p. 826)	if the operation fails due to an internal error.
--	--

Implements **cms::MapMessage** (p. 1786).

6.25.2.23 `virtual bool activemq::commands::ActiveMQMap-
Message::isMarshalAware () const [inline,
virtual]`

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::Message** (p. 1832).

6.25.2.24 virtual bool **activemq::commands::ActiveMQMapMessage::itemExists** (
const std::string & *name*) const [virtual]

Indicates whether an item exists in this **MapMessage** (p. 1779) object.

Parameters

<i>name</i>	String name of the Object in question
-------------	---------------------------------------

Returns

boolean value indicating if the name is in the map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
---------------------------------	--

Implements **cms::MapMessage** (p. 1787).

6.25.2.25 virtual void **activemq::commands::ActiveMQMapMessage::setBoolean** (
const std::string & *name*, bool *value*) [virtual]

Sets a boolean value with the specified name into the Map.

Parameters

<i>name</i>	the name of the boolean
<i>value</i>	the boolean value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNotWritableException	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1787).

6.25.2.26 virtual void **activemq::commands::ActiveMQMapMessage::setByte** (const
std::string & *name*, unsigned char *value*) [virtual]

Sets a Byte value with the specified name into the Map.

Parameters

<i>name</i>	the name of the Byte
<i>value</i>	the Byte value to set in the Map

Exceptions

<i>CMSException</i> (p. 826)	- if the operation fails due to an internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1787).

6.25.2.27 `virtual void activemq::commands::ActiveMQMapMessage::setBytes
(const std::string & name, const std::vector< unsigned char > & value)
[virtual]`

Sets a Bytes value with the specified name into the Map.

Parameters

<i>name</i>	The name of the Bytes
<i>value</i>	The Bytes value to set in the Map

Exceptions

<i>CMSException</i> (p. 826)	- if the operation fails due to an internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1788).

6.25.2.28 `virtual void activemq::commands::ActiveMQMapMessage::setChar (const
std::string & name, char value) [virtual]`

Sets a Char value with the specified name into the Map.

Parameters

<i>name</i>	the name of the Char
<i>value</i>	the Char value to set in the Map

Exceptions

<i>CMSException</i> (p. 826)	- if the operation fails due to an internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1788).

6.25.2.29 virtual void **activemq::commands::ActiveMQMapMessage::setDouble** (
const std::string & *name*, double *value*) [virtual]

Sets a Double value with the specified name into the Map.

Parameters

<i>name</i>	The name of the Double
<i>value</i>	The Double value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNotWriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1789).

6.25.2.30 virtual void **activemq::commands::ActiveMQMapMessage::setFloat** (
const std::string & *name*, float *value*) [virtual]

Sets a Float value with the specified name into the Map.

Parameters

<i>name</i>	The name of the Float
<i>value</i>	The Float value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNotWriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1789).

6.25.2.31 virtual void **activemq::commands::ActiveMQMapMessage::setInt** (const
std::string & *name*, int *value*) [virtual]

Sets a Int value with the specified name into the Map.

Parameters

<i>name</i>	The name of the Int
<i>value</i>	The Int value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1789).

6.25.2.32 `virtual void activemq::commands::ActiveMQMapMessage::setLong (const std::string & name, long long value) [virtual]`

Sets a Long value with the specified name into the Map.

Parameters

<i>name</i>	The name of the Long
<i>value</i>	The Long value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNot-WriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1790).

6.25.2.33 `virtual void activemq::commands::ActiveMQMapMessage::setShort (const std::string & name, short value) [virtual]`

Sets a Short value with the specified name into the Map.

Parameters

<i>name</i>	The name of the Short
<i>value</i>	The Short value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNotWriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1790).

6.25.2.34 virtual void **activemq::commands::ActiveMQMapMessage::setString** (
const std::string & *name*, const std::string & *value*) [virtual]

Sets a String value with the specified name into the Map.

Parameters

<i>name</i>	The name of the String
<i>value</i>	The String value to set in the Map

Exceptions

CMSException (p. 826)	- if the operation fails due to an internal error.
MessageNotWriteableException (p. 1923)	- if the Message (p. 1839) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1791).

6.25.2.35 virtual std::string **activemq::commands::ActiveMQMapMessage::toString** (
) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.25.3 Field Documentation

```
6.25.3.1  const unsigned char activemq::commands::ActiveM-
          QMapMessage::ID_ACTIVEMQMAPMESSAGE = 25
          [static]
```

The documentation for this class was generated from the following file:

6.26.2 Constructor & Destructor Documentation

6.26.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::ActiveMQMapMessageMarshaller ()**
[inline]

6.26.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::~~ActiveMQMapMessageMarshaller ()**
[inline, virtual]

6.26.3 Member Function Documentation

6.26.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::createObject () const** [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.26.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::getDataStructureType () const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.26.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds) [virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1919).

6.26.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis) [virtual]`

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1919).

6.26.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) [virtual]`

Tight Marhsal to the given stream.

6.26 activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller Class

Reference

287

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.26.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

6.26.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i> if an error occurs.
--

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

```

Inheritance diagram for **activemq::commands::ActiveMQMessage**:

Public Member Functions

- **ActiveMQMessage** ()
- virtual **~ActiveMQMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **ActiveMQMessage** * **cloneDataStructure** () const
Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQMESSAGE** = 23

6.27.1 Constructor & Destructor Documentation

6.27.1.1 `activemq::commands::ActiveMQMessage::ActiveMQMessage ()`

6.27.1.2 `virtual activemq::commands::ActiveMQMessage::~~ActiveMQMessage () throw () [inline, virtual]`

6.27.2 Member Function Documentation

6.27.2.1 `virtual cms::Message* activemq::commands::ActiveMQMessage::clone () const [inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1844).

6.27.2.2 `virtual ActiveMQMessage* activemq::commands::ActiveMQMessage::cloneDataStructure () const [virtual]`

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.27.2.3 `virtual void activemq::commands::ActiveMQMessage::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.27.2.4 `virtual bool activemq::commands::ActiveMQMessage::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::Message** > (p. 297).

6.27.2.5 `virtual unsigned char activemq::commands::ActiveMQMessage::getData-
StructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.27.2.6 `virtual std::string activemq::commands::ActiveMQMessage::toString ()
const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.27.3 Field Documentation

6.28.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::ActiveMQMessageMarshaller ()**
[inline]

6.28.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::~~ActiveMQMessageMarshaller ()** [inline, virtual]

6.28.3 Member Function Documentation

6.28.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::createObject ()**
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.28.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::getDataStructureType ()** const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.28.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

6.28 activemq::wireformat::openwire::marshal::generated::ActiveMQMessage-Marshaller Class

Reference

293

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.28.3.4 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::looseUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*)
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.28.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightMarshal1** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **utils::BooleanStream** * *bs*)
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.28.3.6 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightMarshal2` (`OpenWireFormat * format`, `commands::DataStructure * command`, `decaf::io::DataOutputStream * ds`, `utils::BooleanStream * bs`) `[virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1921).

6.28.3.7 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightUnmarshal` (`OpenWireFormat * format`, `commands::DataStructure * command`, `decaf::io::DataInputStream * dis`, `utils::BooleanStream * bs`) `[virtual]`

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1921).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQMessageMarshaller.h`

6.29.2.4 `template<typename T> virtual bool activemq::commands::ActiveMQMessageTemplate< T >::equals (const DataStructure * value)` `const [inline, virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::Message** (p. 1827).

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 169), **activemq::commands::ActiveMQStreamMessage** (p. 362), **activemq::commands::ActiveMQMapMessage** (p. 272), **activemq::commands::ActiveMQBlobMessage** (p. 159), **activemq::commands::ActiveMQTextMessage** (p. 408), **activemq::commands::ActiveMQObjectMessage** (p. 303), and **activemq::commands::ActiveMQMessage** (p. 290).

6.30 activemq::commands::ActiveMQObjectMessage Class - Reference

```
#include <src/main/activemq/commands/ActiveMQObjectMessage.h>
```

Inheritance diagram for `activemq::commands::ActiveMQObjectMessage`:

Public Member Functions

- **ActiveMQObjectMessage** ()
- virtual `~ActiveMQObjectMessage` () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQObjectMessage** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQOBJECTMESSAGE** = 26

6.30.1 Constructor & Destructor Documentation

6.30.1.1 `activemq::commands::ActiveMQObjectMessage::ActiveMQObjectMessage ()`

6.30.1.2 `virtual activemq::commands::ActiveMQObjectMessage::~~ActiveMQObjectMessage () throw () [inline, virtual]`

6.30.2 Member Function Documentation

6.30.2.1 `virtual cms::Message* activemq::commands::ActiveMQObjectMessage::clone () const [inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1844).

6.30.2.2 `virtual ActiveMQObjectMessage* activemq::commands::ActiveMQObjectMessage::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.30.2.3 `virtual void activemq::commands::ActiveMQObjectMessage::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.30.2.4 `virtual bool activemq::commands::ActiveMQObjectMessage::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 297).

6.30.2.5 `virtual unsigned char activemq::commands::ActiveMQObjectMessage::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.30.2.6 `virtual std::string activemq::commands::ActiveMQObjectMessage::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.30.3 Field Documentation

6.30.3.1 `const unsigned char activemq::commands::ActiveMQObjectMessage::ID_ACTIVEMQOBJECTMESSAGE = 26 [static]`

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQObjectMessage.h**

6.31 activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 304).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQObjectMessageMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller:

Public Member Functions

- **ActiveMQObjectMessageMarshaller** ()
- virtual **~ActiveMQObjectMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marhsal to the given stream.

6.31.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 304).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.31 activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller Class

Reference

305

6.31.2 Constructor & Destructor Documentation

6.31.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::ActiveMQObjectMessageMarshaller ()**
[inline]

6.31.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::~~ActiveMQObjectMessageMarshaller ()**
[inline, virtual]

6.31.3 Member Function Documentation

6.31.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::createObject () const** [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.31.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::getDataStructureType () const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.31.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.31.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)** [virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.31.3.5 **virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)** [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.31 activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller Class

Reference

307

6.31.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

6.31.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

6.32 activemq::core::ActiveMQProducer Class Reference

```
#include <src/main/activemq/core/ActiveMQProducer.h>
```

Inheritance diagram for activemq::core::ActiveMQProducer:

Public Member Functions

- **ActiveMQProducer** (**ActiveMQSession** *session, const **Pointer**< **commands::ProducerId** > &producerId, const **Pointer**< **commands::ActiveMQDestination** > &destination, long long sendTimeout)

*Constructor, creates an instance of an **ActiveMQProducer** (p. 308).*

- virtual **~ActiveMQProducer** () throw ()
- virtual void **close** ()

Closes this object and deallocates the appropriate resources.

- virtual void **send** (**cms::Message** *message)

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)

Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const

Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)

Sets if Message Ids are disabled for this Producer.

- virtual bool **getDisableMessageID** () const

Gets if Message Ids are disabled for this Producer.

- virtual void **setDisableMessageTimeStamp** (bool value)

Sets if Message Time Stamps are disabled for this Producer.

- virtual bool **getDisableMessageTimeStamp** () const

Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority)

- Sets the Priority that this Producers sends messages at.*
- virtual int **getPriority** () const
- Gets the Priority level that this producer sends messages at.*
- virtual void **setTimeToLive** (long long time)
- Sets the Time to Live that this Producers sends messages with.*
- virtual long long **getTimeToLive** () const
- Gets the Time to Live that this producer sends messages with.*
- virtual void **setSendTimeout** (long long time)
- Sets the Send Timeout that this Producers sends messages with.*
- virtual long long **getSendTimeout** () const
- Gets the Send Timeout that this producer sends messages with.*
- bool **isClosed** () const
- const **Pointer** < **commands::ProducerInfo** > & **getProducerInfo** () const
- Retries this object ProducerInfo pointer.*
- const **Pointer** < **commands::ProducerId** > & **getProducerId** () const
- Retries this object ProducerId or NULL if closed.*
- virtual void **onProducerAck** (const **commands::ProducerAck** &ack)
- Handles the work of Processing a ProducerAck Command from the Broker.*
- void **dispose** ()
- Performs Producer object cleanup but doesn't attempt to send the Remove command to the broker.*

6.32.1 Constructor & Destructor Documentation

- 6.32.1.1 **activemq::core::ActiveMQProducer::ActiveMQProducer** (**ActiveMQSession** * session, const **Pointer**< **commands::ProducerId** > & producerId, const **Pointer**< **commands::ActiveMQDestination** > & destination, long long sendTimeout)

Constructor, creates an instance of an **ActiveMQProducer** (p. 308).

Parameters

<i>session</i>	The Session which is the parent of this Producer.
<i>producerId</i>	Pointer to a ProducerId object which identifies this producer.
<i>destination</i>	The assigned Destination this Producer sends to, or null if not set. The Producer does not own the Pointer passed.
<i>send-Timeout</i>	The configured send timeout for this Producer.

- 6.32.1.2 **virtual activemq::core::ActiveMQProducer::~~ActiveMQProducer** () throw
() [virtual]

6.32.2 Member Function Documentation

6.32.2.1 `virtual void activemq::core::ActiveMQProducer::close () [virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>CMSEException</i>	- If an error occurs while the resource is being closed.
----------------------	--

Implements **cms::Closeable** (p. 816).

6.32.2.2 `void activemq::core::ActiveMQProducer::dispose ()`

Performs Producer object cleanup but doesn't attempt to send the Remove command to the broker.

Called when the parent resource is closed first to avoid the message send and avoid any exceptions that might be thrown from an attempt to send a remove command to a failed transport.

6.32.2.3 `virtual int activemq::core::ActiveMQProducer::getDeliveryMode () const [inline, virtual]`

Gets the delivery mode for this Producer.

Returns

The DeliveryMode

Implements **cms::MessageProducer** (p. 1926).

6.32.2.4 `virtual bool activemq::core::ActiveMQProducer::getDisableMessageID () const [inline, virtual]`

Gets if Message IDs are disabled for this Producer.

Returns

a boolean indicating state enable / disable (true / false) for MessageIds.

Implements **cms::MessageProducer** (p. 1927).

6.32.2.5 `virtual bool activemq::core::ActiveMQProducer::getDisableMessageTimeStamp () const [inline, virtual]`

Gets if Message Time Stamps are disabled for this Producer.

Returns

boolean indicating state of enable / disable (true / false)

Implements **cms::MessageProducer** (p. 1927).

6.32.2.6 `virtual int activemq::core::ActiveMQProducer::getPriority () const`
`[inline, virtual]`

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Implements **cms::MessageProducer** (p. 1927).

6.32.2.7 `const Pointer<commands::ProducerId>& activemq-`
`::core::ActiveMQProducer::getProducerId () const`
`[inline]`

Retries this object ProducerId or NULL if closed.

Returns

ProducerId Reference

6.32.2.8 `const Pointer<commands::ProducerInfo>& activemq-`
`::core::ActiveMQProducer::getProducerInfo () const`
`[inline]`

Retries this object ProducerInfo pointer.

Returns

ProducerInfo Reference

6.32.2.9 `virtual long long activemq::core::ActiveMQProducer::getSendTimeout ()`
`const [inline, virtual]`

Gets the Send Timeout that this producer sends messages with.

Returns

The default send timeout value in milliseconds.

6.32.2.10 `virtual long long activemq::core::ActiveMQProducer::getTimeToLive ()`
`const [inline, virtual]`

Gets the Time to Live that this producer sends messages with.

Returns

The default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 1928).

6.32.2.11 `bool activemq::core::ActiveMQProducer::isClosed () const [inline]`

Returns

true if this Producer has been closed.

6.32.2.12 `virtual void activemq::core::ActiveMQProducer::onProducerAck (const`
`commands::ProducerAck & ack) [virtual]`

Handles the work of Processing a ProducerAck Command from the Broker.

Parameters

<i>ack</i>	- The ProducerAck message received from the Broker.
------------	---

6.32.2.13 `virtual void activemq::core::ActiveMQProducer::send (cms::Message *`
`message) [virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

<i>message</i>	The message to be sent.
----------------	-------------------------

Exceptions

<i>CMSException</i>	- if an internal error occurs while sending the message.
<i>MessageFormat-Exception</i>	- if an Invalid Message is given.
<i>InvalidDestination-Exception</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>Unsupported-OperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1928).

6.32.2.14 `virtual void activemq::core::ActiveMQProducer::send (cms::Message * message, int deliveryMode, int priority, long long timeToLive) [virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

<i>message</i>	The message to be sent.
<i>delivery-Mode</i>	The delivery mode to be used.
<i>priority</i>	The priority for this message.
<i>timeToLive</i>	The time to live value for this message in milliseconds.

Exceptions

<i>CMSException</i>	- if an internal error occurs while sending the message.
<i>MessageFormat-Exception</i>	- if an Invalid Message is given.
<i>InvalidDestination-Exception</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>Unsupported-OperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1929).

6.32.2.15 `virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * destination, cms::Message * message) [virtual]`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

<i>destination</i>	The destination on which to send the message
<i>message</i>	the message to be sent.

Exceptions

<i>CMSException</i>	- if an internal error occurs while sending the message.
<i>MessageFormat-Exception</i>	- if an Invalid Message is given.
<i>InvalidDestination-Exception</i>	- if a client uses this method with a MessageProducer with an invalid destination.

<i>Unsupported-OperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.
---------------------------------------	--

Implements **cms::MessageProducer** (p. 1929).

6.32.2.16 **virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*)** [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

<i>destination</i>	The destination on which to send the message
<i>message</i>	The message to be sent.
<i>delivery-Mode</i>	The delivery mode to be used.
<i>priority</i>	The priority for this message.
<i>timeToLive</i>	The time to live value for this message in milliseconds.

Exceptions

<i>CMSException</i>	- if an internal error occurs while sending the message.
<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestination-Exception</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>Unsupported-OperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1930).

6.32.2.17 **virtual void activemq::core::ActiveMQProducer::setDeliveryMode (int *mode*)** [inline, virtual]

Sets the delivery mode for this Producer.

Parameters

<i>mode</i>	- The DeliveryMode to use for Message sends.
-------------	--

Implements **cms::MessageProducer** (p. 1931).

6.32.2.18 `virtual void activemq::core::ActiveMQProducer::setDisableMessageID (bool value) [inline, virtual]`

Sets if Message Ids are disabled for this Producer.

Parameters

<i>value</i>	- boolean indicating enable / disable (true / false)
--------------	--

Implements **cms::MessageProducer** (p. 1931).

6.32.2.19 `virtual void activemq::core::ActiveMQProducer::setDisableMessageTimeStamp (bool value) [inline, virtual]`

Sets if Message Time Stamps are disabled for this Producer.

Parameters

<i>value</i>	- boolean indicating enable / disable (true / false)
--------------	--

Implements **cms::MessageProducer** (p. 1931).

6.32.2.20 `virtual void activemq::core::ActiveMQProducer::setPriority (int priority) [inline, virtual]`

Sets the Priority that this Producers sends messages at.

Parameters

<i>priority</i>	int value for Priority level
-----------------	------------------------------

Implements **cms::MessageProducer** (p. 1932).

6.32.2.21 `virtual void activemq::core::ActiveMQProducer::setSendTimeout (long long time) [inline, virtual]`

Sets the Send Timeout that this Producers sends messages with.

Parameters

<i>time</i>	The new default send timeout value in milliseconds.
-------------	---

6.32.2.22 `virtual void activemq::core::ActiveMQProducer::setTimeToLive (long long time) [inline, virtual]`

Sets the Time to Live that this Producers sends messages with.

Parameters

<i>time</i>	The new default time to live value in milliseconds.
-------------	---

Implements **cms::MessageProducer** (p. 1932).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQProducer.h**

6.33 activemq::util::ActiveMQProperties Class Reference

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2200) object.

```
#include <src/main/activemq/util/ActiveMQProperties.h>
```

Inheritance diagram for activemq::util::ActiveMQProperties:

Public Member Functions

- **ActiveMQProperties** ()
- virtual **~ActiveMQProperties** () throw ()
- virtual **decaf::util::Properties** & **getProperties** ()
- virtual const **decaf::util::Properties** & **getProperties** () const
- virtual void **setProperties** (decaf::util::Properties &props)
- virtual int **size** () const
Returns the current count of all the Properties that are currently stored in the - Properties object.
- virtual bool **isEmpty** () const
Returns true if the properties object is empty.
- virtual const char * **getProperty** (const std::string &name) const
Looks up the value for the given property.
- virtual std::string **getProperty** (const std::string &name, const std::string &defaultValue) const
Looks up the value for the given property.
- virtual void **setProperty** (const std::string &name, const std::string &value)
Sets the value for a given property.
- virtual bool **hasProperty** (const std::string &name) const
Check to see if the Property exists in the set.
- virtual std::string **remove** (const std::string &name)
Removes the property with the given name.
- virtual std::vector< std::string > **propertyNames** () const
Returns a vector containing all the names of the properties currently stored in the Properties object.

- virtual std::vector< std::pair < std::string, std::string > > **toArray** () const
Method that serializes the contents of the property map to an array.
- virtual void **copy** (const CMSProperties *source)
- virtual CMSProperties * **clone** () const
Clones this object.
- virtual void **clear** ()
Clears all properties from the map.
- virtual std::string **toString** () const
Formats the contents of the Properties Object into a string that can be logged, etc.

6.33.1 Detailed Description

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2200) object.

Since

2.0

6.33.2 Constructor & Destructor Documentation

6.33.2.1 **activemq::util::ActiveMQProperties::ActiveMQProperties** ()

6.33.2.2 **virtual activemq::util::ActiveMQProperties::~~ActiveMQProperties** ()
throw () [virtual]

6.33.3 Member Function Documentation

6.33.3.1 **virtual void activemq::util::ActiveMQProperties::clear** () [inline, virtual]

Clears all properties from the map.

Implements **cms::CMSProperties** (p. 831).

6.33.3.2 **virtual CMSProperties* activemq::util::ActiveMQProperties::clone** () const
[virtual]

Clones this object.

Returns

a replica of this object.

Implements **cms::CMSProperties** (p. 831).

6.33.3.3 `virtual void activemq::util::ActiveMQProperties::copy (const CMSProperties *
source) [virtual]`

6.33.3.4 `virtual decaf::util::Properties& activemq::util::Active-
MQProperties::getProperties () [inline,
virtual]`

6.33.3.5 `virtual const decaf::util::Properties& activemq::util::Active-
MQProperties::getProperties () const [inline,
virtual]`

6.33.3.6 `virtual const char* activemq::util::ActiveMQProperties::getProperty (const
std::string & name) const [inline, virtual]`

Looks up the value for the given property.

Parameters

<i>name</i>	The name of the property to be looked up.
-------------	---

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implements **cms::CMSProperties** (p. 832).

6.33.3.7 `virtual std::string activemq::util::ActiveMQProperties::getProperty (const
std::string & name, const std::string & defaultValue) const [inline,
virtual]`

Looks up the value for the given property.

Parameters

<i>name</i>	the name of the property to be looked up.
<i>defaultValue</i>	The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *default-Value*.

Implements **cms::CMSProperties** (p. 832).

6.33.3.8 `virtual bool activemq::util::ActiveMQProperties::hasProperty (const
std::string & name) const [inline, virtual]`

Check to see if the Property exists in the set.

Parameters

<i>name</i>	the name of the property to check
-------------	-----------------------------------

Returns

true if property exists, false otherwise.

Implements **cms::CMSProperties** (p. 833).

6.33.3.9 `virtual bool activemq::util::ActiveMQProperties::isEmpty () const`
[inline, virtual]

Returns true if the properties object is empty.

Returns

true if empty

Implements **cms::CMSProperties** (p. 833).

6.33.3.10 `virtual std::vector<std::string> activemq::util::ActiveMQProperties::propertyNames () const` [inline, virtual]

Returns a vector containing all the names of the properties currently stored in the - Properties object.

Returns

an STL `std::vector<std::string>` with all the currently stored property names.

Implements **cms::CMSProperties** (p. 833).

6.33.3.11 `virtual std::string activemq::util::ActiveMQProperties::remove (const std::string & name)` [inline, virtual]

Removes the property with the given name.

If the property existed in the collection then it is removed and returned, otherwise an empty string is returned.

Parameters

<i>name</i>	the name of the property to be removed.
-------------	---

Returns

the value that was removed from the Properties, or empty string.

Implements **cms::CMSProperties** (p. 833).

6.33.3.12 `virtual void activemq::util::ActiveMQProperties::setProperties (decaf::util::Properties & props) [inline, virtual]`

6.33.3.13 `virtual void activemq::util::ActiveMQProperties::setProperty (const std::string & name, const std::string & value) [inline, virtual]`

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

<i>name</i>	The name of the value to be written.
<i>value</i>	The value to be written.

Implements **cms::CMSProperties** (p. 834).

6.33.3.14 `virtual int activemq::util::ActiveMQProperties::size () const [inline, virtual]`

Returns the current count of all the Properties that are currently stored in the Properties object.

Returns

the number of properties currently stored.

Implements **cms::CMSProperties** (p. 834).

6.33.3.15 `virtual std::vector< std::pair< std::string, std::string > > activemq::util::ActiveMQProperties::toArray () const [inline, virtual]`

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

Implements **cms::CMSProperties** (p. 834).

6.33.3.16 `virtual std::string activemq::util::ActiveMQProperties::toString () const`
`[inline, virtual]`

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns

string value of this object.

Implements **cms::CMSProperties** (p. 834).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/ActiveMQProperties.h`

6.34 activemq::commands::ActiveMQQueue Class Reference

```
#include <src/main/activemq/commands/ActiveMQQueue.h>
```

Inheritance diagram for `activemq::commands::ActiveMQQueue`:

Public Member Functions

- **ActiveMQQueue** ()
- **ActiveMQQueue** (const std::string &name)
- virtual **~ActiveMQQueue** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQQueue * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual const **cms::Destination** * **getCMSDestination** () const
- virtual **cms::Destination::DestinationType** **getDestinationType** () const
Returns the Type of Destination that this object represents.
- virtual **cms::Destination** * **clone** () const

Creates a new instance of this destination type that is a copy of this one, and returns it.

- virtual void **copy** (const **cms::Destination** &source)
Copies the contents of the given Destination object to this one.
- virtual const **cms::CMSProperties** & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual bool **equals** (const **cms::Destination** &other) const
Compares two Destination instances to determine if they represent the same logic Destination.
- virtual std::string **getQueueName** () const
Gets the name of this queue.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQQUEUE** = 100

6.34.1 Constructor & Destructor Documentation

6.34.1.1 **activemq::commands::ActiveMQQueue::ActiveMQQueue ()**

6.34.1.2 **activemq::commands::ActiveMQQueue::ActiveMQQueue (const std::string & name)**

6.34.1.3 **virtual activemq::commands::ActiveMQQueue::~~ActiveMQQueue ()**
throw () *[virtual]*

6.34.2 Member Function Documentation

6.34.2.1 **virtual cms::Destination* activemq::commands::ActiveMQQueue::clone () const** *[inline, virtual]*

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 1211).

6.34.2.2 **virtual ActiveMQQueue* activemq::commands::ActiveMQQueue::clone-DataStructure () const** *[virtual]*

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 249).

6.34.2.3 `virtual void activemq::commands::ActiveMQQueue::copy (const cms::Destination & source) [inline, virtual]`

Copies the contents of the given Destination object to this one.

Parameters

<i>source</i>	The source Destination object.
---------------	--------------------------------

Implements **cms::Destination** (p. 1211).

6.34.2.4 `virtual void activemq::commands::ActiveMQQueue::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 249).

6.34.2.5 `virtual bool activemq::commands::ActiveMQQueue::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 250).

6.34.2.6 `virtual bool activemq::commands::ActiveMQQueue::equals (const cms::Destination & other) const [virtual]`

Compares two Destination instances to determine if they represent the same logic - Destination.

Parameters

<i>other</i>	The other destination to compare this one to.
--------------	---

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 1212).

6.34.2.7 `virtual const cms::Destination* activemq::commands::ActiveMQQueue::getCMSDestination () const [inline, virtual]`

Returns

the **cms::Destination** (p. 1210) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

6.34.2.8 `virtual const cms::CMSProperties& activemq::commands::ActiveMQQueue::getCMSProperties () const [inline, virtual]`

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1212).

6.34.2.9 `virtual unsigned char activemq::commands::ActiveMQQueue::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

6.34.2.10 `virtual cms::Destination::DestinationType activemq::commands::ActiveMQQueue::getDestinationType () const [inline, virtual]`

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 251).

References cms::Destination::QUEUE.

6.34.2.11 `virtual std::string activemq::commands::ActiveMQQueue::getQueueName () const [inline, virtual]`

Gets the name of this queue.

Returns

The queue name.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
---------------------	--------------------------------

Implements **cms::Queue** (p. 2222).

6.34.2.12 `virtual std::string activemq::commands::ActiveMQQueue::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 255).

6.34.3 Field Documentation

6.34.3.1 `const unsigned char activemq::commands::ActiveMQQueue::ID_ACTIVEM-
QUEUE = 100 [static]`

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQQueue.h**

6.35 activemq::core::ActiveMQQueueBrowser Class Reference

```
#include <src/main/activemq/core/ActiveMQQueueBrowser.h>
```

Inheritance diagram for activemq::core::ActiveMQQueueBrowser:

Public Member Functions

- **ActiveMQQueueBrowser** (**ActiveMQSession** *session, const **Pointer**< **commands::ConsumerId** > &consumerId, const **Pointer**< **commands::ActiveMQDestination** > &destination, const std::string &selector, bool dispatchAsync)
- virtual ~**ActiveMQQueueBrowser** () throw ()
- virtual const **cms::Queue** * **getQueue** () const
- virtual std::string **getMessageSelector** () const
- virtual **cms::MessageEnumeration** * **getEnumeration** ()
Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue in the order that a client would receive them.
- virtual void **close** ()
Closes this object and deallocates the appropriate resources.
- virtual bool **hasMoreMessages** ()
Returns true if there are more Message in the Browser that can be retrieved via the nextMessage method.
- virtual **cms::Message** * **nextMessage** ()
Returns the Next Message in the Queue if one is present, if no more Message's are available then an Exception is thrown.

Friends

- class **Browser**

6.35.1 Constructor & Destructor Documentation

- 6.35.1.1 **activemq::core::ActiveMQQueueBrowser::ActiveMQQueueBrowser** (**ActiveMQSession** * session, const **Pointer**< **commands::ConsumerId** > & consumerId, const **Pointer**< **commands::ActiveMQDestination** > & destination, const std::string & selector, bool dispatchAsync)
- 6.35.1.2 virtual **activemq::core::ActiveMQQueueBrowser::~~ActiveMQQueueBrowser** () throw () [virtual]

6.35.2 Member Function Documentation

6.35.2.1 `virtual void activemq::core::ActiveMQQueueBrowser::close ()`
`[virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>CMSEException</i>	- If an error occurs while the resource is being closed.
----------------------	--

Implements **cms::Closeable** (p. 816).

6.35.2.2 `virtual cms::MessageEnumeration* activemq::core-
::ActiveMQQueueBrowser::getEnumeration ()`
`[virtual]`

Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue in the order that a client would receive them.

The pointer returned is owned by the browser and should not be deleted by the client application.

Returns

a pointer to a Queue Enumeration, this Pointer is owned by the QueueBrowser and should not be deleted by the client.

Exceptions

<i>CMSEException</i>	if an internal error occurs.
----------------------	------------------------------

Implements **cms::QueueBrowser** (p. 2228).

6.35.2.3 `virtual std::string activemq::core::ActiveMQQueueBrowser::getMessage-
Selector () const` `[virtual]`

Returns

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions

<i>CMSEException</i>	if an internal error occurs.
----------------------	------------------------------

Implements **cms::QueueBrowser** (p. 2228).

6.35.2.4 `virtual const cms::Queue* activemq::core::ActiveMQQueueBrowser::get-Queue () const` [virtual]

Returns

the Queue that this browser is listening on.

Exceptions

<i>CMSEException</i> if an internal error occurs.

Implements **cms::QueueBrowser** (p. 2229).

6.35.2.5 `virtual bool activemq::core::ActiveMQQueueBrowser::hasMoreMessages ()` [virtual]

Returns true if there are more Message in the Browser that can be retrieved via the `nextMessage` method.

If this method returns false and the `nextMessage` method is called then an Exception will be thrown.

Returns

true if more Message's are available in the Browser.

Implements **cms::MessageEnumeration** (p. 1904).

6.35.2.6 `virtual cms::Message* activemq::core::ActiveMQQueueBrowser::next-Message ()` [virtual]

Returns the Next Message in the Queue if one is present, if no more Message's are available then an Exception is thrown.

If a Message object pointer is returned then that object becomes the property of the caller and must be deleted by the caller when finished.

Returns

The next Message in the Queue.

Exceptions

<i>CMSEException</i> if no more Message's currently in the Queue.

Implements **cms::MessageEnumeration** (p. 1905).

6.35.3.1 friend class **Browser** [friend]

The documentation for this class was generated from the following file:

6.36 activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 329).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-  
ActiveMQQueueMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller:

Public Member Functions

- **ActiveMQQueueMarshaller** ()
- virtual **~ActiveMQQueueMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marshal to the given stream.

6.36.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 329).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.36.2 Constructor & Destructor Documentation

6.36.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::ActiveMQQueueMarshaller ()**
[inline]

6.36.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::~~ActiveMQQueueMarshaller ()** [inline, virtual]

6.36.3 Member Function Documentation

6.36.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::createObject ()** const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.36.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::getDataStructureType ()** const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.36 activemq::wireformat::openwire::marshal::generated::ActiveMQQueue-Marshaller Class

Reference

331

6.36.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 259).

6.36.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 259).

6.36.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 260).

6.36.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 260).

6.36.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 261).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQQueueMarshaller.h**

6.37 activemq::core::ActiveMQSession Class Reference

```
#include <src/main/activemq/core/ActiveMQSession.h>
```

Inheritance diagram for activemq::core::ActiveMQSession:

Public Member Functions

- **ActiveMQSession** (**ActiveMQConnection** *connection, const **Pointer**<**commands::SessionId** > &id, **cms::Session::AcknowledgeMode** ackMode, const **decaf::util::Properties** &properties)
- virtual ~**ActiveMQSession** () throw ()
- virtual void **redispatch** (**MessageDispatchChannel** &unconsumedMessages)
Redispatches the given set of unconsumed messages to the consumers.
- virtual void **start** ()
Stops asynchronous message delivery.
- virtual void **stop** ()
Starts asynchronous message delivery.
- bool **isStarted** () const
Indicates whether or not the session is currently in the started state.
- virtual bool **isAutoAcknowledge** () const
- virtual bool **isDupsOkAcknowledge** () const
- virtual bool **isClientAcknowledge** () const
- virtual bool **isIndividualAcknowledge** () const
- void **fire** (const **exceptions::ActiveMQException** &ex)
Fires the given exception to the exception listener of the connection.
- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)
Dispatches a message to a particular consumer.
- virtual void **close** ()
Closes this session as well as any active child consumers or producers.
- virtual void **commit** ()
Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** ()
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination)
Creates a MessageConsumer for the specified destination.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)
Creates a durable subscriber to the specified topic, using a Message selector.
- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination)
Creates a MessageProducer to send messages to the specified destination.
- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual **cms::Queue** * **createQueue** (const std::string &queueName)
Creates a queue identity given a Queue name.
- virtual **cms::Topic** * **createTopic** (const std::string &topicName)
Creates a topic identity given a Queue name.
- virtual **cms::TemporaryQueue** * **createTemporaryQueue** ()
Creates a TemporaryQueue object.
- virtual **cms::TemporaryTopic** * **createTemporaryTopic** ()
Creates a TemporaryTopic object.
- virtual **cms::Message** * **createMessage** ()
Creates a new Message.
- virtual **cms::BytesMessage** * **createBytesMessage** ()
Creates a BytesMessage.
- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize)
Creates a BytesMessage and sets the payload to the passed value.
- virtual **cms::StreamMessage** * **createStreamMessage** ()
Creates a new StreamMessage.
- virtual **cms::TextMessage** * **createTextMessage** ()

Creates a new TextMessage.

- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text)
Creates a new TextMessage and set the text to the value given.
- virtual **cms::MapMessage** * **createMapMessage** ()
Creates a new MapMessage.
- virtual **cms::Session::AcknowledgeMode** **getAcknowledgeMode** () const
Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const
Gets if the Sessions is a Transacted Session.
- virtual void **unsubscribe** (const std::string &name)
Unsubscribes a durable subscription that has been created by a client.
- void **send** (**cms::Message** *message, **ActiveMQProducer** *producer, **util::Usage** *usage)
Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection.
- **cms::ExceptionListener** * **getExceptionListener** ()
This method gets any registered exception listener of this sessions connection and returns it.
- const **commands::SessionInfo** & **getSessionInfo** () const
Gets the Session Information object for this session, if the session is closed than this method throws an exception.
- const **commands::SessionId** & **getSessionId** () const
Gets the Session Id object for this session, if the session is closed than this method throws an exception.
- **ActiveMQConnection** * **getConnection** () const
*Gets the **ActiveMQConnection** (p. 187) that is associated with this session.*
- **Pointer**< **threads::Scheduler** > **getScheduler** () const
Gets a Pointer to this Session's Scheduler instance.
- long long **getLastDeliveredSequenceId** () const
Gets the currently set Last Delivered Sequence Id.
- void **setLastDeliveredSequenceId** (long long value)
Sets the value of the Last Delivered Sequence Id.
- void **oneway** (**Pointer**< **commands::Command** > command)
Sends a Command to the broker without requesting any Response be returned.
- **Pointer**< **commands::Response** > **syncRequest** (**Pointer**< **commands::Command** > command, unsigned int timeout=0)
Sends a synchronous request and returns the response from the broker.
- void **addConsumer** (**ActiveMQConsumer** *consumer)
Adds a MessageConsumer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.
- void **removeConsumer** (const **Pointer**< **commands::ConsumerId** > &consumerId)
Dispose of a MessageConsumer from this session.

- void **addProducer** (**ActiveMQProducer** *producer)
Adds a MessageProducer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.
- void **removeProducer** (**ActiveMQProducer** *producer)
Dispose of a MessageProducer from this session.
- virtual void **doStartTransaction** ()
Starts if not already start a Transaction for this Session.
- **Pointer** < **ActiveMQTransactionContext** > **getTransactionContext** ()
Gets the Pointer to this Session's TransactionContext.
- void **acknowledge** ()
Request that the Session inform all its consumers to Acknowledge all Message's that have been received so far.
- void **deliverAcks** ()
Request that this Session inform all of its consumers to deliver their pending acks.
- void **clearMessagesInProgress** ()
Request that this Session inform all of its consumers to clear all messages that are currently in progress.
- void **wakeup** ()
Causes the Session to wakeup its executor and ensure all messages are dispatched.
- **Pointer**< **commands::ConsumerId** > **getNextConsumerId** ()
Get the Next available Consumer Id.
- **Pointer**< **commands::ProducerId** > **getNextProducerId** ()
Get the Next available Producer Id.
- void **doClose** ()
Performs the actual Session close operations.
- void **dispose** ()
*Cleans up the Session object's resources without attempting to send the Remove command to the broker, this can be called from **ActiveMQConnection** (p. 187) when it knows that the transport is down and the doClose method would throw an exception when it attempt to send the Remove Command.*

Protected Attributes

- SessionConfig * **config**
- **Pointer**< **commands::SessionInfo** > **sessionInfo**
SessionInfo for this Session.
- **Pointer** < **ActiveMQTransactionContext** > **transaction**
Transaction Management object.
- **ActiveMQConnection** * **connection**
Connection.
- **ConsumersMap** **consumers**
Map of consumers.
- **AtomicBoolean** **closed**

Indicates that this connection has been closed, it is no longer usable after this becomes true.

- `std::auto_ptr < ActiveMQSessionExecutor > executor`

Sends incoming messages to the registered consumers.

- `cms::Session::AcknowledgeMode ackMode`

This Sessions Acknowledgment mode.

- `util::LongSequenceGenerator producerIds`

Next available Producer Id.

- `util::LongSequenceGenerator producerSequenceIds`

Next available Producer Sequence Id.

- `util::LongSequenceGenerator consumerIds`

Next available Consumer Id.

- `long long lastDeliveredSequenceId`

Last Delivered Sequence Id.

Friends

- class **ActiveMQSessionExecutor**

6.37.1 Constructor & Destructor Documentation

6.37.1.1 `activemq::core::ActiveMQSession::ActiveMQSession (ActiveMQConnection * connection, const Pointer< commands::SessionId > & id, cms::Session::AcknowledgeMode ackMode, const decaf::util::Properties & properties)`

6.37.1.2 `virtual activemq::core::ActiveMQSession::~~ActiveMQSession () throw ()`
[virtual]

6.37.2 Member Function Documentation

6.37.2.1 `void activemq::core::ActiveMQSession::acknowledge ()`

Request that the Session inform all its consumers to Acknowledge all Message's that have been received so far.

6.37.2.2 `void activemq::core::ActiveMQSession::addConsumer (ActiveMQConsumer * consumer)`

Adds a MessageConsumer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

Parameters

<i>consumer</i>	The ActiveMQConsumer (p. 234) instance to add to this session.
-----------------	---

Exceptions

<i>ActiveMQException</i>	if an internal error occurs.
--------------------------	------------------------------

6.37.2.3 void activemq::core::ActiveMQSession::addProducer (ActiveMQProducer * producer)

Adds a MessageProducer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

Parameters

<i>consumer</i>	The ActiveMQProducer (p. 308) instance to add to this session.
-----------------	---

Exceptions

<i>ActiveMQException</i>	if an internal error occurs.
--------------------------	------------------------------

6.37.2.4 void activemq::core::ActiveMQSession::clearMessagesInProgress ()

Request that this Session inform all of its consumers to clear all messages that are currently in progress.

6.37.2.5 virtual void activemq::core::ActiveMQSession::close () [virtual]

Closes this session as well as any active child consumers or producers.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2365).

6.37.2.6 virtual void activemq::core::ActiveMQSession::commit () [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>IllegalStateException</i>	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 2366).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 437).

6.37.2.7 `virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * queue)`
[virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

<i>queue</i>	the Queue to browse
--------------	---------------------

Returns

New QueueBrowser that is owned by the caller.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>InvalidDestination-Exception</i>	- if the destination given is invalid.

Implements **cms::Session** (p. 2366).

6.37.2.8 `virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * queue, const std::string & selector)`
[virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

<i>queue</i>	the Queue to browse
<i>selector</i>	the Message selector to filter which messages are browsed.

Returns

New QueueBrowser that is owned by the caller.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>InvalidDestination-Exception</i>	- if the destination given is invalid.

Implements **cms::Session** (p. 2367).

6.37.2.9 **virtual cms::BytesMessage* activemq::core::ActiveMQSession::createBytesMessage ()** [virtual]

Creates a BytesMessage.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
---------------------	--------------------------------

Implements **cms::Session** (p. 2367).

6.37.2.10 **virtual cms::BytesMessage* activemq::core::ActiveMQSession::createBytesMessage (const unsigned char * bytes, int bytesSize)** [virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters

<i>bytes</i>	an array of bytes to set in the message
<i>bytesSize</i>	the size of the bytes array, or number of bytes to use

Exceptions

<i>CMSException</i>	- If an internal error occurs.
---------------------	--------------------------------

Implements **cms::Session** (p. 2367).

6.37.2.11 **virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * destination)** [virtual]

Creates a MessageConsumer for the specified destination.

Parameters

<i>destination</i>	the Destination that this consumer receiving messages for.
--------------------	--

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>InvalidDestination-Exception</i>	- if an invalid destination is specified.

Implements **cms::Session** (p. 2368).

6.37.2.12 `virtual cms::MessageConsumer* activemq::core::ActiveMQSession-
::createConsumer (const cms::Destination * destination, const std::string &
selector) [virtual]`

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

<i>destination</i>	the Destination that this consumer receiving messages for.
<i>selector</i>	the Message Selector to use

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>InvalidDestination-Exception</i>	- if an invalid destination is specified.
<i>InvalidSelector-Exception</i>	- if the message selector is invalid.

Implements **cms::Session** (p. 2368).

6.37.2.13 `virtual cms::MessageConsumer* activemq::core::ActiveMQSession-
::createConsumer (const cms::Destination * destination, const std::string &
selector, bool noLocal) [virtual]`

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

<i>destination</i>	the Destination that this consumer receiving messages for.
<i>selector</i>	the Message Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>InvalidDestination-Exception</i>	- if an invalid destination is specified.
<i>InvalidSelector-Exception</i>	- if the message selector is invalid.

Implements **cms::Session** (p. 2369).

6.37.2.14 `virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createDurableConsumer (const cms::Topic * destination, const std::string & name, const std::string & selector, bool noLocal = false) [virtual]`

Creates a durable subscriber to the specified topic, using a Message selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

<i>destination</i>	the topic to subscribe to
<i>name</i>	The name used to identify the subscription
<i>selector</i>	the Message Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>InvalidDestination-Exception</i>	- if an invalid destination is specified.
<i>InvalidSelector-Exception</i>	- if the message selector is invalid.

Implements **cms::Session** (p. 2370).

6.37.2.15 `virtual cms::MapMessage* activemq::core::ActiveMQSession::createMapMessage () [virtual]`

Creates a new MapMessage.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2371).

6.37.2.16 virtual **cms::Message*** **activemq::core::ActiveMQSession::createMessage ()** [virtual]

Creates a new Message.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2371).

6.37.2.17 virtual **cms::MessageProducer*** **activemq::core::ActiveMQSession::createProducer (const cms::Destination * destination)** [virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters

<i>destination</i>	the Destination to send on
--------------------	----------------------------

Returns

New MessageProducer that is owned by the caller.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>InvalidDestinationException</i>	- if an invalid destination is specified.

Implements **cms::Session** (p. 2371).

6.37.2.18 virtual **cms::Queue*** **activemq::core::ActiveMQSession::createQueue (const std::string & queueName)** [virtual]

Creates a queue identity given a Queue name.

Parameters

<i>queueName</i>	the name of the new Queue
------------------	---------------------------

Returns

new Queue pointer that is owned by the caller.

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::Session** (p. 2372).

6.37.2.19 **virtual cms::StreamMessage* activemq::core::ActiveMQSession::createStreamMessage ()** [virtual]

Creates a new StreamMessage.

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::Session** (p. 2372).

6.37.2.20 **virtual cms::TemporaryQueue* activemq::core::ActiveMQSession::createTemporaryQueue ()** [virtual]

Creates a TemporaryQueue object.

Returns

new TemporaryQueue pointer that is owned by the caller.

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::Session** (p. 2373).

6.37.2.21 **virtual cms::TemporaryTopic* activemq::core::ActiveMQSession::createTemporaryTopic ()** [virtual]

Creates a TemporaryTopic object.

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::Session** (p. 2373).

6.37.2.22 virtual **cms::TextMessage*** **activemq::core::ActiveMQSession::createTextMessage ()** [virtual]

Creates a new TextMessage.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2373).

6.37.2.23 virtual **cms::TextMessage*** **activemq::core::ActiveMQSession::createTextMessage (const std::string & text)** [virtual]

Creates a new TextMessage and set the text to the value given.

Parameters

<i>text</i>	the initial text for the message
-------------	----------------------------------

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2374).

6.37.2.24 virtual **cms::Topic*** **activemq::core::ActiveMQSession::createTopic (const std::string & topicName)** [virtual]

Creates a topic identity given a Queue name.

Parameters

<i>topicName</i>	the name of the new Topic
------------------	---------------------------

Returns

new Topic pointer that is owned by the caller.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2374).

6.37.2.25 void activemq::core::ActiveMQSession::deliverAcks ()

Request that this Session inform all of its consumers to deliver their pending acks.

6.37.2.26 virtual void activemq::core::ActiveMQSession::dispatch (const Pointer< MessageDispatch > & message) [virtual]

Dispatches a message to a particular consumer.

Parameters

<i>message</i>	- the message to be dispatched
----------------	--------------------------------

Implements **activemq::core::Dispatcher** (p. 1235).

6.37.2.27 void activemq::core::ActiveMQSession::dispose ()

Cleans up the Session object's resources without attempting to send the Remove command to the broker, this can be called from **ActiveMQConnection** (p. 187) when it knows that the transport is down and the doClose method would throw an exception when it attempt to send the Remove Command.

6.37.2.28 void activemq::core::ActiveMQSession::doClose ()

Performs the actual Session close operations.

This method is meant for use by **ActiveMQConnection** (p. 187), the connection object calls this when it has been closed to skip some of the extraneous processing done by the client level close method.

6.37.2.29 virtual void activemq::core::ActiveMQSession::doStartTransaction ()
[virtual]

Starts if not already start a Transaction for this Session.

If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions

<i>ActiveMQException</i>	if this is not a Transacted Session.
--------------------------	--------------------------------------

Reimplemented in **activemq::core::ActiveMQXASession** (p. 437).

6.37.2.30 `void activemq::core::ActiveMQSession::fire (const exceptions::ActiveMQException & ex)`

Fires the given exception to the exception listener of the connection.

6.37.2.31 `virtual cms::Session::AcknowledgeMode activemq::core::ActiveMQSession::getAcknowledgeMode () const [virtual]`

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

<i>CMSException</i>	- If an internal error occurs.
---------------------	--------------------------------

Implements **cms::Session** (p. 2374).

6.37.2.32 `ActiveMQConnection* activemq::core::ActiveMQSession::getConnection () const [inline]`

Gets the **ActiveMQConnection** (p. 187) that is associated with this session.

6.37.2.33 `cms::ExceptionListener* activemq::core::ActiveMQSession::getExceptionListener ()`

This method gets any registered exception listener of this sessions connection and returns it.

Mainly intended for use by the objects that this session creates so that they can notify the client of exceptions that occur in the context of another thread.

Returns

cms::ExceptionListener (p. 1286) pointer or NULL

6.37.2.34 `long long activemq::core::ActiveMQSession::getLastDeliveredSequenceId () const [inline]`

Gets the currently set Last Delivered Sequence Id.

Returns

long long containing the sequence id of the last delivered Message.

6.37.2.35 `Pointer<commands::ConsumerId> activemq-
::core::ActiveMQSession::getNextConsumerId ()`

Get the Next available Consumer Id.

Returns

the next id in the sequence.

6.37.2.36 `Pointer<commands::ProducerId> activemq::core::ActiveMQSession-
::getNextProducerId ()`

Get the Next available Producer Id.

Returns

the next id in the sequence.

6.37.2.37 `Pointer<threads::Scheduler> activemq::core::ActiveMQSession::get-
Scheduler () const`

Gets a Pointer to this Session's Scheduler instance.

6.37.2.38 `const commands::SessionId& activemq::core::ActiveMQSession::get-
SessionId () const [inline]`

Gets the Session Id object for this session, if the session is closed than this method throws an exception.

Returns

SessionId Reference

6.37.2.39 `const commands::SessionInfo& activemq::core::ActiveMQSession::get-
SessionInfo () const [inline]`

Gets the Session Information object for this session, if the session is closed than this method throws an exception.

Returns

SessionInfo Reference

6.37.2.40 **Pointer<ActiveMQTransactionContext> activemq-
::core::ActiveMQSession::getTransactionContext ()**
[inline]

Gets the Pointer to this Session's TransactionContext.

Returns

a Pointer to this Session's TransactionContext

6.37.2.41 **virtual bool activemq::core::ActiveMQSession::isAutoAcknowledge ()**
const [inline, virtual]

Reimplemented in **activemq::core::ActiveMQXASession** (p. 438).

References cms::Session::AUTO_ACKNOWLEDGE.

6.37.2.42 **virtual bool activemq::core::ActiveMQSession::isClientAcknowledge ()**
const [inline, virtual]

References cms::Session::CLIENT_ACKNOWLEDGE.

6.37.2.43 **virtual bool activemq::core::ActiveMQSession::isDupsOkAcknowledge ()**
const [inline, virtual]

References cms::Session::DUPS_OK_ACKNOWLEDGE.

6.37.2.44 **virtual bool activemq::core::ActiveMQSession::isIndividualAcknowledge ()**
const [inline, virtual]

References cms::Session::INDIVIDUAL_ACKNOWLEDGE.

6.37.2.45 **bool activemq::core::ActiveMQSession::isStarted ()** **const**

Indicates whether or not the session is currently in the started state.

6.37.2.46 **virtual bool activemq::core::ActiveMQSession::isTransacted ()** **const**
[virtual]

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
---------------------	--------------------------------

Implements **cms::Session** (p. 2375).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 438).

6.37.2.47 `void activemq::core::ActiveMQSession::oneway (Pointer< commands::Command > command)`

Sends a Command to the broker without requesting any Response be returned.

Parameters

<i>command</i>	The message to send to the Broker.
----------------	------------------------------------

Exceptions

<i>ActiveMQException</i>	if not currently connected, or if the operation fails for any reason.
--------------------------	---

6.37.2.48 `virtual void activemq::core::ActiveMQSession::recover ()` [virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "re-delivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

<i>CMSException</i>	- if the CMS provider fails to stop and restart message delivery due to some internal error.
<i>IllegalStateException</i>	- if the method is called by a transacted session.

Implements **cms::Session** (p. 2375).

6.37.2.49 **virtual void activemq::core::ActiveMQSession::redispatch (MessageDispatchChannel & *unconsumedMessages*)** [virtual]

Redispatches the given set of unconsumed messages to the consumers.

Parameters

<i>unconsumedMessages</i>	- unconsumed messages to be redelivered.
---------------------------	--

6.37.2.50 **void activemq::core::ActiveMQSession::removeConsumer (const Pointer< commands::ConsumerId > & *consumerId*)**

Dispose of a MessageConsumer from this session.

Removes it from the Connection and clean up any resources associated with it.

Parameters

<i>consumerId</i>	The ConsumerId of the MessageConsumer to remove from this Session.
-------------------	--

Exceptions

<i>ActiveMQException</i>	if an internal error occurs.
--------------------------	------------------------------

6.37.2.51 **void activemq::core::ActiveMQSession::removeProducer (ActiveMQProducer * *producer*)**

Dispose of a MessageProducer from this session.

Removes it from the Connection and clean up any resources associated with it.

Parameters

<i>producerId</i>	The ProducerId of the MessageProducer to remove from this session.
-------------------	--

Exceptions

<i>ActiveMQException</i>	if an internal error occurs.
--------------------------	------------------------------

6.37.2.52 **virtual void activemq::core::ActiveMQSession::rollback ()** [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>IllegalStateException</i>	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 2376).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 439).

6.37.2.53 `void activemq::core::ActiveMQSession::send (cms::Message * message, ActiveMQProducer * producer, util::Usage * usage)`

Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection.

Asynchronous sends will be chosen if at all possible.

Parameters

<i>message</i>	The message to send to the broker.
<i>producer</i>	The sending Producer
<i>usage</i>	Pointer to a Usage tracker which if set will be increased by the size of the given message.

Exceptions

<i>CMSEException</i>

6.37.2.54 `void activemq::core::ActiveMQSession::setLastDeliveredSequenceId (long long value) [inline]`

Sets the value of the Last Delivered Sequence Id.

Parameters

<i>value</i>	The new value to assign to the Last Delivered Sequence Id property.
--------------	---

6.37.2.55 `virtual void activemq::core::ActiveMQSession::start () [virtual]`

Stops asynchronous message delivery.

Implements **cms::Startable** (p. 2534).

6.37.2.56 `virtual void activemq::core::ActiveMQSession::stop () [virtual]`

Starts asynchronous message delivery.

Implements **cms::Stoppable** (p. 2602).

6.37.2.57 `Pointer<commands::Response> activemq::core::ActiveMQSession::syncRequest (Pointer< commands::Command > command, unsigned int timeout = 0)`

Sends a synchronous request and returns the response from the broker.

Converts any error responses into an exception.

Parameters

<i>command</i>	The command to send to the broker.
<i>timeout</i>	The time to wait for a response, default is zero or infinite.

Returns

Pointer to a Response object that the broker has returned for the Command sent.

Exceptions

<i>ActiveMQException</i>	thrown if an error response was received from the broker, or if any other error occurred.
--------------------------	---

6.37.2.58 `virtual void activemq::core::ActiveMQSession::unsubscribe (const std::string & name) [virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

<i>name</i>	The name used to identify this subscription
-------------	---

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::Session** (p. 2376).

6.37.2.59 `void activemq::core::ActiveMQSession::wakeup ()`

Causes the Session to wakeup its executor and ensure all messages are dispatched.

6.38 activemq::core::ActiveMQSessionExecutor Class Reference

Delegate dispatcher for a single session.

```
#include <src/main/activemq/core/ActiveMQSessionExecutor.h>
```

Inheritance diagram for `activemq::core::ActiveMQSessionExecutor`:

Public Member Functions

- **ActiveMQSessionExecutor** (**ActiveMQSession** *session)
Creates an un-started executor for the given session.
- virtual **~ActiveMQSessionExecutor** ()
*Calls **stop()** (p. 359) then **clear()** (p. 356).*
- virtual void **execute** (const **Pointer**< **MessageDispatch** > &data)
Executes the dispatch.
- virtual void **executeFirst** (const **Pointer**< **MessageDispatch** > &data)
Executes the dispatch.

- virtual void **clearMessagesInProgress** ()
Removes all messages in the Dispatch Channel so that non are delivered.
- virtual bool **hasUnconsumedMessages** () const
- virtual void **wakeup** ()
wakeup this executer and dispatch any pending messages.
- virtual void **start** ()
Starts the dispatching.
- virtual void **stop** ()
Stops dispatching.
- virtual void **close** ()
Terminates the dispatching thread.
- virtual bool **isRunning** () const
- virtual bool **isEmpty** ()
- virtual void **clear** ()
Removes all queued messages and destroys them.
- virtual bool **iterate** ()
*Iterates on the **MessageDispatchChannel** (p. 1886) sending all pending messages to the Consumers they are destined for.*
- std::vector< **Pointer** < **MessageDispatch** > > **getUnconsumedMessages** ()

6.38.1 Detailed Description

Delegate dispatcher for a single session.

Contains a thread to provide for asynchronous dispatching.

6.38.2 Constructor & Destructor Documentation

6.38.2.1 `activemq::core::ActiveMQSessionExecutor::ActiveMQSessionExecutor (ActiveMQSession * session)`

Creates an un-started executor for the given session.

6.38.2.2 `virtual activemq::core::ActiveMQSessionExecutor::~~ActiveMQSession-Executor () [virtual]`

Calls **stop()** (p. 359) then **clear()** (p. 356).

6.38.3 Member Function Documentation

6.38.3.1 `virtual void activemq::core::ActiveMQSessionExecutor::clear () [inline, virtual]`

Removes all queued messages and destroys them.

6.38.3.2 virtual void **activemq::core::ActiveMQSessionExecutor::clearMessagesInProgress** () [inline, virtual]

Removes all messages in the Dispatch Channel so that non are delivered.

6.38.3.3 virtual void **activemq::core::ActiveMQSessionExecutor::close** () [inline, virtual]

Terminates the dispatching thread.

Once this is called, the executor is no longer usable.

6.38.3.4 virtual void **activemq::core::ActiveMQSessionExecutor::execute** (const **Pointer< MessageDispatch > & data**) [virtual]

Executes the dispatch.

Adds the given data to the end of the queue.

Parameters

<i>data</i>	- the data to be dispatched.
-------------	------------------------------

6.38.3.5 virtual void **activemq::core::ActiveMQSessionExecutor::executeFirst** (const **Pointer< MessageDispatch > & data**) [virtual]

Executes the dispatch.

Adds the given data to the beginning of the queue.

Parameters

<i>data</i>	- the data to be dispatched.
-------------	------------------------------

6.38.3.6 std::vector< **Pointer< MessageDispatch >** > **activemq::core::ActiveMQSessionExecutor::getUnconsumedMessages** () [inline]

Returns

a vector containing all the unconsumed messages, this clears the Message - Dispatch Channel when called.

```
6.38.3.7 virtual bool activemq::core::ActiveMQSessionExecutor-  
::hasUnconsumedMessages ( ) const [inline,  
virtual]
```

Returns

true if there are any pending messages in the dispatch channel.

```
6.38.3.8 virtual bool activemq::core::ActiveMQSessionExecutor::isEmpty ( )  
[inline, virtual]
```

Returns

true if there are no messages in the Dispatch Channel.

```
6.38.3.9 virtual bool activemq::core::ActiveMQSessionExecutor::isRunning ( )  
const [inline, virtual]
```

Returns

true indicates if the executor is started

```
6.38.3.10 virtual bool activemq::core::ActiveMQSessionExecutor::iterate ( )  
[virtual]
```

Iterates on the **MessageDispatchChannel** (p. 1886) sending all pending messages to the Consumers they are destined for.

Returns

false if there are no more messages to dispatch.

Implements **activemq::threads::Task** (p. 2676).

```
6.38.3.11 virtual void activemq::core::ActiveMQSessionExecutor::start ( )  
[virtual]
```

Starts the dispatching.

6.38.3.12 virtual void **activemq::core::ActiveMQSessionExecutor::stop** ()
[virtual]

Stops dispatching.

6.38.3.13 virtual void **activemq::core::ActiveMQSessionExecutor::wakeup** ()
[virtual]

wakeup this executor and dispatch any pending messages.

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQSessionExecutor.h**

6.39 activemq::commands::ActiveMQStreamMessage Class - Reference

```
#include <src/main/activemq/commands/ActiveMQStreamMessage.h>
```

Inheritance diagram for **activemq::commands::ActiveMQStreamMessage**:

Public Member Functions

- **ActiveMQStreamMessage** ()
- virtual **~ActiveMQStreamMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQStreamMessage * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual void **onSend** ()
*Allows derived **Message** (p. 1821) classes to perform tasks before a message is sent.*
- virtual **cms::StreamMessage * clone** () const

Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual void **clearBody** ()
Clears out the body of the message.
- virtual void **reset** ()
- virtual bool **readBoolean** () const
Reads a Boolean from the Stream message stream.
- virtual void **writeBoolean** (bool value)
Writes a boolean to the Stream message stream as a 1-byte value.
- virtual unsigned char **readByte** () const
Reads a Byte from the Stream message stream.
- virtual void **writeByte** (unsigned char value)
Writes a byte to the Stream message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) const
Reads a byte array from the Stream message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)
Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) const
Reads a portion of the Stream message stream.
- virtual void **writeBytes** (const unsigned char *value, int offset, int length)
Writes a portion of a byte array to the Stream message stream.
- virtual char **readChar** () const
Reads a Char from the Stream message stream.
- virtual void **writeChar** (char value)
Writes a char to the Stream message stream as a 1-byte value.
- virtual float **readFloat** () const
Reads a 32 bit float from the Stream message stream.
- virtual void **writeFloat** (float value)
Writes a float to the Stream message stream as a 4 byte value.
- virtual double **readDouble** () const
Reads a 64 bit double from the Stream message stream.
- virtual void **writeDouble** (double value)
Writes a double to the Stream message stream as a 8 byte value.
- virtual short **readShort** () const
Reads a 16 bit signed short from the Stream message stream.
- virtual void **writeShort** (short value)
Writes a signed short to the Stream message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const
Reads a 16 bit unsigned short from the Stream message stream.
- virtual void **writeUnsignedShort** (unsigned short value)
Writes a unsigned short to the Stream message stream as a 2 byte value.
- virtual int **readInt** () const
Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)
Writes a signed int to the Stream message stream as a 4 byte value.
- virtual long long **readLong** () const
Reads a 64 bit long from the Stream message stream.
- virtual void **writeLong** (long long value)
Writes a long long to the Stream message stream as a 8 byte value.
- virtual std::string **readString** () const
Reads an ASCII String from the Stream message stream.
- virtual void **writeString** (const std::string &value)
Writes an ASCII String to the Stream message stream.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQSTREAMMESSAGE** = 27

6.39.1 Constructor & Destructor Documentation

6.39.1.1 **activemq::commands::ActiveMQStreamMessage::ActiveMQStreamMessage ()**

6.39.1.2 **virtual activemq::commands::ActiveMQStreamMessage::~ActiveMQStreamMessage () throw ()**
[virtual]

6.39.2 Member Function Documentation

6.39.2.1 **virtual void activemq::commands::ActiveMQStreamMessage::clearBody ()** [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 296).

6.39.2.2 **virtual cms::StreamMessage* activemq::commands::ActiveMQStreamMessage::clone () const** [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1844).

6.39.2.3 `virtual ActiveMQStreamMessage* activemq::commands-
::ActiveMQStreamMessage::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.39.2.4 `virtual void activemq::commands::ActiveMQStream-
Message::copyDataStructure (const DataStructure * src)
[virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.39.2.5 `virtual bool activemq::commands::ActiveMQStreamMessage::equals (
const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 297).

6.39.2.6 `virtual unsigned char activemq::commands::ActiveMQStreamMessage::getDataStructureType () const`
`[virtual]`

Get the **DataStream** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.39.2.7 `virtual void activemq::commands::ActiveMQStreamMessage::onSend ()`
`[virtual]`

Allows derived **Message** (p. 1821) classes to perform tasks before a message is sent.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 299).

6.39.2.8 `virtual bool activemq::commands::ActiveMQStreamMessage::read-Boolean () const` `[virtual]`

Reads a Boolean from the Stream message stream.

Returns

boolean value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2608).

6.39.2.9 `virtual unsigned char activemq::commands::ActiveMQStreamMessage::readByte () const` `[virtual]`

Reads a Byte from the Stream message stream.

Returns

unsigned char value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2609).

6.39.2.10 `virtual int activemq::commands::ActiveMQStreamMessage::readBytes (std::vector< unsigned char > & value) const [virtual]`

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

<i>value</i>	buffer to place data in
--------------	-------------------------

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2609).

6.39.2.11 `virtual int activemq::commands::ActiveMQStreamMessage::readBytes (unsigned char * buffer, int length) const` [virtual]

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `CMSException` is thrown. No bytes will be read from the stream for this exception case.

Parameters

<i>buffer</i>	the buffer into which the data is read
<i>length</i>	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2610).

6.39.2.12 `virtual char activemq::commands::ActiveMQStreamMessage::readChar () const` [virtual]

Reads a Char from the Stream message stream.

Returns

char value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2611).

6.39.2.13 virtual double **activemq::commands::ActiveMQStreamMessage::readDouble** () const [virtual]

Reads a 64 bit double from the Stream message stream.

Returns

double value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2612).

6.39.2.14 virtual float **activemq::commands::ActiveMQStreamMessage::readFloat** () const [virtual]

Reads a 32 bit float from the Stream message stream.

Returns

double value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2612).

6.39.2.15 `virtual int activemq::commands::ActiveMQStreamMessage::readInt ()
const [virtual]`

Reads a 32 bit signed integer from the Stream message stream.

Returns

int value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2613).

6.39.2.16 `virtual long long activemq::commands::ActiveMQStreamMessage::read-
Long () const [virtual]`

Reads a 64 bit long from the Stream message stream.

Returns

long long value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
---------------------	---

<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2613).

6.39.2.17 virtual short **activemq::commands::ActiveMQStreamMessage::readShort**
() const [virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns

short value from stream

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i>	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2614).

6.39.2.18 virtual std::string **activemq::commands::ActiveMQStreamMessage::readString**
() const [virtual]

Reads an ASCII String from the Stream message stream.

Returns

String from stream

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i>	- if unexpected end of message stream has been reached.

<i>MessageFormatException</i>	- if this type conversion is invalid.
<i>MessageNotReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2614).

6.39.2.19 virtual unsigned short **activemq::commands::ActiveMQStreamMessage::readUnsignedShort** () const
[virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns

unsigned short value from stream

Exceptions

<i>CMSException</i>	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOFException</i>	- if unexpected end of message stream has been reached.
<i>MessageFormatException</i>	- if this type conversion is invalid.
<i>MessageNotReadableException</i>	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2615).

6.39.2.20 virtual void **activemq::commands::ActiveMQStreamMessage::reset** ()
[virtual]

6.39.2.21 virtual std::string **activemq::commands::ActiveMQStreamMessage::toString** () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.39.2.22 `virtual void activemq::commands::ActiveMQStreamMessage::writeBoolean (bool value) [virtual]`

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

<i>value</i>	boolean to write to the stream
--------------	--------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2615).

6.39.2.23 `virtual void activemq::commands::ActiveMQStreamMessage::writeByte (unsigned char value) [virtual]`

Writes a byte to the Stream message stream as a 1-byte value.

Parameters

<i>value</i>	byte to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWritableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2616).

6.39.2.24 `virtual void activemq::commands::ActiveMQStreamMessage::writeBytes (const std::vector< unsigned char > & value) [virtual]`

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2616).

6.39.2.25 virtual void **activemq::commands::ActiveMQStreamMessage::writeBytes**
(const unsigned char * *value*, int *offset*, int *length*) [virtual]

Writes a portion of a byte array to the Stream message stream.

size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
<i>offset</i>	the initial offset within the byte array
<i>length</i>	the number of bytes to use

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2616).

6.39.2.26 virtual void **activemq::commands::ActiveMQStreamMessage::writeChar** (
char *value*) [virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters

<i>value</i>	char to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2617).

6.39.2.27 **virtual void activemq::commands::ActiveMQStreamMessage::write-
Double (double *value*)** [virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters

<i>value</i>	double to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2617).

6.39.2.28 **virtual void activemq::commands::ActiveMQStreamMessage::writeFloat (float *value*)** [virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters

<i>value</i>	float to write to the stream
--------------	------------------------------

Exceptions

<i>CMSEException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2618).

6.39.2.29 **virtual void activemq::commands::ActiveMQStreamMessage::writeInt (int *value*)** [virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters

<i>value</i>	signed int to write to the stream
--------------	-----------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2618).

6.39.2.30 **virtual void activemq::commands::ActiveMQStreamMessage::writeLong (long long *value*)** [virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters

<i>value</i>	signed long long to write to the stream
--------------	---

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2619).

6.39.2.31 **virtual void activemq::commands::ActiveMQStreamMessage::writeShort (short *value*)** [virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters

<i>value</i>	signed short to write to the stream
--------------	-------------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2619).

6.39.2.32 `virtual void activemq::commands::ActiveMQStreamMessage::writeString
(const std::string & value) [virtual]`

Writes an ASCII String to the Stream message stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2619).

6.39.2.33 `virtual void activemq::commands::ActiveMQStream-
Message::writeUnsignedShort (unsigned short value)
[virtual]`

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters

<i>value</i>	unsigned short to write to the stream
--------------	---------------------------------------

Exceptions

<i>CMSException</i>	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i>	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2620).

6.39.3 Field Documentation

6.39.3.1 `const unsigned char activemq::commands::ActiveMQ-
StreamMessage::ID_ACTIVEMQSTREAMMESSAGE = 27
[static]`

The documentation for this class was generated from the following file:

6.40 activemq::wireformat::openwire::marshal::generated::ActiveMQStream-MessageMarshaller Class

Reference

375

6.40 activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p.375).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-ActiveMQStreamMessageMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller:

Public Member Functions

- **ActiveMQStreamMessageMarshaller** ()
- virtual ~**ActiveMQStreamMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marshal to the given stream.

6.40.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p.375).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.40.2 Constructor & Destructor Documentation

6.40.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::ActiveMQStreamMessageMarshaller ()**
[inline]

6.40.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::~~ActiveMQStreamMessageMarshaller ()**
[inline, virtual]

6.40.3 Member Function Documentation

6.40.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::createObject () const** [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.40.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::getDataStructureType () const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.40.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

6.40 activemq::wireformat::openwire::marshal::generated::ActiveMQStream-MessageMarshaller Class

Reference

377

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.40.3.4 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::looseUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.40.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tightMarshal1** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.40.3.6 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tightMarshal2` (`OpenWireFormat * format`, `commands::DataStructure * command`, `decaf::io::DataOutputStream * ds`, `utils::BooleanStream * bs`) `[virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1921).

6.40.3.7 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tightUnmarshal` (`OpenWireFormat * format`, `commands::DataStructure * command`, `decaf::io::DataInputStream * dis`, `utils::BooleanStream * bs`) `[virtual]`

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1921).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQStreamMessageMarshaller.h`

6.41 activemq::commands::ActiveMQTempDestination Class - Reference

```
#include <src/main/activemq/commands/ActiveMQTempDestination.h>
```

Inheritance diagram for activemq::commands::ActiveMQTempDestination:

Public Member Functions

- **ActiveMQTempDestination** ()
- **ActiveMQTempDestination** (const std::string &name)
- virtual ~**ActiveMQTempDestination** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTempDestination** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual void **close** ()
Closes this object and deallocates the appropriate resources.
- void **setConnection** (core::ActiveMQConnection *connection)
Sets the Parent Connection that is notified when this destination is destroyed.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEMPDESTINATION** = 0

Protected Attributes

- core::ActiveMQConnection * **connection**
Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.41.1 Constructor & Destructor Documentation

- 6.41.1.1 `activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination ()`
- 6.41.1.2 `activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination (const std::string & name)`
- 6.41.1.3 `virtual activemq::commands::ActiveMQTempDestination::~~ActiveMQTempDestination () throw () [virtual]`

6.41.2 Member Function Documentation

- 6.41.2.1 `virtual ActiveMQTempDestination* activemq::commands::ActiveMQTempDestination::cloneDataStructure () const [inline, virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 249).

Reimplemented in `activemq::commands::ActiveMQTempQueue` (p. 388), and `activemq::commands::ActiveMQTempTopic` (p. 397).

- 6.41.2.2 `virtual void activemq::commands::ActiveMQTempDestination::close () [virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>CMSException</i> - If an error occurs while the resource is being closed.
--

Implements `cms::Closeable` (p. 816).

- 6.41.2.3 `virtual void activemq::commands::ActiveMQTempDestination::copyDataStructure (const DataStructure * src) [inline, virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 249).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 388), and **activemq::commands::ActiveMQTempTopic** (p. 398).

References **activemq::commands::ActiveMQDestination::copyDataStructure()**.

6.41.2.4 **virtual bool activemq::commands::ActiveMQTempDestination::equals (const DataStructure * value) const** [inline, virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 250).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 389), and **activemq::commands::ActiveMQTempTopic** (p. 398).

References **activemq::commands::ActiveMQDestination::equals()**.

6.41.2.5 **virtual unsigned char activemq::commands::ActiveMQTempDestination::getDataStructureType () const** [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 390), and **activemq::commands::ActiveMQTempTopic** (p. 399).

6.41.2.6 **void activemq::commands::ActiveMQTempDestination::setConnection (core::ActiveMQConnection * connection)** [inline]

Sets the Parent Connection that is notified when this destination is destroyed.

Parameters

<i>connection</i>	The parent connection to be used to destroy this destination if closed..
-------------------	--

6.41.2.7 `virtual std::string activemq::commands::ActiveMQTempDestination::toString () const` `[virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 255).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 391), and **activemq::commands::ActiveMQTempTopic** (p. 400).

6.41.3 Field Documentation

6.41.3.1 `core::ActiveMQConnection* activemq::commands::ActiveMQTempDestination::connection` `[protected]`

Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.41.3.2 `const unsigned char activemq::commands::ActiveMQTempDestination::ID_ACTIVEMQTEMPDESTINATION = 0` `[static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQTempDestination.h`

6.42 **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** Class Reference

Marshaling code for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p. 382).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTempDestinationMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller`:

- **ActiveMQTempDestinationMarshaller** ()
- virtual **~ActiveMQTempDestinationMarshaller** ()
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marhsal to the given stream.

6.42.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p.382).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.42.2 Constructor & Destructor Documentation

6.42.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::ActiveMQTempDestinationMarshaller** ()
 [inline]

6.42.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::~~ActiveMQTempDestinationMarshaller** ()
 [inline, virtual]

6.42.3 Member Function Documentation

6.42.3.1 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)` [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller` (p. 259).

Reimplemented in `activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller` (p. 393), and `activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller` (p. 403).

6.42.3.2 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)` [virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller` (p. 259).

Reimplemented in `activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller` (p. 394), and `activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller` (p. 403).

6.42 activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller Class

Reference

385

6.42.3.3 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 260).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 394), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 403).

6.42.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*)
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 260).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 395), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 404).

6.42.3.5 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs)` [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller` (p.261).

Reimplemented in `activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller` (p.395), and `activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller` (p.404).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTempDestinationMarshaller.h`

6.43 activemq::commands::ActiveMQTempQueue Class Reference

```
#include <src/main/activemq/commands/ActiveMQTempQueue.h>
```

Inheritance diagram for `activemq::commands::ActiveMQTempQueue`:

Public Member Functions

- `ActiveMQTempQueue ()`
- `ActiveMQTempQueue (const std::string &name)`
- `virtual ~ActiveMQTempQueue () throw ()`
- `virtual unsigned char getDataStructureType () const`
Get the *DataStructure* (p. 1133) Type as defined in *CommandTypes.h*.
- `virtual ActiveMQTempQueue * cloneDataStructure () const`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual const **cms::Destination** * **getCMSDestination** () const
- virtual **cms::Destination::DestinationType** **getDestinationType** () const
Returns the Type of Destination that this object represents.
- virtual **cms::Destination** * **clone** () const
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const **cms::Destination** &source)
Copies the contents of the given Destination object to this one.
- virtual const **cms::CMSProperties** & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual bool **equals** (const **cms::Destination** &other) const
Compares two Destination instances to determine if they represent the same logic Destination.
- virtual std::string **getQueueName** () const
Gets the name of this queue.
- virtual void **destroy** ()
Destroy's the Temporary Destination at the Provider.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEMPQUEUE** = 102

6.43.1 Constructor & Destructor Documentation

6.43.1.1 **activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue** ()

6.43.1.2 **activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue** (const std::string & name)

6.43.1.3 **virtual activemq::commands::ActiveMQTempQueue::~~ActiveMQTempQueue** () throw () [virtual]

6.43.2 Member Function Documentation

6.43.2.1 `virtual cms::Destination* activemq::commands::-`
`ActiveMQTempQueue::clone () const [inline,`
`virtual]`

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 1211).

6.43.2.2 `virtual ActiveMQTempQueue* activemq::commands::-`
`ActiveMQTempQueue::cloneDataStructure () const`
`[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 380).

6.43.2.3 `virtual void activemq::commands::ActiveMQTempQueue::copy (const`
`cms::Destination & source) [inline, virtual]`

Copies the contents of the given Destination object to this one.

Parameters

<i>source</i>	The source Destination object.
---------------	--------------------------------

Implements **cms::Destination** (p. 1211).

6.43.2.4 `virtual void activemq::commands::ActiveMQTempQueue-`
`::copyDataStructure (const DataStructure * src)`
`[virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 380).

6.43.2.5 `virtual void activemq::commands::ActiveMQTempQueue::destroy ()`
[virtual]

Destroy's the Temporary Destination at the Provider.

Exceptions

<i>CMSException</i>	- if an internal error occurs.
---------------------	--------------------------------

Implements **cms::TemporaryQueue** (p. 2699).

6.43.2.6 `virtual bool activemq::commands::ActiveMQTempQueue::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 381).

6.43.2.7 `virtual bool activemq::commands::ActiveMQTempQueue::equals (const cms::Destination & other) const` [virtual]

Compares two Destination instances to determine if they represent the same logic - Destination.

Parameters

<i>other</i>	The other destination to compare this one to.
--------------	---

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 1212).

6.43.2.8 `virtual const cms::Destination* activemq::commands::ActiveMQTempQueue::getCMSDestination () const` [inline, virtual]

Returns

the **cms::Destination** (p. 1210) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

6.43.2.9 `virtual const cms::CMSProperties& activemq::commands::ActiveMQTempQueue::getCMSProperties () const [inline, virtual]`

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1212).

6.43.2.10 `virtual unsigned char activemq::commands::ActiveMQTempQueue::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 381).

6.43.2.11 `virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempQueue::getDestinationType () const [inline, virtual]`

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 251).

References cms::Destination::TEMPORARY_QUEUE.

6.44 activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller Class

Reference

391

6.43.2.12 `virtual std::string activemq::commands::ActiveMQTempQueue::getQueueName () const [inline, virtual]`

Gets the name of this queue.

Returns

The queue name.

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::TemporaryQueue** (p. 2699).

6.43.2.13 `virtual std::string activemq::commands::ActiveMQTempQueue::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 382).

6.43.3 Field Documentation

6.43.3.1 `const unsigned char activemq::commands::ActiveMQTempQueue::ID_ACTIVEMQTEMPQUEUE = 102 [static]`

The documentation for this class was generated from the following file:

[inline]

6.44 activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller Class

Reference

393

6.44.2.2 `virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::~~ActiveMQTempQueueMarshaller ()`
[inline, virtual]

6.44.3 Member Function Documentation

6.44.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::createObject ()`
`const` [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.44.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::getDataStructureType () const`
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.44.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)` [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 384).

6.44.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)`
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 384).

6.44.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs)`
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 385).

6.44 activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller Class

Reference

395

6.44.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 385).

6.44.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 386).

The documentation for this class was generated from the following file:

6.45 activemq::commands::ActiveMQTempTopic Class Reference

```
#include <src/main/activemq/commands/ActiveMQTempTopic.h>
```

Inheritance diagram for activemq::commands::ActiveMQTempTopic:

Public Member Functions

- **ActiveMQTempTopic** ()
- **ActiveMQTempTopic** (const std::string &name)
- virtual ~**ActiveMQTempTopic** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTempTopic** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual const cms::Destination * **getCMSDestination** () const
- virtual cms::Destination::DestinationType **getDestinationType** () const
Returns the Type of Destination that this object represents.
- virtual cms::Destination * **clone** () const
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const cms::Destination &source)
Copies the contents of the given Destination object to this one.
- virtual const cms::CMSProperties & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual bool **equals** (const cms::Destination &other) const
Compares two Destination instances to determine if they represent the same logic Destination.
- virtual std::string **getTopicName** () const
Gets the name of this topic.
- virtual void **destroy** ()
Destroy's the Temporary Destination at the Provider.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEMPTOPIC** = 103

6.45.1 Constructor & Destructor Documentation

6.45.1.1 `activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic ()`

6.45.1.2 `activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic (const std::string & name)`

6.45.1.3 `virtual activemq::commands::ActiveMQTempTopic::~~ActiveMQTempTopic () throw () [virtual]`

6.45.2 Member Function Documentation

6.45.2.1 `virtual cms::Destination* activemq::commands::ActiveMQTempTopic::clone () const [inline, virtual]`

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 1211).

6.45.2.2 `virtual ActiveMQTempTopic* activemq::commands::ActiveMQTempTopic::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 380).

6.45.2.3 `virtual void activemq::commands::ActiveMQTempTopic::copy (const cms::Destination & source) [inline, virtual]`

Copies the contents of the given Destination object to this one.

Parameters

<i>source</i>	The source Destination object.
---------------	--------------------------------

Implements **cms::Destination** (p. 1211).

6.45.2.4 `virtual void activemq::commands::ActiveMQTempTopic-
::copyDataStructure (const DataStructure * src)
[virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 380).

6.45.2.5 `virtual void activemq::commands::ActiveMQTempTopic::destroy ()
[virtual]`

Destroy's the Temporary Destination at the Provider.

Exceptions

<i>CMSException</i>

Implements **cms::TemporaryTopic** (p. 2701).

6.45.2.6 `virtual bool activemq::commands::ActiveMQTempTopic::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 381).

6.45.2.7 `virtual bool activemq::commands::ActiveMQTempTopic::equals (const cms::Destination & other) const` [virtual]

Compares two Destination instances to determine if they represent the same logic - Destination.

Parameters

<i>other</i>	The other destination to compare this one to.
--------------	---

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 1212).

6.45.2.8 `virtual const cms::Destination* activemq::commands::ActiveMQTempTopic::getCMSDestination () const` [inline, virtual]

Returns

the **cms::Destination** (p. 1210) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

6.45.2.9 `virtual const cms::CMSProperties& activemq::commands::ActiveMQTempTopic::getCMSProperties () const` [inline, virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1212).

6.45.2.10 `virtual unsigned char activemq::commands::ActiveMQTempTopic::getDataStructureType () const` [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 381).

6.45.2.11 `virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempTopic::getDestinationType () const [inline, virtual]`

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 251).

References cms::Destination::TEMPORARY_TOPIC.

6.45.2.12 `virtual std::string activemq::commands::ActiveMQTempTopic::getTopicName () const [inline, virtual]`

Gets the name of this topic.

Returns

The topic name.

Exceptions

<i>CMSEException</i> - if an internal error occurs.

Implements **cms::TemporaryTopic** (p. 2701).

6.45.2.13 `virtual std::string activemq::commands::ActiveMQTempTopic::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 382).

[inline, virtual]

6.46.3 Member Function Documentation

6.46.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::createObject ()**
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.46.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::getDataStructureType ()** **const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.46 activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller Class

Reference

403

6.46.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 384).

6.46.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 384).

6.46.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p.385).

6.46.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p.385).

6.46.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 386).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTempTopicMarshaller.h**

6.47 activemq::commands::ActiveMQTextMessage Class Reference

```
#include <src/main/activemq/commands/ActiveMQTextMessage.h>
```

Inheritance diagram for activemq::commands::ActiveMQTextMessage:

Public Member Functions

- **ActiveMQTextMessage** ()
- virtual **~ActiveMQTextMessage** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataSetructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTextMessage** * **cloneDataSetructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataSetructure** (const **DataSetructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataSetructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataSetructure** *value) const
*Compares the **DataSetructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual void **clearBody** ()
Clears out the body of the message.
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat)
Called before marshaling is started to prepare the object to be marshaled.
- virtual unsigned int **getSize** () const
Returns the Size of this message in Bytes.
- virtual **cms::TextMessage** * **clone** () const

Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual std::string **getText** () const
Gets the message character buffer.
- virtual void **setText** (const char *msg)
Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual void **setText** (const std::string &msg)
Sets the message contents.

Data Fields

- std::auto_ptr< std::string > **text**

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEXTMESSAGE** = 28

6.47.1 Constructor & Destructor Documentation

6.47.1.1 **activemq::commands::ActiveMQTextMessage::ActiveMQTextMessage** ()

6.47.1.2 **virtual activemq::commands::ActiveMQTextMessage::~~ActiveMQTextMessage** () throw () [virtual]

6.47.2 Member Function Documentation

6.47.2.1 **virtual void activemq::commands::ActiveMQTextMessage::beforeMarshal** (**wireformat::WireFormat * wireFormat**) [virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

<i>wireFormat</i>	The wireformat object to control marshaling
-------------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

Implements **activemq::wireformat::MarshalAware** (p. 1794).

6.47.2.2 **virtual void activemq::commands::ActiveMQTextMessage::clearBody** () [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

<i>CMSException</i>	- if an internal error occurs.
---------------------	--------------------------------

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::TextMessage** > (p. 296).

6.47.2.3 `virtual cms::TextMessage* activemq::commands::ActiveMQTextMessage::clone () const [inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1844).

6.47.2.4 `virtual ActiveMQTextMessage* activemq::commands::ActiveMQTextMessage::cloneDataStructure () const [virtual]`

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1826).

6.47.2.5 `virtual void activemq::commands::ActiveMQTextMessage::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1827).

6.47.2.6 `virtual bool activemq::commands::ActiveMQTextMessage::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::TextMessage** > (p. 297).

6.47.2.7 `virtual unsigned char activemq::commands::Active-
MQTextMessage::getDataStructureType () const
[virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1829).

6.47.2.8 `virtual unsigned int activemq::commands::ActiveMQTextMessage::getSize () const [virtual]`

Returns the Size of this message in Bytes.

Returns

number of bytes this message equates to.

Reimplemented from **activemq::commands::Message** (p. 1831).

6.47.2.9 `virtual std::string activemq::commands::ActiveMQTextMessage::getText () const [virtual]`

Gets the message character buffer.

Returns

The message character buffer.

Exceptions

<i>CMSException</i>	- if an internal error occurs.
---------------------	--------------------------------

Implements **cms::TextMessage** (p. 2702).

6.47.2.10 virtual void **activemq::commands::ActiveMQTextMessage::setText** (const char * *msg*) [virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters

<i>msg</i>	The message buffer.
------------	---------------------

Exceptions

<i>CMSException</i>	- if an internal error occurs.
<i>MessageNotWriteableException</i>	- if the message is in read-only mode..

Implements **cms::TextMessage** (p. 2703).

6.47.2.11 virtual void **activemq::commands::ActiveMQTextMessage::setText** (const std::string & *msg*) [virtual]

Sets the message contents.

Parameters

<i>msg</i>	The message buffer.
------------	---------------------

Exceptions

<i>CMSException</i>	- if an internal error occurs.
<i>MessageNotWriteableException</i>	- if the message is in read-only mode..

Implements **cms::TextMessage** (p. 2703).

6.47.2.12 virtual std::string **activemq::commands::ActiveMQTextMessage::toString** () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1836).

6.47.3 Field Documentation

6.47.3.1 `const unsigned char activemq::commands::ActiveMQTextMessage::ID_ACTIVEMQTEXTMESSAGE = 28`
[static]

6.47.3.2 `std::auto_ptr<std::string> activemq::commands::ActiveMQTextMessage::text` [mutable]

The documentation for this class was generated from the following file:

6.48 activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 410).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTextMessageMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller`:

Public Member Functions

- **ActiveMQTextMessageMarshaller** ()
- virtual **~ActiveMQTextMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

6.48 activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller Class

Reference

411

Tight Marshal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tight Marshal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

Loose Un-marshal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

Tight Marshal to the given stream.

6.48.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 410).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.48.2 Constructor & Destructor Documentation

6.48.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::ActiveMQTextMessageMarshaller** ()
[inline]

6.48.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::~~ActiveMQTextMessageMarshaller** ()
[inline, virtual]

6.48.3 Member Function Documentation

6.48.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::createObject** () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.48.3.2 virtual unsigned char **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::getDataStructureType** () const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.48.3.3 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::looseMarshal** (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.48.3.4 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::looseUnmarshal** (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

6.48 activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller Class

Reference

413

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.48.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tightMarshal1** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **utils::BooleanStream** * *bs*)
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1920).

6.48.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

6.48.3.7 virtual void `activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs)` [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1921).

The documentation for this class was generated from the following file:

6.49 activemq::commands::ActiveMQTopic Class Reference

```
#include <src/main/activemq/commands/ActiveMQTopic.h>
```

Inheritance diagram for `activemq::commands::ActiveMQTopic`:

Public Member Functions

- **ActiveMQTopic** ()
- **ActiveMQTopic** (const std::string &name)
- virtual ~**ActiveMQTopic** () throw ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTopic** * **cloneDataStructure** () const
Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual const cms::Destination * **getCMSDestination** () const
- virtual cms::Destination::DestinationType **getDestinationType** () const
Returns the Type of Destination that this object represents.
- virtual cms::Destination * **clone** () const
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const cms::Destination &source)
Copies the contents of the given Destination object to this one.
- virtual const cms::CMSProperties & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual bool **equals** (const cms::Destination &other) const
Compares two Destination instances to determine if they represent the same logic Destination.
- virtual std::string **getTopicName** () const
Gets the name of this topic.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTOPIC** = 101

6.49.1 Constructor & Destructor Documentation

6.49.1.1 **activemq::commands::ActiveMQTopic::ActiveMQTopic** ()

6.49.1.2 **activemq::commands::ActiveMQTopic::ActiveMQTopic** (const std::string & name)

6.49.1.3 **virtual activemq::commands::ActiveMQTopic::~~ActiveMQTopic** () throw
() [virtual]

6.49.2 Member Function Documentation

6.49.2.1 **virtual cms::Destination* activemq::commands::ActiveMQTopic::clone** () const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 1211).

6.49.2.2 `virtual ActiveMQTopic* activemq::commands::ActiveMQTopic::clone-
DataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 249).

6.49.2.3 `virtual void activemq::commands::ActiveMQTopic::copy (const
cms::Destination & source) [inline, virtual]`

Copies the contents of the given Destination object to this one.

Parameters

<i>source</i>	The source Destination object.
---------------	--------------------------------

Implements `cms::Destination` (p. 1211).

6.49.2.4 `virtual void activemq::commands::ActiveMQTopic::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 249).

6.49.2.5 `virtual bool activemq::commands::ActiveMQTopic::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure` (p. 1133)'s are Equal.

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 250).

6.49.2.6 `virtual bool activemq::commands::ActiveMQTopic::equals (const cms::Destination & other) const` [virtual]

Compares two Destination instances to determine if they represent the same logic - Destination.

Parameters

<i>other</i>	The other destination to compare this one to.
--------------	---

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 1212).

6.49.2.7 `virtual const cms::Destination* activemq::commands::ActiveMQTopic::getCMSDestination () const` [inline, virtual]

Returns

the **cms::Destination** (p. 1210) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

6.49.2.8 `virtual const cms::CMSProperties& activemq::commands::ActiveMQTopic::getCMSProperties () const` [inline, virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 1212).

6.49.2.9 `virtual unsigned char activemq::commands::ActiveMQTopic::getDataStructureType () const` [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 251).

6.49.2.10 `virtual cms::Destination::DestinationType activemq::commands-
::ActiveMQTopic::getDestinationType () const [inline,
virtual]`

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 251).

References cms::Destination::TOPIC.

6.49.2.11 `virtual std::string activemq::commands::ActiveMQTopic::getTopicName () const [inline, virtual]`

Gets the name of this topic.

Returns

The topic name.

Exceptions

<i>CMSException</i> - If an internal error occurs.
--

Implements **cms::Topic** (p. 2765).

6.49.2.12 `virtual std::string activemq::commands::ActiveMQTopic::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 255).

6.49.3 Field Documentation

6.49.3.1 `const unsigned char activemq::commands::ActiveMQTopic::ID_ACTIVEMQ-
TOPIC = 101 [static]`

6.50.2.1 **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::ActiveMQTopicMarshaller ()**
[inline]

6.50.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::~~ActiveMQTopicMarshaller ()** [inline, virtual]

6.50.3 Member Function Documentation

6.50.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::createObject ()** const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.50.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::getDataStructureType ()** const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.50

activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller Class Reference 421

6.50.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 259).

6.50.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 259).

6.50.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 260).

6.50.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 260).

6.50.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 261).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTopicMarshaller.h**

6.51 activemq::core::ActiveMQTransactionContext Class Reference

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.

```
#include <src/main/activemq/core/ActiveMQTransaction-Context.h>
```

Inheritance diagram for **activemq::core::ActiveMQTransactionContext**:

Public Member Functions

- **ActiveMQTransactionContext** (**ActiveMQSession** *session, const **decaf::util::Properties** &properties)
Constructor.
- virtual ~**ActiveMQTransactionContext** ()
- virtual void **addSynchronization** (const **Pointer**< **Synchronization** > &sync)
*Adds a **Synchronization** (p. 2654) to this Transaction.*
- virtual void **removeSynchronization** (const **Pointer**< **Synchronization** > &sync)
*Removes a **Synchronization** (p. 2654) to this Transaction.*
- virtual void **begin** ()
Begins a new transaction if one is not currently in progress.
- virtual void **commit** ()
Commit the current Transaction.
- virtual void **rollback** ()
Rollback the current Transaction.
- virtual const **decaf::lang::Pointer** < **commands::TransactionId** > & **getTransactionId** () const
Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.
- virtual bool **isInTransaction** () const

Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.

- virtual bool **isInLocalTransaction** () const

Checks to see if there is currently an Local Transaction in progress, returns false if not, true otherwise.

- virtual bool **isInXATransaction** () const

Checks to see if there is currently an XA Transaction in progress, returns false if not, true otherwise.

- virtual void **commit** (const **cms::Xid** *xid, bool onePhase)

Commits a global transaction.

- virtual void **end** (const **cms::Xid** *xid, int flags)

Ends the work done for a transaction branch.

- virtual void **forget** (const **cms::Xid** *xid)

Informs the Resource Manager that it can forget about a specified transaction branch.

- virtual int **getTransactionTimeout** () const

Gets the transaction timeout value for this XAResource.

- virtual bool **isSameRM** (const **cms::XAResource** *theXAResource)

Returns true if the ResourceManager for this XAResource is the same as the Resource Manager for a supplied XAResource.

- virtual int **prepare** (const **cms::Xid** *xid)

Requests the Resource manager to prepare to commit a specified transaction.

- virtual int **recover** (int flag, **cms::Xid** **recovered)

Get a list of prepared transaction branches.

- virtual void **rollback** (const **cms::Xid** *xid)

Requests the Resource Manager to rollback a specified transaction branch.

- virtual bool **setTransactionTimeout** (int seconds)

Sets the transaction timeout value for this XAResource.

- virtual void **start** (const **cms::Xid** *xid, int flags)

Starts work for a specified transaction branch.

6.51.1 Detailed Description

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.

The Transaction represents an always running transaction, when it is committed or rolled back it silently creates a new transaction for the next set of messages. The only way to permanently end this transaction is to delete it.

Since

2.0

6.51.2 Constructor & Destructor Documentation

6.51.2.1 `activemq::core::ActiveMQTransactionContext::ActiveMQTransactionContext (
 ActiveMQSession * session, const decaf::util::Properties & properties)`

Constructor.

Parameters

<i>session</i>	The session that contains this transaction
<i>properties</i>	Configuration parameters for this object

6.51.2.2 `virtual activemq::core::ActiveMQTransactionContext::~~ActiveMQ-
 TransactionContext () [virtual]`

6.51.3 Member Function Documentation

6.51.3.1 `virtual void activemq::core::ActiveMQTransactionContext::add-
 Synchronization (const Pointer< Synchronization > & sync)
 [virtual]`

Adds a **Synchronization** (p. 2654) to this Transaction.

Parameters

<i>sync</i>	- The Synchronization (p. 2654) instance to add.
-------------	---

6.51.3.2 `virtual void activemq::core::ActiveMQTransactionContext::begin ()
 [virtual]`

Begins a new transaction if one is not currently in progress.

Exceptions

<i>ActiveMQException</i>	
--------------------------	--

6.51.3.3 `virtual void activemq::core::ActiveMQTransactionContext::commit ()
 [virtual]`

Commit the current Transaction.

Exceptions

<i>ActiveMQException</i>	
--------------------------	--

6.51.3.4 `virtual void activemq::core::ActiveMQTransactionContext::commit (const cms::Xid * xid, bool onePhase) [virtual]`

Commits a global transaction.

Parameters

<i>xid</i>	the XID which identifies the global transaction.
<i>onePhase</i>	true if the resource manager should use a one-phase commit protocol to commit the transaction.

Exceptions

<i>XAException</i>	if an error occurred.
--------------------	-----------------------

Possible errors are identified by the errorcode in the XAException and include: XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, XA_HEURMIX, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVALID, or XAER_PROTO. In addition, one of the XA_RB* errors can occur if the transaction was not committed and onePhase was set to true. On completion of this method, the Resource Manager has rolled back the transaction and released resources held by the transaction.

Implements **cms::XAResource** (p. 2928).

6.51.3.5 `virtual void activemq::core::ActiveMQTransactionContext::end (const cms::Xid * xid, int flags) [virtual]`

Ends the work done for a transaction branch.

The Resource Manager disconnects the XA resource from the transaction branch and allows the transaction to complete.

Parameters

<i>xid</i>	the XID which identifies the global transaction. Should have previously been used as the parameter to a start. method.
<i>flags</i>	a flags integer - one of: XAResource::TMSUCCESS, XAResource::TMFAIL, or XAResource::TMSUSPEND.

TMSUCCESS means that this section of work completed successfully.

TMFAIL means that this section of work failed. The Resource Manager can mark the transaction for rollback only.

TMSUSPEND means that this section of work is suspended and not yet complete. The associated transaction context is also suspended and must be restarted with a call to **start(Xid, int)** (p. ??) with the TMRESUME flag.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.
--------------------	--

Implements **cms::XAResource** (p.2929).

6.51.3.6 virtual void **activemq::core::ActiveMQTransactionContext::forget** (const **cms::Xid** * *xid*) [virtual]

Informs the Resource Manager that it can forget about a specified transaction branch.

Parameters

<i>xid</i>	the XID which identifies the global transaction.
------------	--

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.
--------------------	--

Implements **cms::XAResource** (p.2930).

6.51.3.7 virtual const **decaf::lang::Pointer**<**commands::TransactionId**>& **activemq::core::ActiveMQTransactionContext::getTransactionId** () const [virtual]

Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.

Returns

TransactionInfo

Exceptions

<i>InvalidStateException</i>	if a Transaction is not in progress.
------------------------------	--------------------------------------

6.51.3.8 virtual int **activemq::core::ActiveMQTransactionContext::getTransactionTimeout** () const [virtual]

Gets the transaction timeout value for this XAResource.

The default timeout value is the default timeout value set for the Resource Manager.

Returns

the transaction timeout value for this XAResource in seconds.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.
--------------------	---

Implements **cms::XAResource** (p. 2930).

6.51.3.9 `virtual bool activemq::core::ActiveMQTransactionContext::isInLocalTransaction () const [virtual]`

Checks to see if there is currently an Local Transaction in progress, returns false if not, true otherwise.

Returns

true if an Local Transaction is in progress.

6.51.3.10 `virtual bool activemq::core::ActiveMQTransactionContext::isInTransaction () const [virtual]`

Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.

Returns

true if a transaction is in progress.

6.51.3.11 `virtual bool activemq::core::ActiveMQTransactionContext::isInXATransaction () const [virtual]`

Checks to see if there is currently an XA Transaction in progress, returns false if not, true otherwise.

Returns

true if an XA Transaction is in progress.

6.51.3.12 `virtual bool activemq::core::ActiveMQTransactionContext::isSameRM (const cms::XAResource * theXAResource) [virtual]`

Returns true if the ResourceManager for this XAResource is the same as the Resource Manager for a supplied XAResource.

Parameters

<i>theXA-Resource</i>	an XAResource object
-----------------------	----------------------

Returns

true if the Resource Manager for this XAResource is the same as the Resource Manager for *theXAResource*.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.
--------------------	---

Implements **cms::XAResource** (p. 2930).

6.51.3.13 `virtual int activemq::core::ActiveMQTransactionContext::prepare (const cms::Xid * xid)` [virtual]

Requests the Resource manager to prepare to commit a specified transaction.

Parameters

<i>xid</i>	the XID which identifies the global transaction.
------------	--

Returns

an integer: XA_RDONLY or XA_OK. XA_OK implies that the transaction work has been prepared normally, XA_RDONLY implies that the transaction branch is read only and has been committed. If there is a failure which requires a rollback, an XAException is raised.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVALID, or XAER_PROTO.
--------------------	--

Implements **cms::XAResource** (p. 2931).

6.51.3.14 `virtual int activemq::core::ActiveMQTransactionContext::recover (int flag, cms::Xid ** recovered)` [virtual]

Get a list of prepared transaction branches.

Typically used by a transaction manager during recovery to find transaction branches that are in prepared or heuristically completed states.

Parameters

<i>flag</i>	an integer. Must be one of: XAResource::TMSTARTRSCAN, XAResource::TMENDRSCAN, XAResource::TMNOFLAGS.
-------------	--

Returns

an array of zero or more XIDs identifying the transaction branches in the prepared or heuristically completed states.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_INVALID, and XAER_PROTO.
--------------------	--

Implements **cms::XAResource** (p. 2931).

6.51.3.15 **virtual void activemq::core::ActiveMQTransactionContext::removeSynchronization (const Pointer< Synchronization > & sync)**
[virtual]

Removes a **Synchronization** (p. 2654) to this Transaction.

Parameters

<i>sync</i>	- The Synchronization (p. 2654) instance to add.
-------------	---

6.51.3.16 **virtual void activemq::core::ActiveMQTransactionContext::rollback ()**
[virtual]

Rollback the current Transaction.

Exceptions

<i>ActiveMQException</i>	
--------------------------	--

6.51.3.17 **virtual void activemq::core::ActiveMQTransactionContext::rollback (const cms::Xid * xid)** [virtual]

Requests the Resource Manager to rollback a specified transaction branch.

Parameters

<i>xid</i>	the XID which identifies the transaction branch.
------------	--

Exceptions

<i>XAException</i>	if an error occurs.
--------------------	---------------------

Implements **cms::XAResource** (p.2932).

6.51.3.18 `virtual bool activemq::core::ActiveMQTransactionContext::setTransactionTimeout (int seconds)`
[virtual]

Sets the transaction timeout value for this XAResource.

If the value is set to 0, the default timeout value for the Resource Manager is used.

Parameters

<i>seconds</i>	the new Timeout value in seconds.
----------------	-----------------------------------

Returns

true if the transaction timeout value has been updated, false otherwise.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, or XAER_INVALID.
--------------------	---

Implements **cms::XAResource** (p.2932).

6.51.3.19 `virtual void activemq::core::ActiveMQTransactionContext::start (const cms::Xid * xid, int flags)` [virtual]

Starts work for a specified transaction branch.

Parameters

<i>xid</i>	the XID which identifies the transaction branch.
<i>flags</i>	an integer. Must be one of XAResource::TMNOFLAGS, XAResource::TMJOIN, or XAResource::TMRESUME.

TMJOIN implies that the start applies to joining a transaction previously passed to the Resource Manager.

TMRESUME implies that the start applies to a suspended transaction that should be restarted.

If TMNOFLAGS is specified, then if the transaction has been previously seen by the Resource Manager, an XAException is raised with the code XAER_DUPID.

Exceptions

<i>XAException</i>	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, or XAER_PROTO.
--------------------	--

Implements **cms::XAResource** (p. 2933).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQTransactionContext.h**

6.52 activemq::core::ActiveMQXAConnection Class Reference

```
#include <src/main/activemq/core/ActiveMQXAConnection.h>
```

Inheritance diagram for activemq::core::ActiveMQXAConnection:

Public Member Functions

- **ActiveMQXAConnection** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)
- virtual ~**ActiveMQXAConnection** () throw ()
- virtual **cms::XASession** * **createXASession** ()
Creates an XASession object.
- virtual **cms::Session** * **createSession** (**cms::Session::AcknowledgeMode** ackMode)

*Creates a new **Session** (p. 2361) to work for this **Connection** (p. 933) using the specified acknowledgment mode.*

Parameters

ackMode	<i>the Acknowledgment Mode to use.</i>
---------	--

Exceptions

CMSEException (p. 826)

6.52.1 Constructor & Destructor Documentation

6.52.1.1 **activemq::core::ActiveMQXAConnection::ActiveMQXAConnection** (const **Pointer**< **transport::Transport** > & *transport*, const **Pointer**< **decaf::util::Properties** > & *properties*)

6.52.1.2 virtual **activemq::core::ActiveMQXAConnection::~~ActiveMQXAConnection** () throw () [virtual]

6.52.2 Member Function Documentation

6.52.2.1 `virtual cms::Session* activemq::core::ActiveMQXAConnectionFactory::createSession (cms::Session::AcknowledgeMode ackMode)`
`[virtual]`

Creates a new **Session** (p. 2361) to work for this **Connection** (p. 933) using the specified acknowledgment mode.

Parameters

<i>ackMode</i>	the Acknowledgment Mode to use.
----------------	---------------------------------

Exceptions

CMSException (p. 826)	
---------------------------------	--

Reimplemented from **activemq::core::ActiveMQConnection** (p. 196).

6.52.2.2 `virtual cms::XASession* activemq::core::ActiveMQXAConnectionFactory::createXASession ()` `[virtual]`

Creates an XASession object.

Returns

a newly created XASession instance, caller owns the pointer.

Exceptions

CMSException	If the XAConnection object fails to create the XASession instance due to an internal error.
---------------------	---

Implements **cms::XAConnection** (p. 2918).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQXAConnectionFactory.h`

6.53 activemq::core::ActiveMQXAConnectionFactory Class Reference

```
#include <src/main/activemq/core/ActiveMQXAConnectionFactory.h>
```

Inheritance diagram for `activemq::core::ActiveMQXAConnectionFactory`:

Public Member Functions

- **ActiveMQXAConnectionFactory** ()
- **ActiveMQXAConnectionFactory** (const std::string &uri, const std::string &username="", const std::string &password="")
Constructor.
- **ActiveMQXAConnectionFactory** (const **decaf::net::URI** &uri, const std::string &username="", const std::string &password="")
Constructor.
- virtual ~**ActiveMQXAConnectionFactory** () throw ()
- virtual **cms::XAConnection** * **createXAConnection** ()
Creates an XAConnection with the default user name and password.
- virtual **cms::XAConnection** * **createXAConnection** (const std::string &username, const std::string &password)
Creates an XA connection with the specified user name and password.

Protected Member Functions

- virtual **ActiveMQConnection** * **createActiveMQConnection** (const **Pointer**<**transport::Transport**> &transport, const **Pointer**<**decaf::util::Properties**> &properties)
*Create a new **ActiveMQConnection** (p. 187) instance using the provided Transport and Properties.*

6.53.1 Constructor & Destructor Documentation

6.53.1.1 **activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory** ()

6.53.1.2 **activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory** (const std::string & uri, const std::string & username = " ", const std::string & password = " ")

Constructor.

Parameters

<i>uri</i>	the URI of the Broker we are connecting to.
<i>username</i>	to authenticate with, defaults to ""
<i>password</i>	to authenticate with, defaults to ""

6.53.1.3 **activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory** (*const decaf::net::URI & uri*, *const std::string & username* = " ", *const std::string & password* = " ")

Constructor.

Parameters

<i>uri</i>	the URI of the Broker we are connecting to.
<i>username</i>	to authenticate with, defaults to ""
<i>password</i>	to authenticate with, defaults to ""

6.53.1.4 **virtual activemq::core::ActiveMQXAConnectionFactory::~~ActiveMQXAConnectionFactory** () throw ()
[virtual]

6.53.2 Member Function Documentation

6.53.2.1 **virtual ActiveMQConnection* activemq::core::ActiveMQXAConnectionFactory::createActiveMQConnection** (*const Pointer< transport::Transport > & transport*, *const Pointer< decaf::util::Properties > & properties*) [protected, virtual]

Create a new **ActiveMQConnection** (p. 187) instance using the provided Transport and Properties.

Subclasses can override this to control the actual type of **ActiveMQConnection** (p. 187) that is created.

Parameters

<i>transport</i>	The Transport that the Connection should use to communicate with the Broker.
<i>properties</i>	The Properties that are assigned to the new Connection instance.

Returns

a new **ActiveMQConnection** (p. 187) pointer instance.

Reimplemented from **activemq::core::ActiveMQConnectionFactory** (p. 217).

6.53.2.2 **virtual cms::XAConnection* activemq::core::ActiveMQXAConnectionFactory::createXAConnection** ()
[virtual]

Creates an XAConnection with the default user name and password.

The connection is created in stopped mode just as the standard Connection object is created from the ConnectionFactory. No messages will be delivered until the Connection.start method is explicitly called.

Returns

a new `XAConnectionFactory` instance, the caller owns the returned pointer.

Exceptions

<i>CMSException</i>	if an internal error occurs while creating the Connection.
<i>CMSSecurity-Exception</i>	if the client authentication fails because the user name or password are invalid.

Implements **cms::XAConnectionFactory** (p. 2920).

6.53.2.3 virtual `cms::XAConnection* activemq::core::ActiveMQXAConnectionFactory::createXAConnection (const std::string & userName, const std::string & password)` [virtual]

Creates an XA connection with the specified user name and password.

The connection is created in stopped mode just as the standard `ConnectionFactory` creates a new `Connection`. No messages will be delivered until the `Connection.start` method is explicitly called.

Returns

a new `XAConnectionFactory` instance, the caller owns the returned pointer.

Exceptions

<i>CMSException</i>	if an internal error occurs while creating the Connection.
<i>CMSSecurity-Exception</i>	if the client authentication fails because the user name or password are invalid.

Implements **cms::XAConnectionFactory** (p. 2920).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQXAConnectionFactory.h`

6.54 activemq::core::ActiveMQXASession Class Reference

```
#include <src/main/activemq/core/ActiveMQXASession.h>
```

Inheritance diagram for `activemq::core::ActiveMQXASession`:

Public Member Functions

- **ActiveMQXASession** (**ActiveMQConnection** ***connection**, const **Pointer**<**commands::SessionId** > &**sessionId**, const **decaf::util::Properties** &**properties**)
- virtual **~ActiveMQXASession** () throw ()
- virtual bool **isTransacted** () const
Gets if the Sessions is a Transacted Session.
- virtual bool **isAutoAcknowledge** () const
- virtual void **doStartTransaction** ()
Starts if not already start a Transaction for this Session.
- virtual void **commit** ()
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual **cms::XAResource** * **getXAResource** () const
Returns the XA resource associated with this Session to the caller.

6.54.1 Constructor & Destructor Documentation

- 6.54.1.1 **activemq::core::ActiveMQXASession::ActiveMQXASession** (**ActiveMQConnection** * **connection**, const **Pointer**< **commands::SessionId** > & **sessionId**, const **decaf::util::Properties** & **properties**)
- 6.54.1.2 virtual **activemq::core::ActiveMQXASession::~~ActiveMQXASession** () throw () [virtual]

6.54.2 Member Function Documentation

- 6.54.2.1 virtual void **activemq::core::ActiveMQXASession::commit** () [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

<i>CMSException</i>	- If an internal error occurs.
<i>IllegalStateException</i>	- if the method is not called by a transacted session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 338).

- 6.54.2.2 virtual void **activemq::core::ActiveMQXASession::doStartTransaction** () [virtual]

Starts if not already start a Transaction for this Session.

If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions

<i>ActiveMQException</i>	if this is not a Transacted Session.
--------------------------	--------------------------------------

Reimplemented from **activemq::core::ActiveMQSession** (p. 346).

6.54.2.3 `virtual cms::XAResource* activemq::core::ActiveMQXASession::getXA-Resource () const [virtual]`

Returns the XA resource associated with this Session to the caller.

The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns

an XAResource instance to the caller, the caller does not own this pointer and should not delete it.

Implements **cms::XASession** (p. 2936).

6.54.2.4 `virtual bool activemq::core::ActiveMQXASession::isAutoAcknowledge () const [virtual]`

Reimplemented from **activemq::core::ActiveMQSession** (p. 349).

6.54.2.5 `virtual bool activemq::core::ActiveMQXASession::isTransacted () const [virtual]`

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Reimplemented from **activemq::core::ActiveMQSession** (p. 349).

6.54.2.6 virtual void **activemq::core::ActiveMQXASession::rollback** ()
[virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
<i>IllegalStateException</i>	- if the method is not called by a transacted session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 351).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXASession.h**

6.55 decaf::util::zip::Adler32 Class Reference

Clas that can be used to compute an Adler-32 **Checksum** (p. 810) for a data stream.

```
#include <src/main/decaf/util/zip/Adler32.h>
```

Inheritance diagram for decaf::util::zip::Adler32:

Public Member Functions

- **Adler32** ()
- virtual \sim **Adler32** ()
- virtual long long **getValue** () const
- virtual void **reset** ()
Reset the checksum to its initial value.
- virtual void **update** (const std::vector< unsigned char > &buffer)
Updates the current checksum with the specified vector of bytes.
- virtual void **update** (const std::vector< unsigned char > &buffer, int offset, int length)
Updates the current checksum with the specified array of bytes.
- virtual void **update** (const unsigned char *buffer, int size, int offset, int length)
Updates the current checksum with the specified array of bytes.
- virtual void **update** (int byte)
Updates the current checksum with the specified byte value.

6.55.1 Detailed Description

Clas that can be used to compute an Adler-32 **Checksum** (p. 810) for a data stream.
The Alder-32 checksum trades reliability for speed over the CRC-32 algorithm.

Since

1.0

6.55.2 Constructor & Destructor Documentation

6.55.2.1 `decaf::util::zip::Adler32::Adler32 ()`

6.55.2.2 `virtual decaf::util::zip::Adler32::~~Adler32 () [virtual]`

6.55.3 Member Function Documentation

6.55.3.1 `virtual long long decaf::util::zip::Adler32::getValue () const [virtual]`

Returns

the current checksum value.

Implements **decaf::util::zip::Checksum** (p. 811).

6.55.3.2 `virtual void decaf::util::zip::Adler32::reset () [virtual]`

Reset the checksum to its initial value.

Implements **decaf::util::zip::Checksum** (p. 811).

6.55.3.3 `virtual void decaf::util::zip::Adler32::update (const std::vector< unsigned char > & buffer) [virtual]`

Updates the current checksum with the specified vector of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
---------------	--

Implements **decaf::util::zip::Checksum** (p. 811).

6.55.3.4 `virtual void decaf::util::zip::Adler32::update (const std::vector< unsigned char > & buffer, int offset, int length) [virtual]`

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if $\text{offset} + \text{length} > \text{size of the buffer}$.
----------------------------------	--

Implements **decaf::util::zip::Checksum** (p. 811).

6.55.3.5 virtual void **decaf::util::zip::Adler32::update** (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>size</i>	The size of the passed buffer.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>NullPointerException</i>	if the passed buffer is NULL.
<i>IndexOutOfBoundsException</i>	if $\text{offset} + \text{length} > \text{size of the buffer}$.

Implements **decaf::util::zip::Checksum** (p. 812).

6.55.3.6 virtual void **decaf::util::zip::Adler32::update** (int *byte*) [virtual]

Updates the current checksum with the specified byte value.

Parameters

<i>byte</i>	The byte value to update the current Checksum (p. 810) with (0..255).
-------------	--

Implements **decaf::util::zip::Checksum** (p. 812).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**Adler32.h**

6.56 decaf::lang::Appendable Class Reference

An object to which char sequences and values can be appended.

```
#include <src/main/decaf/lang/Appendable.h>
```

Inheritance diagram for decaf::lang::Appendable:

Public Member Functions

- virtual **~Appendable** ()
- virtual **Appendable & append** (char value)=0
*Appends the specified character to this **Appendable** (p. 442).*
- virtual **Appendable & append** (const **CharSequence** *csq)=0
*Appends the specified character sequence to this **Appendable** (p. 442).*
- virtual **Appendable & append** (const **CharSequence** *csq, int start, int end)=0
*Appends a subsequence of the specified character sequence to this **Appendable** (p. 442).*

6.56.1 Detailed Description

An object to which char sequences and values can be appended.

The **Appendable** (p. 442) interface must be implemented by any class whose instances are intended to receive formatted output from a Formatter.

TODO The characters to be appended should be valid Unicode characters as described in Unicode **Character** (p. 765) Representation. Note that supplementary characters may be composed of multiple 16-bit char values.

Appendables are not necessarily safe for multithreaded access. **Thread** (p. 2703) safety is the responsibility of classes that extend and implement this interface.

Since this interface may be implemented by existing classes with different styles of error handling there is no guarantee that errors will be propagated to the invoker.

Since

1.0

6.56.2 Constructor & Destructor Documentation

6.56.2.1 virtual decaf::lang::Appendable::~~Appendable () [inline, virtual]

6.56.3 Member Function Documentation

6.56.3.1 `virtual Appendable& decaf::lang::Appendable::append (char value)`
[pure virtual]

Appends the specified character to this **Appendable** (p. 442).

Parameters

<i>value</i>	The character to append.
--------------	--------------------------

Returns

a Reference to this **Appendable** (p. 442)

Exceptions

Exception (p. 1279)	if an error occurs.
----------------------------	---------------------

Implemented in **decaf::io::Writer** (p. 2910), and **decaf::nio::CharBuffer** (p. 789).

6.56.3.2 `virtual Appendable& decaf::lang::Appendable::append (const CharSequence * csq)` [pure virtual]

Appends the specified character sequence to this **Appendable** (p. 442).

Parameters

<i>csq</i>	The character sequence from which a subsequence will be appended. If <i>csq</i> is NULL, then characters will be appended as if <i>csq</i> contained the string "null".
------------	---

Returns

a Reference to this **Appendable** (p. 442).

Exceptions

Exception (p. 1279)	if an error occurs.
----------------------------	---------------------

Implemented in **decaf::io::Writer** (p. 2910), and **decaf::nio::CharBuffer** (p. 789).

6.56.3.3 `virtual Appendable& decaf::lang::Appendable::append (const CharSequence * csq, int start, int end)` [pure virtual]

Appends a subsequence of the specified character sequence to this **Appendable** (p. 442).

Parameters

<i>csq</i>	- The character sequence from which a subsequence will be appended. If <i>csq</i> is NULL, then characters will be appended as if <i>csq</i> contained the string "null".
<i>start</i>	The index of the first character in the subsequence.
<i>end</i>	The index of the character following the last character in the subsequence.

Returns

a Reference to this **Appendable** (p. 442)

Exceptions

Exception (p. 1279)	if an error occurs.
<i>IndexOutOfBoundsException</i>	<i>start</i> is greater than <i>end</i> , or <i>end</i> is greater than <i>csq.length()</i>

Implemented in **decaf::nio::CharBuffer** (p. 790), and **decaf::io::Writer** (p. 2911).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Appendable.h`

6.57 decaf::internal::AprPool Class Reference

Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

```
#include <src/main/decaf/internal/AprPool.h>
```

Public Member Functions

- **AprPool** ()
- virtual **~AprPool** ()
- `apr_pool_t * getAprPool () const`
Gets the internal APR Pool.
- void **cleanup** ()
Clears data that was allocated by this pool.

Static Public Member Functions

- static `apr_pool_t * getGlobalPool ()`
Gets a pointer to the Global APR Pool used for the Application.

6.57.1 Detailed Description

Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

6.57.2 Constructor & Destructor Documentation

6.57.2.1 `decaf::internal::AprPool::AprPool ()`

6.57.2.2 `virtual decaf::internal::AprPool::~~AprPool () [virtual]`

6.57.3 Member Function Documentation

6.57.3.1 `void decaf::internal::AprPool::cleanup ()`

Clears data that was allocated by this pool.

Users should call this after getting the data from the APR functions and copying it to someplace safe.

6.57.3.2 `apr_pool_t* decaf::internal::AprPool::getAprPool () const`

Gets the internal APR Pool.

Returns

the internal APR pool

6.57.3.3 `static apr_pool_t* decaf::internal::AprPool::getGlobalPool () [static]`

Gets a pointer to the Global APR Pool used for the Application.

Returns

pointer to the global APR Pool

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/AprPool.h`

6.58 decaf::util::ArrayList< E > Class Template Reference

```
#include <src/main/decaf/util/ArrayList.h>
```

Inheritance diagram for `decaf::util::ArrayList< E >`:

Public Member Functions

- **ArrayList** ()
- **ArrayList** (const **Collection**< E > &collection)
- **ArrayList** (const **ArrayList**< E > &arrayList)
- **ArrayList** (int initialCapacity)
- virtual ~**ArrayList** ()
- **ArrayList**< E > & **operator=** (const **ArrayList**< E > &list)
- **ArrayList**< E > & **operator=** (const **Collection**< E > &collection)
- void **ensureCapacity** (int minimumCapacity)
*Increases the capacity of this **ArrayList** (p. 445) instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument.*
- void **trimToSize** ()
*Trims the internal array to match the current size of the **ArrayList** (p. 445).*
- virtual void **clear** ()
Removes all of the elements from this collection (optional operation).
- virtual bool **isEmpty** () const
Returns true if this collection contains no elements.
- virtual int **size** () const
Returns the number of elements in this collection.
- virtual E **set** (int index, const E &element)
Replaces the element at the specified position in this list with the specified element.
- virtual E **get** (int index) const
Gets the element contained at position passed.
- virtual bool **add** (const E &value)
Returns true if this collection changed as a result of the call.
- virtual void **add** (int index, const E &element)
Inserts the specified element at the specified position in this list.
- virtual bool **addAll** (const **Collection**< E > &collection)
*Adds all of the elements in the specified collection to this collection.
The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)*

Parameters

collection	The Collection (p. 851) whose elements are added to this one.
------------	--

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of an element prevents it from being added to this collection</i>
IllegalStateException	<i>if an element cannot be added at this time due to insertion restrictions.</i>

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, const **Collection**< E > &collection)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

- virtual bool **remove** (const E &value)

Removes a single instance of the specified element from the collection.

More formally, removes an element `e` such that `(value == NULL ? e == NULL : value == e)`, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this Collection (p. 851).
-------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. - If it finds the element, it removes the element from the collection using the iterator's `remove` method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's `iterator` method does not implement the `remove` method and this collection contains the specified object.

- virtual E **removeAt** (int index)

Removes the element at the specified position in this list.

- virtual bool **contains** (const E &value) const

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element `e` such that `(value == NULL ? e == NULL : value == e)`.

Parameters

value	The value to check for presence in the collection.
-------	--

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
----------------------	---

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual int **indexOf** (const E &value) const

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (const E &value) const

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual std::vector< E > **toArray** () const

*Answers an STL vector containing copies of all elements contained in this **Collection** (p. 851).*

- virtual std::string **toString** () const

```
template<typename E> class decaf::util::ArrayList< E >
```

6.58.1.5 `template<typename E> virtual decaf::util::ArrayList< E >::~~ArrayList ()`
[inline, virtual]

References DECAF_CATCHALL_NOTHROW.

6.58.2 Member Function Documentation

6.58.2.1 `template<typename E> virtual bool decaf::util::ArrayList< E >::add (const E & value)` [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 125).

6.58.2.2 `template<typename E> virtual void decaf::util::ArrayList< E >::add (int index, const E & element) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

<i>index</i>	The index at which the specified element is to be inserted.
<i>element</i>	The element to be inserted in this List (p. 1658).

Exceptions

<i>IndexOutOfBoundsException</i>	if the index is greater than size of the List (p. 1658).
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1660).

6.58.2.3 `template<typename E> virtual bool decaf::util::ArrayList< E >::addAll (const Collection< E > & collection) [inline, virtual]`

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are added to this one.
-------------------	--

Returns

true if this collection changed as a result of the call

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of an element prevents it from being added to this collection
<i>IllegalStateException</i>	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

This implementation iterates over the specified collection, and adds each object re-

turned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 110).

References decaf::util::Collection< E >::size(), and decaf::util::Collection< E >::toArray().

Referenced by decaf::util::ArrayList< E >::operator=().

6.58.2.4 `template<typename E> virtual bool decaf::util::ArrayList< E >::addAll (int index, const Collection< E > & source) [inline, virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

<i>index</i>	The index at which to insert the first element from the specified collection
<i>source</i>	The Collection (p. 851) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 126).

References decaf::util::Collection< E >::size(), and decaf::util::Collection< E >::toArray().

6.58.2.5 `template<typename E> virtual void decaf::util::ArrayList< E >::clear ()`
`[inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>Unsupported- OperationException</i>	if the clear operation is not supported by this collection
--	--

Reimplemented from **decaf::util::AbstractList< E >** (p. 127).

Referenced by `decaf::util::ArrayList< E >::operator=()`.

6.58.2.6 `template<typename E> virtual bool decaf::util::ArrayList< E >::contains (`
`const E & value) const [inline, virtual]`

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element *e* such that `(value == NULL ? e == NULL : value == e)`.

Parameters

<i>value</i>	The value to check for presence in the collection.
--------------	--

Returns

true if there is at least one of the elements in the collection

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 112).

References decaf::util::ArrayList< E >::indexOf().

6.58.2.7 `template<typename E> void decaf::util::ArrayList< E >::ensureCapacity (int minimumCapacity) [inline]`

Increases the capacity of this **ArrayList** (p. 445) instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument.

If the capacity is already greater than or equal to the minimum capacity argument then the array is left unchanged.

Parameters

<i>minimum-Capacity</i>	The desired minimum capacity for this ArrayList (p. 445).
-------------------------	--

References decaf::lang::System::arraycopy().

Referenced by decaf::util::ArrayList< E >::ArrayList().

6.58.2.8 `template<typename E> virtual E decaf::util::ArrayList< E >::get (int index) const [inline, virtual]`

Gets the element contained at position passed.

Parameters

<i>index</i>	The position to get.
--------------	----------------------

Returns

value at index specified.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
----------------------------------	--

Implements **decaf::util::List< E >** (p. 1662).

6.58.2.9 `template<typename E> virtual int decaf::util::ArrayList< E >::indexOf (const E & value) const [inline, virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

<i>value</i>	The element to search for in this List (p. 1658).
--------------	--

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 128).

Referenced by **decaf::util::ArrayList**< **E** >::contains(), and **decaf::util::ArrayList**< **E** >::remove().

```
6.58.2.10  template<typename E> virtual bool decaf::util::ArrayList< E >::isEmpty ( )
           const [inline, virtual]
```

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 457) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 114).

```
6.58.2.11  template<typename E> virtual int decaf::util::ArrayList< E >::lastIndexOf (
           const E & value ) const [inline, virtual]
```

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index *i* such that **get**(*i*) == **value** or -1 if there is no such index.

Parameters

<i>value</i>	The element to search for in this List (p. 1658).
--------------	--

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

Reimplemented from **decaf::util::AbstractList< E >** (p. 129).

6.58.2.12 `template<typename E> ArrayList<E>& decaf::util::ArrayList< E >::operator= (const ArrayList< E > & list) [inline]`

References `decaf::util::ArrayList< E >::addAll()`, and `decaf::util::ArrayList< E >::clear()`.

6.58.2.13 `template<typename E> ArrayList<E>& decaf::util::ArrayList< E >::operator= (const Collection< E > & collection) [inline]`

References `decaf::util::ArrayList< E >::addAll()`, and `decaf::util::ArrayList< E >::clear()`.

6.58.2.14 `template<typename E> virtual bool decaf::util::ArrayList< E >::remove (const E & value) [inline, virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (`value == NULL ? e == NULL : value == e`), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	The reference to the element to remove from this Collection (p. 851).
--------------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's `remove` method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the `remove` method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's `remove` method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the `remove` method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 116).

References `decaf::util::ArrayList< E >::indexOf()`, and `decaf::util::ArrayList< E >::removeAt()`.

6.58.2.15 `template<typename E> virtual E decaf::util::ArrayList< E >::removeAt (int index) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

<i>index</i>	- the index of the element to be removed.
--------------	---

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 133).

References `decaf::lang::System::arraycopy()`.

Referenced by `decaf::util::ArrayList< E >::remove()`.

6.58.2.16 `template<typename E> virtual E decaf::util::ArrayList< E >::set (int index, const E & element) [inline, virtual]`

Replaces the element at the specified position in this list with the specified element.

Parameters

<i>index</i>	The index of the element to replace.
<i>element</i>	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1669).

```
6.58.2.17  template<typename E> virtual int decaf::util::ArrayList< E >::size ( ) const
           [inline, virtual]
```

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 864).

Referenced by decaf::util::ArrayList< E >::ArrayList().

```
6.58.2.18  template<typename E> virtual std::vector<E> decaf::util::ArrayList< E
           >::toArray ( ) const [inline, virtual]
```

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 851).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 851)

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 119).

```
6.58.2.19  template<typename E> virtual std::string decaf::util::ArrayList< E >::toString
           ( ) const [inline, virtual]
```

References decaf::lang::Integer::toString().

```
6.58.2.20  template<typename E> void decaf::util::ArrayList< E >::trimToSize ( )
           [inline]
```

Trims the internal array to match the current size of the **ArrayList** (p. 445).

This compacts the internal array to save storage space used by this **ArrayList** (p. 445).

References decaf::lang::System::arraycopy().

Public Member Functions

- **ArrayListIterator** (const **ArrayPointer**< E > &array, int index)
- virtual **~ArrayListIterator** ()
- virtual E **next** ()
Returns the next element in the iteration.
- virtual bool **hasNext** () const
Returns true if the iteration has more elements.
- virtual void **remove** ()
Removes from the underlying collection the last element returned by the iterator (optional operation).
- virtual void **add** (const E &e **DECAF_UNUSED**)

- virtual void **set** (const E &e **DECAF_UNUSED**)
- virtual bool **hasPrevious** () const
Returns true if this list iterator has more elements when traversing the list in the reverse direction.
- virtual E **previous** ()
Returns the previous element in the list.
- virtual int **nextIndex** () const
Returns the index of the element that would be returned by a subsequent call to next.
- virtual int **previousIndex** () const
Returns the index of the element that would be returned by a subsequent call to previous.

template<typename E> class decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator

6.59.1 Constructor & Destructor Documentation

6.59.1.1 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator (const ArrayPointer< E > &array, int index) [inline]

References decaf::lang::ArrayPointer< T, REFCOUNTER >::length().

6.59.1.2 template<typename E> virtual decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::~~ArrayListIterator () [inline, virtual]

6.59.2 Member Function Documentation

6.59.2.1 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::add (const E &e **DECAF_UNUSED**) [inline, virtual]

6.59.2.2 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::hasNext () const [inline, virtual]

Returns true if the iteration has more elements.

Returns false if the next call to next would result in an **NoSuchElementException** (p. 1984) to be thrown.

Returns

true if there are more elements available for iteration.

Implements **decaf::util::Iterator< E >** (p. 1559).

6.59.2.3 `template<typename E> virtual bool decaf::util::concurrent::CopyOnWrite-
ArrayList< E >::ArrayListIterator::hasPrevious () const [inline,
virtual]`

Returns true if this list iterator has more elements when traversing the list in the reverse direction.

(In other words, returns true if previous would return an element rather than throwing an exception.)

Returns

true if the list iterator has more elements when traversing the list in the reverse direction.

Implements **decaf::util::ListIterator< E >** (p. 1672).

6.59.2.4 `template<typename E> virtual E decaf::util::concurrent::CopyOnWrite-
ArrayList< E >::ArrayListIterator::next () [inline,
virtual]`

Returns the next element in the iteration.

Calling this method repeatedly until the **hasNext()** (p. 459) method returns false will return each element in the underlying collection exactly once.

Returns

the next element in the iteration of elements.

Exceptions

NoSuchElement- Exception (p. 1984)	if the iteration has no more elements.
--	--

Implements **decaf::util::Iterator< E >** (p. 1560).

6.59.2.5 `template<typename E> virtual int decaf::util::concurrent::CopyOnWrite-
ArrayList< E >::ArrayListIterator::nextIndex () const [inline,
virtual]`

Returns the index of the element that would be returned by a subsequent call to next.

(Returns list size if the list iterator is at the end of the list.)

Returns

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

Implements **decaf::util::ListIterator< E >** (p. 1673).

6.59.2.6 `template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::previous () [inline, virtual]`

Returns the previous element in the list.

This method may be called repeatedly to iterate through the list backwards, or inter-mixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns

the previous element in the list.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if the iteration has no previous element.
---	---

Implements **decaf::util::ListIterator< E >** (p. 1673).

6.59.2.7 `template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::previousIndex () const [inline, virtual]`

Returns the index of the element that would be returned by a subsequent call to previous.

(Returns -1 if the list iterator is at the beginning of the list.)

Returns

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

Implements **decaf::util::ListIterator< E >** (p. 1673).

6.59.2.8 `template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::remove () [inline, virtual]`

Removes from the underlying collection the last element returned by the iterator (optional operation).

This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions

<i>Unsupported-OperationException</i>	if the remove operation is not supported by this Iterator (p. 1559).
<i>IllegalStateException</i>	if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

Implements **decaf::util::Iterator**< **E** > (p. 1560).

6.59.2.9 `template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::set (const E &e DECAF_UNUSED)`
`[inline, virtual]`

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CopyOnWriteArrayList.h`

6.60 **decaf::lang::ArrayPointer**< **T**, **REFCOUNTER** > **Class** - Template Reference

Decaf's implementation of a Smart **Pointer** (p. 2083) that is a template on a Type and is **Thread** (p. 2703) Safe if the default Reference Counter is used.

```
#include <src/main/decaf/lang/ArrayPointer.h>
```

Data Structures

- typedef **REFCOUNTER** **CounterType**

Public Member Functions

- **ArrayPointer** ()
Default Constructor.
- **ArrayPointer** (int size)
*Create a new **ArrayPointer** (p. 462) instance and allocates an internal array that is sized using the passed in size value.*
- **ArrayPointer** (int size, const **T** &fillWith)

6.60 decaf::lang::ArrayPointer< T, REFCOUNTER > Class Template Reference 463

Create a new **ArrayPointer** (p. 462) instance and allocates an internal array that is sized using the passed in size value.

- **ArrayPointer** (const **PointerType** value, int size)

Explicit Constructor, creates an **ArrayPointer** (p. 462) that contains value with a single reference.

- **ArrayPointer** (const **ArrayPointer** &value) throw ()

Copy constructor.

- virtual ~**ArrayPointer** () throw ()

- void **reset** (T *value, int size=0)

Resets the **ArrayPointer** (p. 462) to hold the new value.

- T * **release** ()

Releases the **Pointer** (p. 2083) held and resets the internal pointer value to Null.

- **PointerType** **get** () const

Gets the real array pointer that is contained within this **Pointer** (p. 2083).

- int **length** () const

Returns the current size of the contained array or zero if the array is NULL.

- void **swap** (**ArrayPointer** &value) throw ()

Exception (p. 1279) Safe Swap Function.

- **ArrayPointer** **clone** () const

Creates a new **ArrayPointer** (p. 462) instance that is a clone of the value contained in this **ArrayPointer** (p. 462).

- **ArrayPointer** & **operator=** (const **ArrayPointer** &right) throw ()

Assigns the value of right to this **Pointer** (p. 2083) and increments the reference Count.

- template<typename T1 , typename R1 >

ArrayPointer & **operator=** (const **ArrayPointer**< T1, R1 > &right) throw ()

- **ReferenceType** **operator[]** (int index)

Dereference Operator, returns a reference to the Contained value.

- **ConstReferenceType** **operator[]** (int index) const

- bool **operator!** () const

6.60.1 Detailed Description

```
template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRef-
Counter>class decaf::lang::ArrayPointer< T, REFCOUNTER >
```

Decaf's implementation of a Smart **Pointer** (p. 2083) that is a template on a Type and is **Thread** (p. 2703) Safe if the default Reference Counter is used.

This **Pointer** (p. 2083) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2083) instances in the same manner as normal pointer, except that it does not provide an overload of operators (`<`, `<=`, `>`, `>=`). To allow use of a **Pointer** (p. 2083) in a STL container that requires it, **Pointer** (p. 2083) provides an implementation of `std::less`.

Since

1.0

6.60.2 Member Typedef Documentation

6.60.2.1 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef const T& decaf::lang::ArrayPointer< T, REFCOUNTER >::ConstReferenceType`

6.60.2.2 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef REFCOUNTER decaf::lang::ArrayPointer< T, REFCOUNTER >::CounterType`

6.60.2.3 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T* decaf::lang::ArrayPointer< T, REFCOUNTER >::PointerType`

6.60.2.4 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T& decaf::lang::ArrayPointer< T, REFCOUNTER >::ReferenceType`

6.60.3 Constructor & Destructor Documentation

6.60.3.1 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer () [inline]`

Default Constructor.

Initialized the contained array pointer to NULL, using the subscript operator results in an exception unless reset to contain a real value.

6.60 decaf::lang::ArrayPointer< T, REFCOUNTER > Class Template Reference 465

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::clone(), and decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::reset().

```
6.60.3.2  template<typename T, typename REFCOUNTER = decaf::util::concurrent-
           ::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER
           >::ArrayPointer ( int size ) [inline]
```

Create a new **ArrayPointer** (p. 462) instance and allocates an internal array that is sized using the passed in size value.

Parameters

<i>size</i>	The size of the array to allocate for this ArrayPointer (p. 462) instance.
-------------	---

```
6.60.3.3  template<typename T, typename REFCOUNTER = decaf::util::concurrent-
           ::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER
           >::ArrayPointer ( int size, const T & fillWith ) [inline]
```

Create a new **ArrayPointer** (p. 462) instance and allocates an internal array that is sized using the passed in size value.

The array elements are initialized with the given value.

Parameters

<i>size</i>	The size of the array to allocate for this ArrayPointer (p. 462) instance.
<i>fillWith</i>	The value to initialize each element of the newly allocated array with.

```
6.60.3.4  template<typename T, typename REFCOUNTER = decaf::util::concurrent-
           ::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER
           >::ArrayPointer ( const PointerType value, int size ) [inline,
           explicit]
```

Explicit Constructor, creates an **ArrayPointer** (p. 462) that contains value with a single reference.

This object now has ownership until a call to release.

Parameters

<i>value</i>	The pointer to the instance of the array we are taking ownership of.
<i>size</i>	The size of the array this object is taking ownership of.

```
6.60.3.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent-
::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER
>::ArrayPointer ( const ArrayPointer< T, REFCOUNTER > & value ) throw ()
[inline]
```

Copy constructor.

Copies the value contained in the **ArrayPointer** (p. 462) to the new instance and increments the reference counter.

```
6.60.3.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::-
AtomicRefCount> virtual decaf::lang::ArrayPointer< T, REFCOUNTER
>::~~ArrayPointer ( ) throw () [inline, virtual]
```

6.60.4 Member Function Documentation

```
6.60.4.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::-
AtomicRefCount> ArrayPointer decaf::lang::ArrayPointer< T, REFCOUNTER
>::clone ( ) const [inline]
```

Creates a new **ArrayPointer** (p. 462) instance that is a clone of the value contained in this **ArrayPointer** (p. 462).

Returns

an **ArrayPointer** (p. 462) that contains a copy of the data in this **ArrayPointer** (p. 462).

```
6.60.4.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::-
AtomicRefCount> PointerType decaf::lang::ArrayPointer< T, REFCOUNTER
>::get ( ) const [inline]
```

Gets the real array pointer that is contained within this **Pointer** (p. 2083).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL `auto_ptr` and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2083). Use at your own risk.

Returns

the contained pointer.

Referenced by `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::add()`, `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll()`, `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent()`, `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent()`, `decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::clone()`, `decaf::lang::ArrayPointerComparator< T, R >::compare()`, `decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::operator!=()`,

6.60 decaf::lang::ArrayPointer< T, REFCOUNTER > Class Template Reference 467

decaf::lang::operator!=(), decaf::lang::ArrayPointerComparator< T, R >::operator>(), std::less< decaf::lang::ArrayPointer< T > >::operator>(), decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::operator==(), decaf::lang::operator==(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::set().

6.60.4.3 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> int decaf::lang::ArrayPointer< T, REFCOUNTER >::length () const [inline]`

Returns the current size of the contained array or zero if the array is NULL.

Returns

the size of the array or zero if the array is NULL

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::ArrayListIterator(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::contains(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::get(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::indexOf(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::lastIndexOf(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::set(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::toArray().

6.60.4.4 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> bool decaf::lang::ArrayPointer< T, REFCOUNTER >::operator! () const [inline]`

6.60.4.5 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1, typename R1> bool decaf::lang::ArrayPointer< T, REFCOUNTER >::operator!= (const ArrayPointer< T1, R1 > & right) const [inline]`

6.60.4.6 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ArrayPointer& decaf::lang::ArrayPointer< T, REFCOUNTER >::operator= (const ArrayPointer< T, REFCOUNTER > & right) throw () [inline]`

Assigns the value of right to this **Pointer** (p. 2083) and increments the reference Count.

Parameters

<i>right</i>	- Pointer (p. 2083) on the right hand side of an operator= call to this.
--------------	---

6.60.4.7 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> template<typename T1, typename R1 > ArrayPointer& decaf::lang::ArrayPointer< T, REFCOUNTER >::operator= (const ArrayPointer< T1, R1 > & right) throw ()` [inline]

6.60.4.8 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> template<typename T1, typename R1 > bool decaf::lang::ArrayPointer< T, REFCOUNTER >::operator== (const ArrayPointer< T1, R1 > & right) const` [inline]

6.60.4.9 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> ReferenceType decaf::lang::ArrayPointer< T, REFCOUNTER >::operator[] (int index)` [inline]

Dereference Operator, returns a reference to the Contained value.

This method throws an `NullPointerException` if the contained value is NULL.

Returns

reference to the contained pointer.

Exceptions

<i>NullPointerException</i>	if the contained value is Null
-----------------------------	--------------------------------

6.60.4.10 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> ConstReferenceType decaf::lang::ArrayPointer< T, REFCOUNTER >::operator[] (int index) const` [inline]

6.60.4.11 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> T* decaf::lang::ArrayPointer< T, REFCOUNTER >::release ()` [inline]

Releases the **Pointer** (p. 2083) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 2083) is held by more than one object or this method is called from more than one thread.

Parameters

<i>value</i>	- The new value to contain.
--------------	-----------------------------

6.60 decaf::lang::ArrayPointer< T, REFCOUNTER > Class Template Reference 469

Returns

The pointer instance that was held by this **Pointer** (p. 2083) object, the pointer is no longer owned by this **Pointer** (p. 2083) and won't be freed when this **Pointer** (p. 2083) goes out of scope.

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::ArrayPointer().

6.60.4.12 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::ArrayPointer< T, REFCOUNTER >::reset (T * value, int size = 0) [inline]`

Resets the **ArrayPointer** (p. 462) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 2083) to a NULL pointer.

Parameters

<i>value</i>	The new array pointer value to contain.
<i>size</i>	The size of the new array value this object now contains.

6.60.4.13 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::ArrayPointer< T, REFCOUNTER >::swap (ArrayPointer< T, REFCOUNTER > & value) throw () [inline]`

Exception (p. 1279) Safe Swap Function.

Parameters

<i>value</i>	- the value to swap with this.
--------------	--------------------------------

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::operator=(), and decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::swap().

6.60.5 Friends And Related Function Documentation

- virtual int **compare** (const **ArrayPointer**< T, R > &left, const **ArrayPointer**< T, R > &right) const

6.61.1 Detailed Description

```
template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCount>class
decaf::lang::ArrayPointerComparator< T, R >
```

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 462).

This allows for a basic ordering to be acheived in Decaf containers.

Custom implementations are possible where an array of some type has a logical natural ordering such as array of integers where the sum of all ints in the array is used.

6.61.2 Constructor & Destructor Documentation

6.62.2 Member Function Documentation

6.62.2.1 `template<typename E > static void decaf::util::Arrays::fill (E * array, int size, const E & value)` [inline, static]

Fills an array with the specified element.

Parameters

<i>array</i>	The Array to fill.
<i>size</i>	The actual size of the array passed.
<i>value</i>	The value to fill the array with.

Exceptions

<i>NullPointerException</i>	if array is Null.
<i>IllegalArgumentException</i>	if the size parameter is negative, or the start index is greater than the end index.

Referenced by `decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< Message-Dispatch > > >::ArrayPointer()`.

6.62.2.2 `template<typename E > static void decaf::util::Arrays::fill (E * array, int size, int start, int end, const E & value)` [inline, static]

Fills an array with the specified element within the range given.

Parameters

<i>array</i>	The Array to fill.
<i>size</i>	The actual size of the array passed.
<i>start</i>	The index to start the fill from (inclusive).
<i>end</i>	The index to fill to (exclusive).
<i>value</i>	The value to fill the array with.

Exceptions

<i>NullPointerException</i>	if array is Null.
<i>IllegalArgumentException</i>	if the size parameter is negative, or the start index is greater than the end index.
<i>IndexOutOfBoundsException</i>	if the start index is negative or the end index is greater than the size parameter.

6.63 decaf::util::concurrent::atomic::AtomicBoolean Class - Reference

A boolean value that may be updated atomically.

```
#include <src/main/decaf/util/concurrent/atomic/AtomicBoolean.h>
```

Public Member Functions

- **AtomicBoolean** ()
*Creates a new **AtomicBoolean** (p. 473) whose initial value is false.*
- **AtomicBoolean** (bool initialValue)
*Creates a new **AtomicBoolean** (p. 473) with the initial value.*
- virtual ~**AtomicBoolean** ()
- bool **get** () const
*Gets the current value of this **AtomicBoolean** (p. 473).*
- void **set** (bool newValue)
Unconditionally sets to the given value.
- bool **compareAndSet** (bool expect, bool update)
Atomically sets the value to the given updated value if the current value == the expected value.
- bool **getAndSet** (bool newValue)
Atomically sets to the given value and returns the previous value.
- std::string **toString** () const
Returns the String representation of the current value.

6.63.1 Detailed Description

A boolean value that may be updated atomically.

An **AtomicBoolean** (p. 473) is used in applications such as atomically updated flags, and cannot be used as a replacement for a Boolean.

6.63.2 Constructor & Destructor Documentation

6.63.2.1 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean ()

Creates a new **AtomicBoolean** (p. 473) whose initial value is false.

6.63.2.2 **decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean** (*bool initialValue*)

Creates a new **AtomicBoolean** (p. 473) with the initial value.

Parameters

<i>initialValue</i>	- The initial value of this boolean.
---------------------	--------------------------------------

6.63.2.3 **virtual decaf::util::concurrent::atomic::AtomicBoolean::~~AtomicBoolean** () [*inline, virtual*]

6.63.3 Member Function Documentation

6.63.3.1 **bool decaf::util::concurrent::atomic::AtomicBoolean::compareAndSet** (*bool expect, bool update*)

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters

<i>expect</i>	- the expected value
<i>update</i>	- the new value

Returns

true if successful. False return indicates that the actual value was not equal to the expected value.

6.63.3.2 **bool decaf::util::concurrent::atomic::AtomicBoolean::get** () *const* [*inline*]

Gets the current value of this **AtomicBoolean** (p. 473).

Returns

the currently set value.

6.63.3.3 **bool decaf::util::concurrent::atomic::AtomicBoolean::getAndSet** (*bool newValue*)

Atomically sets to the given value and returns the previous value.

Parameters

<i>newValue</i>	- the new value
-----------------	-----------------

Returns

the previous value

6.63.3.4 `void decaf::util::concurrent::atomic::AtomicBoolean::set (bool newValue)`
`[inline]`

Unconditionally sets to the given value.

Parameters

<i>newValue</i>	- the new value
-----------------	-----------------

6.63.3.5 `std::string decaf::util::concurrent::atomic::AtomicBoolean::toString ()`
`const`

Returns the String representation of the current value.

Returns

the String representation of the current value.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/atomic/AtomicBoolean.h`

6.64 decaf::util::concurrent::atomic::AtomicInteger Class Reference

An int value that may be updated atomically.

```
#include <src/main/decaf/util/concurrent/atomic/AtomicInteger.h>
```

Inheritance diagram for `decaf::util::concurrent::atomic::AtomicInteger`:

Public Member Functions

- **AtomicInteger ()**
*Create a new **AtomicInteger** (p. 475) with an initial value of 0.*
- **AtomicInteger (int initialValue)**
*Create a new **AtomicInteger** (p. 475) with the given initial value.*
- `virtual ~AtomicInteger ()`
- `int get () const`

Gets the current value.

- void **set** (int newValue)

Sets to the given value.

- int **getAndSet** (int newValue)

Atomically sets to the given value and returns the old value.

- bool **compareAndSet** (int expect, int update)

Atomically sets the value to the given updated value if the current value == the expected value.

- int **getAndIncrement** ()

Atomically increments by one the current value.

- int **getAndDecrement** ()

Atomically decrements by one the current value.

- int **getAndAdd** (int delta)

Atomically adds the given value to the current value.

- int **incrementAndGet** ()

Atomically increments by one the current value.

- int **decrementAndGet** ()

Atomically decrements by one the current value.

- int **addAndGet** (int delta)

Atomically adds the given value to the current value.

- std::string **toString** () const

Returns the String representation of the current value.

- int **intValue** () const

Description copied from class: Number Returns the value of the specified number as an int.

- long long **longValue** () const

Description copied from class: Number Returns the value of the specified number as a long.

- float **floatValue** () const

Description copied from class: Number Returns the value of the specified number as a float.

- double **doubleValue** () const

Description copied from class: Number Returns the value of the specified number as a double.

6.64.1 Detailed Description

An int value that may be updated atomically.

An **AtomicInteger** (p. 475) is used in applications such as atomically incremented counters, and cannot be used as a replacement for an Integer. However, this class does extend Number to allow uniform access by tools and utilities that deal with numerically-based classes.

6.64.2 Constructor & Destructor Documentation

6.64.2.1 decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger ()

Create a new **AtomicInteger** (p. 475) with an initial value of 0.

6.64.2.2 decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger (int *initialValue*)

Create a new **AtomicInteger** (p. 475) with the given initial value.

Parameters

<i>initialValue</i>	- The initial value of this object.
---------------------	-------------------------------------

6.64.2.3 virtual decaf::util::concurrent::atomic::AtomicInteger::~~AtomicInteger () [inline, virtual]

6.64.3 Member Function Documentation

6.64.3.1 int decaf::util::concurrent::atomic::AtomicInteger::addAndGet (int *delta*)

Atomically adds the given value to the current value.

Parameters

<i>delta</i>	- the value to add.
--------------	---------------------

Returns

the updated value.

6.64.3.2 bool decaf::util::concurrent::atomic::AtomicInteger::compareAndSet (int *expect*, int *update*)

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters

<i>expect</i>	- the expected value
<i>update</i>	- the new value

Returns

true if successful. False return indicates that the actual value was not equal to the expected value.

6.64.3.3 int decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet ()

Atomically decrements by one the current value.

Returns

the updated value.

Referenced by `decaf::util::concurrent::atomic::AtomicRefCounter::release()`.

6.64.3.4 double decaf::util::concurrent::atomic::AtomicInteger::doubleValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as a double.

This may involve rounding.

Returns

the numeric value represented by this object after conversion to type double.

Implements **decaf::lang::Number** (p. 1993).

6.64.3.5 float decaf::util::concurrent::atomic::AtomicInteger::floatValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as a float.

This may involve rounding.

Returns

the numeric value represented by this object after conversion to type float.

Implements **decaf::lang::Number** (p. 1993).

6.64.3.6 int decaf::util::concurrent::atomic::AtomicInteger::get () const [inline]

Gets the current value.

Returns

the current value.

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::offer()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::peek()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::poll()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::put()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::remainingCapacity()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::size()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::take()`, `decaf::util::concurrent::LinkedBlockingQueue< E >::toArray()`, and `decaf::util::concurrent::LinkedBlockingQueue< E >::toString()`.

6.64.3.7 int decaf::util::concurrent::atomic::AtomicInteger::getAndAdd (int *delta*)

Atomically adds the given value to the current value.

Parameters

<i>delta</i>	- The value to add.
--------------	---------------------

Returns

the previous value.

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo()`.

6.64.3.8 int decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement ()

Atomically decrements by one the current value.

Returns

the previous value.

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::poll()`, and `decaf::util::concurrent::LinkedBlockingQueue< E >::take()`.

6.64.3.9 int decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement ()

Atomically increments by one the current value.

Returns

the previous value.

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::offer()`, and `decaf::util::concurrent::LinkedBlockingQueue< E >::put()`.

6.64.3.10 `int decaf::util::concurrent::atomic::AtomicInteger::getAndSet (int
newValue)`

Atomically sets to the given value and returns the old value.

Parameters

<i>newValue</i>	- the new value.
-----------------	------------------

Returns

the previous value.

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::clear()`.

6.64.3.11 `int decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet ()`

Atomically increments by one the current value.

Returns

the updated value.

Referenced by `decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter()`.

6.64.3.12 `int decaf::util::concurrent::atomic::AtomicInteger::intValue () const
[virtual]`

Description copied from class: `Number` Returns the value of the specified number as an int.

This may involve rounding or truncation.

Returns

the numeric value represented by this object after conversion to type int.

Implements **`decaf::lang::Number`** (p. 1993).

6.64.3.13 `long long decaf::util::concurrent::atomic::AtomicInteger::longValue ()
const [virtual]`

Description copied from class: `Number` Returns the value of the specified number as a long.

This may involve rounding or truncation.

Returns

the numeric value represented by this object after conversion to type long long.

Implements **`decaf::lang::Number`** (p. 1994).

6.64.3.14 `void decaf::util::concurrent::atomic::AtomicInteger::set (int newValue)`
`[inline]`

Sets to the given value.

Parameters

<i>newValue</i>	- the new value
-----------------	-----------------

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::clear()`.

6.64.3.15 `std::string decaf::util::concurrent::atomic::AtomicInteger::toString ()`
`const`

Returns the String representation of the current value.

Returns

the String representation of the current value.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/atomic/AtomicInteger.h`

6.65 decaf::util::concurrent::atomic::AtomicRefCounter Class - Reference

```
#include <src/main/decaf/util/concurrent/atomic/Atomic-
RefCounter.h>
```

Inherited by `decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > >, decaf::lang::ArrayPointer< E >, decaf::lang::ArrayPointer< ServiceListener * >, decaf::lang::ArrayPointer< unsigned char >, decaf::lang::Pointer< activemq::threads::TaskRunner >, decaf::lang::Pointer< ActiveMQDestination >, decaf::lang::Pointer< ActiveMQTransactionContext >, decaf::lang::Pointer< BackupTransportPool >, decaf::lang::Pointer< BooleanExpression >, decaf::lang::Pointer< BrokerError >, decaf::lang::Pointer< BrokerId >, decaf::lang::Pointer< ByteArrayAdapter >, decaf::lang::Pointer< CloseTransportsTask >, decaf::lang::Pointer< cms::Destination >, decaf::lang::Pointer< commands::ActiveMQDestination >, decaf::lang::Pointer< commands::ConsumerId >, decaf::lang::Pointer< commands::ConsumerInfo >, decaf::lang::Pointer< commands::Message >, decaf::lang::Pointer< commands::ProducerInfo >, decaf::lang::Pointer< commands::SessionInfo >, decaf::lang::Pointer< commands::WireFormatInfo >, decaf::lang::Pointer< Comparator< E > >, decaf::lang::Pointer< CompositeTaskRunner >, decaf::lang::Pointer< ConnectionId >, decaf::lang::Pointer< ConnectionInfo >, decaf::lang::Pointer< ConsumerId >, decaf::lang::Pointer< ConsumerInfo >, decaf::lang::Pointer<`

Public Member Functions

- **AtomicRefCounter** ()
- **AtomicRefCounter** (const **AtomicRefCounter** &other)
- virtual ~**AtomicRefCounter** ()

Protected Member Functions

- void **swap** (**AtomicRefCounter** &other)
Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.
- bool **release** ()
Removes a reference to the counter Atomically and returns if the counter has reached zero, once the counter hits zero, the internal counter is destroyed and this instance is now considered to be unreferenced.

6.65.1 Constructor & Destructor Documentation

6.65.1.1 **decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter** (
) [inline]

6.65.1.2 **decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter** (
const **AtomicRefCounter** & other) [inline]

References decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet().

6.65.1.3 virtual **decaf::util::concurrent::atomic::AtomicRefCounter::~~AtomicRefCounter** () [inline, virtual]

6.65.2 Member Function Documentation

6.65.2.1 `bool decaf::util::concurrent::atomic::AtomicRefCount::release ()`
`[inline, protected]`

Removes a reference to the counter Atomically and returns if the counter has reached zero, once the counter hits zero, the internal counter is destroyed and this instance is now considered to be unreferenced.

Returns

true if the count is now zero.

Reimplemented in `decaf::lang::ArrayPointer< ServiceListener * >` (p. 468), `decaf::lang::ArrayPointer< E >` (p. 468), `decaf::lang::ArrayPointer< unsigned char >` (p. 468), `decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >` (p. 468), `decaf::lang::Pointer< MessageAck >` (p. 2090), `decaf::lang::Pointer< BooleanExpression >` (p. 2090), `decaf::lang::Pointer< commands::ConsumerId >` (p. 2090), `decaf::lang::Pointer< BrokerError >` (p. 2090), `decaf::lang::Pointer< Transport >` (p. 2090), `decaf::lang::Pointer< wireformat::WireFormat >` (p. 2090), `decaf::lang::Pointer< MessageDispatchChannel >` (p. 2090), `decaf::lang::Pointer< commands::WireFormatInfo >` (p. 2090), `decaf::lang::Pointer< CloseTransportsTask >` (p. 2090), `decaf::lang::Pointer< CompositeTaskRunner >` (p. 2090), `decaf::lang::Pointer< ActiveMQTransactionContext >` (p. 2090), `decaf::lang::Pointer< commands::ProducerInfo >` (p. 2090), `decaf::lang::Pointer< Comparator< E > >` (p. 2090), `decaf::lang::Pointer< BrokerId >` (p. 2090), `decaf::lang::Pointer< LogManagerInternals >` (p. 2090), `decaf::lang::Pointer< commands::SessionInfo >` (p. 2090), `decaf::lang::Pointer< Message >` (p. 2090), `decaf::lang::Pointer< URI >` (p. 2090), `decaf::lang::Pointer< DataStructure >` (p. 2090), `decaf::lang::Pointer< activemq::threads::TaskRunner >` (p. 2090), `decaf::lang::Pointer< commands::ActiveMQDestination >` (p. 2090), `decaf::lang::Pointer< ConsumerInfo >` (p. 2090), `decaf::lang::Pointer< ConnectionId >` (p. 2090), `decaf::lang::Pointer< decaf::lang::Runnable >` (p. 2090), `decaf::lang::Pointer< Properties >` (p. 2090), `decaf::lang::Pointer< BackupTransportPool >` (p. 2090), `decaf::lang::Pointer< ProducerInfo >` (p. 2090), `decaf::lang::Pointer< decaf::lang::Thread >` (p. 2090), `decaf::lang::Pointer< MessageId >` (p. 2090), `decaf::lang::Pointer< Response >` (p. 2090), `decaf::lang::Pointer< QueueNode< E > >` (p. 2090), `decaf::lang::Pointer< SessionId >` (p. 2090), `decaf::lang::Pointer< cms::Destination >` (p. 2090), `decaf::lang::Pointer< TransportListener >` (p. 2090), `decaf::lang::Pointer< ActiveMQDestination >` (p. 2090), `decaf::lang::Pointer< ProducerId >` (p. 2090), `decaf::lang::Pointer< ResponseBuilder >` (p. 2090), `decaf::lang::Pointer< SessionInfo >` (p. 2090), `decaf::lang::Pointer< commands::Message >` (p. 2090), `decaf::lang::Pointer< Tracked >` (p. 2090), `decaf::lang::Pointer< ConnectionInfo >` (p. 2090), `decaf::lang::Pointer< core::ActiveMQAckHandler >` (p. 2090), `decaf::lang::Pointer< Exception >` (p. 2090), `decaf::lang::Pointer< TransactionState >` (p. 2090), `decaf::lang::Pointer< commands::ConsumerInfo >` (p. 2090), `decaf::lang::Pointer< ConsumerId >` (p. 2090), `decaf::lang::Pointer< URIPool >` (p. 2090), `decaf::lang::Pointer< ByteArrayAdapter >` (p. 2090), and `decaf::lang::Pointer< TransactionId >` (p. 2090).

References `decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet()`.

6.65.2.2 `void decaf::util::concurrent::atomic::AtomicRefCounter::swap (AtomicRefCounter & other) [inline, protected]`

Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.

Parameters

<code>other</code>	The value to swap with this one's.
--------------------	------------------------------------

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/atomic/AtomicRefCounter.h`

6.66 `decaf::util::concurrent::atomic::AtomicReference< T >` - Class Template Reference

An Pointer reference that may be updated atomically.

```
#include <src/main/decaf/util/concurrent/atomic/AtomicReference.h>
```

Public Member Functions

- **AtomicReference** ()
- **AtomicReference** (T *value)
- virtual **~AtomicReference** ()
- T * **get** () const
Gets the Current Value.
- void **set** (T *newValue)
Sets the Current value of this Reference.
- bool **compareAndSet** (T *expect, T *update)
Atomically sets the value to the given updated value if the current value == the expected value.
- T * **getAndSet** (T *newValue)
Atomically sets to the given value and returns the old value.
- std::string **toString** () const
Returns the String representation of the current value.

6.66.1 Detailed Description

```
template<typename T>class decaf::util::concurrent::atomic::AtomicReference< T >
```

An Pointer reference that may be updated atomically.

6.66.2 Constructor & Destructor Documentation

6.66.2.1 `template<typename T > decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference () [inline]`

6.66.2.2 `template<typename T > decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference (T * value) [inline]`

6.66.2.3 `template<typename T > virtual decaf::util::concurrent::atomic::~AtomicReference< T >::~~AtomicReference () [inline, virtual]`

6.66.3 Member Function Documentation

6.66.3.1 `template<typename T > bool decaf::util::concurrent::atomic::~AtomicReference< T >::compareAndSet (T * expect, T * update) [inline]`

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters

<i>expect</i>	- the expected value
<i>update</i>	- the new value

Returns

true if successful. False return indicates that the actual value was not equal to the expected value.

6.66.3.2 `template<typename T > T* decaf::util::concurrent::atomic::AtomicReference< T >::get () const [inline]`

Gets the Current Value.

Returns

the current value of this Reference.

```
6.66.3.3  template<typename T > T* decaf::util::concurrent::atomic-
::AtomicReference< T >::getAndSet ( T * newValue )
[inline]
```

Atomically sets to the given value and returns the old value.

Parameters

<i>newValue</i>	the new value
-----------------	---------------

Returns

the previous value.

```
6.66.3.4  template<typename T > void decaf::util::concurrent-
::atomic::AtomicReference< T >::set ( T * newValue )
[inline]
```

Sets the Current value of this Reference.

Parameters

<i>newValue</i>	The new Value of this Reference.
-----------------	----------------------------------

```
6.66.3.5  template<typename T > std::string decaf::util::concurrent-
::atomic::AtomicReference< T >::toString ( ) const
[inline]
```

Returns the String representation of the current value.

Returns

string representation of the current value.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/atomic/**AtomicReference.h**

6.67 activemq::transport::failover::BackupTransport Class - Reference

```
#include <src/main/activemq/transport/failover/Backup-
Transport.h>
```

Inheritance diagram for activemq::transport::failover::BackupTransport:

Public Member Functions

- **BackupTransport** (**BackupTransportPool** *failover)
- virtual **~BackupTransport** ()
- **decaf::net::URI** **getUri** () const
Gets the URI assigned to this Backup.
- void **setUri** (const **decaf::net::URI** &uri)
*Sets the URI assigned to this **Transport** (p. 2790).*
- const **Pointer**< **Transport** > & **getTransport** ()
Gets the currently held transport.
- void **setTransport** (const **Pointer**< **Transport** > &transport)
Sets the held transport, if not NULL then start to listen for exceptions from the held transport.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
Event handler for an exception from a command transport.
- bool **isClosed** () const
*Has the **Transport** (p. 2790) been shutdown and no longer usable.*
- void **setClosed** (bool value)
*Sets the closed flag on this **Transport** (p. 2790).*

6.67.1 Constructor & Destructor Documentation

- 6.67.1.1 **activemq::transport::failover::BackupTransport::BackupTransport** (**BackupTransportPool** * failover)
- 6.67.1.2 virtual **activemq::transport::failover::BackupTransport::~~BackupTransport** () [virtual]

6.67.2 Member Function Documentation

- 6.67.2.1 const **Pointer**<**Transport**>& **activemq::transport::failover::BackupTransport::getTransport** () [inline]

Gets the currently held transport.

Returns

pointer to the held transport or NULL if not set.

- 6.67.2.2 **decaf::net::URI** **activemq::transport::failover::BackupTransport::getUri** () const [inline]

Gets the URI assigned to this Backup.

Returns

the assigned URI

6.67.2.3 `bool activemq::transport::failover::BackupTransport::isClosed () const`
`[inline]`

Has the **Transport** (p. 2790) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2790)

6.67.2.4 `virtual void activemq::transport::failover::BackupTransport::onException (`
`const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

The **BackupTransport** (p. 486) closes its internal **Transport** (p. 2790) when an exception is received and returns the URI to the pool of URIs to attempt connections to.

Parameters

<i>ex</i>	The exception that was passed to this listener to handle.
-----------	---

Implements **activemq::transport::TransportListener** (p. 2811).

6.67.2.5 `void activemq::transport::failover::BackupTransport::setClosed (bool`
`value) [inline]`

Sets the closed flag on this **Transport** (p. 2790).

Parameters

<i>value</i>	- true for closed.
--------------	--------------------

6.67.2.6 `void activemq::transport::failover::BackupTransport::setTransport (const`
`Pointer< Transport > & transport) [inline]`

Sets the held transport, if not NULL then start to listen for exceptions from the held transport.

Parameters

<i>transport</i>	The transport to hold.
------------------	------------------------

6.67.2.7 `void activemq::transport::failover::BackupTransport::setUri (const`
`decaf::net::URI & uri) [inline]`

Sets the URI assigned to this **Transport** (p. 2790).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**BackupTransport.h**

6.68 activemq::transport::failover::BackupTransportPool Class - Reference

```
#include <src/main/activemq/transport/failover/Backup-TransportPool.h>
```

Inheritance diagram for activemq::transport::failover::BackupTransportPool:

Public Member Functions

- **BackupTransportPool** (const **Pointer**< **CompositeTaskRunner** > &taskRunner, const **Pointer**< **CloseTransportsTask** > &closeTask, const **Pointer**< **URIPool** > &uriPool)
- **BackupTransportPool** (int backupPoolSize, const **Pointer**< **CompositeTaskRunner** > &taskRunner, const **Pointer**< **CloseTransportsTask** > &closeTask, const **Pointer**< **URIPool** > &uriPool)
- virtual ~**BackupTransportPool** ()
- virtual bool **isPending** () const
Return true if we don't currently have enough Connected Transports.
- **Pointer**< **BackupTransport** > **getBackup** ()
*Get a Connected **Transport** (p. 2790) from the pool of Backups if any are present, otherwise it return a NULL Pointer.*
- virtual bool **iterate** ()
Connect to a Backup Broker if we haven't already connected to the max number of Backups.
- int **getBackupPoolSize** () const
Gets the Max number of Backups this Task will create.
- void **setBackupPoolSize** (int size)
Sets the Max number of Backups this Task will create.
- bool **isEnabled** () const
*Gets if the backup **Transport** (p. 2790) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.*
- void **setEnabled** (bool value)
*Sets if this Backup **Transport** (p. 2790) Pool is enabled.*

Friends

- class **BackupTransport**

6.68.1 Constructor & Destructor Documentation

6.68.1.1 `activemq::transport::failover::BackupTransportPool::BackupTransportPool (const Pointer< CompositeTaskRunner > & taskRunner, const Pointer< CloseTransportsTask > & closeTask, const Pointer< URIPool > & uriPool)`

6.68.1.2 `activemq::transport::failover::BackupTransportPool::BackupTransportPool (int backupPoolSize, const Pointer< CompositeTaskRunner > & taskRunner, const Pointer< CloseTransportsTask > & closeTask, const Pointer< URIPool > & uriPool)`

6.68.1.3 `virtual activemq::transport::failover::BackupTransportPool::~~BackupTransportPool () [virtual]`

6.68.2 Member Function Documentation

6.68.2.1 `Pointer<BackupTransport> activemq::transport::failover::BackupTransportPool::getBackup ()`

Get a Connected **Transport** (p. 2790) from the pool of Backups if any are present, otherwise it return a NULL Pointer.

Returns

Pointer to a Connected **Transport** (p. 2790) or NULL

6.68.2.2 `int activemq::transport::failover::BackupTransportPool::getBackupPoolSize () const [inline]`

Gets the Max number of Backups this Task will create.

Returns

the max number of active BackupTransports that will be created.

6.68.2.3 `bool activemq::transport::failover::BackupTransportPool::isEnabled () const [inline]`

Gets if the backup **Transport** (p. 2790) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.

Returns

true if enable.

6.68.2.4 `virtual bool activemq::transport::failover::BackupTransportPool::isPending () const [virtual]`

Return true if we don't currently have enough Connected Transports.

Implements **activemq::threads::CompositeTask** (p. 893).

6.68.2.5 `virtual bool activemq::transport::failover::BackupTransportPool::iterate () [virtual]`

Connect to a Backup Broker if we haven't already connected to the max number of Backups.

Implements **activemq::threads::Task** (p. 2676).

6.68.2.6 `void activemq::transport::failover::BackupTransportPool::setBackupPoolSize (int size) [inline]`

Sets the Max number of Backups this Task will create.

Parameters

<i>size</i>	- the max number of active BackupTransports that will be created.
-------------	---

6.68.2.7 `void activemq::transport::failover::BackupTransportPool::setEnabled (bool value)`

Sets if this Backup **Transport** (p. 2790) Pool is enabled.

When not enabled no Backups are created and any that were are destroyed.

Parameters

<i>value</i>	- true to enable backup creation, false to disable.
--------------	---

6.69.1 Constructor & Destructor Documentation

6.69.1.1 `activemq::commands::BaseCommand::BaseCommand ()` `[inline]`

6.69.1.2 `virtual activemq::commands::BaseCommand::~~BaseCommand ()`
`[inline, virtual]`

6.69.2 Member Function Documentation

6.69.2.1 `virtual void activemq::commands::BaseCommand::copyDataStructure (`
`const DataStructure * src)` `[inline, virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1134).

Reimplemented in `activemq::commands::Message` (p. 1827), `activemq::commands::ConsumerInfo` (p. 1012), `activemq::commands::BrokerError` (p. 560), `activemq::commands::ActiveMQBytesMessage` (p. 169), `activemq::commands::BrokerInfo` (p. 574), `activemq::commands::ConnectionInfo` (p. 970), `activemq::commands::MessageAck` (p. 1869), `activemq::commands::ConsumerControl` (p. 993), `activemq::commands::ProducerInfo` (p. 2192), `activemq::commands::ConnectionControl` (p. 940), `activemq::commands::DestinationInfo` (p. 1215), `activemq::commands::MessagePull` (p. 1941), `activemq::commands::SessionInfo` (p. 2388), `activemq::commands::MessageDispatch` (p. 1883), `activemq::commands::MessageDispatchNotification` (p. 1896), `activemq::commands::TransactionInfo` (p. 2775), `activemq::commands::ConnectionError` (p. 949), `activemq::commands::RemoveSubscriptionInfo` (p. 2277), `activemq::commands::ActiveMQStreamMessage` (p. 362), `activemq::commands::ProducerAck` (p. 2173), `activemq::commands::RemoveInfo` (p. 2269), `activemq::commands::DataArrayResponse` (p. 1070), `activemq::commands::DataResponse` (p. 1113), `activemq::commands::ExceptionResponse` (p. 1289), `activemq::commands::ReplayCommand` (p. 2285), `activemq::commands::ControlCommand` (p. 1024), `activemq::commands::IntegerResponse` (p. 1517), `activemq::commands::Response` (p. 2299), `activemq::commands::ActiveMQMapMessage` (p. 272), `activemq::commands::FlushCommand` (p. 1382), `activemq::commands::KeepAliveInfo` (p. 1592), `activemq::commands::ShutdownInfo` (p. 2432), `activemq::commands::ActiveMQBlobMessage` (p. 158), `activemq::commands::WireFormatInfo` (p. 2892), `activemq::commands::ActiveMQTextMessage` (p. 407), `activemq::commands::ActiveMQObjectMessage` (p. 302), and `activemq::commands::ActiveMQMessage` (p. 289).

References `getCommandId()`, and `isResponseRequired()`.

6.69.2.2 `virtual bool activemq::commands::BaseCommand::equals (const
DataStructure * value) const [inline, virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 1135).

Reimplemented in **activemq::commands::Message** (p. 1827), **activemq::commands::ConsumerInfo** (p. 1012), **activemq::commands::ActiveMQBytesMessage** (p. 169), **activemq::commands::BrokerInfo** (p. 574), **activemq::commands::ConnectionInfo** (p. 970), **activemq::commands::MessageAck** (p. 1869), **activemq::commands::ConsumerControl** (p. 994), **activemq::commands::ProducerInfo** (p. 2192), **activemq::commands::ConnectionControl** (p. 940), **activemq::commands::DestinationInfo** (p. 1215), **activemq::commands::MessagePull** (p. 1941), **activemq::commands::SessionInfo** (p. 2388), **activemq::commands::MessageDispatch** (p. 1883), **activemq::commands::MessageDispatchNotification** (p. 1896), **activemq::commands::TransactionInfo** (p. 2776), **activemq::commands::ConnectionError** (p. 949), **activemq::commands::RemoveSubscriptionInfo** (p. 2277), **activemq::commands::ActiveMQStreamMessage** (p. 362), **activemq::commands::ProducerAck** (p. 2173), **activemq::commands::RemoveInfo** (p. 2269), **activemq::commands::ActiveMQMapMessage** (p. 272), **activemq::commands::DataArrayResponse** (p. 1070), **activemq::commands::DataResponse** (p. 1114), **activemq::commands::ExceptionResponse** (p. 1289), **activemq::commands::ReplayCommand** (p. 2285), **activemq::commands::ControlCommand** (p. 1024), **activemq::commands::IntegerResponse** (p. 1518), **activemq::commands::Response** (p. 2299), **activemq::commands::FlushCommand** (p. 1382), **activemq::commands::KeepAliveInfo** (p. 1593), **activemq::commands::ShutdownInfo** (p. 2433), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 297), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 297), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 297), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 297), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 297), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 297), **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 297), **activemq::commands::ActiveMQBlobMessage** (p. 159), **activemq::commands::WireFormatInfo** (p. 2892), **activemq::commands::ActiveMQTextMessage** (p. 408), **activemq::commands::ActiveMQObjectMessage** (p. 303), and **activemq::commands::ActiveMQMessage** (p. 290).

References **activemq::commands::BaseDataStructure::equals()**.

6.69.2.3 `virtual int activemq::commands::BaseCommand::getCommandId () const`
[inline, virtual]

Gets the **Command** (p. 866) Id of this **Message** (p. 1821).

Returns

Command (p. 866) Id

Implements **activemq::commands::Command** (p. 867).

Referenced by copyDataStructure().

6.69.2.4 `virtual bool activemq::commands::BaseCommand::isBrokerInfo () const`
[inline, virtual]

Implements **activemq::commands::Command** (p. 867).

Reimplemented in **activemq::commands::BrokerInfo** (p. 575).

6.69.2.5 `virtual bool activemq::commands::BaseCommand::isConnectionControl () const` [inline, virtual]

Implements **activemq::commands::Command** (p. 867).

Reimplemented in **activemq::commands::ConnectionControl** (p. 941).

6.69.2.6 `virtual bool activemq::commands::BaseCommand::isConnectionInfo () const` [inline, virtual]

Implements **activemq::commands::Command** (p. 867).

Reimplemented in **activemq::commands::ConnectionInfo** (p. 971).

6.69.2.7 `virtual bool activemq::commands::BaseCommand::isConsumerInfo () const` [inline, virtual]

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::ConsumerInfo** (p. 1014).

6.69.2.8 `virtual bool activemq::commands::BaseCommand::isKeepAliveInfo () const` [inline, virtual]

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::KeepAliveInfo** (p. 1593).

6.69.2.9 `virtual bool activemq::commands::BaseCommand::isMessage () const`
`[inline, virtual]`

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::Message** (p. 1832).

6.69.2.10 `virtual bool activemq::commands::BaseCommand::isMessageAck ()`
`const [inline, virtual]`

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::MessageAck** (p. 1871).

6.69.2.11 `virtual bool activemq::commands::BaseCommand::isMessageDispatch (`
`)const [inline, virtual]`

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::MessageDispatch** (p. 1884).

6.69.2.12 `virtual bool activemq::commands::BaseCommand::is-`
`MessageDispatchNotification () const [inline,`
`virtual]`

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::MessageDispatchNotification** (p. 1898).

6.69.2.13 `virtual bool activemq::commands::BaseCommand::isProducerAck ()`
`const [inline, virtual]`

Implements **activemq::commands::Command** (p. 868).

Reimplemented in **activemq::commands::ProducerAck** (p. 2173).

6.69.2.14 `virtual bool activemq::commands::BaseCommand::isProducerInfo ()`
`const [inline, virtual]`

Implements **activemq::commands::Command** (p. 869).

Reimplemented in **activemq::commands::ProducerInfo** (p. 2193).

6.69.2.15 `virtual bool activemq::commands::BaseCommand::isRemoveInfo ()`
`const [inline, virtual]`

Implements **activemq::commands::Command** (p. 869).

Reimplemented in **activemq::commands::RemoveInfo** (p. 2270).

6.69.2.16 `virtual bool activemq::commands::BaseCommand::isRemoveSubscriptionInfo () const [inline, virtual]`

Implements **activemq::commands::Command** (p. 869).

Reimplemented in **activemq::commands::RemoveSubscriptionInfo** (p. 2278).

6.69.2.17 `virtual bool activemq::commands::BaseCommand::isResponse () const [inline, virtual]`

Implements **activemq::commands::Command** (p. 869).

Reimplemented in **activemq::commands::Response** (p. 2300).

6.69.2.18 `virtual bool activemq::commands::BaseCommand::isResponseRequired () const [inline, virtual]`

Is a **Response** (p. 2298) required for this **Command** (p. 866).

Returns

true if a response is required.

Implements **activemq::commands::Command** (p. 869).

Referenced by `copyDataStructure()`.

6.69.2.19 `virtual bool activemq::commands::BaseCommand::isShutdownInfo () const [inline, virtual]`

Implements **activemq::commands::Command** (p. 869).

Reimplemented in **activemq::commands::ShutdownInfo** (p. 2433).

6.69.2.20 `virtual bool activemq::commands::BaseCommand::isTransactionInfo () const [inline, virtual]`

Implements **activemq::commands::Command** (p. 869).

Reimplemented in **activemq::commands::TransactionInfo** (p. 2777).

6.69.2.21 `virtual bool activemq::commands::BaseCommand::isWireFormatInfo () const [inline, virtual]`

Implements **activemq::commands::Command** (p. 870).

Reimplemented in **activemq::commands::WireFormatInfo** (p. 2896).

6.69.2.22 `virtual void activemq::commands::BaseCommand::setCommandId (int id) [inline, virtual]`

Sets the **Command** (p. 866) Id of this **Message** (p. 1821).

Parameters

<i>id</i>	Command (p. 866) Id
-----------	----------------------------

Implements **activemq::commands::Command** (p. 870).

6.69.2.23 `virtual void activemq::commands::BaseCommand::setResponseRequired (const bool required) [inline, virtual]`

Set if this **Message** (p. 1821) requires a **Response** (p. 2298).

Parameters

<i>required</i>	true if response is required
-----------------	------------------------------

Implements **activemq::commands::Command** (p. 870).

6.69.2.24 `virtual std::string activemq::commands::BaseCommand::toString () const [inline, virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implements **activemq::commands::Command** (p. 870).

Reimplemented in **activemq::commands::Message** (p. 1836), **activemq::commands::ConsumerInfo** (p. 1016), **activemq::commands::ActiveMQBytesMessage** (p. 178), **activemq::commands::BrokerInfo** (p. 577), **activemq::commands::ConnectionInfo** (p. 972), **activemq::commands::MessageAck** (p. 1871), **activemq::commands::ConsumerControl** (p. 995), **activemq::commands::ProducerInfo** (p. 2194), **activemq::commands::ConnectionControl** (p. 942), **activemq::commands::DestinationInfo** (p. 1217), **activemq::commands::MessagePull** (p. 1943), **activemq::commands::SessionInfo** (p. 2389), **activemq::commands::MessageDispatch** (p. 1885), **activemq::commands::MessageDispatchNotification** (p. 1898), **activemq::commands::TransactionInfo** (p. 2777), **activemq::commands::ConnectionError** (p. 950), **activemq::commands::RemoveSubscriptionInfo** (p. 2279), **activemq::commands::ActiveMQStreamMessage** (p. 369), **activemq::commands::ProducerAck** (p. 2174), **activemq::commands::RemoveInfo** (p. 2270), **activemq::commands::ActiveMQMapMessage** (p. 283),

6.70.3 Member Function Documentation

6.70.3.1 **virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::looseMarshal** (**OpenWireFormat** * format, **commands::DataStructure** * command, **decaf::io::DataOutputStream** * ds) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1123).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 163), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 185), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 286),

6.70.3.2 virtual void activemq::wireformat::openwire::marshal::generated::Base-
 CommandMarshaller::looseUnmarshal (OpenWireFormat * format,
 commands::DataStructure * command, decaf::io::DataInputStream * dis)
 [virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1125).

(p. 2310), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 2392), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 2436), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 2780), and **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1919).

6.70.3.3 **virtual int activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)**
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1127).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 164), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 186), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 286), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 293), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 306), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 377), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 413), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 581), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 946), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 954), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 976), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 999), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1020), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1028), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1074), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1118), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1220), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1293), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1386),

`activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller` (p. 1521), `activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller` (p. 1597), `activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller` (p. 1875), `activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller` (p. 1893), `activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller` (p. 1902), `activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller` (p. 1946), `activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller` (p. 2177), `activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller` (p. 2197), `activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller` (p. 2274), `activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller` (p. 2282), `activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller` (p. 2290), `activemq::wireformat::openwire::marshal::generated::ResponseMarshaller` (p. 2310), `activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller` (p. 2392), `activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller` (p. 2437), `activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller` (p. 2781), and `activemq::wireformat::openwire::marshal::generated::MessageMarshaller` (p. 1920).

6.70.3.4 virtual void `activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightMarshal2` (`OpenWireFormat * format`, `commands::DataStructure * command`, `decaf::io::DataOutputStream * ds`, `utils::BooleanStream * bs`) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1129).

Reimplemented in `activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller` (p. 165), `activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller` (p. 186), `activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller` (p. 287), `activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller` (p. 294), `activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller` (p. 307), `activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller` (p. 378), `activemq::wireformat::openwire-`

 CommandMarshaller::tightUnmarshal (OpenWireFormat * *format*,
 commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*,
 utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i> if an error occurs.
--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 165), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 187), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 287), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 294), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 307), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 378), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 414), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 582), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 947), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 955), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 977), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 1000), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 1021), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 1029), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1075), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1119), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 1221), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1294), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1387), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1522), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1598), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 1876), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 1894), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 1903), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 1947), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 2178), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 2198), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 2275), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 2283), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 2290), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 2311), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 2393), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 2438), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 2781), and **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1921).

The documentation for this class was generated from the following file:

6.71 activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller Class Reference

Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.

```
#include <src/main/activemq/wireformat/openwire/marshal/-
BaseDataStreamMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller:

Public Member Functions

- virtual **~BaseDataStreamMarshaller** ()
- virtual int **tightMarshal1** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)
Tight Marshal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)
Tight Marshal to the given stream.
- virtual void **tightUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)
Tight Un-Marshal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED)
Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED)
Loose Un-Marshal to the given stream.

Static Public Member Functions

- static std::string **toString** (const **commands::MessageId** *id)

Converts the object to a String.

- static std::string **toString** (const **commands::ProducerId** *id)

Converts the object to a String.

- static std::string **toString** (const **commands::TransactionId** *txnId)

Converts the given transaction ID into a String.

- static std::string **toHexFromBytes** (const std::vector< unsigned char > &data)

given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Protected Member Functions

- virtual **commands::DataStructure** * **tightUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Tight Unmarshal the cached object.

- virtual int **tightMarshalCachedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs)

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

- virtual void **tightMarshalCachedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

- virtual void **looseMarshalCachedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut)

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

- virtual **commands::DataStructure** * **looseUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

Loose Unmarshal the cached object.

- virtual int **tightMarshalNestedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **utils::BooleanStream** *bs)

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

- virtual void **tightMarshalNestedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

- virtual **commands::DataStructure** * **tightUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Tight Unmarshal the nested object.

- virtual **commands::DataStructure** * **looseUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

Loose Unmarshal the nested object.

- virtual void **looseMarshalNestedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut)

Loose marshal the nested object.

- virtual std::string **tightUnmarshalString** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Performs Tight Unmarshaling of String Objects.

- virtual int **tightMarshalString1** (const std::string &value, **utils::BooleanStream** *bs)

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

- virtual void **tightMarshalString2** (const std::string &value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tight Marshals the passed string to the streams passed.

- virtual void **looseMarshalString** (const std::string value, **decaf::io::DataOutputStream** *dataOut)

Loose Marshal the String to the DataOuputStream passed.

- virtual std::string **looseUnmarshalString** (**decaf::io::DataInputStream** *dataIn)

Loose Un-Marshal the String to the DataOuputStream passed.

- virtual int **tightMarshalLong1** (**OpenWireFormat** *wireFormat, long long value, **utils::BooleanStream** *bs)

Tightly marshal the long long to the BooleanStream passed.

- virtual void **tightMarshalLong2** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tightly marshal the long long to the Streams passed.

- virtual long long **tightUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Tight marshal the long long type.

- virtual void **looseMarshalLong** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut)

Tightly marshal the long long to the BooleanStream passed.

- virtual long long **looseUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

Loose marshal the long long type.

- virtual std::vector< unsigned char > **tightUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Tight Unmarshal an array of char.

- virtual std::vector< unsigned char > **looseUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn)

Loose Unmarshal an array of char.

- virtual std::vector< unsigned char > **tightUnmarshalConstByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs, int size)

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

- virtual `std::vector< unsigned char > looseUnmarshalConstByteArray (decaf::io::DataInputStream *dataIn, int size)`
Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.
- virtual `commands::DataStructure * tightUnmarshalBrokerError (OpenWireFormat *wireFormat, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs)`
Tight Unmarshal the Error object.
- virtual `int tightMarshalBrokerError1 (OpenWireFormat *wireFormat, commands::DataStructure *data, utils::BooleanStream *bs)`
Tight Marshal the Error object.
- virtual `void tightMarshalBrokerError2 (OpenWireFormat *wireFormat, commands::DataStructure *data, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs)`
Tight Marshal the Error object.
- virtual `commands::DataStructure * looseUnmarshalBrokerError (OpenWireFormat *wireFormat, decaf::io::DataInputStream *dataIn)`
Loose Unmarshal the Error object.
- virtual `void looseMarshalBrokerError (OpenWireFormat *wireFormat, commands::DataStructure *data, decaf::io::DataOutputStream *dataOut)`
Tight Marshal the Error object.
- `template<typename T >`
`int tightMarshalObjectArray1 (OpenWireFormat *wireFormat, std::vector< T > objects, utils::BooleanStream *bs)`
Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.
- `template<typename T >`
`void tightMarshalObjectArray2 (OpenWireFormat *wireFormat, std::vector< T > objects, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs)`
Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.
- `template<typename T >`
`void looseMarshalObjectArray (OpenWireFormat *wireFormat, std::vector< T > objects, decaf::io::DataOutputStream *dataOut)`
Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.
- virtual `std::string readAsciiString (decaf::io::DataInputStream *dataIn)`
Given an DataInputStream read a know ASCII formatted string from the input and return that string.

6.71.1 Detailed Description

Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.

Since

2.0

6.71.2 Constructor & Destructor Documentation

6.71.2.1 virtual **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::~BaseDataStreamMarshaller** () [inline, virtual]

6.71.3 Member Function Documentation

6.71.3.1 virtual void **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshal** (**OpenWireFormat** **format* **AMQCPP_UNUSED**, **commands::DataStructure** **command* **AMQCPP_UNUSED**, **decaf::io::DataOutputStream** **ds* **AMQCPP_UNUSED**) [inline, virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.2 virtual void **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalBrokerError** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *data*, **decaf::io::DataOutputStream** * *dataOut*) [protected, virtual]

Tight Marshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- Error to Marshal
<i>dataOut</i>	- stream to write marshalled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.3 **virtual void activemq::wireformat::openwire::marshal::BaseDataStream-Marshaller::looseMarshalCachedObject (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*)** [protected, virtual]

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- DataStructure Object Pointer to marshal
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.4 **virtual void activemq::wireformat::openwire::marshal::BaseDataStream-Marshaller::looseMarshalLong (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*)** [protected, virtual]

Tightly marshal the long long to the BooleanStream passed.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>value</i>	- long long to marshal
<i>dataOut</i>	- DataOutputStream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.5 **virtual void activemq::wireformat::openwire::marshal::BaseDataStream-Marshaller::looseMarshalNestedObject (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, decaf::io::DataOutputStream * *dataOut*)** [protected, virtual]

Loose marshal the nested object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>object</i>	- DataStructure Object Pointer to marshal
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.6 `template<typename T > void activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray
(OpenWireFormat * wireFormat, std::vector< T > objects,
decaf::io::DataOutputStream * dataOut) [inline, protected]`

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>objects</i>	- array of DataStructure object pointers.
<i>dataOut</i>	- stream to write marshalled data to

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, decaf::io::DataOutputStream::writeBoolean(), and decaf::io::DataOutputStream::writeShort().

6.71.3.7 `virtual void activemq::wireformat::openwire::marshal::BaseData-
StreamMarshaller::looseMarshalString (const std::string value,
decaf::io::DataOutputStream * dataOut) [protected, virtual]`

Loose Marshal the String to the DataOutputStream passed.

Parameters

<i>value</i>	- string to marshal
<i>dataOut</i>	- stream to write marshaled form to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

```
6.71.3.8 virtual void activemq::wireformat::openwire::marshal::BaseData-
StreamMarshaller::looseUnmarshal ( OpenWireFormat *format
AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED,
decaf::io::DataInputStream *dis AMQCPP_UNUSED ) [inline,
virtual]
```

Loose Un-Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

```
6.71.3.9 virtual commands::DataStructure* activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::looseUnmarshalBrokerError
( OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn )
[protected, virtual]
```

Loose Unmarshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshalled form from

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

```
6.71.3.10 virtual std::vector<unsigned char> activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::looseUnmarshalByteArray (
decaf::io::DataInputStream * dataIn ) [protected, virtual]
```

Loose Unmarshal an array of char.

6.71 activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller

Class Reference

515

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshal from
---------------	--

Returns

the unmarshalled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.11 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalCachedObject (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn)` [protected, virtual]

Loose Unmarshal the cached object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.12 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalConstByteArray (decaf::io::DataInputStream * dataIn, int size)` [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshal from
<i>size</i>	- size of the const array to unmarshal

Returns

the unmarshaled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.13 `virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalLong (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn) [protected, virtual]`

Loose marshal the long long type.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from

Returns

the unmarshaled long long

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.14 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalNestedObject (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn) [protected, virtual]`

Loose Unmarshal the nested object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.15 `virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalString (decaf::io::DataInputStream * dataIn)` [protected, virtual]

Loose Un-Marshal the String to the DataOutputStream passed.

Parameters

<i>dataIn</i>	- stream to read marshaled form from
---------------	--------------------------------------

Returns

the unmarshaled string

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.16 `virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::readAsciiString (decaf::io::DataInputStream * dataIn)` [protected, virtual]

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

Parameters

<i>dataIn</i>	- DataInputStream to read from
---------------	--------------------------------

Returns

string value read from stream

6.71.3.17 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal1 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED)` [inline, virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.18 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal2 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) [inline, virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.19 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerError1 (OpenWireFormat * wireFormat, commands::DataStructure * data, utils::BooleanStream * bs) [protected, virtual]`

Tight Marshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- Error to Marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.20 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerError2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- Error to Marshal
<i>dataOut</i>	- stream to write marshalled data to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.21 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedObject1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.22 **virtual void activemq::wireformat::openwire::marshal::BaseDataStream-Marshaller::tightMarshalCachedObject2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*)** [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>data</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.23 **virtual int activemq::wireformat::openwire::marshal::BaseDataStream-Marshaller::tightMarshalLong1 (OpenWireFormat * *wireFormat*, long long *value*, utils::BooleanStream * *bs*)** [protected, virtual]

Tightly marshal the long long to the BooleanStream passed.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>value</i>	- long long to marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.24 **virtual void activemq::wireformat::openwire::marshal::BaseDataStream-Marshaller::tightMarshalLong2 (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*)** [protected, virtual]

Tightly marshal the long long to the Streams passed.

6.71 activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller

Class Reference

521

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>value</i>	- long long to marshal
<i>dataOut</i>	- stream to write marshaled form to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.25 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, utils::BooleanStream * *bs*)
[protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>object</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.26 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>object</i>	- DataStructure Object Pointer to marshal
<i>bs</i>	- boolean stream to marshal to.
<i>dataOut</i>	- stream to write marshaled data to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

```
6.71.3.27 template<typename T > int activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1
( OpenWireFormat * wireFormat, std::vector< T > objects,
  utils::BooleanStream * bs ) [inline, protected]
```

Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>objects</i>	- array of DataStructure object pointers.
<i>bs</i>	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, and activemq::wireformat::openwire::utils::BooleanStream::writeBoolean().

```
6.71.3.28 template<typename T > void activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2
( OpenWireFormat * wireFormat, std::vector< T > objects,
  decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs )
[inline, protected]
```

Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters

<i>wireFormat</i>	- The OpenwireFormat properties
<i>objects</i>	- array of DataStructure object pointers.
<i>dataOut</i>	- stream to write marshalled data to
<i>bs</i>	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, activemq::wireformat::openwire::utils::BooleanStream::readBoolean(), and decaf::io::DataOutputStream::writeShort().

6.71.3.29 virtual int **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString1** (const std::string & *value*,
utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

Parameters

<i>value</i>	- string to marshal
<i>bs</i>	- BooleanStream to use.

Returns

size of marshaled string.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.30 virtual void **activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString2** (const std::string & *value*,
decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*)
[protected, virtual]

Tight Marshals the passed string to the streams passed.

Parameters

<i>value</i>	- string to marshal
<i>dataOut</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.31 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream *dis AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) [inline, virtual]`

Tight Un-Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to Un-Marshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.32 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalBrokerError (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) [protected, virtual]`

Tight Unmarshal the Error object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshalled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.33 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalByteArray (decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) [protected, virtual]`

Tight Unmarshal an array of char.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Returns

the unmarshaled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.34 `virtual commands::DataStructure* activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::tightUnmarshalCachedObject
(OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs) [protected, virtual]`

Tight Unmarshal the cached object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.35 `virtual std::vector<unsigned char> activemq::wireformat::openwire-
::marshal::BaseDataStreamMarshaller::tightUnmarshalConstByteArray
(decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs, int size)
[protected, virtual]`

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.
<i>size</i>	- size of the const array to unmarshal

Returns

the unmarshaled vector of chars.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.36 `virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalLong (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs)`
[protected, virtual]

Tight marshal the long long type.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

the unmarshaled long long

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.37 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalNestedObject (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs)` [protected, virtual]

Tight Unmarshal the nested object.

Parameters

<i>wireFormat</i>	- The OpenWireFormat properties
<i>dataIn</i>	- stream to read marshaled form from
<i>bs</i>	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.38 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalString (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Performs Tight Unmarshaling of String Objects.

Parameters

<i>dataIn</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Returns

the unmarshaled string.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.71.3.39 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toHexFromBytes (const std::vector< unsigned char > & *data*) [static]

given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Parameters

<i>data</i>	- unsigned char data array pointer
-------------	------------------------------------

Returns

a string coded in hex that represents the data

6.71.3.40 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::MessageId * *id*) [static]

Converts the object to a String.

Parameters

<i>id</i>	- MessageId pointer
-----------	---------------------

Returns

string representing the id

Referenced by `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getCMSMessageID()`.

6.71.3.41 `static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::ProducerId * id)`
[static]

Converts the object to a String.

Parameters

<i>id</i>	- ProducerId pointer
-----------	----------------------

Returns

string representing the id

6.71.3.42 `static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::TransactionId * txnId)`
[static]

Converts the given transaction ID into a String.

Parameters

<i>txnId</i>	- TransactionId pointer
--------------	-------------------------

Returns

string representation of the id

- virtual std::vector< unsigned char > **getMarshaledForm** (wireformat::WireFormat *wireFormat AMQCPP_UNUSED)
- virtual void **copyDataStructure** (const DataStructure *src AMQCPP_UNUSED)
- virtual std::string **toString** () const
Returns a string containing the information for this DataStructure (p. 1133) such as its type and value of its elements.
- virtual bool **equals** (const DataStructure *value AMQCPP_UNUSED) const

6.72.1 Constructor & Destructor Documentation

- 6.72.1.1 virtual activemq::commands::BaseDataStructure::~BaseDataStructure () [inline, virtual]

6.72.2 Member Function Documentation

- 6.72.2.1 virtual void activemq::commands::BaseDataStructure::afterMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) [inline, virtual]
- 6.72.2.2 virtual void activemq::commands::BaseDataStructure::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) [inline, virtual]

Reimplemented in **activemq::commands::WireFormatInfo** (p. 2892), and **activemq::commands::Message** (p. 1826).

6.72.2.3 `virtual void activemq::commands::BaseDataStructure::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) [inline, virtual]`

Reimplemented in `activemq::commands::WireFormatInfo` (p. 2892), and `activemq::commands::Message` (p. 1826).

6.72.2.4 `virtual void activemq::commands::BaseDataStructure::beforeUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) [inline, virtual]`

6.72.2.5 `virtual void activemq::commands::BaseDataStructure::copyDataStructure (const DataStructure *src AMQCPP_UNUSED) [inline, virtual]`

Reimplemented in `activemq::commands::BooleanExpression` (p. 552).

6.72.2.6 `virtual bool activemq::commands::BaseDataStructure::equals (const DataStructure *value AMQCPP_UNUSED) const [inline, virtual]`

Referenced by `activemq::commands::BooleanExpression::equals()`, and `activemq::commands::BaseCommand::equals()`.

6.72.2.7 `virtual std::vector<unsigned char> activemq::commands::BaseDataStructure::getMarshaledForm (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) [inline, virtual]`

6.72.2.8 `virtual bool activemq::commands::BaseDataStructure::isMarshalAware () const [inline, virtual]`

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Implements `activemq::wireformat::MarshalAware` (p. 1795).

Reimplemented in `activemq::commands::Message` (p. 1832), `activemq::commands::WireFormatInfo` (p. 2895), and `activemq::commands::ActiveMQMapMessage` (p. 278).

6.72.2.9 virtual void **activemq::commands::BaseDataStructure::setMarshaledForm**
 (**wireformat::WireFormat** *wireFormat *AMQCPP_UNUSED*, const std::vector<
 char > &data *AMQCPP_UNUSED*) [inline, virtual]

6.72.2.10 virtual std::string **activemq::commands::BaseDataStructure::toString** ()
 const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implements **activemq::commands::DataStructure** (p. 1138).

Reimplemented in **activemq::commands::Message** (p. 1836), **activemq::commands::ActiveMQDestination** (p. 255), **activemq::commands::ConsumerInfo** (p. 1016), **activemq::commands::MessageId** (p. 1911), **activemq::commands::SessionId** (p. 2381), **activemq::commands::ActiveMQBytesMessage** (p. 178), **activemq::commands::BrokerInfo** (p. 577), **activemq::commands::ConnectionInfo** (p. 972), **activemq::commands::ProducerId** (p. 2185), **activemq::commands::ConnectionId** (p. 963), **activemq::commands::MessageAck** (p. 1871), **activemq::commands::ConsumerId** (p. 1004), **activemq::commands::ConsumerControl** (p. 995), **activemq::commands::JournalTopicAck** (p. 1572), **activemq::commands::ProducerInfo** (p. 2194), **activemq::commands::ConnectionControl** (p. 942), **activemq::commands::DestinationInfo** (p. 1217), **activemq::commands::MessagePull** (p. 1943), **activemq::commands::SessionInfo** (p. 2389), **activemq::commands::MessageDispatch** (p. 1885), **activemq::commands::MessageDispatchNotification** (p. 1898), **activemq::commands::SubscriptionInfo** (p. 2634), **activemq::commands::XATransactionId** (p. 2942), **activemq::commands::TransactionInfo** (p. 2777), **activemq::commands::ConnectionError** (p. 950), **activemq::commands::JournalQueueAck** (p. 1563), **activemq::commands::JournalTransaction** (p. 1586), **activemq::commands::RemoveSubscriptionInfo** (p. 2279), **activemq::commands::ActiveMQStreamMessage** (p. 369), **activemq::commands::ActiveMQTempDestination** (p. 382), **activemq::commands::LocalTransactionId** (p. 1678), **activemq::commands::NetworkBridgeFilter** (p. 1974), **activemq::commands::ProducerAck** (p. 2174), **activemq::commands::RemoveInfo** (p. 2270), **activemq::commands::ActiveMQMapMessage** (p. 283), **activemq::commands::DataArrayResponse** (p. 1071), **activemq::commands::DataResponse** (p. 1114), **activemq::commands::DiscoveryEvent** (p. 1229), **activemq::commands::ExceptionResponse** (p. 1290), **activemq::commands::PartialCommand** (p. 2078), **activemq::commands::ReplayCommand** (p. 2286), **activemq::commands::BrokerId** (p. 567), **activemq::commands::ControlCommand** (p. 1025), **activemq::commands::IntegerResponse** (p. 1518), **activemq::commands::JournalTrace** (p. 1579), **activemq::commands::Response** (p. 2300), **activemq::commands::FlushCommand** (p. 1383), **activemq::commands::KeepAliveInfo** (p. 1593), **activemq::commands::LastPartialCommand** (p. 1608), **activemq::commands::ShutdownInfo** (p. 2433), **activemq::commands::TransactionId** (p. 2770), **activemq::commands::BaseCommand** (p. 498), **activemq::commands::ActiveMQBlobMessage** (p. 161), **activemq::commands::Command**

(p. 870), `activemq::commands::WireFormatInfo` (p. 2899), `activemq::commands::ActiveMQQueue` (p. 325), `activemq::commands::ActiveMQTopic` (p. 418), `activemq::commands::ActiveMQTextMessage` (p. 409), `activemq::commands::ActiveMQTempQueue` (p. 391), `activemq::commands::ActiveMQTempTopic` (p. 400), `activemq::commands::ActiveMQObjectMessage` (p. 303), `activemq::commands::ActiveMQMessage` (p. 290), and `activemq::commands::BooleanExpression` (p. 552).

Referenced by `activemq::commands::BooleanExpression::toString()`, and `activemq::commands::BaseCommand::toString()`.

6.73 decaf::net::BindException Class Reference

```
#include <src/main/decaf/net/BindException.h>
```

Inheritance diagram for `decaf::net::BindException`:

Public Member Functions

- **BindException** () throw ()
Default Constructor.
- **BindException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **BindException** (const **BindException** &ex) throw ()
Copy Constructor.
- **BindException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **BindException** (const std::exception *cause) throw ()
Constructor.
- **BindException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **BindException** * clone () const
Clones this exception.
- virtual ~**BindException** () throw ()

6.73.1 Constructor & Destructor Documentation

6.73.1.1 **decaf::net::BindException::BindException () throw ()** `[inline]`

Default Constructor.

6.73.1.2 **decaf::net::BindException::BindException (const Exception & ex) throw ()**
`[inline]`

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.73.1.3 **decaf::net::BindException::BindException (const BindException & ex)**
throw () `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.73.1.4 **decaf::net::BindException::BindException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw ()**
`[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.73.1.5 **decaf::net::BindException::BindException (const std::exception * *cause*)**
throw () `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.73.1.6 `decaf::net::BindException::BindException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.73.1.7 `virtual decaf::net::BindException::~BindException () throw () [inline, virtual]`

6.73.2 Member Function Documentation

6.73.2.1 `virtual BindException* decaf::net::BindException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2473).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/BindException.h`

6.74 decaf::io::BlockingByteArrayInputStream Class Reference

This is a blocking version of a byte buffer stream.

```
#include <src/main/decaf/io/BlockingByteArrayInputStream.h>
```

Inheritance diagram for decaf::io::BlockingByteArrayInputStream:

Public Member Functions

- **BlockingByteArrayInputStream** ()

Default Constructor - uses a default internal buffer.

- **BlockingByteArrayInputStream** (const unsigned char *buffer, int bufferSize)

Constructor that initializes the internal buffer.

- virtual ~**BlockingByteArrayInputStream** ()

- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize)

- virtual int **available** () const

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual void **close** ()

*Closes the **InputStream** (p. 1464) freeing any resources that might have been acquired during the lifetime of this stream.*

The default implementation of this method does nothing.

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs while closing the InputStream (p. 1464).</i>
------------------------------	---

- virtual long long **skip** (long long num)

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

*The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	<i>The number of bytes to skip.</i>
-----	-------------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
UnsupportedOperation-Exception	<i>if the concrete stream class does not support skipping bytes.</i>

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.74.1 Detailed Description

This is a blocking version of a byte buffer stream.

Read operations block until the requested data becomes available in the internal buffer via a call to `setByteArray`.

6.74.2 Constructor & Destructor Documentation

6.74.2.1 `decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream ()`

Default Constructor - uses a default internal buffer.

6.74.2.2 `decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream (const unsigned char * buffer, int bufferSize)`

Constructor that initializes the internal buffer.

See also

setByteArray (p. 537).

6.74.2.3 `virtual decaf::io::BlockingByteArrayInputStream::~~BlockingByteArrayInputStream () [virtual]`

6.74.3 Member Function Documentation

6.74.3.1 `virtual int decaf::io::BlockingByteArrayInputStream::available () const [virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others

may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 1466).

6.74.3.2 virtual void **decaf::io::BlockingByteArrayInputStream::close** ()
[virtual]

Closes the **InputStream** (p. 1464) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs while closing the InputStream (p. 1464).
--	--

Reimplemented from **decaf::io::InputStream** (p. 1466).

6.74.3.3 virtual int **decaf::io::BlockingByteArrayInputStream::doRead-
ArrayBounded** (unsigned char * *buffer*, int *size*, int *offset*, int *length*)
[protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1467).

6.74.3.4 virtual int **decaf::io::BlockingByteArrayInputStream::doReadByte** ()
[protected, virtual]

Implements **decaf::io::InputStream** (p. 1467).

6.74.3.5 virtual void **decaf::io::BlockingByteArrayInputStream::setByteArray** (const
unsigned char * *buffer*, int *bufferSize*) [virtual]

6.74.3.6 virtual long long decaf::io::BlockingByteArrayInputStream::skip (long long num) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>Unsupported-OperationException</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1472).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**BlockingByteArrayInputStream.h**

6.75 decaf::util::concurrent::BlockingQueue< E > Class Template Reference

A **decaf::util::Queue** (p. 2222) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.

```
#include <src/main/decaf/util/concurrent/BlockingQueue.h>
```

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
- virtual E **take** ()=0
Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.
- virtual bool **poll** (E &result, long long timeout, const **TimeUnit** &unit)=0
Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.
- virtual int **remainingCapacity** () const =0
Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.
- virtual int **drainTo** (**Collection**< E > &c)=0
Removes all available elements from this queue and adds them to the given collection.
- virtual int **drainTo** (**Collection**< E > &c, int maxElements)=0
Removes at most the given number of available elements from this queue and adds them to the given collection.

6.75.1 Detailed Description

template<typename E>class decaf::util::concurrent::BlockingQueue< E >

A **decaf::util::Queue** (p. 2222) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.

BlockingQueue (p. 538) methods come in four forms, with different ways of handling operations that cannot be satisfied immediately, but may be satisfied at some point in the future: one throws an exception, the second returns a special value (either `true` or `false`, depending on the operation), the third blocks the current thread indefinitely until the operation can succeed, and the fourth blocks for only a given maximum time limit before giving up. These methods are summarized in the following table:

	<i>Throws exception</i>	<i>Boolean Flag</i>	<i>Blocks</i>	<i>Times out</i>
Insert	add(e) (p. 139)	offer(e) (p. 543)	put(e) (p. 544)	offer(e, time, unit) (p. ??)
Remove	remove() (p. 142)	poll() (p. 543)	take() (p. 545)	poll(time, unit) (p. ??)
Examine	element() (p. 142)	peek() (p. 2225)	<i>not applicable</i>	<i>not applicable</i>

A **BlockingQueue** (p. 538) may be capacity bounded. At any given time it may have a `remainingCapacity` beyond which no additional elements can be put without blocking. A **BlockingQueue** (p. 538) without any intrinsic capacity constraints always reports a remaining capacity of `Integer::MAX_VALUE`.

BlockingQueue (p. 538) implementations are designed to be used primarily for producer-consumer queues, but additionally support **decaf::util::Collection** (p. 851) interface. So, for example, it is possible to remove an arbitrary element from a queue using `remove(x)`. However, such operations are in general *not* performed very efficiently, and are intended for only occasional use, such as when a queued message is cancelled.

BlockingQueue (p. 538) implementations are thread-safe. All queuing methods achieve their effects atomically using internal locks or other forms of concurrency control. However, the *bulk Collection* (p. 851) operations `addAll`, `containsAll`, `retainAll` and `removeAll` are *not* necessarily performed atomically unless specified otherwise in an implementation. So it is possible, for example, for `addAll(c)` to fail (throwing an exception) after adding only some of the elements in `c`.

A **BlockingQueue** (p. 538) does *not* intrinsically support any kind of "close" or "shutdown" operation to indicate that no more items will be added. The needs and usage of such features tend to be implementation-dependent. For example, a common tactic is for producers to insert special *end-of-stream* or *poison* objects, that are interpreted accordingly when taken by consumers.

Usage example, based on a typical producer-consumer scenario. Note that a **BlockingQueue** (p. 538) can safely be used with multiple producers and multiple consumers.

```
class Producer : public Runnable {
private:

    BlockingQueue* queue;

public:

    Producer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
        try {
            while( true ) { queue->put( produce() ); }
        } catch( InterruptedException& ex ) { ... handle ...}
    }

    Object produce() { ... }
}

class Consumer : public Runnable {
private:

    BlockingQueue* queue;
```

6.75 decaf::util::concurrent::BlockingQueue< E > Class Template Reference 541

```
public:

    Consumer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
        try {
            while( true ) { consume( queue->take() (p.545) ); }
        } catch( InterruptedException& ex ) { ... handle ...}
    }

    void consume( Object& x ) { ... }
}

int main( int argc, char** argv ) {

    BlockingQueue (p.538) q = new SomeQueueImplementation();
    Producer p( &q );
    Consumer c1( &q );
    Consumer c2( &q );
    Thread t1( &p ).start();
    Thread t2( &c1 ).start();
    Thread t3( &c2 ).start();
}
```

Memory consistency effects: As with other concurrent collections, actions in a thread prior to placing an object into a **BlockingQueue** (p.538) *happen-before* actions subsequent to the access or removal of that element from the **BlockingQueue** (p.538) in another thread.

Since

1.0

6.75.2 Constructor & Destructor Documentation

6.75.2.1 `template<typename E> virtual decaf::util::concurrent::BlockingQueue< E >::~BlockingQueue()` [inline, virtual]

6.75.3 Member Function Documentation

6.75.3.1 `template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::drainTo(Collection< E > & c)` [pure virtual]

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

<i>c</i>	the collection to transfer elements into
----------	--

Returns

the number of elements transferred

Exceptions

<i>Unsupported- OperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgument- Exception</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1625), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2659).

6.75.3.2 `template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::drainTo (Collection< E > & c, int maxElements) [pure virtual]`

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

<i>c</i>	the collection to transfer elements into
<i>max- Elements</i>	the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

<i>Unsupported- OperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgument- Exception</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

6.75 `decaf::util::concurrent::BlockingQueue< E >` Class Template Reference 543

Implemented in `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1626), and `decaf::util::concurrent::SynchronousQueue< E >` (p. 2659).

6.75.3.3 `template<typename E> virtual bool decaf::util::concurrent::BlockingQueue< E >::offer (const E & e, long long timeout, const TimeUnit & unit)` [pure virtual]

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Parameters

<i>e</i>	the element to add
<i>timeout</i>	how long to wait before giving up, in units of <i>unit</i>
<i>unit</i>	a TimeUnit (p. 2756) determining how to interpret the <i>timeout</i> parameter

Returns

`true` if successful, or `false` if the specified waiting time elapses before space is available

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
<i>NullPointerException</i>	if the specified element is null
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implemented in `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1627), and `decaf::util::concurrent::SynchronousQueue< E >` (p. 2661).

6.75.3.4 `template<typename E> virtual bool decaf::util::concurrent::BlockingQueue< E >::poll (E & result, long long timeout, const TimeUnit & unit)` [pure virtual]

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

Parameters

<i>result</i>	the referenced value that will be assigned the value retrieved from the Queue (p. 2222). Undefined if this methods returned false.
<i>timeout</i>	how long to wait before giving up, in units of <i>unit</i>
<i>unit</i>	a TimeUnit (p. 2756) determining how to interpret the <i>timeout</i> parameter.

Returns

`true` if successful or `false` if the specified waiting time elapses before an element is available.

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
-----------------------------	------------------------------

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1629), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2662).

6.75.3.5 `template<typename E> virtual void decaf::util::concurrent::BlockingQueue< E >::put (const E & value) [pure virtual]`

Inserts the specified element into this queue, waiting if necessary for space to become available.

Parameters

<i>value</i>	the element to add
--------------	--------------------

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
<i>NullPointerException</i>	if the specified element is null
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1630), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2663).

6.75.3.6 `template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::remainingCapacity () const [pure virtual]`

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1630), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2664).

6.75.3.7 `template<typename E> virtual E decaf::util::concurrent::BlockingQueue< E >::take () [pure virtual]`

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Returns

the head of this queue

Exceptions

<i>InterruptedException</i>	if interrupted while waiting
-----------------------------	------------------------------

Implemented in `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1632), and `decaf::util::concurrent::SynchronousQueue< E >` (p. 2664).

The Class object representing the primitive false boolean.
- static const **Boolean _TRUE**
The Class object representing the primitive type boolean.

6.76.1 Constructor & Destructor Documentation

6.76.1.1 decaf::lang::Boolean::Boolean (bool value)

Parameters

<i>value</i>	- primitive boolean to wrap.
--------------	------------------------------

6.76.1.2 decaf::lang::Boolean::Boolean (const std::string & value)

Parameters

<i>value</i>	- String (p. 2620) value to convert to a boolean.
--------------	--

6.76.1.3 virtual decaf::lang::Boolean::~~Boolean () [inline, virtual]

6.76.2 Member Function Documentation

6.76.2.1 bool decaf::lang::Boolean::booleanValue () const [inline]

Returns

the primitive boolean value of this object

6.76.2.2 `virtual int decaf::lang::Boolean::compareTo (const Boolean & b) const`
[virtual]

Compares this **Boolean** (p. 545) instance with another.

Parameters

<i>b</i>	- the Boolean (p. 545) instance to be compared
----------	---

Returns

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable**< **Boolean** > (p. 886).

6.76.2.3 `virtual int decaf::lang::Boolean::compareTo (const bool & b) const`
[virtual]

Compares this **Boolean** (p. 545) instance with another.

Parameters

<i>b</i>	- the Boolean (p. 545) instance to be compared
----------	---

Returns

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable**< **bool** > (p. 886).

6.76.2.4 `bool decaf::lang::Boolean::equals (const Boolean & b) const` [inline, virtual]

Returns

true if the two **Boolean** (p. 545) Objects have the same value.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 887).

6.76.2.5 `bool decaf::lang::Boolean::equals (const bool & b) const` `[inline, virtual]`

Returns

true if the two **Boolean** (p. 545) Objects have the same value.

Implements **decaf::lang::Comparable**< **bool** > (p. 887).

6.76.2.6 `virtual bool decaf::lang::Boolean::operator< (const Boolean & value) const` `[virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 887).

6.76.2.7 `virtual bool decaf::lang::Boolean::operator< (const bool & value) const` `[virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **bool** > (p. 887).

6.76.2.8 `virtual bool decaf::lang::Boolean::operator== (const Boolean & value) const` `[virtual]`

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 888).

6.76.2.9 `virtual bool decaf::lang::Boolean::operator==(const bool & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **bool** > (p. 888).

6.76.2.10 `static bool decaf::lang::Boolean::parseBoolean (const std::string & value)`
[static]

Parses the **String** (p. 2620) passed and extracts an bool.

Parameters

<i>value</i>	The std::string value to parse
--------------	--------------------------------

Returns

bool value

6.76.2.11 `std::string decaf::lang::Boolean::toString () const`

Returns

the string representation of this Booleans value.

6.76.2.12 `static std::string decaf::lang::Boolean::toString (bool value)` [static]

Converts the bool to a **String** (p. 2620) representation.

Parameters

<i>value</i>	The bool value to convert.
--------------	----------------------------

Returns

std::string representation of the bool value passed.

6.76.2.13 static Boolean decaf::lang::Boolean::valueOf (bool *value*) [static]

Parameters

<i>value</i>	The bool value to convert to a Boolean (p. 545) instance.
--------------	--

Returns

a **Boolean** (p. 545) instance of the primitive boolean value

6.76.2.14 static Boolean decaf::lang::Boolean::valueOf (const std::string & *value*) [static]

Parameters

<i>value</i>	The std::string value to convert to a Boolean (p. 545) instance.
--------------	---

Returns

a **Boolean** (p. 545) instance of the string value

6.76.3 Field Documentation

6.76.3.1 const Boolean decaf::lang::Boolean::_FALSE [static]

The Class object representing the primitive false boolean.

6.76.3.2 const Boolean decaf::lang::Boolean::_TRUE [static]

The Class object representing the primitive type boolean.

The documentation for this class was generated from the following file:

6.77 activemq::commands::BooleanExpression Class Reference

```
#include <src/main/activemq/commands/BooleanExpression.h>
```

Inheritance diagram for `activemq::commands::BooleanExpression`:

Public Member Functions

- **BooleanExpression** ()
- virtual **~BooleanExpression** () throw ()
- virtual **DataStructure** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src AMQCPP_UNUSED)
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*

6.77.1 Constructor & Destructor Documentation

6.77.1.1 `activemq::commands::BooleanExpression::BooleanExpression ()`
`[inline]`

6.77.1.2 `virtual activemq::commands::BooleanExpression::~~BooleanExpression () throw ()` `[inline, virtual]`

6.77.2 Member Function Documentation

6.77.2.1 `virtual DataStructure* activemq::commands::BooleanExpression::cloneDataStructure () const` `[inline, virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1133).

```
6.77.2.2 virtual void activemq::commands::BooleanExpression::copyData-
          Structure ( const DataStructure *src AMQCPP_UNUSED ) [inline,
          virtual]
```

Reimplemented from **activemq::commands::BaseDataStructure** (p. 530).

```
6.77.2.3 virtual bool activemq::commands::BooleanExpression::equals ( const
          DataStructure * value ) const [inline, virtual]
```

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 1135).

References **activemq::commands::BaseDataStructure::equals()**.

```
6.77.2.4 virtual std::string activemq::commands::BooleanExpression::toString ( )
          const [inline, virtual]
```

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 531).

References **activemq::commands::BaseDataStructure::toString()**.

6.78 activemq::wireformat::openwire::utils::BooleanStream Class Reference

Manages the writing and reading of boolean data streams to and from a data source such as a `DataInputStream` or `DataOutputStream`.

```
#include <src/main/activemq/wireformat/openwire/utils/-
BooleanStream.h>
```

Public Member Functions

- **BooleanStream** ()
- virtual **~BooleanStream** () throw ()
- bool **readBoolean** ()
Read a boolean data element from the internal data buffer.
- void **writeBoolean** (bool value)
Writes a Boolean value to the internal data buffer.
- void **marshal** (decaf::io::DataOutputStream *dataOut)
Marshal the data to a DataOutputStream.
- void **marshal** (std::vector< unsigned char > &dataOut)
Marshal the data to a STL vector of unsigned chars.
- void **unmarshal** (decaf::io::DataInputStream *dataIn)
Unmarshal a Boolean data stream from the Input Stream.
- void **clear** ()
Clears to old position markers, data starts at the beginning.
- int **marshalledSize** ()
Calc the size that data is marshalled to.

6.78.1 Detailed Description

Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream.

The booleans are stored as single bits in the stream, with the stream size pre-pended to the stream when the data is marshalled.

The serialized form of the size field can be between 1 and 3 bytes. If the number of used bytes < 64, size=1 byte If the number of used bytes >=64 and < 256 (size of an unsigned byte), size=2 bytes If the number of used bytes >=256, size=3 bytes

The high-order 2 bits (128 and 64) of the first byte of the size field are used to encode the information about the number of bytes in the size field. The only time the first byte will contain a value >=64 is if there are more bytes in the size field. If the first byte < 64, the value of the byte is simply the size value. If the first byte = 0xC0, the following unsigned byte is the size field. If the first byte = 0x80, the following short (two bytes) are the size field.

6.78.2 Constructor & Destructor Documentation

6.78.2.1 **activemq::wireformat::openwire::utils::BooleanStream::BooleanStream** ()

6.78.2.2 **virtual activemq::wireformat::openwire::utils::BooleanStream::~~BooleanStream** () throw () [virtual]

6.78.3 Member Function Documentation

6.78.3.1 void activemq::wireformat::openwire::utils::BooleanStream::clear ()

Clears to old position markers, data starts at the beginning.

6.78.3.2 void activemq::wireformat::openwire::utils::BooleanStream::marshal (decaf::io::DataOutputStream * dataOut)

Marshal the data to a DataOutputStream.

Parameters

<i>dataOut</i>	- Stream to write the data to.
----------------	--------------------------------

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

6.78.3.3 void activemq::wireformat::openwire::utils::BooleanStream::marshal (std::vector< unsigned char > & dataOut)

Marshal the data to a STL vector of unsigned chars.

Parameters

<i>dataOut</i>	- reference to a vector to write the data to.
----------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

6.78.3.4 int activemq::wireformat::openwire::utils::BooleanStream::marshalled-Size ()

Calc the size that data is marshalled to.

Returns

int size of marshalled data.

6.78.3.5 bool activemq::wireformat::openwire::utils::BooleanStream::read-Boolean ()

Read a boolean data element from the internal data buffer.

6.78 activemq::wireformat::openwire::utils::BooleanStream Class Reference 555

Returns

boolean from the stream

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

6.78.3.6 void `activemq::wireformat::openwire::utils::BooleanStream::unmarshal (decaf::io::DataInputStream * dataIn)`

Unmarshal a Boolean data stream from the Input Stream.

Parameters

<i>dataIn</i>	- Input Stream to read data from.
---------------	-----------------------------------

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

6.78.3.7 void `activemq::wireformat::openwire::utils::BooleanStream::write-Boolean (bool value)`

Writes a Boolean value to the internal data buffer.

Parameters

<i>value</i>	- boolean data to write.
--------------	--------------------------

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`.

The documentation for this class was generated from the following file:

6.79 decaf::util::concurrent::BrokenBarrierException Class - Reference

```
#include <src/main/decaf/util/concurrent/BrokenBarrierException.h>
```

Inheritance diagram for decaf::util::concurrent::BrokenBarrierException:

Public Member Functions

- **BrokenBarrierException** () throw ()
Default Constructor.
- **BrokenBarrierException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **BrokenBarrierException** (const **BrokenBarrierException** &ex) throw ()
Copy Constructor.
- **BrokenBarrierException** (const std::exception ***cause**) throw ()
Constructor.
- **BrokenBarrierException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **BrokenBarrierException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **BrokenBarrierException** * **clone** () const
Clones this exception.
- virtual ~**BrokenBarrierException** () throw ()

6.79.1 Constructor & Destructor Documentation

6.79.1.1 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException () throw () [inline]

Default Constructor.

6.79.1.2 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.79.1.3 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const BrokenBarrierException & *ex*) throw ()
`[inline]`

Copy Constructor.

Parameters

<i>ex</i>	The Exception to copy in this new instance.
-----------	---

6.79.1.4 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const std::exception * *cause*) throw ()
`[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.79.1.5 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()
`[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>msg</i>	- The message to report
<i>...</i>	- list of primitives that are formatted into the message

6.79.1.6 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>cause</i>	- The exception that was the cause for this one to be thrown.
<i>msg</i>	- The message to report
<i>...</i>	- list of primitives that are formatted into the message

6.79.1.7 `virtual decaf::util::concurrent::BrokenBarrierException::~BrokenBarrierException () throw () [virtual]`

6.79.2 Member Function Documentation

6.79.2.1 `virtual BrokenBarrierException* decaf::util::concurrent::BrokenBarrierException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from `decaf::lang::Exception` (p. 1282).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/BrokenBarrierException.h`

6.80 activemq::commands::BrokerError Class Reference

This class represents an Exception sent from the Broker.

```
#include <src/main/activemq/commands/BrokerError.h>
```

Inheritance diagram for `activemq::commands::BrokerError`:

Data Structures

- struct `StackTraceElement`

Public Member Functions

- **BrokerError** ()
- virtual **~BrokerError** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **BrokerError** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **decaf::lang::Pointer** < **commands::Command** > **visit** (activemq::state::CommandVisitor *visitor)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- virtual const std::string & **getMessage** () const
Gets the string holding the error message.
- virtual void **setMessage** (const std::string &message)
*Sets the string that contains the error **Message** (p. 1821).*
- virtual const std::string & **getExceptionClass** () const
Gets the string holding the Exception Class name.
- virtual void **setExceptionClass** (const std::string &exceptionClass)
Sets the string that contains the Exception Class name.
- virtual const **decaf::lang::Pointer** < **BrokerError** > & **getCause** () const
Gets the Broker Error that caused this exception.
- virtual void **setCause** (const **decaf::lang::Pointer**< **BrokerError** > &cause)
Sets the Broker Error that caused this exception.
- virtual const std::vector < **decaf::lang::Pointer** < **StackTraceElement** > > & **getStackTraceElements** () const
Gets the Stack Trace Elements for the Exception.
- virtual void **setStackTraceElements** (const std::vector< **decaf::lang::Pointer**< **StackTraceElement** > > &stackTraceElements)
Sets the Stack Trace Elements for this Exception.

6.80.1 Detailed Description

This class represents an Exception sent from the Broker.

The Broker sends java Throwables, so we must mimic its structure here.

6.80.2 Constructor & Destructor Documentation

6.80.2.1 **activemq::commands::BrokerError::BrokerError ()**

6.80.2.2 **virtual activemq::commands::BrokerError::~~BrokerError ()**
[virtual]

6.80.3 Member Function Documentation

6.80.3.1 **virtual BrokerError* activemq::commands::BrokerError::cloneDataStructure () const** [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

References `copyDataStructure()`.

6.80.3.2 **virtual void activemq::commands::BrokerError::copyDataStructure (const DataStructure * src)** [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

Referenced by `cloneDataStructure()`.

6.80.3.3 **virtual const decaf::lang::Pointer<BrokerError>& activemq::commands::BrokerError::getCause () const** [inline, virtual]

Gets the Broker Error that caused this exception.

Returns

Broker Error Pointer

6.80.3.4 `virtual unsigned char activemq::commands::BrokerError::getDataStructureType () const [inline, virtual]`

Get the **DataSet** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataSet** (p. 1137).

6.80.3.5 `virtual const std::string& activemq::commands::BrokerError::getExceptionClass () const [inline, virtual]`

Gets the string holding the Exception Class name.

Returns

Exception Class name

6.80.3.6 `virtual const std::string& activemq::commands::BrokerError::getMessage () const [inline, virtual]`

Gets the string holding the error message.

Returns

String **Message** (p. 1821)

6.80.3.7 `virtual const std::vector< decaf::lang::Pointer<StackTraceElement> >& activemq::commands::BrokerError::getStackTraceElements () const [inline, virtual]`

Gets the Stack Trace Elements for the Exception.

Returns

Stack Trace Elements

6.80.3.8 `virtual void activemq::commands::BrokerError::setCause (const decaf::lang::Pointer< BrokerError > & cause) [inline, virtual]`

Sets the Broker Error that caused this exception.

Parameters

<i>cause</i>	- Broker Error
--------------	----------------

6.80.3.9 `virtual void activemq::commands::BrokerError::setExceptionClass (const std::string & exceptionClass) [inline, virtual]`

Sets the string that contains the Exception Class name.

Parameters

<i>exception- Class</i>	- String Exception Class name
-----------------------------	-------------------------------

6.80.3.10 `virtual void activemq::commands::BrokerError::setMessage (const std::string & message) [inline, virtual]`

Sets the string that contains the error **Message** (p. 1821).

Parameters

<i>message</i>	- String Error Message (p. 1821)
----------------	---

6.80.3.11 `virtual void activemq::commands::BrokerError::setStackTraceElements (const std::vector< decaf::lang::Pointer< StackTraceElement > > & stackTraceElements) [inline, virtual]`

Sets the Stack Trace Elements for this Exception.

Parameters

<i>stackTrace- Elements</i>	- Stack Trace Elements
---------------------------------	------------------------

6.80.3.12 `virtual decaf::lang::Pointer<commands::Command> activemq::commands::BrokerError::visit (activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**BrokerError.h**

6.81 activemq::exceptions::BrokerException Class Reference

- **BrokerId** & **operator=** (const **BrokerId** &other)

Static Public Attributes

- static const unsigned char **ID_BROKERID** = 124

Protected Attributes

- std::string **value**

6.82.1 Member Typedef Documentation

- 6.82.1.1 `typedef decaf::lang::PointerComparator<BrokerId>
 activemq::commands::BrokerId::COMPARATOR`

6.82.2 Constructor & Destructor Documentation

- 6.82.2.1 `activemq::commands::BrokerId::BrokerId ()`
- 6.82.2.2 `activemq::commands::BrokerId::BrokerId (const BrokerId & other)`
- 6.82.2.3 `virtual activemq::commands::BrokerId::~~BrokerId () [virtual]`

6.82.3 Member Function Documentation

- 6.82.3.1 `virtual BrokerId* activemq::commands::BrokerId::cloneDataStructure ()
 const [virtual]`

Clone this obbect and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.82.3.2 `virtual int activemq::commands::BrokerId::compareTo (const BrokerId & value) const [virtual]`

6.82.3.3 `virtual void activemq::commands::BrokerId::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1134).

6.82.3.4 `virtual bool activemq::commands::BrokerId::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 1135).

6.82.3.5 `virtual bool activemq::commands::BrokerId::equals (const BrokerId & value) const [virtual]`

6.82.3.6 `virtual unsigned char activemq::commands::BrokerId::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.83 activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller Class Reference 567

- 6.82.3.7 `virtual const std::string& activemq::commands::BrokerId::getValue () const`
[virtual]
- 6.82.3.8 `virtual std::string& activemq::commands::BrokerId::getValue ()`
[virtual]
- 6.82.3.9 `virtual bool activemq::commands::BrokerId::operator< (const BrokerId & value) const` [virtual]
- 6.82.3.10 `BrokerId& activemq::commands::BrokerId::operator= (const BrokerId & other)`
- 6.82.3.11 `virtual bool activemq::commands::BrokerId::operator== (const BrokerId & value) const` [virtual]
- 6.82.3.12 `virtual void activemq::commands::BrokerId::setValue (const std::string & value)` [virtual]
- 6.82.3.13 `virtual std::string activemq::commands::BrokerId::toString () const`
[virtual]

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 531).

6.82.4 Field Documentation

- 6.82.4.1 `const unsigned char activemq::commands::BrokerId::ID_BROKERID = 124`
[static]
- 6.82.4.2 `std::string activemq::commands::BrokerId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/BrokerId.h`

6.83 activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 567).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-  
BrokerIdMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller:

Public Member Functions

- **BrokerIdMarshaller** ()
- virtual **~BrokerIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**)
Tight Marhsal to the given stream.

6.83.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 567).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.83.2 Constructor & Destructor Documentation

- 6.83.2.1 **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::BrokerIdMarshaller** ()
[inline]

6.83.2.2 `virtual activemq::wireformat::openwire::marshal::generated-
::BrokerIdMarshaller::~~BrokerIdMarshaller () [inline,
virtual]`

6.83.3 Member Function Documentation

6.83.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire-
::marshal::generated::BrokerIdMarshaller::createObject () const
[virtual]`

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller`
(p. 1120).

6.83.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal-
::generated::BrokerIdMarshaller::getDataStructureType () const
[virtual]`

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller`
(p. 1122).

6.83.3.3 `virtual void activemq::wireformat::openwire::marshal::generated-
::BrokerIdMarshaller::looseMarshal (OpenWireFormat * format,
commands::DataStructure * command, decaf::io::DataOutputStream * ds
) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1123).

6.83.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)**
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1125).

6.83.3.5 **virtual int activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)**
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

6.83.3.6 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

6.83.3.7 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**BrokerIdMarshaller.h**

6.84 activemq::commands::BrokerInfo Class Reference

6.84.1 Constructor & Destructor Documentation

6.84.1.1 **activemq::commands::BrokerInfo::BrokerInfo** ()

6.84.1.2 **virtual activemq::commands::BrokerInfo::~~BrokerInfo** () [virtual]

6.84.2 Member Function Documentation

6.84.2.1 `virtual BrokerInfo* activemq::commands::BrokerInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1133).

6.84.2.2 `virtual void activemq::commands::BrokerInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 493).

6.84.2.3 `virtual bool activemq::commands::BrokerInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure` (p. 1133)'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 494).

6.84.2.4 `virtual const Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId () const [virtual]`

6.84.2.5 `virtual Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId () [virtual]`

- 6.84.2.36 `virtual std::string activemq::commands::BrokerInfo::toString () const` [virtual]

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

- 6.84.2.37 `virtual Pointer<Command> activemq::commands::BrokerInfo::visit (activemq::state::CommandVisitor * visitor)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

- 6.85.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::createObject** () const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.85.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::getDataStructureType () const`
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.85.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)` [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 500).

6.85.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)`
[virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller` (p. 501).

6.85.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::-`
`BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * format,`
`commands::DataStructure * command, utils::BooleanStream * bs)`
`[virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller` (p. 503).

6.85.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::-`
`BrokerInfoMarshaller::tightMarshal2 (OpenWireFormat * format,`
`commands::DataStructure * command, decaf::io::DataOutputStream * ds,`
`utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.85.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

6.86.1 Detailed Description

A container for data of a specific primitive type.

A buffer is a linear, finite sequence of elements of a specific primitive type. Aside from its content, the essential properties of a buffer are its capacity, limit, and position:

A buffer's capacity is the number of elements it contains. The capacity of a buffer is never negative and never changes.

A buffer's limit is the index of the first element that should not be read or written. A buffer's limit is never negative and is never greater than its capacity.

A buffer's position is the index of the next element to be read or written. A buffer's position is never negative and is never greater than its limit.

There is one subclass of this class for each non-boolean primitive type.

Transferring data: Each subclass of this class defines two categories of get and put operations: * Relative operations read or write one or more elements starting at the current position and then increment the position by the number of elements transferred. If the requested transfer exceeds the limit then a relative get operation throws a **BufferUnderflowException** (p. 611) and a relative put operation throws a **BufferOverflowException** (p. 609); in either case, no data is transferred. * Absolute operations take an explicit element index and do not affect the position. Absolute get and put operations throw an **IndexOutOfBoundsException** if the index argument exceeds the limit.

Data may also, of course, be transferred in to or out of a buffer by the I/O operations of an appropriate channel, which are always relative to the current position.

Marking and resetting:

A buffer's mark is the index to which its position will be reset when the reset method is invoked. The mark is not always defined, but when it is defined it is never negative and is never greater than the position. If the mark is defined then it is discarded when the position or the limit is adjusted to a value smaller than the mark. If the mark is not defined then invoking the reset method causes an **InvalidMarkException** (p. 1539) to be thrown.

Invariants:

The following invariant holds for the mark, position, limit, and capacity values: $0 \leq \text{mark} \leq \text{position} \leq \text{limit} \leq \text{capacity}$

A newly-created buffer always has a position of zero and a mark that is undefined. The initial limit may be zero, or it may be some other value that depends upon the type of the buffer and the manner in which it is constructed. The initial content of a buffer is, in general, undefined.

Clearing, flipping, and rewinding:

In addition to methods for accessing the position, limit, and capacity values and for marking and resetting, this class also defines the following operations upon buffers:

clear() (p. 585) makes a buffer ready for a new sequence of channel-read or relative put operations: It sets the limit to the capacity and the position to zero.

flip() (p. 585) makes a buffer ready for a new sequence of channel-write or relative get operations: It sets the limit to the current position and then sets the position to zero.

rewind() (p. 588) makes a buffer ready for re-reading the data that it already contains: It leaves the limit unchanged and sets the position to zero.

Read-only buffers:

Every buffer is readable, but not every buffer is writable. The mutation methods of each buffer class are specified as optional operations that will throw a **ReadOnlyBufferException** (p. 2244) when invoked upon a read-only buffer. A read-only buffer does not allow its content to be changed, but its mark, position, and limit values are mutable. Whether or not a buffer is read-only may be determined by invoking its `isReadOnly` method.

Thread safety:

Buffers are not safe for use by multiple concurrent threads. If a buffer is to be used by more than one thread then access to the buffer should be controlled by appropriate synchronization.

Invocation chaining:

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained; for example, the sequence of statements

```
b.flip(); b.position(23); b.limit(42);
```

can be replaced by the single, more compact statement `b.flip().position(23).limit(42);`

6.86.2 Constructor & Destructor Documentation

6.86.2.1 `decaf::nio::Buffer::Buffer (int capacity)`

6.86.2.2 `decaf::nio::Buffer::Buffer (const Buffer & other)`

6.86.2.3 `virtual decaf::nio::Buffer::~~Buffer () [inline, virtual]`

6.86.3 Member Function Documentation

6.86.3.1 `virtual int decaf::nio::Buffer::capacity () const [inline, virtual]`

Returns

this buffer's capacity.

6.86.3.2 `virtual Buffer& decaf::nio::Buffer::clear () [virtual]`

Clears this buffer.

The position is set to zero, the limit is set to the capacity, and the mark is discarded.

Invoke this method before using a sequence of channel-read or put operations to fill this buffer. For example:

```
buf.clear(); // Prepare buffer for reading in.read(buf); // Read data
```

This method does not actually erase the data in the buffer, but it is named as if it did because it will most often be used in situations in which that might as well be the case.

Returns

a reference to this buffer.

6.86.3.3 `virtual Buffer& decaf::nio::Buffer::flip () [virtual]`

Flips this buffer.

The limit is set to the current position and then the position is set to zero. If the mark is defined then it is discarded.

After a sequence of channel-read or put operations, invoke this method to prepare for a sequence of channel-write or relative get operations. For example:

```
buf.put(magic); // Prepend header in.read(buf); // Read data into rest of buffer buf.flip();
// Flip buffer out.write(buf); // Write header + data to channel
```

This method is often used in conjunction with the compact method when transferring data from one place to another.

Returns

a reference to this buffer.

6.86.3.4 `virtual bool decaf::nio::Buffer::hasRemaining () const [inline, virtual]`

Tells whether there are any elements between the current position and the limit.

Returns

true if, and only if, there is at least one element remaining in this buffer.

6.86.3.5 `virtual bool decaf::nio::Buffer::isReadOnly () const [pure virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implemented in **decaf::nio::ByteBuffer** (p. 707), **decaf::internal::nio::ByteBuffer** (p. 671), **decaf::internal::nio::CharArrayBuffer** (p. 782), **decaf::internal::nio::DoubleArrayBuffer** (p. 1257), **decaf::internal::nio::FloatArrayBuffer** (p. 1366), **decaf::internal::nio::IntArrayBuffer** (p. 1486), **decaf::internal::nio::LongArrayBuffer** (p. 1750), and **decaf::internal::nio::ShortArrayBuffer** (p. 2417).

6.86.3.6 `virtual int decaf::nio::Buffer::limit () const [inline, virtual]`

Returns

this buffers Limit

6.86.3.7 virtual Buffer& decaf::nio::Buffer::limit (int *newLimit*) [virtual]

Sets this buffer's limit.

If the position is larger than the new limit then it is set to the new limit. If the mark is defined and larger than the new limit then it is discarded.

Parameters

<i>newLimit</i>	The new limit value; must be no larger than this buffer's capacity.
-----------------	---

Returns

A reference to This buffer

Exceptions

<i>IllegalArgument-Exception</i>	if preconditions on the new pos don't hold.
----------------------------------	---

6.86.3.8 virtual Buffer& decaf::nio::Buffer::mark () [virtual]

Sets this buffer's mark at its position.

Returns

a reference to this buffer.

6.86.3.9 virtual int decaf::nio::Buffer::position () const [inline, virtual]**Returns**

the current position in the buffer

6.86.3.10 virtual Buffer& decaf::nio::Buffer::position (int *newPosition*) [virtual]

Sets this buffer's position.

If the mark is defined and larger than the new position then it is discarded.

Parameters

<i>newPosition</i>	The new postion in the buffer to set.
--------------------	---------------------------------------

Returns

a reference to This buffer.

Exceptions

<i>IllegalArgument-Exception</i>	if preconditions on the new pos don't hold.
----------------------------------	---

6.86.3.11 `virtual int decaf::nio::Buffer::remaining () const [inline, virtual]`

Returns the number of elements between the current position and the limit.

Returns

The number of elements remaining in this buffer

6.86.3.12 `virtual Buffer& decaf::nio::Buffer::reset () [virtual]`

Resets this buffer's position to the previously-marked position.

Returns

a reference to this buffer.

Exceptions

<i>InvalidMark-Exception</i> (p. 1539)	- If the mark has not been set
---	--------------------------------

6.86.3.13 `virtual Buffer& decaf::nio::Buffer::rewind () [virtual]`

Rewinds this buffer.

The position is set to zero and the mark is discarded.

Invoke this method before a sequence of channel-write or get operations, assuming that the limit has already been set appropriately. For example:

```
out.write(buf); // Write remaining data buf.rewind(); // Rewind buffer buf.get(array); // Copy data into array
```

Returns

a reference to this buffer.

6.86.4 Field Documentation

6.86.4.1 int decaf::nio::Buffer::_capacity [protected]

6.86.4.2 int decaf::nio::Buffer::_limit [protected]

6.86.4.3 int decaf::nio::Buffer::_mark [protected]

6.86.4.4 bool decaf::nio::Buffer::_markSet [protected]

6.86.4.5 int decaf::nio::Buffer::_position [mutable, protected]

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**Buffer.h**

6.87 decaf::io::BufferedInputStream Class Reference

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

```
#include <src/main/decaf/io/BufferedInputStream.h>
```

Inheritance diagram for decaf::io::BufferedInputStream:

Public Member Functions

- **BufferedInputStream** (InputStream *stream, bool own=false)

Constructor.

- **BufferedInputStream** (InputStream *stream, int bufferSize, bool own=false)

Constructor.

- virtual ~**BufferedInputStream** ()

- virtual int **available** () const

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual void **close** ()

*Closes the **InputStream** (p. 1464) freeing any resources that might have been acquired during the lifetime of this stream.*

The default implementation of this method does nothing.

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs while closing the InputStream (p. 1464).</i>
------------------------------	---

- virtual long long **skip** (long long num)

*Skips over and discards *n* bytes of data from this input stream.*

*The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.*

*The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	<i>The number of bytes to skip.</i>
-----	-------------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

UnsupportedOperation-Exception	<i>if the concrete stream class does not support skipping bytes.</i>
--------------------------------	--

- virtual void **mark** (int readLimit)

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	<i>The max bytes read before marked position is invalid.</i>
-----------	--

- virtual void **reset** ()

Repositions this stream to the position at the time the mark method was last called on this input stream.

*If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1545) might be thrown. * If such an **IOException** (p. 1545) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

*If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1545). * If an **IOException** (p. 1545) is not thrown, then the stream*

is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1545).

Exceptions

IOException (p. 1545)	if an I/O error occurs.
------------------------------	-------------------------

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.87.1 Detailed Description

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

6.87.2 Constructor & Destructor Documentation

6.87.2.1 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * stream, bool own = false)

Constructor.

Parameters

<i>stream</i>	The target input stream to buffer.
<i>own</i>	Indicates if we own the stream object, defaults to false.

6.87.2.2 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * stream, int bufferSize, bool own = false)

Constructor.

Parameters

<i>stream</i>	The target input stream to buffer.
<i>bufferSize</i>	The size in bytes to allocate for the internal buffer.
<i>own</i>	Indicates if we own the stream object, defaults to false.

Exceptions

<i>IllegalArgumentException</i>	if the size is zero or negative.
---------------------------------	----------------------------------

6.87.2.3 `virtual decaf::io::BufferedInputStream::~~BufferedInputStream ()`
[virtual]

6.87.3 Member Function Documentation

6.87.3.1 `virtual int decaf::io::BufferedInputStream::available () const`
[virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 1545)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::FilterInputStream** (p. 1337).

6.87.3.2 `virtual void decaf::io::BufferedInputStream::close ()` [virtual]

Closes the **InputStream** (p. 1464) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException (p. 1545)	if an I/O error occurs while closing the InputStream (p. 1464).
---------------------------------	--

Reimplemented from `decaf::io::FilterInputStream` (p. 1337).

6.87.3.3 `virtual int decaf::io::BufferedInputStream::doReadArrayBounded (unsigned char * buffer, int size, int offset, int length)` `[protected, virtual]`

Reimplemented from `decaf::io::FilterInputStream` (p. 1338).

6.87.3.4 `virtual int decaf::io::BufferedInputStream::doReadByte ()` `[protected, virtual]`

Reimplemented from `decaf::io::FilterInputStream` (p. 1338).

6.87.3.5 `virtual void decaf::io::BufferedInputStream::mark (int readLimit)` `[virtual]`

Marks the current position in the stream. A subsequent call to the `reset` method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the `reset` method is called so long the `readLimit` is not reached.

Calling `mark` on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

<i>readLimit</i>	The max bytes read before marked position is invalid.
------------------	---

Reimplemented from `decaf::io::FilterInputStream` (p. 1338).

6.87.3.6 `virtual bool decaf::io::BufferedInputStream::markSupported () const` `[inline, virtual]`

Determines if this input stream supports the `mark` and `reset` methods.

Whether or not `mark` and `reset` are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns `false`.

Returns

`true` if this stream instance supports marks

Reimplemented from `decaf::io::FilterInputStream` (p. 1339).

6.87.3.7 virtual void decaf::io::BufferedInputStream::reset () [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1545) might be thrown. * If such an **IOException** (p. 1545) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1545). * If an **IOException** (p. 1545) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1545).

Exceptions

IOException (p. 1545)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::FilterInputStream** (p. 1339).

6.87.3.8 virtual long long decaf::io::BufferedInputStream::skip (long long num) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>Unsupported-Operation-Exception</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::FilterInputStream** (p. 1340).

The documentation for this class was generated from the following file:

6.88.2 Constructor & Destructor Documentation

6.88.2.1 `decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * stream, bool own = false)`

Constructor.

Parameters

<i>stream</i>	The target output stream.
<i>own</i>	Indicates if this class owns the stream pointer.

6.88.2.2 `decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * stream, int bufferSize, bool own = false)`

Constructor.

Parameters

<i>stream</i>	The target output stream.
<i>bufferSize</i>	The size for the internal buffer.
<i>own</i>	Indicates if this class owns the stream pointer.

Exceptions

<i>IllegalArgumentException</i>	if the <i>bufferSize</i> given is negative.

- static **decaf::nio::ShortBuffer * createShortBuffer** (std::vector< short > &buffer)
Wraps the passed STL Short Vector in a ShortBuffer.

6.89.1 Detailed Description

Factory class used by static methods in the **decaf::nio** (p. 94) package to create the various default version of the NIO interfaces.

Since

1.0

6.89.2 Constructor & Destructor Documentation

6.89.2.1 virtual **decaf::internal::nio::BufferFactory::~~BufferFactory** ()
[inline, virtual]

6.89.3 Member Function Documentation

6.89.3.1 static **decaf::nio::ByteBuffer*** **decaf::internal::nio::BufferFactory::createByteBuffer** (int *capacity*)
[static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated ByteBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.2 static **decaf::nio::ByteBuffer*** **decaf::internal::nio::BufferFactory::createByteBuffer** (unsigned char * *buffer*, int *size*, int *offset*, int *length*)
[static]

Wraps the passed buffer with a new ByteBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new ByteBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.3 `static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (std::vector< unsigned char > & buffer)`
`[static]`

Wraps the passed STL Byte Vector in a ByteBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new ByteBuffer that is backed by buffer, caller owns.

6.89.3.4 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (int capacity)`
`[static]`

Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated CharBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.5 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (char * buffer, int size, int offset, int length)`
`[static]`

Wraps the passed buffer with a new CharBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new CharBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.6 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (std::vector< char > & buffer)`
`[static]`

Wraps the passed STL Byte Vector in a CharBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new CharBuffer that is backed by `buffer`, caller owns.

6.89.3.7 `static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (int capacity)`
[static]

Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated DoubleBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.8 `static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (double * buffer, int size, int offset, int length)`
[static]

Wraps the passed buffer with a new DoubleBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new DoubleBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.9 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (std::vector< double > & buffer)
[static]

Wraps the passed STL Double Vector in a DoubleBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new DoubleBuffer that is backed by buffer, caller owns.

6.89.3.10 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (int capacity)
[static]

Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated FloatBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.11 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (float * buffer, int size, int offset, int length)`
`[static]`

Wraps the passed buffer with a new FloatBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new FloatBuffer that is backed by `buffer`, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.12 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (std::vector< float > & buffer)`
`[static]`

Wraps the passed STL Float Vector in a FloatBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new FloatBuffer that is backed by `buffer`, caller owns.

6.89.3.13 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::create-
IntBuffer (int *capacity*) [static]

Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated IntBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.14 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory-
::createIntBuffer (int * *buffer*, int *size*, int *offset*, int *length*)
[static]

Wraps the passed buffer with a new IntBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new IntBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.15 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (std::vector< int > & buffer)`
`[static]`

Wraps the passed STL int Vector in a IntBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new IntBuffer that is backed by buffer, caller owns.

6.89.3.16 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (int capacity)`
`[static]`

Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	- the internal buffer's capacity.
-----------------	-----------------------------------

Returns

a newly allocated DoubleBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.17 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (long long * buffer, int size, int offset, int length)`
`[static]`

Wraps the passed buffer with a new LongBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be

array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new LongBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.18 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (std::vector< long long > & buffer)`
[static]

Wraps the passed STL Long Vector in a LongBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new LongBuffer that is backed by buffer, caller owns.

6.89.3.19 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (int capacity)`
[static]

Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated ShortBuffer which the caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.
----------------------------------	--

6.89.3.20 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (short * buffer, int size, int offset, int length)`
`[static]`

Wraps the passed buffer with a new ShortBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The array that will back the new buffer.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new ShortBuffer that is backed by `buffer`, caller owns the returned pointer.

Exceptions

<i>NullPointerException</i>	if the buffer given in Null.
<i>IndexOutOfBoundsException</i>	if the capacity specified is negative.

6.89.3.21 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (std::vector< short > & buffer)`
`[static]`

Wraps the passed STL Short Vector in a ShortBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new `DoubleBuffer` that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

6.90.1 Constructor & Destructor Documentation

6.90.1.1 `decaf::nio::BufferOverflowException::BufferOverflowException () throw ()` `[inline]`

Default Constructor.

6.90.1.2 `decaf::nio::BufferOverflowException::BufferOverflowException (const lang::Exception & ex) throw ()` `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.90.1.3 `decaf::nio::BufferOverflowException::BufferOverflowException (const BufferOverflowException & ex) throw ()` `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.90.1.4 `decaf::nio::BufferOverflowException::BufferOverflowException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.90.1.5 `decaf::nio::BufferOverflowException::BufferOverflowException (const std::exception * cause) throw ()` `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.90.1.6 **decaf::nio::BufferOverflowException::BufferOverflowException** (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.90.1.7 **virtual decaf::nio::BufferOverflowException::~~BufferOverflowException** () throw () [inline, virtual]

6.90.2 Member Function Documentation

6.90.2.1 **virtual BufferOverflowException* decaf::nio::BufferOverflowException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::Exception** (p. 1282).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**BufferOverflowException.h**

6.91 decaf::nio::BufferUnderflowException Class Reference

```
#include <src/main/decaf/nio/BufferUnderflowException.h>
```

Inheritance diagram for decaf::nio::BufferUnderflowException:

Public Member Functions

- **BufferUnderflowException** () throw ()

Default Constructor.

- **BufferUnderflowException** (const lang::Exception &ex) throw ()

Copy Constructor.

- **BufferUnderflowException** (const **BufferUnderflowException** &ex) throw ()

Copy Constructor.

- **BufferUnderflowException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- **BufferUnderflowException** (const std::exception *cause) throw ()

Constructor.

- **BufferUnderflowException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor.

- virtual **BufferUnderflowException** * clone () const

Clones this exception.

- virtual ~**BufferUnderflowException** () throw ()

6.91.1 Constructor & Destructor Documentation

6.91.1.1 **decaf::nio::BufferUnderflowException::BufferUnderflowException ()**
throw () [inline]

Default Constructor.

6.91.1.2 **decaf::nio::BufferUnderflowException::BufferUnderflowException (**
const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy
----	-----------------------

6.91.1.3 **decaf::nio::BufferUnderflowException::BufferUnderflowException (**
const **BufferUnderflowException** & ex) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type
----	--

6.91.1.4 **decaf::nio::BufferUnderflowException::BufferUnderflowException (**
const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.91.1.5 **decaf::nio::BufferUnderflowException::BufferUnderflowException (**
const std::exception * *cause*) throw () `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.91.1.6 **decaf::nio::BufferUnderflowException::BufferUnderflowException (**
const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () `[inline]`

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.91.1.7 **virtual decaf::nio::BufferUnderflowException::~~-**
BufferUnderflowException () throw () `[inline,`
virtual]

6.91.2 Member Function Documentation

6.91.2.1 virtual **BufferUnderflowException*** **decaf::nio::BufferUnderflowException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::Exception** (p. 1282).

The documentation for this class was generated from the following file:

6.92 decaf::lang::Byte Class Reference

```
#include <src/main/decaf/lang/Byte.h>
```

Inheritance diagram for **decaf::lang::Byte**:

Public Member Functions

- **Byte** (unsigned char value)
- **Byte** (const std::string &value)
*Creates a new **Byte** (p. 614) instance from the given string.*
- virtual ~**Byte** ()
- virtual int **compareTo** (const **Byte** &c) const
*Compares this **Byte** (p. 614) instance with another.*
- virtual bool **operator==** (const **Byte** &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Byte** &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const unsigned char &c) const
*Compares this **Byte** (p. 614) instance with a char type.*
- virtual bool **operator==** (const unsigned char &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const unsigned char &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (const **Byte** &c) const
- bool **equals** (const unsigned char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const

Answers the double value which the receiver represents.

- virtual float **floatValue** () const

Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

Answers the short value which the receiver represents.

- virtual int **intValue** () const

Answers the int value which the receiver represents.

- virtual long long **longValue** () const

Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (unsigned char value)

- static **Byte decode** (const std::string &value)

*Decodes a **String** (p. 2620) into a **Byte** (p. 614).*

- static unsigned char **parseByte** (const std::string &s, int radix)

Parses the string argument as a signed unsigned char in the radix specified by the second argument.

- static unsigned char **parseByte** (const std::string &s)

Parses the string argument as a signed decimal unsigned char.

- static **Byte valueOf** (unsigned char value)

*Returns a **Character** (p. 765) instance representing the specified char value.*

- static **Byte valueOf** (const std::string &value)

*Returns a **Byte** (p. 614) object holding the value given by the specified std::string.*

- static **Byte valueOf** (const std::string &value, int radix)

*Returns a **Byte** (p. 614) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const unsigned char **MIN_VALUE** = 0x7F

The minimum value that a unsigned char can take on.

- static const unsigned char **MAX_VALUE** = 0x80

The maximum value that a unsigned char can take on.

- static const int **SIZE** = 8

The size of the primitive charactor in bits.

6.92.1 Constructor & Destructor Documentation

6.92.1.1 `decaf::lang::Byte::Byte (unsigned char value)`

Parameters

<i>value</i>	- the primitive value to wrap
--------------	-------------------------------

6.92.1.2 `decaf::lang::Byte::Byte (const std::string & value)`

Creates a new **Byte** (p. 614) instance from the given string.

Parameters

<i>value</i>	The string to convert to an unsigned char
--------------	---

Exceptions

<i>NumberFormatException</i>	if the string is not a valid byte.
------------------------------	------------------------------------

6.92.1.3 `virtual decaf::lang::Byte::~~Byte () [inline, virtual]`

6.92.2 Member Function Documentation

6.92.2.1 `virtual unsigned char decaf::lang::Byte::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1993).

6.92.2.2 `virtual int decaf::lang::Byte::compareTo (const Byte & c) const [inline, virtual]`

Compares this **Byte** (p. 614) instance with another.

Parameters

<i>c</i>	- the Byte (p. 614) instance to be compared
----------	--

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Byte** > (p. 886).

6.92.2.3 `virtual int decaf::lang::Byte::compareTo (const unsigned char & c) const`
`[inline, virtual]`

Compares this **Byte** (p. 614) instance with a char type.

Parameters

<code>c</code>	- the char instance to be compared
----------------	------------------------------------

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **unsigned char** > (p. 886).

6.92.2.4 `static Byte decaf::lang::Byte::decode (const std::string & value)`
`[static]`

Decodes a **String** (p. 2620) into a **Byte** (p. 614).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Byte::parseByte** (p. 620) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a **NumberFormatException** will be thrown. The result is negated if first character of the specified **String** (p. 2620) is the minus sign. No whitespace characters are permitted in the string.

Parameters

<code>value</code>	- The string to decode
--------------------	------------------------

Returns

a **Byte** (p. 614) object containing the decoded value

Exceptions

<i>NumberFormatException</i>	if the string is not formatted correctly.
------------------------------	---

6.92.2.5 `virtual double decaf::lang::Byte::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.92.2.6 `bool decaf::lang::Byte::equals (const Byte & c) const [inline, virtual]`

Returns

true if the two **Byte** (p. 614) Objects have the same value.

Implements **decaf::lang::Comparable< Byte >** (p. 887).

6.92.2.7 `bool decaf::lang::Byte::equals (const unsigned char & c) const [inline, virtual]`

Returns

true if the two Bytes have the same value.

Implements **decaf::lang::Comparable< unsigned char >** (p. 887).

6.92.2.8 `virtual float decaf::lang::Byte::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.92.2.9 `virtual int decaf::lang::Byte::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.92.2.10 `virtual long long decaf::lang::Byte::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long long the value of the receiver.

Implements **decaf::lang::Number** (p. 1994).

6.92.2.11 `virtual bool decaf::lang::Byte::operator< (const Byte & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Byte >** (p. 887).

6.92.2.12 `virtual bool decaf::lang::Byte::operator< (const unsigned char & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p. 887).

6.92.2.13 `virtual bool decaf::lang::Byte::operator==(const Byte & c) const` `[inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Byte** > (p. 888).

6.92.2.14 `virtual bool decaf::lang::Byte::operator==(const unsigned char & c) const` `[inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **unsigned char** > (p. 888).

6.92.2.15 `static unsigned char decaf::lang::Byte::parseByte (const std::string & s, int radix)` `[static]`

Parses the string argument as a signed unsigned char in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 768) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type **NumberFormatException** is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 773) or larger than **Character::MAX_RADIX** (p. 772). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type unsigned char.

Parameters

<i>s</i>	- the String (p. 2620) containing the unsigned char to be parsed
<i>radix</i>	- the radix to be used while parsing <i>s</i>

Returns

the unsigned char represented by the string argument in the specified radix.

Exceptions

<i>NumberFormatException</i>	- If String (p. 2620) does not contain a parsable unsigned char.
------------------------------	---

6.92.2.16 static unsigned char decaf::lang::Byte::parseByte (const std::string & s)
[static]

Parses the string argument as a signed decimal unsigned char.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting unsigned char value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseByte(const std::string, int) method.

Parameters

<i>s</i>	- String (p. 2620) to convert to a unsigned char
----------	---

Returns

the converted unsigned char value

Exceptions

<i>NumberFormatException</i>	if the string is not a unsigned char.
------------------------------	---------------------------------------

6.92.2.17 virtual short decaf::lang::Byte::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1994).

6.92.2.18 `std::string decaf::lang::Byte::toString () const`

Returns

this **Byte** (p. 614) Object as a **String** (p. 2620) Representation

6.92.2.19 `static std::string decaf::lang::Byte::toString (unsigned char value)` [static]

Returns

a string representing the primitive value as Base 10

6.92.2.20 `static Byte decaf::lang::Byte::valueOf (unsigned char value)` [inline, static]

Returns a **Character** (p. 765) instance representing the specified char value.

Parameters

<i>value</i>	- the primitive char to wrap.
--------------	-------------------------------

Returns

a new **Character** (p. 765) instance that wraps this value.

6.92.2.21 `static Byte decaf::lang::Byte::valueOf (const std::string & value)` [static]

Returns a **Byte** (p. 614) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal unsigned char, exactly as if the argument were given to the `parseByte(std::string)` method. The result is a **Byte** (p. 614) object that represents the unsigned char value specified by the string.

Parameters

<i>value</i>	- std::string to parse as base 10
--------------	-----------------------------------

Returns

new **Byte** (p. 614) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i>	if the string is not a decimal unsigned char.
------------------------------	---

6.92.2.22 `static Byte decaf::lang::Byte::valueOf (const std::string & value, int radix)`
`[static]`

Returns a **Byte** (p. 614) object holding the value extracted from the specified `std::string` when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed unsigned char in the radix specified by the second argument, exactly as if the argument were given to the `parse-Byte(std::string, int)` method. The result is a **Byte** (p. 614) object that represents the unsigned char value specified by the string.

Parameters

<i>value</i>	- <code>std::string</code> to parse as base (<i>radix</i>)
<i>radix</i>	- base of the string to parse.

Returns

new **Byte** (p. 614) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i> <i>Exception</i>	if the string is not a valid unsigned char.
--	---

6.92.3 Field Documentation

6.92.3.1 `const unsigned char decaf::lang::Byte::MAX_VALUE = 0x80` `[static]`

The maximum value that a unsigned char can take on.

6.92.3.2 `const unsigned char decaf::lang::Byte::MIN_VALUE = 0x7F` `[static]`

The minimum value that a unsigned char can take on.

6.92.3.3 `const int decaf::lang::Byte::SIZE = 8` `[static]`

The size of the primitive character in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Byte.h`

6.93 decaf::internal::util::ByteArrayAdapter Class Reference

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

```
#include <src/main/decaf/internal/util/ByteArrayAdapter.h>
```

Data Structures

- union **Array**

Public Member Functions

- **ByteArrayAdapter** (int size)
Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.
- **ByteArrayAdapter** (unsigned char *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (char *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (double *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (float *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (long long *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (int *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (short *array, int size, bool own=false)
Creates a byte array object that wraps the given array.
- virtual ~**ByteArrayAdapter** ()
- virtual int **getCapacity** () const
Gets the size of the underlying array.
- virtual int **getCharCapacity** () const
Gets the size of the underlying array as if it contains chars.
- virtual int **getDoubleCapacity** () const
Gets the size of the underlying array as if it contains doubles.
- virtual int **getFloatCapacity** () const
Gets the size of the underlying array as if it contains doubles.
- virtual int **getLongCapacity** () const
Gets the size of the underlying array as if it contains doubles.
- virtual int **getIntCapacity** () const
Gets the size of the underlying array as if it contains ints.

- virtual int **getShortCapacity** () const
Gets the size of the underlying array as if it contains shorts.
- virtual unsigned char * **getByteArray** ()
Gets the pointer to the array we are wrapping.
- virtual char * **getCharArray** ()
Gets the pointer to the array we are wrapping.
- virtual short * **getShortArray** ()
Gets the pointer to the array we are wrapping.
- virtual int * **getIntArray** ()
Gets the pointer to the array we are wrapping.
- virtual long long * **getLongArray** ()
Gets the pointer to the array we are wrapping.
- virtual double * **getDoubleArray** ()
Gets the pointer to the array we are wrapping.
- virtual float * **getFloatArray** ()
Gets the pointer to the array we are wrapping.
- virtual void **read** (unsigned char *buffer, int size, int offset, int length) const
Reads from the Byte array starting at the specified offset and reading the specified length.
- virtual void **write** (unsigned char *buffer, int size, int offset, int length)
Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects internal array.
- virtual void **resize** (int size)
Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.
- virtual void **clear** () throw ()
Clear all data from that Array, setting the underlying bytes to zero.
- unsigned char & **operator[]** (int index)
*Allows the **ByteArrayAdapter** (p. 624) to be indexed as a standard array.*
- const unsigned char & **operator[]** (int index) const
- virtual unsigned char **get** (int index) const
Absolute get method.
- virtual char **getChar** (int index) const
Reads one byte at the given index and returns it.
- virtual double **getDouble** (int index) const
Reads eight bytes at the given index and returns it.
- virtual double **getDoubleAt** (int index) const
Reads eight bytes at the given byte index and returns it.
- virtual float **getFloat** (int index) const
Reads four bytes at the given index and returns it.
- virtual float **getFloatAt** (int index) const
Reads four bytes at the given byte index and returns it.
- virtual long long **getLong** (int index) const

- Reads eight bytes at the given index and returns it.*
- virtual long long **getLongAt** (int index) const
- Reads eight bytes at the given byte index and returns it.*

- Reads four bytes at the given index and returns it.*
- virtual int **getIntAt** (int index) const
- Reads four bytes at the given byte index and returns it.*
- virtual short **getShort** (int index) const
- Reads two bytes at the given index and returns it.*
- virtual short **getShortAt** (int index) const
- Reads two bytes at the given byte index and returns it.*
- virtual **ByteArrayAdapter** & **put** (int index, unsigned char value)
- Writes the given byte into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putChar** (int index, char value)
- Writes one byte containing the given value, into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putDouble** (int index, double value)
- Writes eight bytes containing the given value, into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putDoubleAt** (int index, double value)
- Writes eight bytes containing the given value, into this buffer at the given byte index.*
- virtual **ByteArrayAdapter** & **putFloat** (int index, float value)
- Writes four bytes containing the given value, into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putFloatAt** (int index, float value)
- Writes four bytes containing the given value, into this buffer at the given byte index.*
- virtual **ByteArrayAdapter** & **putLong** (int index, long long value)
- Writes eight bytes containing the given value, into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putLongAt** (int index, long long value)
- Writes eight bytes containing the given value, into this buffer at the given byte index.*
- virtual **ByteArrayAdapter** & **putInt** (int index, int value)
- Writes four bytes containing the given value, into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putIntAt** (int index, int value)
- Writes four bytes containing the given value, into this buffer at the given byte index.*
- virtual **ByteArrayAdapter** & **putShort** (int index, short value)
- Writes two bytes containing the given value, into this buffer at the given index.*
- virtual **ByteArrayAdapter** & **putShortAt** (int index, short value)
- Writes two bytes containing the given value, into this buffer at the given byte index.*

6.93.1 Detailed Description

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

All the array types are mapped down to a byte array and methods are supplied for accessing the data in any of the primitive type forms.

Methods in this class that do not return a specific value return a reference to this object so that calls can be chained.

Since

1.0

6.93.2 Constructor & Destructor Documentation

6.93.2.1 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int size)

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>size</i>	The size of the array, this is the limit we read and write to.
-------------	--

Exceptions

<i>IllegalArgumentException</i>	if size is negative.
---------------------------------	----------------------

6.93.2.2 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (unsigned char * array, int size, bool own = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.3 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (char * array, int size, bool own = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.4 **decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter** (*double * array*, *int size*, *bool own = false*)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.5 **decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter** (*float * array*, *int size*, *bool own = false*)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.6 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (long long * array, int size, bool own = false)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.7 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int * array, int size, bool own = false)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.8 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (short * array, int size, bool own = false)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The physical array to wrap.
--------------	-----------------------------

<i>size</i>	The size of the array, this is the limit we read and write to.
<i>own</i>	Indicates if this class is now the owner of the pointer.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the size is negative.

6.93.2.9 **virtual** **decaf::internal::util::ByteArrayAdapter::~~ByteArrayAdapter** ()
[virtual]

6.93.3 Member Function Documentation

6.93.3.1 **virtual void** **decaf::internal::util::ByteArrayAdapter::clear** () throw ()
[virtual]

Clear all data from that Array, setting the underlying bytes to zero.

6.93.3.2 **virtual unsigned char** **decaf::internal::util::ByteArrayAdapter::get** (int *index*)
const [virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

<i>index</i>	The index in the Buffer where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	If index is not smaller than the buffer's limit or is negative.
----------------------------------	---

6.93.3.3 **virtual unsigned char*** **decaf::internal::util::ByteArrayAdapter::getByteArray**
() [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects

that point to this array.

Returns

an unsigned char* pointer to the array this object wraps.

6.93.3.4 virtual int **decaf::internal::util::ByteArrayAdapter::getCapacity** () const
[inline, virtual]

Gets the size of the underlying array.

Returns

the size the array.

6.93.3.5 virtual char **decaf::internal::util::ByteArrayAdapter::getChar** (int *index*)
const [virtual]

Reads one byte at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	If index is not smaller than the buffer's limit or is negative.
----------------------------------	---

6.93.3.6 virtual char* **decaf::internal::util::ByteArrayAdapter::getCharArray** ()
[inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects that point to this array.

Returns

an char* pointer to the array this object wraps.

6.93.3.7 `virtual int decaf::internal::util::ByteArrayAdapter::getCharCapacity ()`
`const [inline, virtual]`

Gets the size of the underlying array as if it contains chars.

Returns

the size the array.

6.93.3.8 `virtual double decaf::internal::util::ByteArrayAdapter::getDouble (int index`
`) const [virtual]`

Reads eight bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.9 `virtual double* decaf::internal::util::ByteArrayAdapter::getDoubleArray ()`
`[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects that point to this array.

Returns

an `double*` pointer to the array this object wraps.

6.93.3.10 `virtual double decaf::internal::util::ByteArrayAdapter::getDoubleAt (int`
`index) const [virtual]`

Reads eight bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.11 virtual int decaf::internal::util::ByteArrayAdapter::getDoubleCapacity ()
const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.93.3.12 virtual float decaf::internal::util::ByteArrayAdapter::getFloat (int *index*)
const [virtual]

Reads four bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.13 `virtual float* decaf::internal::util::ByteArrayAdapter::getFloatArray ()`
`[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects that point to this array.

Returns

an float* pointer to the array this object wraps.

6.93.3.14 `virtual float decaf::internal::util::ByteArrayAdapter::getFloatAt (int index)`
`const [virtual]`

Reads four bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.15 `virtual int decaf::internal::util::ByteArrayAdapter::getFloatCapacity ()`
`const [inline, virtual]`

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.93.3.16 `virtual int decaf::internal::util::ByteArrayAdapter::getInt (int index) const`
`[virtual]`

Reads four bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.17 virtual int* **decaf::internal::util::ByteArrayAdapter::getIntArray** ()
[inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects that point to this array.

Returns

an int* pointer to the array this object wraps.

6.93.3.18 virtual int **decaf::internal::util::ByteArrayAdapter::getIntAt** (int *index*)
const [virtual]

Reads four bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.19 `virtual int decaf::internal::util::ByteArrayAdapter::getIntCapacity () const`
`[inline, virtual]`

Gets the size of the underlying array as if it contains ints.

Returns

the size the array.

6.93.3.20 `virtual long long decaf::internal::util::ByteArrayAdapter::getLong (int index`
`) const [virtual]`

Reads eight bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.21 `virtual long long* decaf::internal::util::ByteArrayAdapter::getLongArray (`
`) [inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects that point to this array.

Returns

an `long long*` pointer to the array this object wraps.

6.93.3.22 `virtual long long decaf::internal::util::ByteArrayAdapter::getLongAt (int`
`index) const [virtual]`

Reads eight bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.23 virtual int decaf::internal::util::ByteArrayAdapter::getLongCapacity ()
const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.93.3.24 virtual short decaf::internal::util::ByteArrayAdapter::getShort (int *index*)
const [virtual]

Reads two bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read.
--------------	---

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.25 `virtual short* decaf::internal::util::ByteArrayAdapter::getShortArray ()`
`[inline, virtual]`

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 624) objects that point to this array.

Returns

an short* pointer to the array this object wraps.

6.93.3.26 `virtual short decaf::internal::util::ByteArrayAdapter::getShortAt (int index) const` `[virtual]`

Reads two bytes at the given byte index and returns it.

Parameters

<i>index</i>	The index in the Buffer where the bytes are to be read
--------------	--

Returns

the value at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

6.93.3.27 `virtual int decaf::internal::util::ByteArrayAdapter::getShortCapacity ()`
`const [inline, virtual]`

Gets the size of the underlying array as if it contains shorts.

Returns

the size the array.

6.93.3.28 `unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int index)`

Allows the **ByteArrayAdapter** (p. 624) to be indexed as a standard array.
 calling the non constant version allows the user to change the value at index

Parameters

<i>index</i>	The position in the array to access, if the value is negative or greater than the size of the underlying array an <code>IndexOutOfBoundsException</code> is thrown.
--------------	---

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions of <i>index</i> are not met.
----------------------------------	---

6.93.3.29 `const unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int index) const`

6.93.3.30 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::put (int index, unsigned char value) [virtual]`

Writes the given byte into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if <i>index</i> greater than the buffer's limit minus the size of the type being written, or <i>index</i> is negative.
----------------------------------	--

6.93.3.31 `virtual ByteArrayAdapter& decaf::internal::util::-
ByteArrayAdapter::putChar (int index, char value)
[virtual]`

Writes one byte containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.32 `virtual ByteArrayAdapter& decaf::internal::util::Byte-
ArrayAdapter::putDouble (int index, double value)
[virtual]`

Writes eight bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.33 `virtual ByteArrayAdapter& decaf::internal::util::Byte-
ArrayAdapter::putDoubleAt (int index, double value)
[virtual]`

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.34 virtual **ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloat (int *index*, float *value*)**
[virtual]

Writes four bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array $\text{index} * \text{sizeof}(\text{type})$ if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.35 virtual **ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloatAt (int *index*, float *value*)**
[virtual]

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.36 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putInt (int index, int value) [virtual]`

Writes four bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.37 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putIntAt (int index, int value) [virtual]`

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.38 virtual **ByteArrayAdapter&** decaf::internal::util::Byte-
ArrayAdapter::putLong (int *index*, long long *value*)
[virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.39 virtual **ByteArrayAdapter&** decaf::internal::util::Byte-
ArrayAdapter::putLongAt (int *index*, long long *value*)
[virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.40 `virtual ByteArrayAdapter& decaf::internal::util::Byte-
ArrayAdapter::putShort (int index, short value)
[virtual]`

Writes two bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.41 `virtual ByteArrayAdapter& decaf::internal::util::Byte-
ArrayAdapter::putShortAt (int index, short value)
[virtual]`

Writes two bytes containing the given value, into this buffer at the given byte index.

Parameters

<i>index</i>	The position in the Buffer to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
----------------------------------	--

6.93.3.42 `virtual void decaf::internal::util::ByteArrayAdapter::read (unsigned char *
buffer, int size, int offset, int length) const [virtual]`

Reads from the Byte array starting at the specified offset and reading the specified length.

If the length is greater than the size of this underlying byte array then an `BufferUnderflowException` is thrown.

Parameters

<i>buffer</i>	The buffer to read data from this array into.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in this array to start reading from.
<i>length</i>	The amount of data to read from this array.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length exceeds the size.
<i>NullPointerException</i>	if buffer is null
<i>BufferUnderflowException</i>	if there is not enough data to read because the offset or the length is greater than the size of this array.

6.93.3.43 `virtual void decaf::internal::util::ByteArrayAdapter::resize (int size)
[virtual]`

Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.

A **ByteArrayAdapter** (p. 624) can only be resized when it owns the underlying array, if it does not then it will throw an `InvalidStateException`.

Parameters

<i>size</i>	The new size of the array.
-------------	----------------------------

Exceptions

<i>IllegalArgument-Exception</i>	if the size parameter is negative.
<i>InvalidStateException</i>	if this object does not own the buffer.

6.93.3.44 `virtual void decaf::internal::util::ByteArrayAdapter::write (unsigned char *
buffer, int size, int offset, int length) [virtual]`

Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects internal array.

. If the length is greater than the size of this underlying byte array then an BufferOverflowException is thrown.

Parameters

<i>buffer</i>	The buffer to read data from this array into.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in this array to start reading from.
<i>length</i>	The amount of data to read from this array.

Exceptions

<i>IndexOutOfBoundsException</i>	if the offset + length exceeds the size.
<i>NullPointerException</i>	if buffer is null
<i>BufferOverflowException</i>	if the amount of data to be written to this array or the offset given are larger than this array's size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**ByteArrayAdapter.h**

6.94 decaf::internal::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:

```
#include <src/main/decaf/internal/nio/ByteBuffer.h>
```

Inheritance diagram for decaf::internal::nio::ByteBuffer:

Public Member Functions

- **ByteBuffer** (int **capacity**, bool readOnly=false)
*Creates a **ByteBuffer** (p. 646) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ByteBuffer** (unsigned char ***array**, int size, int offset, int length, bool readOnly=false)
*Creates a **ByteBuffer** (p. 646) object that wraps the given array.*
- **ByteBuffer** (const decaf::lang::Pointer< **ByteArrayAdapter** > &**array**, int offset, int length, bool readOnly=false)

Creates a byte buffer that wraps the passed ByteBufferAdapter and start at the given offset.

- **ByteBuffer** (const **ByteBuffer** &other)

*Create a **ByteBuffer** (p. 646) that mirrors this one, meaning it shares a reference to this buffers ByteBufferAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**ByteBuffer** ()
- virtual bool **isReadOnly** () const

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

- virtual unsigned char * **array** ()

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is backed by an array but is read-only</i>
UnsupportedOperation-Exception	<i>if this buffer is not backed by an accessible array</i>

- virtual int **arrayOffset** () const

Returns the offset within this buffer's backing array of the first element of the buffer.

*If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset**() (p. 696).*

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is backed by an array but is read-only.</i>
UnsupportedOperation-Exception	<i>if this buffer is not backed by an accessible array.</i>

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual **decaf::nio::CharBuffer * asCharBuffer ()** const

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new Char **Buffer** (p. 582), which the caller then owns.*

- virtual **decaf::nio::DoubleBuffer * asDoubleBuffer ()** const

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new double **Buffer** (p. 582), which the caller then owns.*

- virtual **decaf::nio::FloatBuffer * asFloatBuffer ()** const

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new float **Buffer** (p. 582), which the caller then owns.*

- virtual **decaf::nio::IntBuffer * asIntBuffer ()** const

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new int **Buffer** (p. 582), which the caller then owns.*

- virtual **decaf::nio::LongBuffer * asLongBuffer ()** const

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 582), which the caller then owns.

- virtual **decaf::nio::ShortBuffer * asShortBuffer ()** const

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 582), which the caller then owns.

- virtual **ByteBuffer * asReadOnlyBuffer ()** const

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

- virtual **ByteBuffer & compact ()**

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n + 1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 690).

Exceptions

ReadOnlyBufferException (p. 2244)	if this buffer is read-only.
---	------------------------------

- virtual **ByteBuffer * duplicate ()**

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 582) which the caller owns.

- virtual unsigned char **get** () const

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if the buffer's current position is not smaller than its limit.</i>
--	--

- virtual unsigned char **get** (int index) const

Absolute get method.

Reads the byte at the given index.

Parameters

index	<i>The index in the Buffer (p. 582) where the byte is to be read.</i>
-------	--

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or index is negative.</i>
---------------------------	---

- virtual char **getChar** ()

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
--	--

- virtual char **getChar** (int index) const

Reads one byte at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 582) where the byte is to be read.</i>
-------	--

Returns

the char at the given index in the buffer

Exceptions

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or index is negative.</i>
---------------------------	---

- virtual double **getDouble** ()

Reads the next eight bytes at this buffer's current position, and then increments the

position by that amount.

Returns

the next double in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
--	--

- virtual double **getDouble** (int index) const

Reads eight bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 582) where the bytes are to be read.</i>
-------	--

Returns

the double at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or index is negative.</i>
---------------------------	---

- virtual float **getFloat** ()

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
--	--

- virtual float **getFloat** (int index) const

Reads four bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 582) where the bytes are to be read.</i>
-------	--

Returns

the float at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	<i>if there are not enough bytes remaining to fill the requested Data Type, or index is negative.</i>
---------------------------	---

- virtual long long **getLong** ()

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
--	--

- virtual long long **getLong** (int index) const

Reads eight bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 582) where the bytes are to be read.</i>
-------	--

Returns

the long long at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	<i>if there are not enough bytes remaining to fill the requested Data Type, or index is negative.</i>
----------------------------	---

- virtual int **getInt** ()

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
--	--

- virtual int **getInt** (int index) const

Reads four bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 582) where the bytes are to be read.</i>
-------	--

Returns

the int at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	<i>if there are not enough bytes remaining to fill the requested Data Type, or index is negative.</i>
----------------------------	---

- virtual short **getShort** ()

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there are no more bytes remaining in this buffer, meaning we have reached the set limit.</i>
--	--

- virtual short **getShort** (int index) const

Reads two bytes at the given index and returns it.

Parameters

index	<i>The index in the Buffer (p. 582) where the bytes are to be read.</i>
-------	--

Returns

the short at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	<i>if there are not enough bytes remaining to fill the requested Data Type, or index is negative.</i>
---------------------------	---

- virtual **ByteBuffer** & **put** (unsigned char value)

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

value	<i>- the byte value to be written.</i>
-------	--

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	<i>if this buffer's current position is not smaller than its limit.</i>
ReadOnlyBufferException (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **put** (int index, unsigned char value)

Writes the given byte into this buffer at the given index.

Parameters

index	<i>- position in the Buffer (p. 582) to write the data</i>
value	<i>- the byte to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBufferException (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putChar** (char value)

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only</i>

- virtual **ByteBuffer & putChar** (int index, char value)

Writes one byte containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data.</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only</i>

- virtual **ByteBuffer & putDouble** (double value)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only</i>

- virtual **ByteBuffer & putDouble** (int index, double value)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putFloat** (float value)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putFloat** (int index, float value)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putLong** (long long value)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer & putLong** (int index, long long value)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data.</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer & putInt** (int value)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only</i>

- virtual **ByteBuffer & putInt** (int index, int value)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data.</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only</i>

- virtual **ByteBuffer** & **putShort** (short value)

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	<i>The value to be written.</i>
-------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if there are fewer than bytes remaining in this buffer than the size of the data to be written.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** & **putShort** (int index, short value)

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data</i>
value	<i>The value to write.</i>

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ByteBuffer** * **slice** () const

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers'

position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the newly create **ByteBuffer** (p. 690) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

*Sets this **ByteBuffer** (p. 646) as Read-Only or not Read-Only.*

6.94.1 Detailed Description

This class defines six categories of operations upon byte buffers:

1. Absolute and relative get and put methods that read and write single bytes; 2. - Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 668) float **getFloat(int index)** void **putFloat(float f)** (p. 675) void **putFloat(int index, float f)** (p. 675)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The **asFloatBuffer** method, for example, creates an instance of the **FloatBuffer** class that is backed by the byte buffer

upon which the method is invoked. Corresponding view-creation methods are defined for the types `char`, `short`, `int`, `long`, and `double`.

View buffers have two important advantages over the families of type-specific `get` and `put` methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk `get` and `put` methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

Since

1.0

6.94.2 Constructor & Destructor Documentation

6.94.2.1 `decaf::internal::nio::ByteBuffer::ByteBuffer (int capacity, bool readOnly = false)`

Creates a **ByteBuffer** (p. 646) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size of the array, this is the limit we read and write to.
<i>readOnly</i>	Should this buffer be read-only, default as <code>false</code>

Exceptions

<i>IllegalArgument-Exception</i>	if the capacity value is negative.
----------------------------------	------------------------------------

6.94.2.2 `decaf::internal::nio::ByteBuffer::ByteBuffer (unsigned char * array, int size, int offset, int length, bool readOnly = false)`

Creates a **ByteBuffer** (p. 646) object that wraps the given array.

Parameters

<i>array</i>	The array to wrap.
<i>size</i>	The size of the array passed.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The size of the sub-array, this is the limit we read and write to.
<i>readOnly</i>	Should this buffer be read-only, default as <code>false</code> .

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset and length are violated.

6.94.2.3 `decaf::internal::nio::ByteBuffer::ByteBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & array, int offset, int length, bool readOnly = false)`

Creates a byte buffer that wraps the passed `ByteArrayAdapter` and start at the given offset.

The capacity and limit of the new **ByteBuffer** (p. 646) will be that of the remaining capacity of the passed buffer.

Parameters

<i>array</i>	The <code>ByteArrayAdapter</code> to wrap
<i>offset</i>	The offset into array where the buffer starts
<i>length</i>	The length of the array we are wrapping or limit.
<i>readOnly</i>	Boolean indicating if this a readOnly buffer.

Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

6.94.2.4 `decaf::internal::nio::ByteBuffer::ByteBuffer (const ByteBuffer & other)`

Create a **ByteBuffer** (p. 646) that mirrors this one, meaning it shares a reference to this buffers `ByteArrayAdapter` and when changes are made to that data it is reflected in both.

Parameters

<i>other</i>	The ByteBuffer (p. 646) this one is to mirror.
--------------	---

6.94.2.5 `virtual decaf::internal::nio::ByteBuffer::~~ByteBuffer ()`
[virtual]

6.94.3 Member Function Documentation

6.94.3.1 `virtual unsigned char* decaf::internal::nio::ByteBuffer::array ()`
`[virtual]`

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is backed by an array but is read-only
<i>UnsupportedOperationException</i>	if this buffer is not backed by an accessible array

Implements **decaf::nio::ByteBuffer** (p. 695).

6.94.3.2 `virtual int decaf::internal::nio::ByteBuffer::arrayOffset () const`
`[virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position `p` corresponds to array index `p + arrayOffset()` (p. 696).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is backed by an array but is read-only.
<i>UnsupportedOperationException</i>	if this buffer is not backed by an accessible array.

Implements **decaf::nio::ByteBuffer** (p. 696).

```
6.94.3.3 virtual decaf::nio::CharBuffer* decaf::internal::nio::-
        ByteArrayBuffer::asCharBuffer ( ) const [inline,
        virtual]
```

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 582), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 696).

```
6.94.3.4 virtual decaf::nio::DoubleBuffer* decaf::internal::nio::-
        ByteArrayBuffer::asDoubleBuffer ( ) const [inline,
        virtual]
```

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 582), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 697).

```
6.94.3.5 virtual decaf::nio::FloatBuffer* decaf::internal::nio::-
        ByteArrayBuffer::asFloatBuffer ( ) const [inline,
        virtual]
```

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 582), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 697).

6.94.3.6 `virtual decaf::nio::IntBuffer* decaf::internal::nio::-
ByteBuffer::asIntBuffer () const [inline,
virtual]`

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 582), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 697).

6.94.3.7 `virtual decaf::nio::LongBuffer* decaf::internal::nio::-
ByteBuffer::asLongBuffer () const [inline,
virtual]`

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 582), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 698).

6.94.3.8 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::asRead-
OnlyBuffer () const [virtual]`

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 698).

```
6.94.3.9 virtual decaf::nio::ShortBuffer* decaf::internal::nio::-
        ByteArrayBuffer::asShortBuffer ( ) const [inline,
        virtual]
```

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 582), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 698).

```
6.94.3.10 virtual ByteArrayBuffer& decaf::internal::nio::ByteBuffer::compact (
        ) [virtual]
```

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 690).

Exceptions

<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is read-only.
--	------------------------------

Implements **decaf::nio::ByteBuffer** (p. 699).

6.94.3.11 virtual **ByteBuffer*** **decaf::internal::nio::ByteBuffer::duplicate**
() [virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 582) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 699).

6.94.3.12 virtual unsigned char **decaf::internal::nio::ByteBuffer::get**() const
[virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

<i>BufferUnderflowException</i> (p. 611)	if the buffer's current position is not smaller than its limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 701).

6.94.3.13 virtual unsigned char **decaf::internal::nio::ByteArrayBuffer::get** (int *index*)
const [virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 701).

6.94.3.14 virtual char **decaf::internal::nio::ByteArrayBuffer::getChar** ()
[inline, virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

BufferUnderflow-Exception (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 702).

6.94.3.15 virtual char **decaf::internal::nio::ByteArrayBuffer::getChar** (int *index*) const
[inline, virtual]

Reads one byte at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the byte is to be read.
--------------	---

Returns

the char at the given index in the buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 702).

6.94.3.16 virtual double **decaf::internal::nio::ByteBuffer::getDouble** ()
[virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 703).

6.94.3.17 virtual double **decaf::internal::nio::ByteBuffer::getDouble** (int *index*)
const [virtual]

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the double at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 703).

6.94.3.18 virtual float **decaf::internal::nio::ByteBuffer::getFloat** ()
[virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implements **decaf::nio::ByteBuffer** (p. 703).

6.94.3.19 virtual float **decaf::internal::nio::ByteBuffer::getFloat** (int *index*)
const [virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the float at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 704).

6.94.3.20 virtual int **decaf::internal::nio::ByteBuffer::getInt** () [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 704).

6.94.3.21 virtual int **decaf::internal::nio::ByteBuffer::getInt** (int *index*) const
[virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the int at the given index in the buffer.

Exceptions

<i>IndexOutOfBounds-Exception</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
--	--

Implements **decaf::nio::ByteBuffer** (p. 705).

6.94.3.22 virtual long long **decaf::internal::nio::ByteBuffer::getLong** ()
[virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 705).

6.94.3.23 virtual long long decaf::internal::nio::ByteBuffer::getLong (int *index*)
const [virtual]

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the long long at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implements **decaf::nio::ByteBuffer** (p. 705).

6.94.3.24 virtual short decaf::internal::nio::ByteBuffer::getShort ()
[virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implements **decaf::nio::ByteBuffer** (p. 706).

6.94.3.25 `virtual short decaf::internal::nio::ByteBuffer::getShort (int index)
const [virtual]`

Reads two bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the short at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implements **decaf::nio::ByteBuffer** (p. 706).

6.94.3.26 `virtual bool decaf::internal::nio::ByteBuffer::hasArray () const
[inline, virtual]`

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ByteBuffer** (p. 707).

6.94.3.27 `virtual bool decaf::internal::nio::ByteBuffer::isReadOnly () const
[inline, virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 707).

6.94.3.28 virtual **ByteBuffer&** **decaf::internal::nio::ByteBuffer::put** (
 unsigned char *value*) [virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	- the byte value to be written.
--------------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if this buffer's current position is not smaller than its limit.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 709).

6.94.3.29 virtual **ByteBuffer&** **decaf::internal::nio::ByteBuffer::put** (int
 index, unsigned char *value*) [virtual]

Writes the given byte into this buffer at the given index.

Parameters

<i>index</i>	- position in the Buffer (p. 582) to write the data
<i>value</i>	- the byte to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 710).

6.94.3.30 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putChar (
 char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 710).

6.94.3.31 virtual **ByteBuffer&** decaf::internal::nio::ByteBuffer::putChar (
 int *index*, char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 711).

6.94.3.32 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::put-Double (double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 711).

6.94.3.33 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putDouble (int *index*, double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 712).

6.94.3.34 virtual **ByteBuffer& decaf::internal::nio::ByteBuffer::putFloat** (
float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 712).

6.94.3.35 virtual **ByteBuffer& decaf::internal::nio::ByteBuffer::putFloat** (
int *index*, float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 713).

6.94.3.36 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putInt (int value)** [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 713).

6.94.3.37 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putInt (int index, int value)** [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 714).

6.94.3.38 virtual **ByteBuffer& decaf::internal::nio::ByteBuffer::putLong** (
long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 714).

6.94.3.39 virtual **ByteBuffer& decaf::internal::nio::ByteBuffer::putLong** (
int *index*, long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 715).

6.94.3.40 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putShort (short value) [virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 715).

6.94.3.41 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putShort (int index, short value) [virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 716).

6.94.3.42 `virtual void decaf::internal::nio::ByteBuffer::setReadOnly (bool value) [inline, protected, virtual]`

Sets this **ByteBuffer** (p. 646) as Read-Only or not Read-Only.

Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

6.94.3.43 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::slice () const [virtual]`

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 690) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 716).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/ByteBuffer.h`

6.95 decaf::io::ByteArrayInputStream Class Reference

A **ByteArrayInputStream** (p. 679) contains an internal buffer that contains bytes that may be read from the stream.

```
#include <src/main/decaf/io/ByteArrayInputStream.h>
```

Inheritance diagram for **decaf::io::ByteArrayInputStream**:

Public Member Functions

- **ByteArrayInputStream** ()

Creates an **ByteArrayInputStream** (p. 679) with an empty input buffer, the buffer can be initialized with a call to `setByteArray`.

- **ByteArrayInputStream** (const std::vector< unsigned char > &buffer)

Creates the input stream and calls `setBuffer` with the specified buffer object.

- **ByteArrayInputStream** (const unsigned char *buffer, int bufferSize, bool own=false)

Create an instance of the **ByteArrayInputStream** (p. 679) with the given buffer as the source of input for all read operations.

- **ByteArrayInputStream** (const unsigned char *buffer, int bufferSize, int offset, int length, bool own=false)

Create an instance of the **ByteArrayInputStream** (p. 679) with the given buffer as the source of input for all read operations.

- virtual ~**ByteArrayInputStream** ()

- virtual void **setByteArray** (const std::vector< unsigned char > &buffer)

Sets the internal buffer.

- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize)

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

- virtual void **setByteArray** (const unsigned char *buffer, int bufferSize, int offset, int length)

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

- virtual int **available** () const

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 1545)	if an I/O error occurs.
------------------------------	-------------------------

- virtual long long **skip** (long long num)

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.
-----	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
UnsupportedOperation-Exception	<i>if the concrete stream class does not support skipping bytes.</i>

- virtual void **mark** (int readLimit)

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	<i>The max bytes read before marked position is invalid.</i>
-----------	--

- virtual void **reset** ()

Repositions this stream to the position at the time the mark method was last called on this input stream.

*If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1545) might be thrown. * If such an **IOException** (p. 1545) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

*If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1545). * If an **IOException** (p. 1545) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

*The default implementation of this method throws an **IOException** (p. 1545).*

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()

- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.95.1 Detailed Description

A **ByteArrayInputStream** (p. 679) contains an internal buffer that contains bytes that may be read from the stream.

An internal counter keeps track of the next byte to be supplied by the read method. The **ByteArrayInputStream** (p. 679) never copies the supplied buffers, only points to them, therefore the caller must ensure that the supplied buffer remain in scope, or is not deleted before this **ByteArrayInputStream** (p. 679) is freed. If the own argument of one of the constructors that accepts an array pointer is set to true than the **ByteArrayInputStream** (p. 679) instance will take ownership of the supplied pointer and delete it when that instance is destroyed.

Closing a **ByteArrayInputStream** (p. 679) has no effect. The methods in this class can be called after the stream has been closed without generating an **IOException** (p. 1545).

Since

1.0

6.95.2 Constructor & Destructor Documentation

6.95.2.1 decaf::io::ByteArrayInputStream::ByteArrayInputStream ()

Creates an **ByteArrayInputStream** (p. 679) with an empty input buffer, the buffer can be initialized with a call to `setByteArray`.

6.95.2.2 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const std::vector< unsigned char > & buffer)

Creates the input stream and calls `setBuffer` with the specified buffer object.

Parameters

<i>buffer</i>	The buffer to be used.
---------------	------------------------

6.95.2.3 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * buffer, int bufferSize, bool own = false)

Create an instance of the **ByteArrayInputStream** (p. 679) with the given buffer as the source of input for all read operations.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.
<i>own</i>	Indicates if this object should take ownership of the array, default is false.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgument-Exception</i>	if the bufferSize is negative.

6.95.2.4 `decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * buffer, int bufferSize, int offset, int length, bool own = false)`

Create an instance of the **ByteArrayInputStream** (p. 679) with the given buffer as the source of input for all read operations.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.
<i>offset</i>	The offset into the buffer to begin reading from.
<i>length</i>	The number of bytes to read past the offset.
<i>own</i>	Indicates if this object should take ownership of the array, default is false.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgument-Exception</i>	if the bufferSize is negative.

6.95.2.5 `virtual decaf::io::ByteArrayInputStream::~~ByteArrayInputStream ()`
[virtual]

6.95.3 Member Function Documentation

6.95.3.1 `virtual int decaf::io::ByteArrayInputStream::available () const`
[virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller

should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 1466).

6.95.3.2 `virtual int decaf::io::ByteArrayInputStream::doReadArrayBounded
(unsigned char * buffer, int size, int offset, int length)` [protected,
virtual]

Reimplemented from **decaf::io::InputStream** (p. 1467).

6.95.3.3 `virtual int decaf::io::ByteArrayInputStream::doReadByte ()`
[protected, virtual]

Implements **decaf::io::InputStream** (p. 1467).

6.95.3.4 `virtual void decaf::io::ByteArrayInputStream::mark (int readLimit)`
[virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

<i>readLimit</i>	The max bytes read before marked position is invalid.
------------------	---

Reimplemented from **decaf::io::InputStream** (p. 1468).

6.95.3.5 `virtual bool decaf::io::ByteArrayInputStream::markSupported () const`
`[inline, virtual]`

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::InputStream** (p. 1468).

6.95.3.6 `virtual void decaf::io::ByteArrayInputStream::reset ()` `[virtual]`

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method `markSupported` returns true, then: * If the method `mark` has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to `mark` at that last call, then an **IOException** (p. 1545) might be thrown. * If such an **IOException** (p. 1545) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to `mark` (or since the start of the file, if `mark` has not been called) will be resupplied to subsequent callers of the `read` method, followed by any bytes that otherwise would have been the next input data as of the time of the call to `reset`.

If the method `markSupported` returns false, then: * The call to `reset` may throw an **IOException** (p. 1545). * If an **IOException** (p. 1545) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the `read` method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1545).

Exceptions

IOException (p. 1545)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 1471).

6.95.3.7 `virtual void decaf::io::ByteArrayInputStream::setByteArray (const`
`std::vector< unsigned char > & buffer)` `[virtual]`

Sets the internal buffer.

The input stream will wrap around this buffer and will perform all read operations on it. The position will be reinitialized to the beginning of the specified buffer. This class will

not own the given buffer - it is the caller's responsibility to free the memory of the given buffer as appropriate.

Parameters

<i>buffer</i>	The buffer to be used.
---------------	------------------------

6.95.3.8 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgument-Exception</i>	if the bufferSize is negative.

6.95.3.9 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*, int *offset*, int *length*) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters

<i>buffer</i>	The initial byte array to use to read from.
<i>bufferSize</i>	The size of the buffer.
<i>offset</i>	The offset into the buffer to begin reading from.
<i>length</i>	The number of bytes to read past the offset.

Exceptions

<i>NullPointerException</i>	if the buffer is Null.
<i>IllegalArgument-Exception</i>	if the bufferSize is negative.

6.95.3.10 virtual long long decaf::io::ByteArrayInputStream::skip (long long *num*)
[virtual]

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>Unsupported-Operation-Exception</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1472).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**ByteArrayInputStream.h**

6.96 decaf::io::ByteArrayOutputStream Class Reference

```
#include <src/main/decaf/io/ByteArrayOutputStream.h>
```

Inheritance diagram for decaf::io::ByteArrayOutputStream:

Public Member Functions

- **ByteArrayOutputStream ()**
Default Constructor - uses a default internal buffer of 32 bytes, the size increases as the need for more room arises.

- **ByteArrayOutputStream** (int bufferSize)
Creates a **ByteArrayOutputStream** (p. 687) with an internal buffer allocated with the given size.
- virtual ~**ByteArrayOutputStream** ()
- std::pair< unsigned char *, int > **toByteArray** () const
Creates a newly allocated byte array.
- long long **size** () const
Gets the current count of bytes written into this **ByteArrayOutputStream** (p. 687).
- virtual void **reset** ()
Clear current Stream contents.
- virtual std::string **toString** () const
Converts the bytes in the buffer into a standard C++ string.
- void **writeTo** (**OutputStream** *out) const
Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using out.write(buf, 0, count).

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.96.1 Constructor & Destructor Documentation

6.96.1.1 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream ()

Default Constructor - uses a default internal buffer of 32 bytes, the size increases as the need for more room arises.

6.96.1.2 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream (int bufferSize)

Creates a **ByteArrayOutputStream** (p. 687) with an internal buffer allocated with the given size.

Parameters

<i>bufferSize</i>	The size to use for the internal buffer.
-------------------	--

Exceptions

<i>IllegalArgumentException</i>	if the size is less than or equal to zero.
---------------------------------	--

6.96.1.3 virtual **decaf::io::ByteArrayOutputStream::~~ByteArrayOutputStream** ()
[virtual]

6.96.2 Member Function Documentation

6.96.2.1 virtual void **decaf::io::ByteArrayOutputStream::doWriteArrayBounded** (
const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected,
virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.96.2.2 virtual void **decaf::io::ByteArrayOutputStream::doWriteByte** (unsigned char
value) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2069).

6.96.2.3 virtual void **decaf::io::ByteArrayOutputStream::reset** () [virtual]

Clear current Stream contents.

Exceptions

<i>IOException</i> (p. 1545)	
--	--

6.96.2.4 long long **decaf::io::ByteArrayOutputStream::size** () const

Gets the current count of bytes written into this **ByteArrayOutputStream** (p. 687).

Returns

the number of valid bytes contained in the **ByteArrayOutputStream** (p. 687).

6.96.2.5 std::pair<unsigned char*, int> **decaf::io::ByteArrayOutputStream::toByte-
Array** () const

Creates a newly allocated byte array.

Its size is the current size of this output stream and the valid contents of the buffer have been copied into it. The newly allocated array and its size are returned inside an STL pair structure, the caller is responsible for freeing the returned array.

Returns

an STL pair containing the copied array and its size.

6.96.2.6 `virtual std::string decaf::io::ByteArrayOutputStream::toString () const`
`[virtual]`

Converts the bytes in the buffer into a standard C++ string.

Returns

a string containing the bytes in the buffer

Reimplemented from **decaf::io::OutputStream** (p. 2070).

6.96.2.7 `void decaf::io::ByteArrayOutputStream::writeTo (OutputStream * out)`
`const`

Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using `out.write(buf, 0, count)`.

The documentation for this class was generated from the following file:

- `src/main/decaf/io/ByteArrayOutputStream.h`

6.97 decaf::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:

```
#include <src/main/decaf/nio/ByteBuffer.h>
```

Inheritance diagram for `decaf::nio::ByteBuffer`:

Public Member Functions

- `virtual ~ByteBuffer ()`
- `virtual std::string toString () const`
- **ByteBuffer & get** (std::vector< unsigned char > buffer)
Relative bulk get method.
- **ByteBuffer & get** (unsigned char *buffer, int size, int offset, int length)
Relative bulk get method.
- **ByteBuffer & put (ByteBuffer &src)**
This method transfers the bytes remaining in the given source buffer into this buffer.
- **ByteBuffer & put** (const unsigned char *buffer, int size, int offset, int length)
This method transfers bytes into this buffer from the given source array.
- **ByteBuffer & put** (std::vector< unsigned char > &buffer)
This method transfers the entire content of the given source byte array into this buffer.

- virtual bool **isReadOnly** () const =0
Tells whether or not this buffer is read-only.
- virtual unsigned char * **array** ()=0
Returns the byte array that backs this buffer.
- virtual int **arrayOffset** () const =0
Returns the offset within this buffer's backing array of the first element of the buffer.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible byte array.
- virtual **CharBuffer** * **asCharBuffer** () const =0
Creates a view of this byte buffer as a char buffer.
- virtual **DoubleBuffer** * **asDoubleBuffer** () const =0
Creates a view of this byte buffer as a double buffer.
- virtual **FloatBuffer** * **asFloatBuffer** () const =0
Creates a view of this byte buffer as a float buffer.
- virtual **IntBuffer** * **asIntBuffer** () const =0
Creates a view of this byte buffer as a int buffer.
- virtual **LongBuffer** * **asLongBuffer** () const =0
Creates a view of this byte buffer as a long buffer.
- virtual **ShortBuffer** * **asShortBuffer** () const =0
Creates a view of this byte buffer as a short buffer.
- virtual **ByteBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only byte buffer that shares this buffer's content.
- virtual **ByteBuffer** & **compact** ()=0
Compacts this buffer.
- virtual **ByteBuffer** * **duplicate** ()=0
Creates a new byte buffer that shares this buffer's content.
- virtual unsigned char **get** () const =0
Relative get method.
- virtual unsigned char **get** (int index) const =0
Absolute get method.
- virtual char **getChar** ()=0
Reads the next byte at this buffer's current position, and then increments the position by one.
- virtual char **getChar** (int index) const =0
Reads one byte at the given index and returns it.
- virtual double **getDouble** ()=0
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual double **getDouble** (int index) const =0
Reads eight bytes at the given index and returns it.
- virtual float **getFloat** ()=0
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual float **getFloat** (int index) const =0

Reads four bytes at the given index and returns it.

- virtual long long **getLong** ()=0
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual long long **getLong** (int index) const =0
Reads eight bytes at the given index and returns it.
- virtual int **getInt** ()=0
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual int **getInt** (int index) const =0
Reads four bytes at the given index and returns it.
- virtual short **getShort** ()=0
Reads the next two bytes at this buffer's current position, and then increments the position by that amount.
- virtual short **getShort** (int index) const =0
Reads two bytes at the given index and returns it.
- virtual **ByteBuffer & put** (unsigned char value)=0
Writes the given byte into this buffer at the current position, and then increments the position.
- virtual **ByteBuffer & put** (int index, unsigned char value)=0
Writes the given byte into this buffer at the given index.
- virtual **ByteBuffer & putChar** (char value)=0
Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.
- virtual **ByteBuffer & putChar** (int index, char value)=0
Writes one byte containing the given value, into this buffer at the given index.
- virtual **ByteBuffer & putDouble** (double value)=0
Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer & putDouble** (int index, double value)=0
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer & putFloat** (float value)=0
Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer & putFloat** (int index, float value)=0
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer & putLong** (long long value)=0
Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer & putLong** (int index, long long value)=0
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer & putInt** (int value)=0
Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer & putInt** (int index, int value)=0

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putShort** (short value)=0

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (int index, short value)=0

Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** * **slice** () const =0

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

- virtual int **compareTo** (const **ByteBuffer** &value) const

- virtual bool **equals** (const **ByteBuffer** &value) const

- virtual bool **operator==** (const **ByteBuffer** &value) const

- virtual bool **operator<** (const **ByteBuffer** &value) const

Static Public Member Functions

- static **ByteBuffer** * **allocate** (int capacity)

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **ByteBuffer** * **wrap** (unsigned char *array, int size, int offset, int length)

*Wraps the passed buffer with a new **ByteBuffer** (p. 690).*

- static **ByteBuffer** * **wrap** (std::vector< unsigned char > &buffer)

*Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 690).*

Protected Member Functions

- **ByteBuffer** (int capacity)

*Creates a **ByteBuffer** (p. 690) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.97.1 Detailed Description

This class defines six categories of operations upon byte buffers:

1. Absolute and relative get and put methods that read and write single bytes;
2. - Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array;
3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer;
4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order;
5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some

other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 703) float **getFloat(int index)** void **putFloat(float f)** (p. 712) void **putFloat(int index, float f)** (p. 713)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The **asFloatBuffer** method, for example, creates an instance of the **FloatBuffer** (p. 1368) class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.97.2 Constructor & Destructor Documentation

6.97.2.1 `decaf::nio::ByteBuffer::ByteBuffer (int capacity)` [protected]

Creates a **ByteBuffer** (p. 690) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size of the array, this is the limit we read and write to.
-----------------	--

Exceptions

<i>IllegalArgument-Exception</i>	if capacity is negative.
----------------------------------	--------------------------

6.97.2.2 virtual decaf::nio::ByteBuffer::~ByteBuffer () [inline, virtual]

6.97.3 Member Function Documentation

6.97.3.1 static ByteBuffer* decaf::nio::ByteBuffer::allocate (int capacity)
[static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

<i>capacity</i>	The internal buffer's capacity.
-----------------	---------------------------------

Returns

a newly allocated **ByteBuffer** (p. 690) which the caller owns.

Exceptions

<i>IllegalArgument-Exception</i>	if capacity is negative.
----------------------------------	--------------------------

6.97.3.2 virtual unsigned char* decaf::nio::ByteBuffer::array () [pure virtual]

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is backed by an array but is read-only
--	---

<i>Unsupported- OperationException</i>	if this buffer is not backed by an accessible array
--	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 661).

6.97.3.3 `virtual int decaf::nio::ByteBuffer::arrayOffset () const` `[pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position *p* corresponds to array index *p* + **arrayOffset()** (p. 696).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

<i>ReadOnlyBuffer- Exception</i> (p. 2244)	if this buffer is backed by an array but is read-only.
<i>Unsupported- OperationException</i>	if this buffer is not backed by an accessible array.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 661).

6.97.3.4 `virtual CharBuffer* decaf::nio::ByteBuffer::asCharBuffer () const` `[pure virtual]`

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 582), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 662).

6.97.3.5 `virtual DoubleBuffer* decaf::nio::ByteBuffer::asDoubleBuffer () const`
[pure virtual]

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 582), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 662).

6.97.3.6 `virtual FloatBuffer* decaf::nio::ByteBuffer::asFloatBuffer () const`
[pure virtual]

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 582), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 662).

6.97.3.7 `virtual IntBuffer* decaf::nio::ByteBuffer::asIntBuffer () const` [pure virtual]

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 582), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 663).

6.97.3.8 `virtual LongBuffer* decaf::nio::ByteBuffer::asLongBuffer () const`
`[pure virtual]`

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 582), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 663).

6.97.3.9 `virtual ByteBuffer* decaf::nio::ByteBuffer::asReadOnlyBuffer () const`
`[pure virtual]`

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 663).

6.97.3.10 `virtual ShortBuffer* decaf::nio::ByteBuffer::asShortBuffer () const`
`[pure virtual]`

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 582), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 664).

6.97.3.11 virtual **ByteBuffer&** **decaf::nio::ByteBuffer::compact** () [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 690).

Exceptions

ReadOnlyBufferException (p. 2244)	if this buffer is read-only.
---	------------------------------

Implemented in **decaf::internal::nio::ByteBuffer** (p. 664).

6.97.3.12 virtual int **decaf::nio::ByteBuffer::compareTo** (const **ByteBuffer** & *value*) const [virtual]

6.97.3.13 virtual **ByteBuffer*** **decaf::nio::ByteBuffer::duplicate** () [pure virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content

will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new **Byte Buffer** (p. 582) which the caller owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 665).

6.97.3.14 `virtual bool decaf::nio::ByteBuffer::equals (const ByteBuffer & value) const`
[virtual]

6.97.3.15 `ByteBuffer& decaf::nio::ByteBuffer::get (std::vector< unsigned char >`
`buffer)`

Relative bulk get method.

This method transfers bytes from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Byte Buffer** (p. 582).

Exceptions

BufferUnderflow-Exception (p. 611)	if there are fewer than length bytes remaining in this buffer
--	---

6.97.3.16 `ByteBuffer& decaf::nio::ByteBuffer::get (unsigned char * buffer, int size, int`
`offset, int length)`

Relative bulk get method.

This method transfers bytes from this buffer into the given destination array. If there are fewer bytes remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 588), then no bytes are transferred and a **BufferUnderflow-Exception** (p. 611) is thrown.

Otherwise, this method copies length bytes from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the passed in Buffer (p. 582).
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 582).

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.
BufferUnderflow-Exception (p. 611)	if there are fewer than length bytes remaining in this buffer.
<i>NullPointerException</i>	if the passed buffer is null.

6.97.3.17 virtual unsigned char decaf::nio::ByteBuffer::get () const [pure virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

BufferUnderflow-Exception (p. 611)	if the buffer's current position is not smaller than its limit.
--	---

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 665).

6.97.3.18 virtual unsigned char decaf::nio::ByteBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the byte is to be read.
--------------	---

Returns

the byte that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 666).

6.97.3.19 `virtual char decaf::nio::ByteBuffer::getChar () [pure virtual]`

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 666).

6.97.3.20 `virtual char decaf::nio::ByteBuffer::getChar (int index) const [pure virtual]`

Reads one byte at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the byte is to be read.
--------------	---

Returns

the char at the given index in the buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 666).

6.97.3.21 virtual double **decaf::nio::ByteBuffer::getDouble** () [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 667).

6.97.3.22 virtual double **decaf::nio::ByteBuffer::getDouble** (int *index*) const [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the double at the given index in the buffer.

Exceptions

<i>IndexOutOfBounds-Exception</i>	if index is not smaller than the buffer's limit, or index is negative.
--	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 667).

6.97.3.23 virtual float **decaf::nio::ByteBuffer::getFloat** () [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 668).

6.97.3.24 `virtual float decaf::nio::ByteBuffer::getFloat (int index) const` [pure virtual]

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the float at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 668).

6.97.3.25 `virtual int decaf::nio::ByteBuffer::getInt ()` [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
---	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 669).

6.97.3.26 `virtual int decaf::nio::ByteBuffer::getInt (int index) const` `[pure virtual]`

Reads four bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the int at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
----------------------------------	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 669).

6.97.3.27 `virtual long long decaf::nio::ByteBuffer::getLong ()` `[pure virtual]`

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implemented in **decaf::internal::nio::ByteBuffer** (p. 669).

6.97.3.28 `virtual long long decaf::nio::ByteBuffer::getLong (int index) const` `[pure virtual]`

Reads eight bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the long long at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 670).

6.97.3.29 virtual short **decaf::nio::ByteBuffer::getShort** () [pure virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

<i>BufferUnderflowException</i> (p. 611)	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.
--	---

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 670).

6.97.3.30 virtual short **decaf::nio::ByteBuffer::getShort** (int *index*) const [pure virtual]

Reads two bytes at the given index and returns it.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the bytes are to be read.
--------------	---

Returns

the short at the given index in the buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.
---	--

Implemented in **decaf::internal::nio::ByteBuffer** (p. 671).

6.97.3.31 `virtual bool decaf::nio::ByteBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 671).

6.97.3.32 `virtual bool decaf::nio::ByteBuffer::isReadOnly () const [pure virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 586).

Implemented in **decaf::internal::nio::ByteBuffer** (p. 671).

6.97.3.33 `virtual bool decaf::nio::ByteBuffer::operator< (const ByteBuffer & value) const [virtual]`

6.97.3.34 `virtual bool decaf::nio::ByteBuffer::operator== (const ByteBuffer & value) const [virtual]`

6.97.3.35 `ByteBuffer& decaf::nio::ByteBuffer::put (ByteBuffer & src)`

This method transfers the bytes remaining in the given source buffer into this buffer.

If there are more bytes remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 588), then no bytes are transferred and a **BufferOverflowException** (p. 609) is thrown.

Otherwise, this method copies `n = src.remaining()` bytes from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

<code>src</code>	The buffer to take bytes from an place in this one.
------------------	---

Returns

a reference to this buffer

Exceptions

<i>BufferOverflow-Exception</i> (p. 609)	if there is insufficient space in this buffer for the remaining bytes in the source buffer
<i>IllegalArgumentException</i>	if the source buffer is this buffer
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only

6.97.3.36 ByteBuffer& decaf::nio::ByteBuffer::put (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

This method transfers bytes into this buffer from the given source array.

If there are more bytes to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 588), then no bytes are transferred and a **BufferOverflow-Exception** (p. 609) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

<i>buffer</i>	The array from which bytes are to be read.
<i>size</i>	The size of the given array.
<i>offset</i>	The offset within the array of the first byte to be read.
<i>length</i>	The number of bytes to be read from the given array.

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflow-Exception</i> (p. 609)	if there is insufficient space in this buffer.
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of <code>size</code> , <code>offset</code> , or <code>length</code> are not met.

6.97.3.37 ByteBuffer& decaf::nio::ByteBuffer::put (std::vector< unsigned char > & *buffer*)

This method transfers the entire content of the given source byte array into this buffer.

This is the same as calling put(&buffer[0], buffer.size(), 0, buffer.size())

Parameters

<i>buffer</i>	The buffer whose contents are copied to this ByteBuffer (p. 690).
---------------	--

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there is insufficient space in this buffer.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

6.97.3.38 virtual ByteBuffer& decaf::nio::ByteBuffer::put (unsigned char *value*) [pure virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	- the byte value to be written.
--------------	---------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if this buffer's current position is not smaller than its limit.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 672).

6.97.3.39 `virtual ByteBuffer& decaf::nio::ByteBuffer::put (int index, unsigned char value)` [pure virtual]

Writes the given byte into this buffer at the given index.

Parameters

<i>index</i>	- position in the Buffer (p. 582) to write the data
<i>value</i>	- the byte to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 672).

6.97.3.40 `virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (char value)` [pure virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 2244)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 673).

6.97.3.41 virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (int *index*, char *value*)
[pure virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 673).

6.97.3.42 virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (double *value*)
[pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 2244)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 674).

6.97.3.43 `virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (int index, double value)` [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 674).

6.97.3.44 `virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (float value)` [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 675).

6.97.3.45 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (int *index*, float *value*)
[pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 675).

6.97.3.46 virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 2244)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 676).

6.97.3.47 `virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int index, int value)`
`[pure virtual]`

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 676).

6.97.3.48 `virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (long long value)`
`[pure virtual]`

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflowException</i> (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
<i>ReadOnlyBufferException</i> (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 677).

6.97.3.49 virtual **ByteBuffer& decaf::nio::ByteBuffer::putLong** (int *index*, long long *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The value to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 677).

6.97.3.50 virtual **ByteBuffer& decaf::nio::ByteBuffer::putShort** (short *value*) [pure virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

<i>value</i>	The value to be written.
--------------	--------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 678).

6.97.3.51 `virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (int index, short value)` [pure virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data
<i>value</i>	The value to write.

Returns

a reference to this buffer

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 678).

6.97.3.52 `virtual ByteBuffer* decaf::nio::ByteBuffer::slice () const` [pure virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 690) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 679).

6.97.3.53 `virtual std::string decaf::nio::ByteBuffer::toString () const` [virtual]

Returns

a std::string describing this object

6.97.3.54 static **ByteBuffer*** **decaf::nio::ByteBuffer::wrap** (unsigned char * *array*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new **ByteBuffer** (p. 690).

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the provided array.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new **ByteBuffer** (p. 690) that is backed by `buffer`, caller owns.

Exceptions

<i>NullPointerException</i>	if the array passed in is NULL.
<i>IndexOutOfBoundsException</i>	if the preconditions of <code>size</code> , <code>offset</code> , or <code>length</code> are not met.

6.97.3.55 static **ByteBuffer*** **decaf::nio::ByteBuffer::wrap** (std::vector< unsigned char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 690).

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new **ByteBuffer** (p. 690) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/ByteBuffer.h`

6.98 cms::BytesMessage Class Reference

A **BytesMessage** (p.718) object is used to send a message containing a stream of unsigned bytes.

```
#include <src/main/cms/BytesMessage.h>
```

Inheritance diagram for cms::BytesMessage:

Public Member Functions

- virtual **~BytesMessage** () throw ()
- virtual void **setBodyBytes** (const unsigned char *buffer, int numBytes)=0
sets the bytes given to the message body.
- virtual unsigned char * **getBodyBytes** () const =0
Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.
- virtual int **getBodyLength** () const =0
Returns the number of bytes contained in the body of this message.
- virtual void **reset** ()=0
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const =0
Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)=0
Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () const =0
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)=0
Writes a byte to the bytes message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) const =0
Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0
Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) const =0
Reads a portion of the bytes message stream.
- virtual void **writeBytes** (const unsigned char *value, int offset, int length)=0
Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () const =0
Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value)=0
Writes a char to the bytes message stream as a 1-byte value.

- virtual float **readFloat** () const =0
Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value)=0
Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () const =0
Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value)=0
Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () const =0
Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value)=0
Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const =0
Reads a 16 bit unsigned short from the Bytes message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () const =0
Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)=0
Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () const =0
Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)=0
Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () const =0
Reads an ASCII String from the Bytes message stream.
- virtual void **writeString** (const std::string &value)=0
Writes an ASCII String to the Bytes message stream.
- virtual std::string **readUTF** () const =0
*Reads an UTF String from the **BytesMessage** (p. 718) stream.*
- virtual void **writeUTF** (const std::string &value)=0
*Writes an UTF String to the **BytesMessage** (p. 718) stream.*
- virtual **BytesMessage** * **clone** () const =0
Clones this message.

6.98.1 Detailed Description

A **BytesMessage** (p. 718) object is used to send a message containing a stream of unsigned bytes.

It inherits from the **Message** (p. 1839) interface and adds a bytes message body. -
The receiver of the message supplies the interpretation of the bytes using the methods added by the **BytesMessage** (p. 718) interface.

The **BytesMessage** (p. 718) methods are based largely on those found in **decaf.io.DataInputStream** (p. 1094) and **decaf.io.DataOutputStream** (p. 1109).

Although the CMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. Because the C++ language is more limited when dealing with primitive types the JMS equivalent generic read and write methods that take Java objects cannot be provided in the CMS API.

When the message is first created, and when `clearBody` is called, the body of the message is in write-only mode. After the first call to `reset` has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called `reset` so that the message body is in read-only mode for the client.

If `clearBody` is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a **MessageNotReadableException** (p. 1922) is thrown.

If a client attempts to write a message in read-only mode, a **MessageNotWriteableException** (p. 1923) is thrown.

Since

1.0

6.98.2 Constructor & Destructor Documentation

6.98.2.1 `virtual cms::BytesMessage::~BytesMessage () throw () [virtual]`

6.98.3 Member Function Documentation

6.98.3.1 `virtual BytesMessage* cms::BytesMessage::clone () const [pure virtual]`

Clones this message.

Returns

a deep copy of this message.

Exceptions

CMSException (p. 826)	- if an internal error occurs while cloning the Message (p. 1839).
---------------------------------	---

Implements **cms::Message** (p. 1844).

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 168).

6.98.3.2 `virtual unsigned char* cms::BytesMessage::getBodyBytes () const` [pure virtual]

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions

<i>CMSEException</i> (p. 826)	- If an internal error occurs.
<i>MessageNotReadableException</i> (p. 1922)	- If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 170).

6.98.3.3 `virtual int cms::BytesMessage::getBodyLength () const` [pure virtual]

Returns the number of bytes contained in the body of this message.

Returns

number of bytes.

Exceptions

<i>CMSEException</i> (p. 826)	- If an internal error occurs.
<i>MessageNotReadableException</i> (p. 1922)	- If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 170).

6.98.3.4 `virtual bool cms::BytesMessage::readBoolean () const` [pure virtual]

Reads a Boolean from the Bytes message stream.

Returns

boolean value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 171).

6.98.3.5 `virtual unsigned char cms::BytesMessage::readByte () const` [pure virtual]

Reads a Byte from the Bytes message stream.

Returns

unsigned char value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 171).

6.98.3.6 `virtual int cms::BytesMessage::readBytes (std::vector< unsigned char > & value) const [pure virtual]`

Reads a byte array from the bytes message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

<i>value</i>	buffer to place data in
--------------	-------------------------

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 172).

6.98.3.7 `virtual int cms::BytesMessage::readBytes (unsigned char * buffer, int length) const [pure virtual]`

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an -

`IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters

<i>buffer</i>	the buffer into which the data is read
<i>length</i>	the number of bytes to read; must be less than or equal to <code>value.length</code>

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 172).

6.98.3.8 `virtual char cms::BytesMessage::readChar() const` [pure virtual]

Reads a Char from the Bytes message stream.

Returns

char value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 173).

6.98.3.9 virtual double cms::BytesMessage::readDouble () const [pure virtual]

Reads a 64 bit double from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of bytes stream has been reached.
MessageNot-ReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 173).

6.98.3.10 virtual float cms::BytesMessage::readFloat () const [pure virtual]

Reads a 32 bit float from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of bytes stream has been reached.
MessageNot-ReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 174).

6.98.3.11 virtual int cms::BytesMessage::readInt () const [pure virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns

int value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 174).

6.98.3.12 `virtual long long cms::BytesMessage::readLong () const` [pure virtual]

Reads a 64 bit long from the Bytes message stream.

Returns

long long value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 175).

6.98.3.13 `virtual short cms::BytesMessage::readShort () const` [pure virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns

short value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 175).

6.98.3.14 `virtual std::string cms::BytesMessage::readString () const` [pure virtual]

Reads an ASCII String from the Bytes message stream.

Returns

String from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 176).

6.98.3.15 `virtual unsigned short cms::BytesMessage::readUnsignedShort () const` [pure virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns

unsigned short value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
--	---

<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 176).

6.98.3.16 `virtual std::string cms::BytesMessage::readUTF () const` [pure virtual]

Reads an UTF String from the **BytesMessage** (p. 718) stream.

Returns

String from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of bytes stream has been reached.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 176).

6.98.3.17 `virtual void cms::BytesMessage::reset ()` [pure virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions

<i>CMSException</i> (p. 826)	- If the provider fails to perform the reset operation.
<i>MessageFormatException</i> (p. 1906)	- If the Message (p. 1839) has an invalid format.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 177).

6.98.3.18 virtual void cms::BytesMessage::setBodyBytes (const unsigned char * *buffer*, int *numBytes*) [pure virtual]

sets the bytes given to the message body.

Parameters

<i>buffer</i>	Byte Buffer to copy
<i>numBytes</i>	Number of bytes in Buffer to copy

Exceptions

CMSException (p. 826)	- If an internal error occurs.
MessageNot-WriteableException (p. 1923)	- if in Read Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 177).

6.98.3.19 virtual void cms::BytesMessage::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the bytes message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

<i>value</i>	boolean to write to the stream
--------------	--------------------------------

Exceptions

CMSException (p. 826)	- if the CMS provider fails to write the message due to some internal error.
MessageNot-WriteableException (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 178).

6.98.3.20 virtual void cms::BytesMessage::writeByte (unsigned char *value*) [pure virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters

<i>value</i>	byte to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 178).

6.98.3.21 `virtual void cms::BytesMessage::writeBytes (const std::vector< unsigned char > & value) [pure virtual]`

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 179).

6.98.3.22 `virtual void cms::BytesMessage::writeBytes (const unsigned char * value, int offset, int length) [pure virtual]`

Writes a portion of a byte array to the bytes message stream.
size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
<i>offset</i>	the initial offset within the byte array
<i>length</i>	the number of bytes to use

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 179).

6.98.3.23 virtual void cms::BytesMessage::writeChar (char *value*) [pure virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters

<i>value</i>	char to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 179).

6.98.3.24 virtual void cms::BytesMessage::writeDouble (double *value*) [pure virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters

<i>value</i>	double to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 180).

6.98.3.25 `virtual void cms::BytesMessage::writeFloat (float value)` [pure virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters

<i>value</i>	float to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 180).

6.98.3.26 `virtual void cms::BytesMessage::writeInt (int value)` [pure virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters

<i>value</i>	signed int to write to the stream
--------------	-----------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 181).

6.98.3.27 `virtual void cms::BytesMessage::writeLong (long long value)` [pure virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters

<i>value</i>	signed long long to write to the stream
--------------	---

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 181).

6.98.3.28 virtual void cms::BytesMessage::writeShort (short *value*) [pure virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	signed short to write to the stream
--------------	-------------------------------------

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 181).

6.98.3.29 virtual void cms::BytesMessage::writeString (const std::string & *value*) [pure virtual]

Writes an ASCII String to the Bytes message stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 182).

6.98.3.30 `virtual void cms::BytesMessage::writeUnsignedShort (unsigned short value)` [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

<i>value</i>	unsigned short to write to the stream
--------------	---------------------------------------

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 182).

6.98.3.31 `virtual void cms::BytesMessage::writeUTF (const std::string & value)` [pure virtual]

Writes an UTF String to the **BytesMessage** (p. 718) stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSEException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 183).

The documentation for this class was generated from the following file:

- `src/main/cms/BytesMessage.h`

6.99 activemq::cmsutil::CachedConsumer Class Reference

A cached message consumer contained within a pooled session.

```
#include <src/main/activemq/cmsutil/CachedConsumer.h>
```

Inheritance diagram for activemq::cmsutil::CachedConsumer:

Public Member Functions

- **CachedConsumer** (**cms::MessageConsumer** *consumer)
- virtual **~CachedConsumer** () throw ()
- virtual void **close** ()
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual void **start** ()
Starts the service.
- virtual void **stop** ()
Stops this service.
- virtual **cms::Message** * **receive** ()
Synchronously Receive a Message.
- virtual **cms::Message** * **receive** (int millisecs)
Synchronously Receive a Message, time out after defined interval.
- virtual **cms::Message** * **receiveNoWait** ()
Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void **setMessageListener** (**cms::MessageListener** *listener)
Sets the MessageListener that this class will send notifs on.
- virtual **cms::MessageListener** * **getMessageListener** () const
Gets the MessageListener that this class will send new Message notification events to.
- virtual std::string **getMessageSelector** () const
Gets this message consumer's message selector expression.

6.99.1 Detailed Description

A cached message consumer contained within a pooled session.

6.99.2 Constructor & Destructor Documentation

6.99.2.1 **activemq::cmsutil::CachedConsumer::CachedConsumer** (**cms::MessageConsumer** * consumer) [inline]

6.99.2.2 **virtual activemq::cmsutil::CachedConsumer::~~CachedConsumer** () throw () [inline, virtual]

6.99.3 Member Function Documentation

6.99.3.1 `virtual void activemq::cmsutil::CachedConsumer::close () [inline, virtual]`

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements **cms::Closeable** (p. 816).

6.99.3.2 `virtual cms::MessageListener* activemq::cmsutil::CachedConsumer::getMessageListener () const [inline, virtual]`

Gets the MessageListener that this class will send new Message notification events to.

Returns

The listener of messages received by this consumer

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1878).

6.99.3.3 `virtual std::string activemq::cmsutil::CachedConsumer::getMessageSelector () const [inline, virtual]`

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1878).

6.99.3.4 `virtual cms::Message* activemq::cmsutil::CachedConsumer::receive () [inline, virtual]`

Synchronously Receive a Message.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1879).

6.99.3.5 virtual **cms::Message*** **activemq::cmsutil::CachedConsumer::receive** (int *millisecs*) [inline, virtual]

Synchronously Receive a Message, time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1879).

6.99.3.6 virtual **cms::Message*** **activemq::cmsutil::CachedConsumer::receiveNoWait** () [inline, virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

<i>CMSEException</i>	- If an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageConsumer** (p. 1880).

6.99.3.7 virtual void **activemq::cmsutil::CachedConsumer::setMessageListener** (**cms::MessageListener** * *listener*) [inline, virtual]

Sets the MessageListener that this class will send notifs on.

Parameters

<i>listener</i>	The listener of messages received by this consumer.
-----------------	---

Exceptions

<i>CMSEException</i> - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1880).

6.99.3.8 `virtual void activemq::cmsutil::CachedConsumer::start () [inline, virtual]`

Starts the service.

Exceptions

<i>CMSEException</i> if an internal error occurs while starting.
--

Implements **cms::Startable** (p. 2534).

6.99.3.9 `virtual void activemq::cmsutil::CachedConsumer::stop () [inline, virtual]`

Stops this service.

Exceptions

<i>CMSEException</i> - if an internal error occurs while stopping the Service.
--

Implements **cms::Stoppable** (p. 2602).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CachedConsumer.h`

6.100 activemq::cmsutil::CachedProducer Class Reference

A cached message producer contained within a pooled session.

```
#include <src/main/activemq/cmsutil/CachedProducer.h>
```

Inheritance diagram for `activemq::cmsutil::CachedProducer`:

Public Member Functions

- **CachedProducer** (**cms::MessageProducer** *producer)
- virtual **~CachedProducer** () throw ()
- virtual void **close** ()

Does nothing - the real producer resource will be closed by the lifecycle manager.

- virtual void **send** (cms::Message *message)

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (cms::Message *message, int deliveryMode, int priority, long long timeToLive)

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const cms::Destination *destination, cms::Message *message)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const cms::Destination *destination, cms::Message *message, int deliveryMode, int priority, long long timeToLive)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)

Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const

Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)

Sets if Message Ids are disabled for this Producer.

- virtual bool **getDisableMessageID** () const

Gets if Message Ids are disabled for this Producer.

- virtual void **setDisableMessageTimeStamp** (bool value)

Sets if Message Time Stamps are disabled for this Producer.

- virtual bool **getDisableMessageTimeStamp** () const

Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority)

Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const

Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)

Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const

Gets the Time to Live that this producer sends messages with.

6.100.1 Detailed Description

A cached message producer contained within a pooled session.

6.100.2 Constructor & Destructor Documentation

6.100.2.1 `activemq::cmsutil::CachedProducer::CachedProducer (cms::MessageProducer * producer) [inline]`

6.100.2.2 `virtual activemq::cmsutil::CachedProducer::~~CachedProducer () throw () [inline, virtual]`

6.100.3 Member Function Documentation

6.100.3.1 `virtual void activemq::cmsutil::CachedProducer::close () [inline, virtual]`

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements **cms::Closeable** (p. 816).

6.100.3.2 `virtual int activemq::cmsutil::CachedProducer::getDeliveryMode () const [inline, virtual]`

Gets the delivery mode for this Producer.

Returns

The DeliveryMode

Exceptions

<i>CMSEException</i> - if an internal error occurs.

Implements **cms::MessageProducer** (p. 1926).

6.100.3.3 `virtual bool activemq::cmsutil::CachedProducer::getDisableMessageID () const [inline, virtual]`

Gets if Message Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

<i>CMSEException</i> - if an internal error occurs.

Implements **cms::MessageProducer** (p. 1927).

6.100.3.4 `virtual bool activemq::cmsutil::CachedProducer::get-DisableMessageTimeStamp () const [inline, virtual]`

Gets if Message Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1927).

6.100.3.5 `virtual int activemq::cmsutil::CachedProducer::getPriority () const [inline, virtual]`

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1927).

6.100.3.6 `virtual long long activemq::cmsutil::CachedProducer::getTimeToLive () const [inline, virtual]`

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1928).

6.100.3.7 `virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message) [inline, virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

<i>message</i>	The message to be sent.
----------------	-------------------------

Exceptions

<i>CMSException</i>	- if an internal error occurs while sending the message.
<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1928).

6.100.3.8 `virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message, int deliveryMode, int priority, long long timeToLive) [inline, virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

<i>message</i>	The message to be sent.
<i>delivery-Mode</i>	The delivery mode to be used.
<i>priority</i>	The priority for this message.
<i>timeToLive</i>	The time to live value for this message in milliseconds.

Exceptions

<i>CMSException</i>	- if an internal error occurs while sending the message.
<i>MessageFormatException</i>	- if an Invalid Message is given.
<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1929).

6.100.3.9 `virtual void activemq::cmsutil::CachedProducer::send (const
cms::Destination * destination, cms::Message * message) [inline,
virtual]`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

<i>destination</i>	The destination on which to send the message
<i>message</i>	the message to be sent.

Exceptions

<i>CMSEException</i>	- if an internal error occurs while sending the message.
<i>MessageFormat-Exception</i>	- if an Invalid Message is given.
<i>InvalidDestination-Exception</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>Unsupported-OperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1929).

6.100.3.10 `virtual void activemq::cmsutil::CachedProducer::send (const
cms::Destination * destination, cms::Message * message, int deliveryMode,
int priority, long long timeToLive) [inline, virtual]`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

<i>destination</i>	The destination on which to send the message
<i>message</i>	The message to be sent.
<i>delivery-Mode</i>	The delivery mode to be used.
<i>priority</i>	The priority for this message.
<i>timeToLive</i>	The time to live value for this message in milliseconds.

Exceptions

<i>CMSEException</i>	- if an internal error occurs while sending the message.
<i>MessageFormat-Exception</i>	- if an Invalid Message is given.

<i>InvalidDestinationException</i>	- if a client uses this method with a MessageProducer with an invalid destination.
<i>UnsupportedOperationException</i>	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1930).

6.100.3.11 **virtual void activemq::cmsutil::CachedProducer::setDeliveryMode (int mode)** [inline, virtual]

Sets the delivery mode for this Producer.

Parameters

<i>mode</i>	The DeliveryMode
-------------	------------------

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1931).

6.100.3.12 **virtual void activemq::cmsutil::CachedProducer::setDisableMessageID (bool value)** [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters

<i>value</i>	boolean indicating enable / disable (true / false)
--------------	--

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1931).

6.100.3.13 **virtual void activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp (bool value)** [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters

<i>value</i>	- boolean indicating enable / disable (true / false)
--------------	--

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1931).

6.100.3.14 `virtual void activemq::cmsutil::CachedProducer::setPriority (int priority)
[inline, virtual]`

Sets the Priority that this Producers sends messages at.

Parameters

<i>priority</i>	int value for Priority level
-----------------	------------------------------

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1932).

6.100.3.15 `virtual void activemq::cmsutil::CachedProducer::setTimeToLive (long
long time) [inline, virtual]`

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

<i>time</i>	default time to live value in milliseconds
-------------	--

Exceptions

<i>CMSEException</i>	- if an internal error occurs.
----------------------	--------------------------------

Implements **cms::MessageProducer** (p. 1932).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CachedProducer.h**

6.101 decaf::util::concurrent::Callable< V > Class Template - Reference

A task that returns a result and may throw an exception.

```
#include <src/main/decaf/util/concurrent/Callable.h>
```

Public Member Functions

- virtual **~Callable** ()
- virtual V **call** ()=0

Computes a result, or throws an exception if unable to do so.

6.101.1 Detailed Description

```
template<typename V>class decaf::util::concurrent::Callable< V >
```

A task that returns a result and may throw an exception.

Implementors define a single method with no arguments called **call**. This interface differs from the **Runnable** interface in that a **Callable** (p. 746) object can return a result and is allowed to throw an exceptions from its **call** method.

The **Executors** (p. 1299) class contains utility methods to convert from other common forms to **Callable** (p. 746) classes.

Since

1.0

6.101.2 Constructor & Destructor Documentation

6.101.2.1 `template<typename V > virtual decaf::util::concurrent::Callable< V >::~~Callable () [inline, virtual]`

6.101.3 Member Function Documentation

6.101.3.1 `template<typename V > virtual V decaf::util::concurrent::Callable< V >::call () [pure virtual]`

Computes a result, or throws an exception if unable to do so.

Returns

Computed Result.

6.102 decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy Class

Reference

747

Exceptions

<i>Exception</i>	If unable to compute a result.
------------------	--------------------------------

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Callable.h**

6.102 decaf::util::concurrent::ThreadPoolExecutor::CallerRuns-Policy Class Reference

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p.2724) this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.

```
#include <src/main/decaf/util/concurrent/ThreadPoolExecutor.h>
```

Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy:

Data Structures

- class **DiscardOldestPolicy**
*Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2724) this class always destroys the oldest unexecuted task in the **Queue** (p. 2222) and then attempts to execute the rejected task using the passed in executor.*
- class **DiscardPolicy**
*Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2724) this class always destroys the rejected task and returns quietly.*

Public Member Functions

- **CallerRunsPolicy** ()
- virtual **~CallerRunsPolicy** ()
- virtual void **rejectedExecution** (decaf::lang::Runnable *task, **ThreadPool-Executor** *executor **DECAF_UNUSED**)

6.102.1 Detailed Description

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p.2724) this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.

Since

1.0

6.102.2 Constructor & Destructor Documentation

6.102.2.1 **decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::CallerRunsPolicy ()** [inline]

6.102.2.2 **virtual decaf::util::concurrent::ThreadPoolExecutor::~CallerRunsPolicy::~~CallerRunsPolicy ()** [inline, virtual]

6.102.3 Member Function Documentation

6.102.3.1 **virtual void decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::rejectedExecution (decaf::lang::Runnable * task, ThreadPoolExecutor *executer *DECAF_UNUSED*)** [inline, virtual]

References decaf::lang::Runnable::run().

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadPoolExecutor.h**

6.103 decaf::util::concurrent::CancellationException Class - Reference

```
#include <src/main/decaf/util/concurrent/Cancellation-Exception.h>
```

Inheritance diagram for decaf::util::concurrent::CancellationException:

Public Member Functions

- **CancellationException ()** throw ()
Default Constructor.
- **CancellationException (const decaf::lang::Exception &ex)** throw ()
Conversion Constructor from some other Exception.
- **CancellationException (const CancellationException &ex)** throw ()
Copy Constructor.
- **CancellationException (const std::exception *cause)** throw ()
Constructor.

- **CancellationException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **CancellationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CancellationException** * **clone** () const
Clones this exception.
- virtual ~**CancellationException** () throw ()

6.103.1 Constructor & Destructor Documentation

6.103.1.1 **decaf::util::concurrent::CancellationException::CancellationException**
 () throw () [inline]

Default Constructor.

6.103.1.2 **decaf::util::concurrent::CancellationException::CancellationException**
 (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.103.1.3 **decaf::util::concurrent::CancellationException::CancellationException**
 (const CancellationException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	- The Exception to copy in this new instance.
-----------	---

6.103.1.4 **decaf::util::concurrent::CancellationException::CancellationException**
 (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.103.1.5 `decaf::util::concurrent::CancellationException::CancellationException`
`(const char * file, const int lineNumber, const char * msg, ...) throw ()`
`[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>msg</i>	- The message to report
...	- list of primitives that are formatted into the message

6.103.1.6 `decaf::util::concurrent::CancellationException::CancellationException`
`(const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>cause</i>	- The exception that was the cause for this one to be thrown.
<i>msg</i>	- The message to report
...	- list of primitives that are formatted into the message

6.103.1.7 `virtual decaf::util::concurrent::CancellationException-`
`::~CancellationException () throw ()` `[inline,`
`virtual]`

6.103.2 Member Function Documentation

6.103.2.1 `virtual CancellationException* decaf::util::concurrent-`
`::CancellationException::clone () const` `[inline,`
`virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1282).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CancellationException.h**

6.104 decaf::security::cert::Certificate Class Reference

Base interface for all identity certificates.

```
#include <src/main/decaf/security/cert/Certificate.h>
```

Inheritance diagram for decaf::security::cert::Certificate:

Public Member Functions

- virtual **~Certificate** ()
- virtual bool **equals** (const **Certificate** &cert) const =0
Compares the encoded form of the two certificates.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0
Provides the encoded form of this certificate.
- virtual std::string **getType** () const =0
Returns the type of this certificate.
- virtual **PublicKey** * **getPublicKey** ()=0
Gets the public key of this certificate.
- virtual const **PublicKey** * **getPublicKey** () const =0
Gets the public key of this certificate.
- virtual void **verify** (const **PublicKey** &publicKey) const =0
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual void **verify** (const **PublicKey** &publicKey, const std::string &sigProvider) const =0
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual std::string **toString** () const =0
Returns a string representation of this certificate.

6.104.1 Detailed Description

Base interface for all identity certificates.

6.104.2 Constructor & Destructor Documentation

6.104.2.1 `virtual decaf::security::cert::Certificate::~~Certificate () [inline, virtual]`

6.104.3 Member Function Documentation

6.104.3.1 `virtual bool decaf::security::cert::Certificate::equals (const Certificate & cert) const [pure virtual]`

Compares the encoded form of the two certificates.

Parameters

<i>cert</i>	The certificate to be tested for equality with this certificate.
-------------	--

Returns

true if the given certificate is equal to this certificate.

6.104.3.2 `virtual void decaf::security::cert::Certificate::getEncoded (std::vector< unsigned char > & output) const [pure virtual]`

Provides the encoded form of this certificate.

Parameters

<i>output</i>	Receives the encoded form of this certificate.
---------------	--

Exceptions

Certificate- EncodingException (p. 755)	if an encoding error occurs
---	-----------------------------

6.104.3.3 `virtual PublicKey* decaf::security::cert::Certificate::getPublicKey () [pure virtual]`

Gets the public key of this certificate.

Returns

the public key

6.104.3.4 `virtual const PublicKey* decaf::security::cert::Certificate::getPublicKey () const [pure virtual]`

Gets the public key of this certificate.

Returns

the public key

6.104.3.5 `virtual std::string decaf::security::cert::Certificate::getType () const [pure virtual]`

Returns the type of this certificate.

Returns

the type of this certificate

6.104.3.6 `virtual std::string decaf::security::cert::Certificate::toString () const [pure virtual]`

Returns a string representation of this certificate.

Returns

a string representation of this certificate

6.104.3.7 `virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey) const [pure virtual]`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters

<i>publicKey</i>	The public key used to carry out the validation.
------------------	--

Exceptions

NoSuchAlgorithm-Exception (p. 1981)	- on unsupported signature algorithms.
InvalidKey-Exception (p. 1536)	- on incorrect key.

NoSuchProvider-Exception (p. 1986)	- if there's no default provider.
SignatureException (p. 2438)	- on signature errors.
Certificate-Exception (p. 757)	- on encoding errors.

6.104.3.8 `virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey, const std::string & sigProvider) const [pure virtual]`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Uses the verification engine of the specified provider.

Parameters

<i>publicKey</i>	The public key used to carry out the validation.
<i>sigProvider</i>	The name of the signature provider

Exceptions

NoSuchAlgorithm-Exception (p. 1981)	- on unsupported signature algorithms.
InvalidKey-Exception (p. 1536)	- on incorrect key.
NoSuchProvider-Exception (p. 1986)	- if there's no default provider.
SignatureException (p. 2438)	- on signature errors.
Certificate-Exception (p. 757)	- on encoding errors.

The documentation for this class was generated from the following file:

6.105 decaf::security::cert::CertificateEncodingException Class - Reference

```
#include <src/main/decaf/security/cert/CertificateEncodingException.h>
```

Inheritance diagram for decaf::security::cert::CertificateEncodingException:

Public Member Functions

- **CertificateEncodingException** () throw ()
Default Constructor.
- **CertificateEncodingException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **CertificateEncodingException** (const **CertificateEncodingException** &ex) throw ()
Copy Constructor.
- **CertificateEncodingException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CertificateEncodingException** * **clone** () const
Clones this exception.
- virtual ~**CertificateEncodingException** () throw ()

6.105.1 Constructor & Destructor Documentation

6.105.1.1 decaf::security::cert::CertificateEncodingException::CertificateEncodingException () throw () [inline]

Default Constructor.

6.105.1.2 decaf::security::cert::CertificateEncodingException::~CertificateEncodingException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
----	--

6.105.1.3 **decaf::security::cert::CertificateEncodingException::CertificateEncodingException** (const CertificateEncodingException & ex) throw ()
[inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.105.1.4 **decaf::security::cert::CertificateEncodingException::CertificateEncodingException** (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
...	list of primitives that are formatted into the message

6.105.1.5 **virtual decaf::security::cert::CertificateEncodingException::~CertificateEncodingException** () throw () [inline, virtual]

6.105.2 Member Function Documentation

6.105.2.1 **virtual CertificateEncodingException* decaf::security::cert::CertificateEncodingException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::cert::CertificateException** (p. 758).

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**CertificateEncodingException.h**

6.106 decaf::security::cert::CertificateException Class Reference

- **CertificateParsingException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CertificateParsingException** * **clone** () const
Clones this exception.
- virtual ~**CertificateParsingException** () throw ()

6.109.1 Constructor & Destructor Documentation

6.109.1.1 decaf::security::cert::CertificateParsingException::CertificateParsingException () throw () [inline]

Default Constructor.

6.109.1.2 decaf::security::cert::CertificateParsingException::~CertificateParsingException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
----	--

6.109.1.3 **decaf::security::cert::CertificateParsingException::CertificateParsingException** (const CertificateParsingException & ex) throw ()
[inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.109.1.4 **decaf::security::cert::CertificateParsingException::CertificateParsingException** (const char * file, const int lineNumber, const char * msg, ...) throw ()
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
<i>...</i>	list of primitives that are formatted into the message

6.109.1.5 **virtual decaf::security::cert::CertificateParsingException::~CertificateParsingException** () throw () [inline, virtual]

6.109.2 Member Function Documentation

6.109.2.1 **virtual CertificateParsingException* decaf::security::cert::CertificateParsingException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::cert::CertificateException** (p. 758).

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**CertificateParsingException.h**

6.110 decaf::lang::Character Class Reference

```
#include <src/main/decaf/lang/Character.h>
```

Inheritance diagram for decaf::lang::Character:

Public Member Functions

- **Character** (char value)
- virtual int **compareTo** (const **Character** &c) const
*Compares this **Character** (p. 765) instance with another.*
- virtual bool **operator==** (const **Character** &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Character** &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const char &c) const
*Compares this **Character** (p. 765) instance with a char type.*
- virtual bool **operator==** (const char &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const char &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (const **Character** &c) const
- bool **equals** (const char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static **Character** **valueOf** (char value)
*Returns a **Character** (p. 765) instance representing the specified char value.*
- static bool **isWhitespace** (char c)
Indicates whether or not the given character is considered whitespace.
- static bool **isDigit** (char c)
Indicates whether or not the given character is a digit.
- static bool **isLowerCase** (char c)
Indicates whether or not the given character is a lower case character.
- static bool **isUpperCase** (char c)
Indicates whether or not the given character is a upper case character.
- static bool **isLetter** (char c)
Indicates whether or not the given character is a letter.
- static bool **isLetterOrDigit** (char c)
Indicates whether or not the given character is either a letter or a digit.
- static bool **isISOControl** (char c)
Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.
- static int **digit** (char c, int radix)
Returns the numeric value of the character ch in the specified radix.

Static Public Attributes

- static const int **MIN_RADIX** = 2
The minimum radix available for conversion to and from strings.
- static const int **MAX_RADIX** = 36
The maximum radix available for conversion to and from strings.
- static const char **MIN_VALUE** = (char)0x7F
The minimum value that a signed char can take on.
- static const char **MAX_VALUE** = (char)0x80
The maximum value that a signed char can take on.
- static const int **SIZE** = 8
The size of the primitive charactor in bits.

6.110.1 Constructor & Destructor Documentation

6.110.1.1 `decaf::lang::Character::Character (char value)`

Parameters

<i>value</i>	- char to wrap.
--------------	-----------------

6.110.2 Member Function Documentation

6.110.2.1 virtual unsigned char **decaf::lang::Character::byteValue** () const
[inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1993).

6.110.2.2 virtual int **decaf::lang::Character::compareTo** (const **Character** & *c*) const
[inline, virtual]

Compares this **Character** (p. 765) instance with another.

Parameters

<i>c</i>	- the Character (p. 765) instance to be compared
----------	---

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Character** > (p. 886).

6.110.2.3 virtual int **decaf::lang::Character::compareTo** (const char & *c*) const
[inline, virtual]

Compares this **Character** (p. 765) instance with a char type.

Parameters

<i>c</i>	- the char instance to be compared
----------	------------------------------------

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **char** > (p. 886).

6.110.2.4 `static int decaf::lang::Character::digit (char c, int radix)` `[static]`

Returns the numeric value of the character *ch* in the specified radix.

If the radix is not in the range `MIN_RADIX <= radix <= MAX_RADIX` or if the value of *ch* is not a valid digit in the specified radix, -1 is returned. A character is a valid digit if at least one of the following is true:

- * The method `isDigit` is true of the character and the single-character decomposition is less than the specified radix. In this case the decimal digit value is returned.
- * The character is one of the uppercase Latin letters 'A' through 'Z' and its code is less than `radix + 'A' - 10`. In this case, `ch - 'A' + 10` is returned.
- * The character is one of the lowercase Latin letters 'a' through 'z' and its code is less than `radix + 'a' - 10`. In this case, `ch - 'a' + 10` is returned.

Parameters

<i>c</i>	- the char to be converted
<i>radix</i>	- the radix of the number

Returns

the numeric value of the number represented in the given radix

6.110.2.5 `virtual double decaf::lang::Character::doubleValue () const` `[inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements `decaf::lang::Number` (p. 1993).

6.110.2.6 `bool decaf::lang::Character::equals (const Character & c) const` `[inline, virtual]`

Returns

true if the two **Character** (p. 765) Objects have the same value.

Implements `decaf::lang::Comparable< Character >` (p. 887).

6.110.2.7 `bool decaf::lang::Character::equals (const char & c) const` `[inline, virtual]`

Returns

true if the two Characters have the same value.

Implements `decaf::lang::Comparable< char >` (p. 887).

6.110.2.8 `virtual float decaf::lang::Character::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.110.2.9 `virtual int decaf::lang::Character::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.110.2.10 `static bool decaf::lang::Character::isDigit (char c) [inline, static]`

Indicates whether or not the given character is a digit.

6.110.2.11 `static bool decaf::lang::Character::isISOControl (char c) [inline, static]`

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

Parameters

<code>c</code>	- the character, including supplementary characters
----------------	---

Returns

true if the char is an ISO control character

6.110.2.12 `static bool decaf::lang::Character::isLetter (char c) [inline, static]`

Indicates whether or not the given character is a letter.

6.110.2.13 `static bool decaf::lang::Character::isLetterOrDigit (char c)` `[inline, static]`

Indicates whether or not the given character is either a letter or a digit.

6.110.2.14 `static bool decaf::lang::Character::isLowerCase (char c)` `[inline, static]`

Indicates whether or not the given character is a lower case character.

6.110.2.15 `static bool decaf::lang::Character::isUpperCase (char c)` `[inline, static]`

Indicates whether or not the given character is a upper case character.

6.110.2.16 `static bool decaf::lang::Character::isWhitespace (char c)` `[inline, static]`

Indicates whether or not the given character is considered whitespace.

6.110.2.17 `virtual long long decaf::lang::Character::longValue () const` `[inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1994).

6.110.2.18 `virtual bool decaf::lang::Character::operator< (const Character & c) const` `[inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>c</i>	- the value to be compared to this one.
----------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Character** > (p. 887).

6.110.2.19 `virtual bool decaf::lang::Character::operator< (const char & c) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **char** > (p. 887).

6.110.2.20 `virtual bool decaf::lang::Character::operator== (const Character & c) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Character** > (p. 888).

6.110.2.21 `virtual bool decaf::lang::Character::operator== (const char & c) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

<code>c</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **char** > (p. 888).

6.110.2.22 `virtual short decaf::lang::Character::shortValue () const` `[inline, virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1994).

6.110.2.23 `std::string decaf::lang::Character::toString () const`

Returns

this **Character** (p. 765) Object as a **String** (p. 2620) Representation

6.110.2.24 `static Character decaf::lang::Character::valueOf (char value)` `[inline, static]`

Returns a **Character** (p. 765) instance representing the specified char value.

Parameters

<i>value</i>	- the primitive char to wrap.
--------------	-------------------------------

Returns

a new Charactor instance that wraps this value.

6.110.3 Field Documentation

6.110.3.1 `const int decaf::lang::Character::MAX_RADIX = 36` `[static]`

The maximum radix available for conversion to and from strings.

6.110.3.2 `const char decaf::lang::Character::MAX_VALUE = (char)0x80` `[static]`

The maximum value that a signed char can take on.

6.110.3.3 `const int decaf::lang::Character::MIN_RADIX = 2` `[static]`

The minimum radix available for conversion to and from strings.

6.110.3.4 `const char decaf::lang::Character::MIN_VALUE = (char)0x7F` `[static]`

The minimum value that a signed char can take on.

6.110.3.5 `const int decaf::lang::Character::SIZE = 8` `[static]`

The size of the primitive character in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Character.h`

6.111 decaf::internal::nio::CharArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/CharArrayBuffer.h>
```

Inheritance diagram for `decaf::internal::nio::CharArrayBuffer`:

Public Member Functions

- **CharArrayBuffer** (int size, bool **readOnly**=false)
*Creates a **CharArrayBuffer** (p. 773) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **CharArrayBuffer** (char *array, int size, int **offset**, int **length**, bool **readOnly**=false)
*Creates a **CharArrayBuffer** (p. 773) object that wraps the given array.*
- **CharArrayBuffer** (const `decaf::lang::Pointer< ByteArrayAdapter >` &array, int **offset**, int **length**, bool **readOnly**=false)
Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **CharArrayBuffer** (const **CharArrayBuffer** &other)
*Create a **CharArrayBuffer** (p. 773) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual `~CharArrayBuffer ()`
- virtual char * **array** ()
*Returns the character array that backs this buffer (optional operation).
Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.*

Returns

the array that backs this **Buffer** (p. 582).

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	if this Buffer (p. 582) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

- virtual int **arrayOffset** ()

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	if this Buffer (p. 582) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

- virtual **CharBuffer * asReadOnlyBuffer** () const

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

- virtual **CharBuffer & compact** ()

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 785).

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	- If this buffer is read-only
--	-------------------------------

- virtual **CharBuffer** * **duplicate** ()

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new char **Buffer** (p. 582) which the caller owns.*

- virtual char **get** ()

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

BufferUnderflow-Exception (p. 611)	if there no more data to return
--	---------------------------------

- virtual char **get** (int index) const

Absolute get method.

Reads the char at the given index.

Parameters

index	The index in the Buffer (p. 582) where the char is to be read.
-------	---

Returns

the char that is located at the given index.

Exceptions

IndexOutOfBoundsException	if index is not smaller than the buffer's limit or is negative.
---------------------------	---

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () const

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual **CharBuffer & put** (char value)

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value	<i>The char value to be written.</i>
-------	--------------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if this buffer's current position is not smaller than its limit</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **CharBuffer & put** (int index, char value)

Writes the given char into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data.</i>
value	<i>The char to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	<i>if index greater than the buffer's limit minus the size of the type being written, or index is negative.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **CharBuffer * slice ()** const

*Creates a new **CharBuffer** (p. 785) whose content is a shared subsequence of this buffer's content.*

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the newly create **CharBuffer** (p. 785) which the caller owns.*

- virtual **lang::CharSequence * subSequence** (int start, int end) const

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new

buffer's capacity will be that of this buffer, its position will be **position()** (p. 587) + start, and its limit will be **position()** (p. 587) + end. The new **Buffer** (p. 582) will be read-only if, and only if, this buffer is read-only.

Parameters

start	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than remaining() (p. 588).
end	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than remaining() (p. 588).

Returns

The new character buffer, caller owns.

Exceptions

IndexOutOfBoundsException	if the preconditions on start and end fail.
---------------------------	---

Protected Member Functions

- virtual void **setReadOnly** (bool value)

Sets this **CharArrayBuffer** (p. 773) as Read-Only.

Protected Attributes

- decaf::lang::Pointer < ByteArrayAdapter > _array
- int **offset**
- int **length**
- bool **readOnly**

6.111.1 Constructor & Destructor Documentation

6.111.1.1 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (int size, bool readOnly = false)

Creates a **CharArrayBuffer** (p. 773) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArgumentException	if the capacity value is negative.
--------------------------	------------------------------------

6.111.1.2 **decaf::internal::nio::CharArrayBuffer::CharArrayBuffer** (*char * array*, *int size*, *int offset*, *int length*, *bool readOnly = false*)

Creates a **CharArrayBuffer** (p. 773) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The actual array to wrap.
<i>size</i>	The size of the given array.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

6.111.1.3 **decaf::internal::nio::CharArrayBuffer::CharArrayBuffer** (*const decaf::lang::Pointer< ByteArrayAdapter > & array*, *int offset*, *int length*, *bool readOnly = false*)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **CharArrayBuffer** (p. 773) will be that of the remaining capacity of the passed buffer.

Parameters

<i>array</i>	The ByteArrayAdapter to wrap.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset + length is greater than array size.

6.111.1.4 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const CharArrayBuffer & other)

Create a **CharArrayBuffer** (p. 773) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters

<i>other</i>	The CharArrayBuffer (p. 773) this one is to mirror.
--------------	--

6.111.1.5 virtual decaf::internal::nio::CharArrayBuffer::~CharArrayBuffer () [virtual]

6.111.2 Member Function Documentation

6.111.2.1 virtual char* decaf::internal::nio::CharArrayBuffer::array () [virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 582).

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	if this Buffer (p. 582) is read only.
<i>Unsupported-OperationException</i>	if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 790).

6.111.2.2 virtual int decaf::internal::nio::CharArrayBuffer::arrayOffset () [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBufferException</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 791).

6.111.2.3 **virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::asReadOnlyBuffer() const** [virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implements **decaf::nio::CharBuffer** (p. 791).

6.111.2.4 **virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::compact()** [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n + 1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 785).

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	- If this buffer is read-only
---	-------------------------------

Implements **decaf::nio::CharBuffer** (p. 792).

6.111.2.5 **virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::duplicate ()**
[virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 582) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 793).

6.111.2.6 **virtual char decaf::internal::nio::CharArrayBuffer::get ()** [virtual]

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there no more data to return
---	---------------------------------

Implements **decaf::nio::CharBuffer** (p. 793).

6.111.2.7 `virtual char decaf::internal::nio::CharArrayBuffer::get (int index) const`
`[virtual]`

Absolute get method.

Reads the char at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the char is to be read.
--------------	---

Returns

the char that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit or is negative.
----------------------------------	---

Implements **decaf::nio::CharBuffer** (p. 794).

6.111.2.8 `virtual bool decaf::internal::nio::CharArrayBuffer::hasArray () const`
`[inline, virtual]`

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::CharBuffer** (p. 795).

6.111.2.9 `virtual bool decaf::internal::nio::CharArrayBuffer::isReadOnly () const`
`[inline, virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 586).

6.111.2.10 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (char *value*) [virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The char value to be written.
--------------	-------------------------------

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if this buffer's current position is not smaller than its limit
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 798).

6.111.2.11 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (int *index*, char *value*) [virtual]

Writes the given char into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The char to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 798).

6.111.2.12 `virtual void decaf::internal::nio::CharArrayBuffer::setReadOnly (bool value) [inline, protected, virtual]`

Sets this **CharArrayBuffer** (p. 773) as Read-Only.

Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

6.111.2.13 `virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::slice () const [virtual]`

Creates a new **CharBuffer** (p. 785) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 785) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 801).

6.111.2.14 `virtual lang::CharSequence* decaf::internal::nio::CharArrayBuffer::subSequence (int start, int end) const [virtual]`

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 587) + *start*, and its limit will be **position()** (p. 587) + *end*. The new **Buffer** (p. 582) will be read-only if, and only if, this buffer is read-only.

Parameters

<i>start</i>	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than remaining() (p. 588).
<i>end</i>	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than <i>start</i> and no larger than remaining() (p. 588).

Returns

The new character buffer, caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions on start and end fail.
----------------------------------	---

Implements **decaf::nio::CharBuffer** (p. 801).

6.111.3 Field Documentation

- 6.111.3.1 **decaf::lang::Pointer<ByteArrayAdapter>**
decaf::internal::nio::CharArrayBuffer::_array [protected]

6.112 decaf::nio::CharBuffer Class Reference

This class defines four categories of operations upon character buffers:

```
#include <src/main/decaf/nio/CharBuffer.h>
```

Inheritance diagram for decaf::nio::CharBuffer:

Public Member Functions

- virtual **~CharBuffer** ()
- virtual std::string **toString** () const
- **CharBuffer & append** (char value)
Appends the specified character to this buffer.
- **CharBuffer & append** (const lang::CharSequence *value)
Appends the specified character sequence to this buffer.
- **CharBuffer & append** (const lang::CharSequence *value, int start, int end)

Appends a subsequence of the specified character sequence to this buffer. If value is Null the the string "null" is appended to the buffer.

- virtual char * **array** ()=0
Returns the character array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **CharBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only char buffer that shares this buffer's content.
- char **charAt** (int index) const
Reads the character at the given index relative to the current position.
- virtual **CharBuffer** & **compact** ()=0
Compacts this buffer.
- virtual **CharBuffer** * **duplicate** ()=0
Creates a new char buffer that shares this buffer's content.
- virtual char **get** ()=0
Relative get method.
- virtual char **get** (int index) const =0
Absolute get method.
- **CharBuffer** & **get** (std::vector< char > buffer)
Relative bulk get method.
- **CharBuffer** & **get** (char *buffer, int size, int offset, int **length**)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible char array.
- int **length** () const
Returns the length of this character buffer.
- **CharBuffer** & **put** (**CharBuffer** &src)
This method transfers the chars remaining in the given source buffer into this buffer.
- **CharBuffer** & **put** (const char *buffer, int size, int offset, int **length**)
This method transfers chars into this buffer from the given source array.
- **CharBuffer** & **put** (std::vector< char > &buffer)
This method transfers the entire content of the given source char array into this buffer.
- virtual **CharBuffer** & **put** (char value)=0
Writes the given char into this buffer at the current position, and then increments the position.
- virtual **CharBuffer** & **put** (int index, char value)=0
Writes the given char into this buffer at the given index.
- **CharBuffer** & **put** (std::string &src, int start, int end)
Relative bulk put method (optional operation).
- **CharBuffer** & **put** (const std::string &src)
Relative bulk put method (optional operation).
- virtual int **read** (**CharBuffer** *target)
Attempts to read characters into the specified character buffer.

- virtual **lang::CharSequence** * **subSequence** (int start, int end) const =0
Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.
- virtual **CharBuffer** * **slice** () const =0
*Creates a new **CharBuffer** (p. 785) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **CharBuffer** &value) const
- virtual bool **equals** (const **CharBuffer** &value) const
- virtual bool **operator==** (const **CharBuffer** &value) const
- virtual bool **operator<** (const **CharBuffer** &value) const

Static Public Member Functions

- static **CharBuffer** * **allocate** (int capacity)
Allocates a new character buffer.
- static **CharBuffer** * **wrap** (char *array, int size, int offset, int length)
*Wraps the passed buffer with a new **CharBuffer** (p. 785).*
- static **CharBuffer** * **wrap** (std::vector< char > &buffer)
*Wraps the passed STL char Vector in a **CharBuffer** (p. 785).*

Protected Member Functions

- **CharBuffer** (int capacity)
*Creates a **CharBuffer** (p. 785) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.112.1 Detailed Description

This class defines four categories of operations upon character buffers:

o Absolute and relative get and put methods that read and write single characters; o Relative bulk get methods that transfer contiguous sequences of characters from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of characters from a character array, a string, or some other character buffer into this buffer. o Methods for compacting, duplicating, and slicing a character buffer.

Character buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing character array or string into a buffer, or by creating a view of an existing byte buffer

This class implements the `CharSequence` interface so that character buffers may be used wherever character sequences are accepted, for example in the regular-expression package `decaf.util.regex`.

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained. The sequence of statements

```
cb.put("text/"); cb.put(subtype); cb.put("; charset="); cb.put(enc);
```

can, for example, be replaced by the single statement

```
cb.put("text/").put(subtype).put("; charset=").put(enc);
```

6.112.2 Constructor & Destructor Documentation

6.112.2.1 `decaf::nio::CharBuffer::CharBuffer (int capacity)` [protected]

Creates a **CharBuffer** (p. 785) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size of the array, this is the limit we read and write to.
-----------------	--

Exceptions

<i>IllegalArgument-Exception</i>	if capacity is negative.
----------------------------------	--------------------------

6.112.2.2 `virtual decaf::nio::CharBuffer::~CharBuffer ()` [inline, virtual]

6.112.3 Member Function Documentation

6.112.3.1 `static CharBuffer* decaf::nio::CharBuffer::allocate (int capacity)` [static]

Allocates a new character buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

<i>capacity</i>	The size of the Char buffer in chars (1 byte).
-----------------	--

Returns

the **CharBuffer** (p. 785) that was allocated, caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if capacity is negative.
----------------------------------	--------------------------

6.112.3.2 CharBuffer& decaf::nio::CharBuffer::append (char value) [virtual]

Appends the specified character to this buffer.

Parameters

<i>value</i>	The char to append.
--------------	---------------------

Returns

a reference to this modified **CharBuffer** (p. 785).

Exceptions

BufferOverflow-Exception (p. 609)	if there is no more space
ReadOnlyBuffer-Exception (p. 2244)	if this Buffer (p. 582) is read only.

Implements **decaf::lang::Appendable** (p. 443).

6.112.3.3 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * value) [virtual]

Appends the specified character sequence to this buffer.

If value is Null the the string "null" is appended to the buffer.

Parameters

<i>value</i>	The CharSequence to append.
--------------	-----------------------------

Returns

a reference to this modified **CharBuffer** (p. 785)

Exceptions

BufferOverflow-Exception (p. 609)	if there is no more space
---	---------------------------

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this Buffer (p. 582) is read only.
---	--

Implements **decaf::lang::Appendable** (p. 443).

6.112.3.4 **CharBuffer& decaf::nio::CharBuffer::append** (**const lang::CharSequence** * *value*, **int** *start*, **int** *end*) [virtual]

Appends a subsequence of the specified character sequence to this buffer. If *value* is Null the the string "null" is appended to the buffer.

Parameters

<i>value</i>	The CharSequence to append.
<i>start</i>	The index to start appending from.
<i>end</i>	The index to append to.

Returns

a reference to this modified **CharBuffer** (p. 785).

Exceptions

<i>BufferOverflow-Exception</i> (p. 609)	if there is no more space
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>IndexOutOfBoundsException</i>	if <i>start</i> > <i>end</i> , or > length of sequence.

Implements **decaf::lang::Appendable** (p. 443).

6.112.3.5 **virtual char* decaf::nio::CharBuffer::array** () [pure virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 582).

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>Unsupported-Operation</i> Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 779).

6.112.3.6 virtual int decaf::nio::CharBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>Unsupported-Operation</i> Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 779).

6.112.3.7 virtual CharBuffer* decaf::nio::CharBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of

this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 780).

6.112.3.8 `char decaf::nio::CharBuffer::charAt (int index) const` [virtual]

Reads the character at the given index relative to the current position.

Parameters

<i>index</i>	- The index of the character to be read relative to position
--------------	--

Returns

The character at index **position()** (p. 587) + index.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index + the current position exceeds the size of the buffer or the index is negative.
----------------------------------	--

Implements **decaf::lang::CharSequence** (p. 804).

6.112.3.9 `virtual CharBuffer& decaf::nio::CharBuffer::compact ()` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \mathbf{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\mathbf{limit}()$ (p. 586) - 1 is copied to index $n = \mathbf{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 785).

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	- If this buffer is read-only
---	-------------------------------

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 780).

6.112.3.10 `virtual int decaf::nio::CharBuffer::compareTo (const CharBuffer & value)
const [virtual]`

6.112.3.11 `virtual CharBuffer* decaf::nio::CharBuffer::duplicate () [pure
virtual]`

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 582) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 781).

6.112.3.12 `virtual bool decaf::nio::CharBuffer::equals (const CharBuffer & value)
const [virtual]`

6.112.3.13 `virtual char decaf::nio::CharBuffer::get () [pure virtual]`

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there no more data to return
---	---------------------------------

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 781).

6.112.3.14 `virtual char decaf::nio::CharBuffer::get (int index) const` [pure virtual]

Absolute get method.

Reads the char at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the char is to be read.
--------------	---

Returns

the char that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit or is negative.
----------------------------------	---

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 782).

6.112.3.15 `CharBuffer& decaf::nio::CharBuffer::get (std::vector< char > buffer)`

Relative bulk get method.

This method transfers chars from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **CharBuffer** (p. 785).

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are fewer than length chars remaining in this buffer.
--	--

6.112.3.16 `CharBuffer& decaf::nio::CharBuffer::get (char * buffer, int size, int offset, int length)`

Relative bulk get method.

This method transfers chars from this buffer into the given destination array. If there are fewer chars remaining in the buffer than are required to satisfy the request, that is, if

length > **remaining()** (p. 588), then no bytes are transferred and a **BufferUnderflow-Exception** (p. 611) is thrown.

Otherwise, this method copies length chars from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 582).

Exceptions

BufferUnderflow-Exception (p. 611)	if there are fewer than length chars remaining in this buffer
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.112.3.17 `virtual bool decaf::nio::CharBuffer::hasArray () const` `[pure virtual]`

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 782).

6.112.3.18 `int decaf::nio::CharBuffer::length () const` `[inline, virtual]`

Returns the length of this character buffer.

Returns

the length of this buffer from the position to the limit.

Implements **decaf::lang::CharSequence** (p. 804).

6.112.3.19 `virtual bool decaf::nio::CharBuffer::operator< (const CharBuffer & value) const`
[virtual]

6.112.3.20 `virtual bool decaf::nio::CharBuffer::operator== (const CharBuffer & value) const`
[virtual]

6.112.3.21 `CharBuffer& decaf::nio::CharBuffer::put (CharBuffer & src)`

This method transfers the chars remaining in the given source buffer into this buffer.

If there are more chars remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 588), then no chars are transferred and a **BufferOverflowException** (p. 609) is thrown.

Otherwise, this method copies `n = src.remaining()` chars from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

<code>src</code>	- the buffer to take chars from an place in this one.
------------------	---

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	if there is insufficient space in this buffer for the remaining chars in the source buffer.
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

6.112.3.22 `CharBuffer& decaf::nio::CharBuffer::put (const char * buffer, int size, int offset, int length)`

This method transfers chars into this buffer from the given source array.

If there are more chars to be copied from the array than remain in this buffer, that is,

if `length > remaining()` (p. 588), then no chars are transferred and a **BufferOverflow-Exception** (p. 609) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

<i>buffer</i>	The array from which chars are to be read.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The offset within the array of the first char to be read.
<i>length</i>	The number of chars to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there is insufficient space in this buffer
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.112.3.23 CharBuffer& decaf::nio::CharBuffer::put (std::vector< char > &buffer)

This method transfers the entire content of the given source char array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size())`.

Parameters

<i>buffer</i>	The buffer whose contents are copied to this CharBuffer (p. 785).
---------------	--

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there is insufficient space in this buffer.
---	--

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.
---	------------------------------

6.112.3.24 `virtual CharBuffer& decaf::nio::CharBuffer::put (char value)` [pure virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The char value to be written.
--------------	-------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflow-Exception</i> (p. 609)	if this buffer's current position is not smaller than its limit
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 783).

6.112.3.25 `virtual CharBuffer& decaf::nio::CharBuffer::put (int index, char value)` [pure virtual]

Writes the given char into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The char to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in `decaf::internal::nio::CharArrayBuffer` (p. 783).

6.112.3.26 `CharBuffer& decaf::nio::CharBuffer::put (std::string & src, int start, int end)`

Relative bulk put method (optional operation).

This method transfers characters from the given string into this buffer. If there are more characters to be copied from the string than remain in this buffer, that is, if `end - start > remaining()` (p. 588), then no characters are transferred and a **BufferOverflowException** (p. 609) is thrown.

Returns

a reference to this buffer

Otherwise, this method copies `n = end - start` characters from the given string into this buffer, starting at the given start index and at the current position of this buffer. The position of this buffer is then incremented by `n`.

Parameters

<i>src</i>	The string to copy from.
<i>start</i>	The position in <i>src</i> to start from.
<i>end</i>	The position in <i>src</i> to stop at.

Returns

a reference to this **CharBuffer** (p. 785).

Exceptions

BufferOverflowException (p. 609)	if this buffer's current position is not
<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only

6.112.3.27 CharBuffer& decaf::nio::CharBuffer::put (const std::string & *src*)

Relative bulk put method (optional operation).

This method transfers the entire content of the given source string into this buffer. An invocation of this method of the form `dst.put(s)` behaves in exactly the same way as the invocation.

Parameters

<i>src</i>	The string to copy from.
------------	--------------------------

Returns

a reference to this **CharBuffer** (p. 785).

Exceptions

BufferOverflow-Exception (p. 609)	if this buffer's current position is not.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

6.112.3.28 virtual int decaf::nio::CharBuffer::read (CharBuffer * *target*) [virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

<i>target</i>	The buffer to read characters into
---------------	------------------------------------

Returns

The number of characters added to the buffer, or `string::npos` if this source of characters is at its end

Exceptions

<i>NullPointerException</i>	if <i>target</i> is Null.
<i>IllegalArgumentException</i>	if <i>target</i> is this CharBuffer (p. 785).
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is in read-only mode.

6.112.3.29 `virtual CharBuffer* decaf::nio::CharBuffer::slice () const` [pure virtual]

Creates a new **CharBuffer** (p. 785) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 785) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 784).

6.112.3.30 `virtual lang::CharSequence* decaf::nio::CharBuffer::subSequence (int start, int end) const` [pure virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 587) + start, and its limit will be **position()** (p. 587) + end. The new **Buffer** (p. 582) will be read-only if, and only if, this buffer is read-only.

Parameters

<i>start</i>	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than remaining() (p. 588).
<i>end</i>	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than remaining() (p. 588).

Returns

The new character buffer, caller owns.

Exceptions

<i>IndexOutOfBoundsException</i>	if the preconditions on start and end fail.
----------------------------------	---

Implements **decaf::lang::CharSequence** (p. 804).

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 784).

6.112.3.31 **virtual std::string decaf::nio::CharBuffer::toString () const** [virtual]

Returns

a std::string describing this object

Implements **decaf::lang::CharSequence** (p. 805).

6.112.3.32 **static CharBuffer* decaf::nio::CharBuffer::wrap (char * array, int size, int offset, int length)** [static]

Wraps the passed buffer with a new **CharBuffer** (p. 785).

The new buffer will be backed by the given char array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the array passed in.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new **CharBuffer** (p. 785) that is backed by buffer, caller owns.

Exceptions

<i>NullPointerException</i>	if the array pointer is Null.
<i>IndexOutOfBoundsException</i>	if capacity is negative.

6.112.3.33 **static CharBuffer* decaf::nio::CharBuffer::wrap (std::vector< char > & buffer)** [static]

Wraps the passed STL char Vector in a **CharBuffer** (p. 785).

The new buffer will be backed by the given char array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling <code>vector.resize(N)</code> .
---------------	--

Returns

a new **CharBuffer** (p. 785) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/CharBuffer.h`

6.113 decaf::lang::CharSequence Class Reference

A **CharSequence** (p. 803) is a readable sequence of char values.

```
#include <src/main/decaf/lang/CharSequence.h>
```

Inheritance diagram for `decaf::lang::CharSequence`:

Public Member Functions

- virtual `~CharSequence()`
- virtual `int length()` `const =0`
- virtual `char charAt(int index)` `const =0`
Returns the Char at the specified index so long as the index is not greater than the length of the sequence.
- virtual `CharSequence * subSequence(int start, int end)` `const =0`
*Returns a new **CharSequence** (p. 803) that is a subsequence of this sequence.*
- virtual `std::string toString()` `const =0`

6.113.1 Detailed Description

A **CharSequence** (p. 803) is a readable sequence of char values.

This interface provides uniform, read-only access to many different kinds of char sequences.

This interface does not define that a **CharSequence** (p. 803) should implement comparable, it is therefore up to the derived classes that implement this interface to define equality, which implies that comparison of two `CharSequences` does not have a contract on equality.

6.113.2 Constructor & Destructor Documentation

6.113.2.1 `virtual decaf::lang::CharSequence::~CharSequence () [inline, virtual]`

6.113.3 Member Function Documentation

6.113.3.1 `virtual char decaf::lang::CharSequence::charAt (int index) const [pure virtual]`

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

<i>index</i>	The position to return the char at.
--------------	-------------------------------------

Returns

the char at the given position.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is > than length() (p. 804) or negative
----------------------------------	---

Implemented in **decaf::nio::CharBuffer** (p. 792), and **decaf::lang::String** (p. 2624).

6.113.3.2 `virtual int decaf::lang::CharSequence::length () const [pure virtual]`

Returns

the length of the underlying character sequence.

Implemented in **decaf::nio::CharBuffer** (p. 795), and **decaf::lang::String** (p. 2624).

6.113.3.3 `virtual CharSequence* decaf::lang::CharSequence::subSequence (int start, int end) const [pure virtual]`

Returns a new **CharSequence** (p. 803) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters

<i>start</i>	The start index, inclusive.
<i>end</i>	The end index, exclusive.

Returns

a new **CharSequence** (p. 803)

Exceptions

<i>IndexOutOfBoundsException</i>	if start or end > length() (p. 804) or start or end are negative.
----------------------------------	--

Implemented in **decaf::nio::CharBuffer** (p. 801), **decaf::internal::nio::CharArrayBuffer** (p. 784), and **decaf::lang::String** (p. 2625).

6.113.3.4 `virtual std::string decaf::lang::CharSequence::toString () const [pure virtual]`

Returns

the string representation of this **CharSequence** (p. 803)

Implemented in **decaf::lang::String** (p. 2625), and **decaf::nio::CharBuffer** (p. 802).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**CharSequence.h**

6.114 decaf::util::zip::CheckedInputStream Class Reference

An implementation of a FilterInputStream that will maintain a **Checksum** (p. 810) of the bytes read, the **Checksum** (p. 810) can then be used to verify the integrity of the input stream.

```
#include <src/main/decaf/util/zip/CheckedInputStream.h>
```

Inheritance diagram for decaf::util::zip::CheckedInputStream:

Public Member Functions

- **CheckedInputStream** (InputStream *inputStream, Checksum *sum, bool own=false)
Create a new instance of a **CheckedInputStream** (p. 805).
- virtual ~**CheckedInputStream** ()

- **Checksum** * **getChecksum** () const

Returns a Pointer to the **Checksum** (p. 810) that is in use by this **CheckedInputStream** (p. 805).

- virtual long long **skip** (long long num)

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.
-----	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 1545)	if an I/O error occurs.
UnsupportedOperationException	if the concrete stream class does not support skipping bytes.

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.114.1 Detailed Description

An implementation of a **FilterInputStream** that will maintain a **Checksum** (p. 810) of the bytes read, the **Checksum** (p. 810) can then be used to verify the integrity of the input stream.

Since

1.0

6.114.2 Constructor & Destructor Documentation

- 6.114.2.1 **decaf::util::zip::CheckedInputStream::CheckedInputStream** (**InputStream** * *inputStream*, **Checksum** * *sum*, bool *own* = false)

Create a new instance of a **CheckedInputStream** (p. 805).

Parameters

<i>inputStream</i>	The <code>InputStream</code> instance to Wrap.
<i>sum</i>	The Checksum (p. 810) instance to use (does not take ownership of the Pointer).
<i>own</i>	Indicates if this filer should take ownership of the <code>InputStream</code> .

Exceptions

<i>NullPointerException</i>	if the Checksum (p. 810) pointer is NULL.
-----------------------------	--

6.114.2.2 virtual `decaf::util::zip::CheckedInputStream::~~CheckedInputStream ()`
[virtual]

6.114.3 Member Function Documentation

6.114.3.1 virtual `int decaf::util::zip::CheckedInputStream::doReadArrayBounded (unsigned char * buffer, int size, int offset, int length)` [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1338).

6.114.3.2 virtual `int decaf::util::zip::CheckedInputStream::doReadByte ()`
[protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1338).

6.114.3.3 **Checksum*** `decaf::util::zip::CheckedInputStream::getChecksum ()`
`const` [inline]

Returns a Pointer to the **Checksum** (p. 810) that is in use by this **CheckedInputStream** (p. 805).

Returns

the pointer to the **Checksum** (p. 810) instance that is in use by this object.

6.114.3.4 virtual `long long decaf::util::zip::CheckedInputStream::skip (long long num)` [virtual]

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>UnsupportedOperationException</i>	if the concrete stream class does not support skipping bytes.

Adds the skipped bytes into the **Checksum** (p. 810).

Reimplemented from **decaf::io::FilterInputStream** (p. 1340).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedInputStream.h**

6.115 decaf::util::zip::CheckedOutputStream Class Reference

An implementation of a **FilterOutputStream** that will maintain a **Checksum** (p. 810) of the bytes written, the **Checksum** (p. 810) can then be used to verify the integrity of the output stream.

```
#include <src/main/decaf/util/zip/CheckedOutputStream.h>
```

Inheritance diagram for decaf::util::zip::CheckedOutputStream:

Public Member Functions

- **CheckedOutputStream** (decaf::io::OutputStream *outputStream, Checksum *sum, bool own=false)
Create a new instance of a **CheckedOutputStream** (p. 808).
- virtual ~**CheckedOutputStream** ()
- **Checksum** * **getChecksum** () const

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.115.1 Detailed Description

An implementation of a `FilterOutputStream` that will maintain a **Checksum** (p. 810) of the bytes written, the **Checksum** (p. 810) can then be used to verify the integrity of the output stream.

Since

1.0

6.115.2 Constructor & Destructor Documentation

6.115.2.1 `decaf::util::zip::CheckedOutputStream::CheckedOutputStream (decaf::io::OutputStream * outputStream, Checksum * sum, bool own = false)`

Create a new instance of a **CheckedOutputStream** (p. 808).

Parameters

<i>output-Stream</i>	The <code>OutputStream</code> instance to Wrap.
<i>sum</i>	The Checksum (p. 810) instance to use (does not take ownership of the Pointer).
<i>own</i>	Indicates if this filer should take ownership of the <code>InputStream</code> .

Exceptions

<i>NullPointerException</i>	if the Checksum (p. 810) pointer is NULL.
-----------------------------	--

6.115.2.2 `virtual decaf::util::zip::CheckedOutputStream::~~CheckedOutputStream () [virtual]`

6.115.3 Member Function Documentation

6.115.3.1 `virtual void decaf::util::zip::CheckedOutputStream::doWriteArrayBounded (const unsigned char * buffer, int size, int offset, int length) [protected, virtual]`

Reimplemented from **decaf::io::FilterOutputStream** (p. 1343).

6.115.3.2 virtual void **decaf::util::zip::CheckedOutputStream::doWriteByte** (unsigned char *value*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1343).

6.115.3.3 **Checksum*** **decaf::util::zip::CheckedOutputStream::getChecksum** () const [inline]

Returns

a pointer to the **Checksum** (p. 810) instance in use by this object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedOutputStream.h**

6.116 decaf::util::zip::Checksum Class Reference

An interface used to represent **Checksum** (p. 810) values in the Zip package.

```
#include <src/main/decaf/util/zip/Checksum.h>
```

Inheritance diagram for **decaf::util::zip::Checksum**:

Public Member Functions

- virtual **~Checksum** ()
- virtual long long **getValue** () const =0
- virtual void **reset** ()=0
Reset the checksum to its initial value.
- virtual void **update** (const std::vector< unsigned char > &buffer)=0
Updates the current checksum with the specified vector of bytes.
- virtual void **update** (const std::vector< unsigned char > &buffer, int offset, int length)=0
Updates the current checksum with the specified array of bytes.
- virtual void **update** (const unsigned char *buffer, int size, int offset, int length)=0
Updates the current checksum with the specified array of bytes.
- virtual void **update** (int byte)=0
Updates the current checksum with the specified byte value.

6.116.1 Detailed Description

An interface used to represent **Checksum** (p. 810) values in the Zip package.

Since

1.0

6.116.2 Constructor & Destructor Documentation

6.116.2.1 `virtual decaf::util::zip::Checksum::~Checksum () [inline, virtual]`

6.116.3 Member Function Documentation

6.116.3.1 `virtual long long decaf::util::zip::Checksum::getValue () const [pure virtual]`

Returns

the current checksum value.

Implemented in **decaf::util::zip::Adler32** (p. 440), and **decaf::util::zip::CRC32** (p. 1066).

6.116.3.2 `virtual void decaf::util::zip::Checksum::reset () [pure virtual]`

Reset the checksum to its initial value.

Implemented in **decaf::util::zip::Adler32** (p. 440), and **decaf::util::zip::CRC32** (p. 1066).

6.116.3.3 `virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & buffer) [pure virtual]`

Updates the current checksum with the specified vector of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
---------------	--

Implemented in **decaf::util::zip::Adler32** (p. 440), and **decaf::util::zip::CRC32** (p. 1067).

6.116.3.4 `virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & buffer, int offset, int length) [pure virtual]`

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if $\text{offset} + \text{length} > \text{size of the buffer}$.
----------------------------------	--

Implemented in **decaf::util::zip::Adler32** (p. 440), and **decaf::util::zip::CRC32** (p. 1067).

6.116.3.5 `virtual void decaf::util::zip::Checksum::update (const unsigned char * buffer, int size, int offset, int length) [pure virtual]`

Updates the current checksum with the specified array of bytes.

Parameters

<i>buffer</i>	The buffer to read the updated bytes from.
<i>size</i>	The size of the passed buffer.
<i>offset</i>	The position in the buffer to start reading.
<i>length</i>	The amount of data to read from the byte buffer.

Exceptions

<i>NullPointerException</i>	if the passed buffer is NULL.
<i>IndexOutOfBoundsException</i>	if $\text{offset} + \text{length} > \text{size of the buffer}$.

Implemented in **decaf::util::zip::Adler32** (p. 441), and **decaf::util::zip::CRC32** (p. 1067).

6.116.3.6 `virtual void decaf::util::zip::Checksum::update (int byte) [pure virtual]`

Updates the current checksum with the specified byte value.

Parameters

<i>byte</i>	The byte value to update the current Checksum (p. 810) with (0..255).
-------------	--

Implemented in **decaf::util::zip::Adler32** (p. 441), and **decaf::util::zip::CRC32** (p. 1068).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/Checksum.h

6.117 decaf::lang::exceptions::ClassCastException Class Reference

```
#include <src/main/decaf/lang/exceptions/ClassCastException.h>
```

Inheritance diagram for decaf::lang::exceptions::ClassCastException:

Public Member Functions

- **ClassCastException** () throw ()
Default Constructor.
- **ClassCastException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1279).*
- **ClassCastException** (const **ClassCastException** &ex) throw ()
Copy Constructor.
- **ClassCastException** (const std::exception *cause) throw ()
Constructor.
- **ClassCastException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ClassCastException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ClassCastException** * clone () const
Clones this exception.
- virtual ~**ClassCastException** () throw ()

6.117.1 Constructor & Destructor Documentation

6.117.1.1 decaf::lang::exceptions::ClassCastException::ClassCastException ()
throw () [inline]

Default Constructor.

6.117.1.2 decaf::lang::exceptions::ClassCastException::ClassCastException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1279).

Parameters

<i>ex</i>	The Exception (p. 1279) whose data is to be copied into this one.
-----------	--

6.117.1.3 **decaf::lang::exceptions::ClassCastException::ClassCastException (**
const ClassCastException & *ex*) throw () `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	The Exception (p. 1279) whose data is to be copied into this one.
-----------	--

6.117.1.4 **decaf::lang::exceptions::ClassCastException::ClassCastException (**
const std::exception * *cause*) throw () `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer (p.2083) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.117.1.5 **decaf::lang::exceptions::ClassCastException::ClassCastException**
(const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()
`[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.117.1.6 **decaf::lang::exceptions::ClassCastException::ClassCastException (**
const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.117.1.7 `virtual decaf::lang::exceptions::ClassCastException-
::~ClassCastException () throw () [inline,
virtual]`

6.117.2 Member Function Documentation

6.117.2.1 `virtual ClassCastException* decaf::lang::exceptions-
::ClassCastException::clone () const [inline,
virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1279) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1282).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**ClassCastException.h**

6.118 cms::Closeable Class Reference

Interface for a class that implements the close method.

```
#include <src/main/cms/Closeable.h>
```

Inheritance diagram for cms::Closeable:

Public Member Functions

- virtual **~Closeable** () throw ()
- virtual void **close** ()=0

Closes this object and deallocates the appropriate resources.

6.118.1 Detailed Description

Interface for a class that implements the close method.

A class that implements this interface should release all resources upon the close call and should throw an exception from any methods that require those resources after they have been closed.

Since

1.0

6.118.2 Constructor & Destructor Documentation

6.118.2.1 `virtual cms::Closeable::~~Closeable () throw ()` [virtual]

6.118.3 Member Function Documentation

6.118.3.1 `virtual void cms::Closeable::close ()` [pure virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>CMSException</i> (p. 826)	- If an error occurs while the resource is being closed.
--	--

Implemented in `activemq::core::ActiveMQConnection` (p. 195), `activemq::core::ActiveMQSession` (p. 338), `cms::Session` (p. 2365), `activemq::core::ActiveMQProducer` (p. 310), `activemq::core::ActiveMQConsumer` (p. 237), `activemq::cmsutil::PooledSession` (p. 2095), `activemq::core::ActiveMQQueueBrowser` (p. 327), `cms::Connection` (p. 935), `activemq::commands::ActiveMQTempDestination` (p. 380), `activemq::cmsutil::CachedConsumer` (p. 736), and `activemq::cmsutil::CachedProducer` (p. 740).

The documentation for this class was generated from the following file:

- `src/main/cms/Closeable.h`

6.119 decaf::io::Closeable Class Reference

Interface for a class that implements the close method.

```
#include <src/main/decaf/io/Closeable.h>
```

Inheritance diagram for `decaf::io::Closeable`:

Public Member Functions

- virtual `~Closeable()`
- virtual void `close()`=0

Closes this object and deallocates the appropriate resources.

6.119.1 Detailed Description

Interface for a class that implements the close method.

6.119.2 Constructor & Destructor Documentation

6.119.2.1 virtual `decaf::io::Closeable::~~Closeable()` [inline, virtual]

6.119.3 Member Function Documentation

6.119.3.1 virtual void `decaf::io::Closeable::close()` [pure virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i> (p. 1545)	if an error occurs while closing.
--	-----------------------------------

Implemented in `decaf::net::Socket` (p. 2458), `activemq::transport::IOTransport` (p. 1551), `activemq::transport::mock::MockTransport` (p. 1951), `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2062), `activemq::transport::TransportFilter` (p. 2802), `activemq::transport::failover::FailoverTransport` (p. 1308), `decaf::util::zip::InflaterInputStream` (p. 1461), `decaf::util::zip::DeflaterOutputStream` (p. 1192), `activemq::transport::tcp::TcpTransport` (p. 2694), `decaf::util::logging::StreamHandler` (p. 2604), `decaf::io::FilterOutputStream` (p. 1342), `activemq::transport::correlator::ResponseCorrelator` (p. 2304), `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2020), `decaf::io::BufferedInputStream` (p. 592), `decaf::io::BlockingByteArrayInputStream` (p. 537), `decaf::io::FilterInputStream` (p. 1337), `decaf::internal::net::tcp::TcpSocketInputStream` (p. 2690), `activemq::transport::inactivity::InactivityMonitor` (p. 1427), `decaf::io::InputStreamReader` (p. 1476), `decaf::io::OutputStreamWriter` (p. 2075), `decaf::util::logging::ConsoleHandler` (p. 991), `decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream` (p. 2042), `decaf::io::InputStream` (p. 1466), `decaf::io::OutputStream` (p. 2068), `decaf::internal::net::tcp::TcpSocketOutputStream` (p. 2692), `decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream` (p. 2044), `decaf::internal::io::StandardErrorOutputStream` (p. 2529), and `decaf::internal::io::StandardOutputStream` (p. 2533).

6.120 activemq::transport::failover::CloseTransportsTask Class Reference

```
#include <src/main/activemq/transport/failover/Close-
TransportsTask.h>
```

Inheritance diagram for activemq::transport::failover::CloseTransportsTask:

Public Member Functions

- **CloseTransportsTask** ()
- virtual **~CloseTransportsTask** ()
- void **add** (const **Pointer**< **Transport** > &transport)
*Add a new **Transport** (p. 2790) to close.*
- virtual bool **isPending** () const
This Task is pending if there are transports in the Queue that need to be closed.
- virtual bool **iterate** ()
Return true until all transports have been closed and removed from the queue.

6.120.1 Constructor & Destructor Documentation

6.120.1.1 **activemq::transport::failover::CloseTransportsTask::CloseTransportsTask** ()

6.120.1.2 virtual **activemq::transport::failover::CloseTransportsTask::~~CloseTransportsTask** () [virtual]

6.120.2 Member Function Documentation

6.120.2.1 void **activemq::transport::failover::CloseTransportsTask::add** (const **Pointer**< **Transport** > & *transport*)

Add a new **Transport** (p. 2790) to close.

6.120.2.2 virtual bool **activemq::transport::failover::CloseTransportsTask::isPending** () const [virtual]

This Task is pending if there are transports in the Queue that need to be closed.

Returns

true if there is a transport in the queue that needs closed.

Implements **activemq::threads::CompositeTask** (p. 893).

6.120.2.3 `virtual bool activemq::transport::failover::CloseTransportsTask::iterate () [virtual]`

Return true until all transports have been closed and removed from the queue.

Implements **activemq::threads::Task** (p. 2676).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/CloseTransportsTask.h`

6.121 activemq::cmsutil::CmsAccessor Class Reference

Base class for **activemq.cmsutil.CmsTemplate** (p. 836) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 955) to operate on.

```
#include <src/main/activemq/cmsutil/CmsAccessor.h>
```

Inheritance diagram for **activemq::cmsutil::CmsAccessor**:

Public Member Functions

- **CmsAccessor** ()
- virtual **~CmsAccessor** ()
- virtual **ResourceLifecycleManager** * **getResourceLifecycleManager** ()
- virtual const **ResourceLifecycleManager** * **getResourceLifecycleManager** () const
- virtual void **setConnectionFactory** (**cms::ConnectionFactory** *connectionFactory)
- *Set the ConnectionFactory to use for obtaining CMS Connections.*
- virtual const **cms::ConnectionFactory** * **getConnectionFactory** () const
- *Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.*
- virtual **cms::ConnectionFactory** * **getConnectionFactory** ()
- *Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.*
- virtual void **setSessionAcknowledgeMode** (**cms::Session::AcknowledgeMode** sessionAcknowledgeMode)
- *Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.*

- virtual **cms::Session::AcknowledgeMode** getSessionAcknowledgeMode () const

Return the acknowledgment mode for CMS sessions.

Protected Member Functions

- **CmsAccessor** (const **CmsAccessor** &)
- **CmsAccessor** & **operator=** (const **CmsAccessor** &)
- virtual void **init** ()
Initializes this object and prepares it for use.
- virtual void **destroy** ()
Shuts down this object and destroys any allocated resources.
- virtual **cms::Connection** * **createConnection** ()
Create a CMS Connection via this template's ConnectionFactory.
- virtual **cms::Session** * **createSession** (**cms::Connection** *con)
Create a CMS Session for the given Connection.
- virtual void **checkConnectionFactory** ()
Verifies that the connection factory is valid.

6.121.1 Detailed Description

Base class for **activemq.cmsutil.CmsTemplate** (p. 836) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 955) to operate on.

The subclass **activemq.cmsutil.CmsDestinationAccessor** (p. 823) adds further, destination-related properties.

Not intended to be used directly.

activemq.cmsutil.CmsDestinationAccessor (p. 823)
activemq.cmsutil.CmsTemplate (p. 836)

6.121.2 Constructor & Destructor Documentation

- 6.121.2.1 **activemq::cmsutil::CmsAccessor::CmsAccessor** (const **CmsAccessor** &) [protected]
- 6.121.2.2 **activemq::cmsutil::CmsAccessor::CmsAccessor** ()
- 6.121.2.3 virtual **activemq::cmsutil::CmsAccessor::~~CmsAccessor** () [virtual]

6.121.3 Member Function Documentation

6.121.3.1 `virtual void activemq::cmsutil::CmsAccessor::checkConnectionFactory ()` [protected, virtual]

Verifies that the connection factory is valid.

Exceptions

<i>IllegalStateException</i>	if this object has not been initialized.
------------------------------	--

6.121.3.2 `virtual cms::Connection* activemq::cmsutil::CmsAccessor::createConnection ()` [protected, virtual]

Create a CMS Connection via this template's ConnectionFactory.

Returns

the new CMS Connection

Exceptions

<i>CMSEException</i>	if thrown by CMS API methods
<i>IllegalStateException</i>	if this object has not been initialized.

6.121.3.3 `virtual cms::Session* activemq::cmsutil::CmsAccessor::createSession (cms::Connection * con)` [protected, virtual]

Create a CMS Session for the given Connection.

Parameters

<i>con</i>	The CMS Connection to create a Session for
------------	--

Returns

the new CMS Session

Exceptions

<i>CMSEException</i>	if thrown by CMS API methods
<i>IllegalStateException</i>	if this object has not been initialized.

6.121.3.4 `virtual void activemq::cmsutil::CmsAccessor::destroy () [inline, protected, virtual]`

Shuts down this object and destroys any allocated resources.

Exceptions

<i>CMSException</i>	if an error occurs during destruction.
<i>IllegalStateException</i>	if this object has already been destroyed.

Reimplemented in **activemq::cmsutil::CmsTemplate** (p. 840), and **activemq::cmsutil::CmsDestinationAccessor** (p. 824).

6.121.3.5 `virtual const cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () const [inline, virtual]`

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.121.3.6 `virtual cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () [inline, virtual]`

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.121.3.7 `virtual ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () [inline, virtual]`

6.121.3.8 `virtual const ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () const [inline, virtual]`

6.121.3.9 `virtual cms::Session::AcknowledgeMode activemq::cmsutil::CmsAccessor::getSessionAcknowledgeMode () const [inline, virtual]`

Return the acknowledgment mode for CMS sessions.

Returns

the acknowledgment mode applied by this accessor

6.121.3.10 `virtual void activemq::cmsutil::CmsAccessor::init () [protected, virtual]`

Initializes this object and prepares it for use.

This should be called before any other methods are called. This version does nothing.

Exceptions

<i>CMSException</i>	if an error occurs during initialization.
<i>IllegalStateException</i>	if this object has already been initialized.

Reimplemented in **activemq::cmsutil::CmsTemplate** (p.843), and **activemq::cmsutil::CmsDestinationAccessor** (p.825).

6.121.3.11 **CmsAccessor& activemq::cmsutil::CmsAccessor::operator= (const CmsAccessor &)** [protected]

6.121.3.12 **virtual void activemq::cmsutil::CmsAccessor::setConnectionFactory (cms::ConnectionFactory * *connectionFactory*)** [inline, virtual]

Set the ConnectionFactory to use for obtaining CMS Connections.

6.121.3.13 **virtual void activemq::cmsutil::CmsAccessor::setSessionAcknowledgeMode (cms::Session::AcknowledgeMode *sessionAcknowledgeMode*)** [inline, virtual]

Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.

Default is AUTO_ACKNOWLEDGE.

Parameters

<i>session-AcknowledgeMode</i>	The acknowledgment mode to assign to the Session.
--------------------------------	---

The documentation for this class was generated from the following file:

6.123 cms::CMSException Class Reference

CMS API Exception that is the base for all exceptions thrown from CMS classes.

```
#include <src/main/cms/CMSException.h>
```

Inheritance diagram for `cms::CMSException`:

Public Member Functions

- `CMSException ()`
- `CMSException (const CMSException &ex)`
- `CMSException (const std::string &message)`
- `CMSException (const std::string &message, const std::exception *cause)`
- `CMSException (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace)`
- `virtual ~CMSException () throw ()`
- `virtual std::string getMessage () const`
Gets the cause of the error.
- `virtual const std::exception * getCause () const`
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- `virtual std::vector< std::pair < std::string, int > > getStackTrace () const`
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- `virtual void setMark (const char *file, const int lineNumber)`
Adds a file/line number to the stack trace.
- `virtual void printStackTrace () const`
Prints the stack trace to std::err.
- `virtual void printStackTrace (std::ostream &stream) const`
Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const
Gets the stack trace as one contiguous string.
- virtual const char * **what** () const throw ()
*Overloads the std::exception **what()** (p. 829) function to return the cause of the exception.*

6.123.1 Detailed Description

CMS API Exception that is the base for all exceptions thrown from CMS classes.

This class represents an error that has occurred in CMS, providers can wrap provider specific exceptions in this class by setting the cause to an instance of a provider specific exception provided it can be cast to an std::exception.

Since the contained cause exception is of type std::exception and the C++ exception class has no clone or copy method defined the contained exception can only be owned by one instance of an **CMSException** (p. 826). To that end the class hands off the exception to each successive copy so care must be taken when handling **CMSException** (p. 826) instances.

Since

1.0

6.123.2 Constructor & Destructor Documentation

- 6.123.2.1 **cms::CMSException::CMSException** ()
- 6.123.2.2 **cms::CMSException::CMSException** (const **CMSException** & *ex*)
- 6.123.2.3 **cms::CMSException::CMSException** (const std::string & *message*)
- 6.123.2.4 **cms::CMSException::CMSException** (const std::string & *message*, const std::exception * *cause*)
- 6.123.2.5 **cms::CMSException::CMSException** (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*)
- 6.123.2.6 virtual **cms::CMSException::~~CMSException** () throw () [virtual]

6.123.3 Member Function Documentation

- 6.123.3.1 virtual const std::exception* **cms::CMSException::getCause** () const [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow

for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

6.123.3.2 `virtual std::string cms::CMSException::getMessage () const` [virtual]

Gets the cause of the error.

Returns

string errors message

6.123.3.3 `virtual std::vector< std::pair< std::string, int> > cms::CMSException::getStackTrace () const` [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

6.123.3.4 `virtual std::string cms::CMSException::getStackTraceString () const` [virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

6.123.3.5 `virtual void cms::CMSException::printStackTrace () const` [virtual]

Prints the stack trace to std::err.

6.123.3.6 `virtual void cms::CMSException::printStackTrace (std::ostream & stream) const` [virtual]

Prints the stack trace to the given output stream.

Parameters

<i>stream</i>	the target output stream.
---------------	---------------------------

6.123.3.7 virtual void **cms::CMSException::setMark** (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters

<i>file</i>	The name of the file calling this method (use <code>__FILE__</code>).
<i>lineNumber</i>	The line number in the calling file (use <code>__LINE__</code>).

6.123.3.8 virtual const char* **cms::CMSException::what** () const throw () [virtual]

Overloads the std::exception **what()** (p. 829) function to return the cause of the exception.

Returns

const char pointer to error message

6.125 cms::CMSProperties Class Reference

Interface for a Java-like properties object.

```
#include <src/main/cms/CMSProperties.h>
```

Inheritance diagram for `cms::CMSProperties`:

Public Member Functions

- virtual `~CMSProperties ()` throw `()`
- virtual `int size ()` const =0
Returns the current count of all the Properties that are currently stored in the - Properties object.
- virtual `bool isEmpty ()` const =0
Returns true if the properties object is empty.
- virtual `const char * getProperty (const std::string &name)` const =0
Looks up the value for the given property.
- virtual `std::string getProperty (const std::string &name, const std::string &defaultValue)` const =0
Looks up the value for the given property.
- virtual `void setProperty (const std::string &name, const std::string &value)`=0
Sets the value for a given property.
- virtual `bool hasProperty (const std::string &name)` const =0
Check to see if the Property exists in the set.
- virtual `std::string remove (const std::string &name)`=0
Removes the property with the given name.
- virtual `std::vector< std::string > propertyNames ()` const =0
Returns a vector containing all the names of the properties currently stored in the Properties object.
- virtual `std::vector< std::pair < std::string, std::string > > toArray ()` const =0
Method that serializes the contents of the property map to an array.
- virtual `void copy (const CMSProperties *source)`=0
Copies the contents of the given properties object to this one.
- virtual `CMSProperties * clone ()` const =0
Clones this object.
- virtual `void clear ()`=0
Clears all properties from the map.
- virtual `std::string toString ()` const =0
Formats the contents of the Properties Object into a string that can be logged, etc.

6.125.1 Detailed Description

Interface for a Java-like properties object.

This is essentially a map of key-value string pairs.

Since

1.1

6.125.2 Constructor & Destructor Documentation

6.125.2.1 `virtual cms::CMSProperties::~~CMSProperties () throw () [virtual]`

6.125.3 Member Function Documentation

6.125.3.1 `virtual void cms::CMSProperties::clear () [pure virtual]`

Clears all properties from the map.

Implemented in **activemq::util::ActiveMQProperties** (p. 317).

6.125.3.2 `virtual CMSProperties* cms::CMSProperties::clone () const [pure virtual]`

Clones this object.

Returns

a replica of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 317).

6.125.3.3 `virtual void cms::CMSProperties::copy (const CMSProperties * source) [pure virtual]`

Copies the contents of the given properties object to this one.

Parameters

<i>source</i>	The source properties object.
---------------	-------------------------------

6.125.3.4 `virtual const char* cms::CMSProperties::getProperty (const std::string & name) const [pure virtual]`

Looks up the value for the given property.

Parameters

<i>name</i>	The name of the property to be looked up.
-------------	---

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implemented in **activemq::util::ActiveMQProperties** (p. 318).

6.125.3.5 `virtual std::string cms::CMSProperties::getProperty (const std::string & name, const std::string & defaultValue) const` [pure virtual]

Looks up the value for the given property.

Parameters

<i>name</i>	the name of the property to be looked up.
<i>defaultValue</i>	The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

Implemented in **activemq::util::ActiveMQProperties** (p.318).

6.125.3.6 `virtual bool cms::CMSProperties::hasProperty (const std::string & name) const` [pure virtual]

Check to see if the Property exists in the set.

Parameters

<i>name</i>	the name of the property to check
-------------	-----------------------------------

Returns

true if property exists, false otherwise.

Implemented in **activemq::util::ActiveMQProperties** (p.318).

6.125.3.7 `virtual bool cms::CMSProperties::isEmpty () const` [pure virtual]

Returns true if the properties object is empty.

Returns

true if empty

Implemented in **activemq::util::ActiveMQProperties** (p.319).

6.125.3.8 `virtual std::vector<std::string> cms::CMSProperties::propertyNames () const` [pure virtual]

Returns a vector containing all the names of the properties currently stored in the - Properties object.

Returns

an STL `std::vector<std::string>` with all the currently stored property names.

Implemented in **activemq::util::ActiveMQProperties** (p. 319).

6.125.3.9 `virtual std::string cms::CMSProperties::remove (const std::string & name)`
`[pure virtual]`

Removes the property with the given name.

If the property existed in the collection then it is removed and returned, otherwise an empty string is returned.

Parameters

<i>name</i>	the name of the property to be removed.
-------------	---

Returns

the value that was removed from the Properties, or empty string.

Implemented in **activemq::util::ActiveMQProperties** (p. 319).

6.125.3.10 `virtual void cms::CMSProperties::setProperty (const std::string & name,`
`const std::string & value) [pure virtual]`

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

<i>name</i>	The name of the value to be written.
<i>value</i>	The value to be written.

Implemented in **activemq::util::ActiveMQProperties** (p. 320).

6.125.3.11 `virtual int cms::CMSProperties::size () const` `[pure virtual]`

Returns the current count of all the Properties that are currently stored in the Properties object.

Returns

the number of properties currently stored.

Implemented in **activemq::util::ActiveMQProperties** (p. 320).

6.125.3.12 `virtual std::vector< std::pair< std::string, std::string > >
 cms::CMSProperties::toArray() const [pure virtual]`

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

Implemented in **activemq::util::ActiveMQProperties** (p. 320).

6.125.3.13 `virtual std::string cms::CMSProperties::toString() const [pure
 virtual]`

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns

string value of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 321).

The documentation for this class was generated from the following file:

- src/main/cms/**CMSProperties.h**

6.126 cms::CMSSecurityException Class Reference

This exception must be thrown when a provider rejects a user name/password submitted by a client.

```

- virtual ~**CMSSecurityException** () throw ()

6.126.1 Detailed Description

This exception must be thrown when a provider rejects a user name/password submitted by a client.

It may also be thrown for any case where a security restriction prevents a method from completing.

Since

1.3

6.127.1 Detailed Description

CmsTemplate (p. 836) simplifies performing synchronous CMS operations.

This class is intended to be for CMS what Spring's `JmsTemplate` is for JMS. Provided with a `CMS ConnectionFactory`, creates and manages all other CMS resources internally.

Before using **CmsTemplate** (p. 836) the user must first set the destination (either by name or by setting the destination object directly) and then call `init` to initialize the object for use.

CmsTemplate (p. 836) allows the user to get access to a `CMS Session` through a user-defined **SessionCallback** (p. 2377). Similarly, if the user wants direct access to a `CMS MessageProducer`, it can provide a **ProducerCallback** (p. 2179). As a convenience, the user can bypass having to provide callbacks altogether for sending messages, by calling one of the `send` methods.

6.127.2 Constructor & Destructor Documentation

6.127.2.1 `activemq::cmsutil::CmsTemplate::CmsTemplate ()`

6.127.2.2 `activemq::cmsutil::CmsTemplate::CmsTemplate (cms::ConnectionFactory * connectionFactory)`

6.127.2.3 `virtual activemq::cmsutil::CmsTemplate::~~CmsTemplate () throw ()`
`[virtual]`

6.127.3 Member Function Documentation

6.127.3.1 `void activemq::cmsutil::CmsTemplate::destroy ()` `[protected, virtual]`

Shuts down this object and destroys any allocated resources.

Exceptions

<i>CMSException</i>	if an error occurs during destruction.
<i>IllegalStateException</i>	if this object has already been destroyed.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 824).

6.127.3.2 `virtual void activemq::cmsutil::CmsTemplate::execute (SessionCallback * action)` `[virtual]`

Executes the given action within a CMS Session.

Parameters

<i>action</i>	the action to perform within a CMS Session
---------------	--

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.3 virtual void **activemq::cmsutil::CmsTemplate::execute** (**ProducerCallback** * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

<i>action</i>	the action to perform
---------------	-----------------------

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.4 virtual void **activemq::cmsutil::CmsTemplate::execute** (**cms::Destination** * *dest*, **ProducerCallback** * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

<i>dest</i>	the destination to send messages to
<i>action</i>	the action to perform

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.5 virtual void **activemq::cmsutil::CmsTemplate::execute** (const std::string & *destinationName*, **ProducerCallback** * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

<i>destination-Name</i>	the name of the destination to send messages to (to internally be resolved to an actual destination)
<i>action</i>	the action to perform

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.6 `virtual const cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () const [inline, virtual]`

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Const version of this method.

6.127.3.7 `virtual cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () [inline, virtual]`

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Non-const version of this method.

6.127.3.8 `virtual const std::string activemq::cmsutil::CmsTemplate::getDefaultDestinationName () const [inline, virtual]`

Gets the name of the default destination to be used for send/receive operations.

The destination type (topic/queue) is determined by the `pubSubDomain` property.

Returns

the default name of the destination for send/receive operations.

6.127.3.9 `virtual int activemq::cmsutil::CmsTemplate::getDeliveryMode () const [inline, virtual]`

Return the delivery mode to use when sending a message.

6.127.3.10 `virtual int activemq::cmsutil::CmsTemplate::getPriority () const [inline, virtual]`

Return the priority of a message when sending.

6.127.3.11 `virtual long long activemq::cmsutil::CmsTemplate::getReceiveTimeout () const [inline, virtual]`

6.127.3.12 `virtual long long activemq::cmsutil::CmsTemplate::getTimeToLive () const [inline, virtual]`

Return the time-to-live of the message when sending.

6.127.3.13 `void activemq::cmsutil::CmsTemplate::init () [protected, virtual]`

Initializes this object and prepares it for use.

This should be called before any other methods are called. This version does nothing.

Exceptions

<i>CMSException</i>	if an error occurs during initialization.
<i>IllegalStateException</i>	if this object has already been initialized.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 825).

6.127.3.14 `virtual bool activemq::cmsutil::CmsTemplate::isExplicitQosEnabled () const [inline, virtual]`

If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.

Otherwise, the default values, that may be set administratively, will be used.

Returns

true if overriding default values of QOS parameters (deliveryMode, priority, and timeToLive)

See also

setDeliveryMode (p. 848)

setPriority (p. 849)

setTimeToLive (p. 850)

6.127.3.15 `virtual bool activemq::cmsutil::CmsTemplate::isMessageIdEnabled () const [inline, virtual]`

6.127.3.16 `virtual bool activemq::cmsutil::CmsTemplate::is-MessageTimestampEnabled () const [inline, virtual]`

6.127.3.17 `virtual bool activemq::cmsutil::CmsTemplate::isNoLocal () const`
`[inline, virtual]`

6.127.3.18 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive ()`
`[virtual]`

Performs a synchronous read from the default destination.

Returns

the message

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs
--	---------------------------

6.127.3.19 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (cms::Destination * destination)` `[virtual]`

Performs a synchronous read from the specified destination.

Parameters

<i>destination</i>	the destination to receive on
--------------------	-------------------------------

Returns

the message

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs
--	---------------------------

6.127.3.20 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (const std::string & destinationName)` `[virtual]`

Performs a synchronous read from the specified destination.

Parameters

<i>destination-Name</i>	the name of the destination to receive on (will be resolved to destination internally).
-------------------------	---

Returns

the message

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs
--	---------------------------

6.127.3.21 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & selector)`
[virtual]

Performs a synchronous read consuming only messages identified by the given selector.

Parameters

<i>selector</i>	the selector expression.
-----------------	--------------------------

Returns

the message

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs
--	---------------------------

6.127.3.22 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (cms::Destination * destination, const std::string & selector)`
[virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

<i>destination</i>	the destination to receive on.
<i>selector</i>	the selector expression.

Returns

the message

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs
--	---------------------------

6.127.3.23 **virtual cms::Message* activemq::cmsutil::CmsTemplate::receive-Selected (const std::string & *destinationName*, const std::string & *selector*)**
[virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

<i>destination-Name</i>	the name of the destination to receive on (will be resolved to destination internally).
<i>selector</i>	the selector expression.

Returns

the message

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs
--	---------------------------

6.127.3.24 **virtual void activemq::cmsutil::CmsTemplate::send (MessageCreator * *messageCreator*)** [virtual]

Convenience method for sending a message to the default destination.

Parameters

<i>message-Creator</i>	Responsible for creating the message to be sent
------------------------	---

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.25 `virtual void activemq::cmsutil::CmsTemplate::send (cms::Destination *
dest, MessageCreator * messageCreator) [virtual]`

Convenience method for sending a message to the specified destination.

Parameters

<i>dest</i>	The destination to send to
<i>message-Creator</i>	Responsible for creating the message to be sent

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.26 `virtual void activemq::cmsutil::CmsTemplate::send (const std::string &
destinationName, MessageCreator * messageCreator) [virtual]`

Convenience method for sending a message to the specified destination.

Parameters

<i>destination-Name</i>	The name of the destination to send to.
<i>message-Creator</i>	Responsible for creating the message to be sent

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.127.3.27 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestination (cms::Destination * defaultDestination) [inline, virtual]`

Sets the destination object to be used by default for send/receive operations.

If no default destination is provided, the `defaultDestinationName` property is used to resolve this default destination for send/receive operations.

Parameters

<i>default-Destination</i>	the default destination
----------------------------	-------------------------

6.127.3.28 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestinationName (const std::string & defaultDestinationName) [inline, virtual]`

Sets the name of the default destination to be used from send/receive operations.

Calling this method will set the `defaultDestination` property to NULL. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Parameters

<i>default-Destination-Name</i>	the name of the destination for send/receive to by default.
---------------------------------	---

6.127.3.29 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryMode (int deliveryMode) [inline, virtual]`

Set the delivery mode to use when sending a message.

Default is the Message default: "PERSISTENT".

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

<i>delivery-Mode</i>	the delivery mode to use
----------------------	--------------------------

See also

isExplicitQosEnabled (p. 843)

6.127.3.30 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryPersistent (bool deliveryPersistent) [inline, virtual]`

Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").

This will set the delivery mode accordingly, to either "PERSISTENT" or "NON_PERSISTENT".

Default it "true" aka delivery mode "PERSISTENT".

See also

setDeliveryMode(int) (p. 848)

6.127.3.31 `virtual void activemq::cmsutil::CmsTemplate::setExplicitQosEnabled (bool explicitQosEnabled) [inline, virtual]`

Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

See also

setDeliveryMode (p. 848)

setPriority (p. 849)

setTimeToLive (p. 850)

6.127.3.32 `virtual void activemq::cmsutil::CmsTemplate::setMessageIdEnabled (bool messageIdEnabled) [inline, virtual]`

6.127.3.33 `virtual void activemq::cmsutil::CmsTemplate::setMessageTimestampEnabled (bool messageTimestampEnabled) [inline, virtual]`

6.127.3.34 `virtual void activemq::cmsutil::CmsTemplate::setNoLocal (bool noLocal) [inline, virtual]`

6.127.3.35 `virtual void activemq::cmsutil::CmsTemplate::setPriority (int priority) [inline, virtual]`

Set the priority of a message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

See also

isExplicitQosEnabled (p. 843)

6.127.3.36 `virtual void activemq::cmsutil::CmsTemplate::setPubSubDomain (bool pubSubDomain) [inline, virtual]`

Indicates whether the default destination is a topic (true) or a queue (false).

Calling this method will set the `defaultDestination` property to NULL.

Parameters

<i>pubSubDomain</i>	indicates whether to use pub-sub messaging (topics).
---------------------	--

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 825).

References `activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain()`.

6.127.3.37 `virtual void activemq::cmsutil::CmsTemplate::setReceiveTimeout (long long receiveTimeout)` `[inline, virtual]`

6.127.3.38 `virtual void activemq::cmsutil::CmsTemplate::setTimeToLive (long long timeToLive)` `[inline, virtual]`

Set the time-to-live of the message when sending.

Since a default value may be defined administratively, this is only used when "isExplicit-QosEnabled" equals "true".

Parameters

<i>timeToLive</i>	the message's lifetime (in milliseconds)
-------------------	--

- virtual bool **retainAll** (const **Collection**< E > &collection)=0
Retains only the elements in this collection that are contained in the specified collection (optional operation).
- virtual int **size** () const =0
Returns the number of elements in this collection.
- virtual std::vector< E > **toArray** () const =0
Returns an array containing all of the elements in this collection.

6.129.1 Detailed Description

template<typename E>class decaf::util::Collection< E >

The root interface in the collection hierarchy.

A collection represents a group of objects, known as its elements. Some collections allow duplicate elements and others do not. Some are ordered and others unordered. This interface is typically used to pass collections around and manipulate them where maximum generality is desired.

All general-purpose **Collection** (p. 851) implementation classes (which typically implement **Collection** (p. 851) indirectly through one of its subinterfaces) should provide two "standard" constructors: a void (no arguments) constructor, which creates an empty collection, and a constructor with a single argument of type **Collection** (p. 851), which creates a new collection with the same elements as its argument. In effect, the latter constructor allows the user to copy any collection, producing an equivalent collection

of the desired implementation type. There is no way to enforce this convention (as interfaces cannot contain constructors) but all of the general-purpose **Collection** (p. 851) implementations in the Decaf platform libraries comply.

The "destructive" methods contained in this interface, that is, the methods that modify the collection on which they operate, are specified to throw `UnsupportedOperationException` if this collection does not support the operation. If this is the case, these methods may, but are not required to, throw an `UnsupportedOperationException` if the invocation would have no effect on the collection. For example, invoking the `addAll(-Collection)` method on an unmodifiable collection may, but is not required to, throw the exception if the collection to be added is empty.

Many methods in Collections Framework interfaces are defined in terms of the `equals` method. For example, the specification for the `contains(Object o)` method says: "returns true if and only if this collection contains at least one element `e` such that (`o==null ? e==null : o.equals(e)`)."

Since

1.0

6.129.2 Constructor & Destructor Documentation

6.129.2.1 `template<typename E> virtual decaf::util::Collection< E >::~Collection ()`
`[inline, virtual]`

6.129.3 Member Function Documentation

6.129.3.1 `template<typename E> virtual bool decaf::util::Collection< E >::add (const E & value)` `[pure virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::StlList< E >** (p. 2542), **decaf::util::AbstractList< E >** (p. 125), **decaf::util::AbstractList< Pointer< Transport > >** (p. 125), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 125), **decaf::util::AbstractList< CompositeTask * >** (p. 125), **decaf::util::AbstractList< URI >** (p. 125), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 125), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 125), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 125), **decaf::util::AbstractList< Pointer< Command > >** (p. 125), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 125), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 125), **decaf::util::AbstractList< cms::Destination * >** (p. 125), **decaf::util::AbstractList< cms::Session * >** (p. 125), **decaf::util::AbstractList< cms::Connection * >** (p. 125), **decaf::util::PriorityQueue< E >** (p. 2165), **decaf::util::StlSet< E >** (p. 2577), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2577), **decaf::util::StlSet< Resource * >** (p. 2577), **decaf::util::ArrayList< E >** (p. 448), **decaf::util::LinkedList< E >** (p. 1639), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1639), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1639), **decaf::util::LinkedList< CompositeTask * >** (p. 1639), **decaf::util::LinkedList< URI >** (p. 1639), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1639), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1639), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1639), **decaf::util::LinkedList< Pointer< Command > >** (p. 1639), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1639), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1639), **decaf::util::LinkedList< cms::Destination * >** (p. 1639), **decaf::util::LinkedList< cms::Session * >** (p. 1639), **decaf::util::LinkedList< cms::Connection * >** (p. 1639), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1033), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1033), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1054), and **decaf::util::AbstractQueue< E >** (p. 139).

6.129.3.2 `template<typename E> virtual bool decaf::util::Collection< E >::addAll (const Collection< E > & collection) [pure virtual]`

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are added to this one.
-------------------	--

Returns

true if this collection changed as a result of the call

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of an element prevents it from being added to this collection
<i>IllegalStateException</i>	if an element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::StlList< E >** (p. 2543), **decaf::util::ArrayList< E >** (p. 450), **decaf::util::AbstractCollection< E >** (p. 110), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 110), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 110), **decaf::util::AbstractCollection< Resource * >** (p. 110), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 110), **decaf::util::AbstractCollection< CompositeTask * >** (p. 110), **decaf::util::AbstractCollection< URI >** (p. 110), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 110), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 110), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 110), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 110), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 110), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 110), **decaf::util::AbstractCollection< cms::Destination * >** (p. 110), **decaf::util::AbstractCollection< cms::Session * >** (p. 110), **decaf::util::AbstractCollection< cms::Connection * >** (p. 110), **decaf::util::LinkedList< E >** (p. 1641), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1641), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1641), **decaf::util::LinkedList< CompositeTask * >** (p. 1641), **decaf::util::LinkedList< URI >** (p. 1641), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1641), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1641), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1641), **decaf::util::LinkedList< Pointer< Command > >** (p. 1641), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1641), **decaf::util::LinkedList<**

cms::MessageProducer * > (p. 1641), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1641), **decaf::util::LinkedList**< **cms::Session** * > (p. 1641), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1641), **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 1034), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 1034), **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1055), and **decaf::util::AbstractQueue**< **E** > (p. 140).

6.129.3.3 `template<typename E> virtual void decaf::util::Collection< E >::clear ()`
`[pure virtual]`

Removes all of the elements from this collection (optional operation).

This collection will be empty after this method returns unless it throws an exception.

Exceptions

<i>Unsupported- OperationException</i>	if this is an unmodifiable collection.
--	--

Implemented in **decaf::util::AbstractList**< **E** > (p. 127), **decaf::util::AbstractList**< **Pointer**< **Transport** > > (p. 127), **decaf::util::AbstractList**< **cms::MessageConsumer** * > (p. 127), **decaf::util::AbstractList**< **CompositeTask** * > (p. 127), **decaf::util::AbstractList**< **URI** > (p. 127), **decaf::util::AbstractList**< **Pointer**< **MessageDispatch** > > (p. 127), **decaf::util::AbstractList**< **Pointer**< **DestinationInfo** > > (p. 127), **decaf::util::AbstractList**< **PrimitiveValueNode** > (p. 127), **decaf::util::AbstractList**< **Pointer**< **Command** > > (p. 127), **decaf::util::AbstractList**< **Pointer**< **BackupTransport** > > (p. 127), **decaf::util::AbstractList**< **cms::MessageProducer** * > (p. 127), **decaf::util::AbstractList**< **cms::Destination** * > (p. 127), **decaf::util::AbstractList**< **cms::Session** * > (p. 127), **decaf::util::AbstractList**< **cms::Connection** * > (p. 127), **decaf::util::StlList**< **E** > (p. 2545), **decaf::util::PriorityQueue**< **E** > (p. 2166), **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2658), **decaf::util::concurrent::LinkedBlockingQueue**< **E** > (p. 1624), **decaf::util::LinkedList**< **E** > (p. 1644), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1644), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1644), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1644), **decaf::util::LinkedList**< **URI** > (p. 1644), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1644), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1644), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1644), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1644), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1644), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1644), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1644), **decaf::util::LinkedList**< **cms::Session** * > (p. 1644), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1644), **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 1036), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 1036), **decaf::util::StlSet**< **E** > (p. 2578), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 2578), **decaf::util::StlSet**< **Resource** * > (p. 2578), **decaf::util::ArrayList**< **E** > (p. 452), **decaf::util::AbstractQueue**< **E** > (p. 141), **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1056), **decaf::util::AbstractCollection**< **E** > (p. 111), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 111), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > >

6.129.3.4 `template<typename E> virtual bool decaf::util::Collection< E >::contains (const E & value) const [pure virtual]`

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element *e* such that `(value == NULL ? e == NULL : value == e)`.

Parameters

<i>value</i>	The value to check for presence in the collection.
--------------	--

Returns

true if there is at least one of the elements in the collection

Exceptions

<i>NullPointerException</i>	if the Collection (p.851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	--

Implemented in **decaf::util::StlList< E >** (p. 2545), **decaf::util::ArrayList< E >** (p. 452), **decaf::util::LinkedList< E >** (p. 1644), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1644), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1644), **decaf::util::LinkedList< CompositeTask * >** (p. 1644), **decaf::util::LinkedList< URI >** (p. 1644), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1644), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1644), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1644), **decaf::util::LinkedList< Pointer< Command > >** (p. 1644), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1644), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1644), **decaf::util::LinkedList< cms::Destination * >** (p. 1644), **decaf::util::LinkedList< cms::Session * >** (p. 1644), **decaf::util::LinkedList< cms::Connection * >** (p. 1644), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1037), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1037), **decaf::util::StlSet< E >** (p. 2578), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2578), **decaf::util::StlSet< Resource * >** (p. 2578), **decaf::util::AbstractCollection< E >** (p. 112), **decaf::util::AbstractCollection<**

Referenced by **decaf::util::AbstractSet**< **Resource** * >::**removeAll**(), **decaf::util::AbstractCollection**< **cms::Connection** * >::**removeAll**(), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * >::**removeAll**(), **decaf::util::AbstractCollection**< **cms::Connection** * >::**retainAll**(), and **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * >::**retainAll**().

6.129.3.5 **template**<typename **E**> **virtual bool decaf::util::Collection**< **E** >::**containsAll** (**const Collection**< **E** > & *collection*) **const** [pure virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) to compare to this one.
-------------------	--

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

Implemented in **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2658), **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 1037), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 1037), **decaf::util::AbstractCollection**< **E** > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 113), **decaf::util::AbstractCollection**< **Resource** * > (p. 113), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 113), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 113), **decaf::util::AbstractCollection**< **URI** > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 113), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 113), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 113), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 113), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 113),

decaf::util::AbstractCollection< **cms::Connection** * > (p. 113), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1057).

6.129.3.6 `template<typename E> virtual void decaf::util::Collection< E >::copy (const Collection< E > & collection) [pure virtual]`

Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).

Parameters

<i>collection</i>	The collection to mirror.
-------------------	---------------------------

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>IllegalStateException</i>	if the elements cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::StlList**< **E** > (p. 2546), **decaf::util::LinkedList**< **E** > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1645), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1645), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1645), **decaf::util::LinkedList**< **URI** > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1645), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1645), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1645), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1645), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1645), **decaf::util::LinkedList**< **cms::Session** * > (p. 1645), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1645), **decaf::util::StlSet**< **E** > (p. 2579), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 2579), **decaf::util::StlSet**< **Resource** * > (p. 2579), **decaf::util::AbstractCollection**< **E** > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 113), **decaf::util::AbstractCollection**< **Resource** * > (p. 113), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 113), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 113), **decaf::util::AbstractCollection**< **URI** > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 113), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 113), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 113), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 113), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 113), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 113), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 113), **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 1038), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 1038), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 1057).

```
6.129.3.7  template<typename E> virtual bool decaf::util::Collection< E >::equals (
            const Collection< E > & value ) const    [pure virtual]
```

Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.

Returns

true if the Collections contain the same elements.

Implemented in **decaf::util::StlList< E >** (p.2546), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p.1038), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p.1038), **decaf::util::concurrent::SynchronousQueue< E >** (p.2660), **decaf::util::StlSet< E >** (p.2580), **decaf::util::StlSet< Pointer< Synchronization > >** (p.2580), **decaf::util::StlSet< Resource * >** (p.2580), **decaf::util::AbstractCollection< E >** (p.114), **decaf::util::AbstractCollection< Pointer< Transport > >** (p.114), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p.114), **decaf::util::AbstractCollection< Resource * >** (p.114), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p.114), **decaf::util::AbstractCollection< CompositeTask * >** (p.114), **decaf::util::AbstractCollection< URI >** (p.114), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p.114), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p.114), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p.114), **decaf::util::AbstractCollection< Pointer< Command > >** (p.114), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p.114), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p.114), **decaf::util::AbstractCollection< cms::Destination * >** (p.114), **decaf::util::AbstractCollection< cms::Session * >** (p.114), **decaf::util::AbstractCollection< cms::Connection * >** (p.114), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p.1058).

```
6.129.3.8  template<typename E> virtual bool decaf::util::Collection< E >::isEmpty ( )
            const    [pure virtual]
```

Returns

true if this collection contains no elements.

Implemented in **decaf::util::StlList< E >** (p.2548), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p.1040), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p.1040), **decaf::util::concurrent::SynchronousQueue< E >** (p.2660), **decaf::util::LinkedList< E >** (p.1648), **decaf::util::LinkedList< Pointer< Transport > >** (p.1648), **decaf::util::LinkedList< cms::MessageConsumer * >** (p.1648), **decaf::util::LinkedList< CompositeTask * >** (p.1648), **decaf::util::LinkedList< URI >** (p.1648), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p.1648), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p.1648), **decaf::util::LinkedList< PrimitiveValueNode >** (p.1648), **decaf::util::LinkedList< Pointer< Command > >** (p.1648), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p.1648), **decaf::util::LinkedList<**

Referenced by decaf::util::AbstractList< cms::Connection * >::addAll(), decaf::util::StlList< E >::addAll(), decaf::util::concurrent::SynchronousQueue< E >::containsAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll().

6.129.3.9 `template<typename E> virtual bool decaf::util::Collection< E >::remove (const E & value) [pure virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (*value* == NULL ? *e* == NULL : *value* == *e*), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	The reference to the element to remove from this Collection (p. 851).
--------------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

Implemented in `decaf::util::StlList< E >` (p. 2550), `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1631), `decaf::util::PriorityQueue< E >` (p. 2170), `decaf::util::ArrayList< E >` (p. 455), `decaf::util::concurrent::CopyOnWriteArrayList< E >` (p. 1043), `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >` (p. 1043), `decaf::util::AbstractCollection< E >` (p. 116), `decaf::util::AbstractCollection< Pointer< Transport > >` (p. 116), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 116), `decaf::util::AbstractCollection< Resource * >` (p. 116), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 116), `decaf::util::AbstractCollection< CompositeTask * >` (p. 116), `decaf::util::AbstractCollection< URI >` (p. 116), `decaf::util::AbstractCollection< Pointer< MessageDispatch > >` (p. 116), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 116), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 116), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 116), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 116), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 116), `decaf::util::AbstractCollection< cms::Destination * >` (p. 116), `decaf::util::AbstractCollection< cms::Session * >` (p. 116), `decaf::util::AbstractCollection< cms::Connection * >` (p. 116), `decaf::util::StlSet< E >` (p. 2580), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2580), `decaf::util::StlSet< Resource * >` (p. 2580), `decaf::util::LinkedList< E >` (p. 1654), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1654), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1654), `decaf::util::LinkedList< CompositeTask * >` (p. 1654), `decaf::util::LinkedList< URI >` (p. 1654), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1654), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1654), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1654), `decaf::util::LinkedList< Pointer< Command > >` (p. 1654), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1654), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1654), `decaf::util::LinkedList< cms::Destination * >` (p. 1654), `decaf::util::LinkedList< cms::Session * >` (p. 1654), `decaf::util::LinkedList< cms::Connection * >` (p. 1654), and `decaf::util::concurrent::CopyOnWriteArraySet< E >` (p. 1059).

6.129.3.10 `template<typename E> virtual bool decaf::util::Collection< E >::removeAll (const Collection< E > & collection) [pure virtual]`

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are to be removed from this one.
-------------------	--

Returns

true if the collection changed as a result of this call.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1044), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1044), **decaf::util::AbstractCollection< E >** (p. 117), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 117), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 117), **decaf::util::AbstractCollection< Resource * >** (p. 117), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 117), **decaf::util::AbstractCollection< CompositeTask * >** (p. 117), **decaf::util::AbstractCollection< URI >** (p. 117), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 117), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 117), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 117), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 117), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 117), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 117), **decaf::util::AbstractCollection< cms::Destination * >** (p. 117), **decaf::util::AbstractCollection< cms::Session * >** (p. 117), **decaf::util::AbstractCollection< cms::Connection * >** (p. 117), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 1059), **decaf::util::AbstractSet< E >** (p. 153), **decaf::util::AbstractSet< Pointer< Synchronization > >** (p. 153), and **decaf::util::AbstractSet< Resource * >** (p. 153).

6.129.3.11 `template<typename E> virtual bool decaf::util::Collection< E >::retainAll (const Collection< E > & collection) [pure virtual]`

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are to be retained.
-------------------	---

Returns

true if the collection changed as a result of this call.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

Implemented in `decaf::util::concurrent::CopyOnWriteArrayList< E >` (p. 1045), `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >` (p. 1045), `decaf::util::AbstractCollection< E >` (p. 118), `decaf::util::AbstractCollection< Pointer< Transport > >` (p. 118), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 118), `decaf::util::AbstractCollection< Resource * >` (p. 118), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 118), `decaf::util::AbstractCollection< CompositeTask * >` (p. 118), `decaf::util::AbstractCollection< URI >` (p. 118), `decaf::util::AbstractCollection< Pointer< MessageDispatch > >` (p. 118), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 118), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 118), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 118), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 118), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 118), `decaf::util::AbstractCollection< cms::Destination * >` (p. 118), `decaf::util::AbstractCollection< cms::Session * >` (p. 118), `decaf::util::AbstractCollection< cms::Connection * >` (p. 118), and `decaf::util::concurrent::CopyOnWriteArraySet< E >` (p. 1061).

6.129.3.12 `template<typename E> virtual int decaf::util::Collection< E >::size () const`
`[pure virtual]`

Returns the number of elements in this collection.

If this collection contains more than `Integer::MAX_VALUE` elements, returns `Integer::MAX_VALUE`.

Returns

the number of elements in this collection

Implemented in `decaf::util::concurrent::CopyOnWriteArrayList< E >` (p. 1046), `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >` (p. 1046), `decaf::util::StlList< E >` (p. 2552), `decaf::util::PriorityQueue< E >` (p. 2171), `decaf::util::concurrent::SynchronousQueue< E >` (p. 2664), `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1632), `decaf::util::LinkedList< E >` (p. 1658), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1658), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1658), `decaf::util::LinkedList< CompositeTask * >` (p. 1658), `decaf::util::LinkedList< URI >` (p. 1658), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1658), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1658), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1658), `decaf::util::LinkedList< Pointer< Command > >` (p. 1658), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1658), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1658), `decaf::util::LinkedList< cms::Destination * >` (p. 1658), `decaf::util::LinkedList< cms::Session * >` (p. 1658), `decaf::util::LinkedList< cms::Connection * >` (p. 1658), `decaf::util::StlSet< E >` (p. 2581), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2581), `decaf::util::StlSet< Resource * >` (p. 2581), `decaf::util::ArrayList< E >` (p. 457), and `decaf::util::concurrent::CopyOnWriteArraySet< E >` (p. 1061).

Referenced by `decaf::util::AbstractList< cms::Connection * >::add()`, `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll()`, `decaf::util::ArrayList< E >::addAll()`, `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener`

* >::addAllAbsent(), decaf::util::ArrayList< E >::ArrayList(), decaf::util::AbstractList< cms::Connection * >::clear(), decaf::util::concurrent::CopyOnWriteArraySet< E >::equals(), decaf::util::AbstractCollection< cms::Connection * >::equals(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::equals(), decaf::util::AbstractCollection< cms::Connection * >::isEmpty(), decaf::util::AbstractList< cms::Connection * >::lastIndexOf(), decaf::util::AbstractSet< Resource * >::removeAll(), and decaf::util::AbstractCollection< cms::Connection * >::toArray().

6.129.3.13 `template<typename E> virtual std::vector<E> decaf::util::Collection< E >::toArray () const [pure virtual]`

Returns an array containing all of the elements in this collection.

If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns

an array of the elements in this collection in the form of an STL vector.

Implemented in `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1632), `decaf::util::concurrent::CopyOnWriteArrayList< E >` (p. 1047), `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >` (p. 1047), `decaf::util::ArrayList< E >` (p. 457), `decaf::util::AbstractCollection< E >` (p. 119), `decaf::util::AbstractCollection< Pointer< Transport > >` (p. 119), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 119), `decaf::util::AbstractCollection< Resource * >` (p. 119), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 119), `decaf::util::AbstractCollection< CompositeTask * >` (p. 119), `decaf::util::AbstractCollection< URI >` (p. 119), `decaf::util::AbstractCollection< Pointer< MessageDispatch > >` (p. 119), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 119), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 119), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 119), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 119), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 119), `decaf::util::AbstractCollection< cms::Destination * >` (p. 119), `decaf::util::AbstractCollection< cms::Session * >` (p. 119), `decaf::util::AbstractCollection< cms::Connection * >` (p. 119), `decaf::util::LinkedList< E >` (p. 1658), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1658), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1658), `decaf::util::LinkedList< CompositeTask * >` (p. 1658), `decaf::util::LinkedList< URI >` (p. 1658), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1658), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1658), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1658), `decaf::util::LinkedList< Pointer< Command > >` (p. 1658), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1658), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1658), `decaf::util::LinkedList< cms::Destination * >` (p. 1658), `decaf::util::LinkedList< cms::Session * >` (p. 1658), `decaf::util::LinkedList< cms::Connection * >` (p. 1658), `decaf::util::concurrent::SynchronousQueue< E >` (p. 2665), and `decaf::util::concurrent::CopyOnWriteArraySet< E >` (p. 1062).

Referenced by `decaf::util::ArrayList< E >::addAll()`, and `decaf::util::StlList< E >::addAll()`.

6.130 activemq::commands::Command Class Reference

```
#include <src/main/activemq/commands/Command.h>
```

Inheritance diagram for `activemq::commands::Command`:

Public Member Functions

- virtual `~Command ()`
- virtual void `setCommandId (int id)=0`
*Sets the **Command** (p. 866) Id of this **Message** (p. 1821).*
- virtual int `getCommandId () const =0`
*Gets the **Command** (p. 866) Id of this **Message** (p. 1821).*
- virtual void `setResponseRequired (const bool required)=0`
*Set if this **Message** (p. 1821) requires a **Response** (p. 2298).*
- virtual bool `isResponseRequired () const =0`
*Is a **Response** (p. 2298) required for this **Command** (p. 866).*
- virtual `std::string toString () const =0`
Returns a provider-specific string that provides information about the contents of the command.
- virtual `decaf::lang::Pointer < commands::Command > visit (activemq::state::CommandVisitor *visitor)=0`
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- virtual bool `isConnectionControl () const =0`
- virtual bool `isConnectionInfo () const =0`
- virtual bool `isConsumerInfo () const =0`
- virtual bool `isBrokerInfo () const =0`
- virtual bool `isKeepAliveInfo () const =0`
- virtual bool `isMessage () const =0`
- virtual bool `isMessageAck () const =0`
- virtual bool `isMessageDispatch () const =0`
- virtual bool `isMessageDispatchNotification () const =0`
- virtual bool `isProducerAck () const =0`
- virtual bool `isProducerInfo () const =0`
- virtual bool `isResponse () const =0`

- virtual bool **isRemoveInfo** () const =0
- virtual bool **isRemoveSubscriptionInfo** () const =0
- virtual bool **isShutdownInfo** () const =0
- virtual bool **isTransactionInfo** () const =0
- virtual bool **isWireFormatInfo** () const =0

6.130.1 Constructor & Destructor Documentation

6.130.1.1 virtual **activemq::commands::Command::~~Command** () [inline, virtual]

6.130.2 Member Function Documentation

6.130.2.1 virtual int **activemq::commands::Command::getCommandId** () const [pure virtual]

Gets the **Command** (p. 866) Id of this **Message** (p. 1821).

Returns

Command (p. 866) Id

Implemented in **activemq::commands::BaseCommand** (p. 495).

6.130.2.2 virtual bool **activemq::commands::Command::isBrokerInfo** () const [pure virtual]

Implemented in **activemq::commands::BrokerInfo** (p. 575), and **activemq::commands::BaseCommand** (p. 495).

6.130.2.3 virtual bool **activemq::commands::Command::isConnectionControl** () const [pure virtual]

Implemented in **activemq::commands::ConnectionControl** (p. 941), and **activemq::commands::BaseCommand** (p. 495).

6.130.2.4 virtual bool **activemq::commands::Command::isConnectionInfo** () const [pure virtual]

Implemented in **activemq::commands::ConnectionInfo** (p. 971), and **activemq::commands::BaseCommand** (p. 495).

6.130.2.5 `virtual bool activemq::commands::Command::isConsumerInfo () const`
[pure virtual]

Implemented in `activemq::commands::ConsumerInfo` (p. 1014), and `activemq::commands::BaseCommand` (p. 495).

6.130.2.6 `virtual bool activemq::commands::Command::isKeepAliveInfo () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 495), and `activemq::commands::KeepAliveInfo` (p. 1593).

6.130.2.7 `virtual bool activemq::commands::Command::isMessage () const`
[pure virtual]

Implemented in `activemq::commands::Message` (p. 1832), and `activemq::commands::BaseCommand` (p. 496).

6.130.2.8 `virtual bool activemq::commands::Command::isMessageAck () const`
[pure virtual]

Implemented in `activemq::commands::MessageAck` (p. 1871), and `activemq::commands::BaseCommand` (p. 496).

6.130.2.9 `virtual bool activemq::commands::Command::isMessageDispatch () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 496), and `activemq::commands::MessageDispatch` (p. 1884).

6.130.2.10 `virtual bool activemq::commands::Command::isMessageDispatchNotification () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 496), and `activemq::commands::MessageDispatchNotification` (p. 1898).

6.130.2.11 `virtual bool activemq::commands::Command::isProducerAck () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 496), and `activemq::commands::ProducerAck` (p. 2173).

6.130.2.12 `virtual bool activemq::commands::Command::isProducerInfo () const`
[pure virtual]

Implemented in **activemq::commands::BaseCommand** (p.496), and **activemq::commands::ProducerInfo** (p.2193).

6.130.2.13 `virtual bool activemq::commands::Command::isRemoveInfo () const`
[pure virtual]

Implemented in **activemq::commands::BaseCommand** (p.496), and **activemq::commands::RemoveInfo** (p.2270).

6.130.2.14 `virtual bool activemq::commands::Command::isRemoveSubscriptionInfo () const` [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p.497), and **activemq::commands::RemoveSubscriptionInfo** (p.2278).

6.130.2.15 `virtual bool activemq::commands::Command::isResponse () const`
[pure virtual]

Implemented in **activemq::commands::BaseCommand** (p.497), and **activemq::commands::Response** (p.2300).

6.130.2.16 `virtual bool activemq::commands::Command::isResponseRequired () const` [pure virtual]

Is a **Response** (p.2298) required for this **Command** (p.866).

Returns

true if a response is required.

Implemented in **activemq::commands::BaseCommand** (p.497).

6.130.2.17 `virtual bool activemq::commands::Command::isShutdownInfo () const`
[pure virtual]

Implemented in **activemq::commands::BaseCommand** (p.497), and **activemq::commands::ShutdownInfo** (p.2433).

6.130.2.18 `virtual bool activemq::commands::Command::isTransactionInfo () const`
[pure virtual]

Implemented in **activemq::commands::BaseCommand** (p.497), and **activemq::commands::TransactionInfo** (p.2777).

6.130.2.19 `virtual bool activemq::commands::Command::isWireFormatInfo () const`
`[pure virtual]`

Implemented in `activemq::commands::WireFormatInfo` (p. 2896), and `activemq::commands::BaseCommand` (p. 497).

6.130.2.20 `virtual void activemq::commands::Command::setCommandId (int id)`
`[pure virtual]`

Sets the **Command** (p. 866) Id of this **Message** (p. 1821).

Parameters

<i>id</i>	Command (p. 866) Id
-----------	----------------------------

Implemented in `activemq::commands::BaseCommand` (p. 498).

6.130.2.21 `virtual void activemq::commands::Command::setResponseRequired (`
`const bool required) [pure virtual]`

Set if this **Message** (p. 1821) requires a **Response** (p. 2298).

Parameters

<i>required</i>	true if response is required
-----------------	------------------------------

Implemented in `activemq::commands::BaseCommand` (p. 498).

6.130.2.22 `virtual std::string activemq::commands::Command::toString () const`
`[pure virtual]`

Returns a provider-specific string that provides information about the contents of the command.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 531).

Implemented in `activemq::commands::Message` (p. 1836), `activemq::commands::ConsumerInfo` (p. 1016), `activemq::commands::ActiveMQBytesMessage` (p. 178), `activemq::commands::BrokerInfo` (p. 577), `activemq::commands::ConnectionInfo` (p. 972), `activemq::commands::MessageAck` (p. 1871), `activemq::commands::ConsumerControl` (p. 995), `activemq::commands::ProducerInfo` (p. 2194), `activemq::commands::ConnectionControl` (p. 942), `activemq::commands::DestinationInfo` (p. 1217), `activemq::commands::MessagePull` (p. 1943), `activemq::commands::SessionInfo` (p. 2389), `activemq::commands::MessageDispatch` (p. 1885), `activemq::commands::MessageDispatchNotification` (p. 1898), `activemq::commands::TransactionInfo` (p. 2777), `activemq::commands::ConnectionError` (p. 950), `activemq::commands::RemoveSubscriptionInfo` (p. 2279), `activemq::commands::ActiveMQStreamMessage` (p. 369), `activemq::commands::ProducerAck` (p. 2174), `activemq::commands::`

::RemoveInfo (p. 2270), **activemq::commands::ActiveMQMapMessage** (p. 283), **activemq::commands::DataArrayResponse** (p. 1071), **activemq::commands::DataResponse** (p. 1114), **activemq::commands::ExceptionResponse** (p. 1290), **activemq::commands::ReplayCommand** (p. 2286), **activemq::commands::ControlCommand** (p. 1025), **activemq::commands::IntegerResponse** (p. 1518), **activemq::commands::Response** (p. 2300), **activemq::commands::FlushCommand** (p. 1383), **activemq::commands::KeepAliveInfo** (p. 1593), **activemq::commands::ShutdownInfo** (p. 2433), **activemq::commands::BaseCommand** (p. 498), **activemq::commands::ActiveMQBlobMessage** (p. 161), **activemq::commands::WireFormatInfo** (p. 2899), **activemq::commands::ActiveMQTextMessage** (p. 409), **activemq::commands::ActiveMQObjectMessage** (p. 303), and **activemq::commands::ActiveMQMessage** (p. 290).

```
6.130.2.23 virtual decaf::lang::Pointer<commands::Command> activemq-
::commands::Command::visit ( activemq::state::CommandVisitor *
visitor ) [pure virtual]
```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implemented in **activemq::commands::Message** (p. 1837), **activemq::commands::ConsumerInfo** (p. 1016), **activemq::commands::BrokerInfo** (p. 577), **activemq::commands::ConnectionInfo** (p. 973), **activemq::commands::MessageAck** (p. 1872), **activemq::commands::ConnectionControl** (p. 942), **activemq::commands::ProducerInfo** (p. 2194), **activemq::commands::ConsumerControl** (p. 995), **activemq::commands::MessageDispatch** (p. 1885), **activemq::commands::MessageDispatchNotification** (p. 1898), **activemq::commands::MessagePull** (p. 1943), **activemq::commands::DestinationInfo** (p. 1217), **activemq::commands::RemoveSubscriptionInfo** (p. 2279), **activemq::commands::TransactionInfo** (p. 2777), **activemq::commands::BrokerError** (p. 562), **activemq::commands::SessionInfo** (p. 2389), **activemq::commands::ProducerAck** (p. 2174), **activemq::commands::RemoveInfo** (p. 2270), **activemq::commands::ConnectionError** (p. 950), **activemq::commands::Response** (p. 2301), **activemq::commands::ReplayCommand** (p. 2286), **activemq::commands::KeepAliveInfo** (p. 1594), **activemq::commands::ShutdownInfo** (p. 2434), **activemq::commands::ControlCommand** (p. 1025), **activemq::commands::FlushCommand** (p. 1383), and **activemq::commands::WireFormatInfo** (p. 2899).

The documentation for this class was generated from the following file:

6.131.1 Detailed Description

Interface for an Object that can visit the various Command Objects that are sent from and to this client.

The Commands themselves implement a `visit` method that is called with an instance of this interface and each one then call the appropriate `processXXX` method.

Since

3.0

6.133 decaf::lang::Comparable< T > Class Template Reference

This interface imposes a total ordering on the objects of each class that implements it.

```
#include <src/main/decaf/lang/Comparable.h>
```

Public Member Functions

- virtual `~Comparable()`
- virtual `int compareTo (const T &value) const =0`
Compares this object with the specified object for order.
- virtual `bool equals (const T &value) const =0`
- virtual `bool operator== (const T &value) const =0`
Compares equality between this object and the one passed.
- virtual `bool operator< (const T &value) const =0`
Compares this object to another and returns true if this object is considered to be less than the one passed.

6.133.1 Detailed Description

```
template<typename T>class decaf::lang::Comparable< T >
```

This interface imposes a total ordering on the objects of each class that implements it.

This ordering is referred to as the class's natural ordering, and the class's `compareTo` method is referred to as its natural comparison method.

6.133.2 Constructor & Destructor Documentation

```
6.133.2.1 template<typename T> virtual decaf::lang::Comparable< T
>::~~Comparable( ) [inline, virtual]
```

6.133.3 Member Function Documentation

```
6.133.3.1 template<typename T> virtual int decaf::lang::Comparable< T
>::compareTo ( const T & value ) const [pure virtual]
```

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all x and y. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementer must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all z.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the **Comparable** (p. 885)

interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters

<i>value</i>	- the Object to be compared.
--------------	------------------------------

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Implemented in **decaf::lang::Double** (p. 1239), **decaf::lang::Float** (p. 1348), **decaf::lang::Integer** (p. 1504), **decaf::lang::Long** (p. 1730), **decaf::lang::Boolean** (p. 547), **decaf::lang::Short** (p. 2401), **decaf::lang::Byte** (p. 617), **decaf::lang::Character** (p. 767), **decaf::lang::Double** (p. 1239), **decaf::lang::Float** (p. 1348), **decaf::lang::Boolean** (p. 547), **decaf::lang::Integer** (p. 1503), **decaf::lang::Long** (p. 1729), **decaf::lang::Byte** (p. 616), **decaf::lang::Short** (p. 2401), and **decaf::lang::Character** (p. 767).

6.133.3.2 `template<typename T> virtual bool decaf::lang::Comparable< T >::equals (const T & value) const [pure virtual]`

Returns

true if this value is considered equal to the passed value.

Implemented in **decaf::lang::Byte** (p. 618), **decaf::lang::Boolean** (p. 548), **decaf::lang::Character** (p. 768), **decaf::lang::Byte** (p. 618), **decaf::lang::Double** (p. 1241), **decaf::lang::Float** (p. 1349), **decaf::lang::Character** (p. 768), **decaf::lang::Integer** (p. 1505), **decaf::lang::Long** (p. 1731), **decaf::lang::Short** (p. 2402), **decaf::lang::Boolean** (p. 547), **decaf::lang::Double** (p. 1241), **decaf::lang::Float** (p. 1349), **decaf::lang::Integer** (p. 1505), **decaf::lang::Long** (p. 1731), and **decaf::lang::Short** (p. 2402).

6.133.3.3 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator< (const T & value) const [pure virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implemented in **decaf::lang::Double** (p. 1244), **decaf::lang::Float** (p. 1352), **decaf::lang::Integer** (p. 1508), **decaf::lang::Long** (p. 1734), **decaf::lang::Short** (p. 2404), **decaf::lang::Boolean** (p. 548), **decaf::lang::Byte** (p. 619), **decaf::lang::Character** (p. 771), **decaf::lang::Double** (p. 1243), **decaf::lang::Float** (p. 1352), **decaf::lang::Integer** (p. 1507), **decaf::lang::Long** (p. 1734), **decaf::lang::Short** (p. 2403), **decaf::lang::Boolean** (p. 548), **decaf::lang::Byte** (p. 619), and **decaf::lang::Character** (p. 770).

```
6.133.3.4  template<typename T> virtual bool decaf::lang::Comparable< T >::operator==
           ( const T & value ) const    [pure virtual]
```

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

Implemented in **decaf::lang::Double** (p. 1244), **decaf::lang::Float** (p. 1353), **decaf::lang::Integer** (p. 1508), **decaf::lang::Long** (p. 1735), **decaf::lang::Short** (p. 2404), **decaf::lang::Boolean** (p. 549), **decaf::lang::Byte** (p. 620), **decaf::lang::Character** (p. 771), **decaf::lang::Double** (p. 1244), **decaf::lang::Float** (p. 1353), **decaf::lang::Integer** (p. 1508), **decaf::lang::Long** (p. 1734), **decaf::lang::Boolean** (p. 548), **decaf::lang::Short** (p. 2404), **decaf::lang::Byte** (p. 620), and **decaf::lang::Character** (p. 771).

6.134 decaf::util::Comparator< T > Class Template Reference

A comparison function, which imposes a total ordering on some collection of objects.

```
#include <src/main/decaf/util/Comparator.h>
```

Public Member Functions

- virtual **~Comparator** ()
- virtual bool **operator()** (const T &left, const T &right) const =0

*Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 888) to be passed to an STL **Map** (p. 1768) for use as the sorting criteria.*

- virtual int **compare** (const T &o1, const T &o2) const =0

Compares its two arguments for order.

6.134.1 Detailed Description

```
template<typename T>class decaf::util::Comparator< T >
```

A comparison function, which imposes a total ordering on some collection of objects.

Comparators can be passed to a sort method (such as Collections.sort) to allow precise control over the sort order. Comparators can also be used to control the order of certain data structures.

The ordering imposed by a **Comparator** (p. 888) c on a set of elements S is said to be consistent with equals if and only if (compare(e1, e2) == 0) has the same boolean value as (e1 == e2) for every e1 and e2 in S.

Since

1.0

6.134.2 Constructor & Destructor Documentation

```
6.134.2.1 template<typename T> virtual decaf::util::Comparator< T >::~Comparator (
) [inline, virtual]
```

6.134.3 Member Function Documentation

```
6.134.3.1 template<typename T> virtual int decaf::util::Comparator< T >::compare (
const T & o1, const T & o2 ) const [pure virtual]
```

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that $\text{sgn}(\text{compare}(x, y)) == -\text{sgn}(\text{compare}(y, x))$ for all x and y. (This implies that compare(x, y) must throw an exception if and only if compare(y, x) throws an exception.)

The implementor must also ensure that the relation is transitive: $((\text{compare}(x, y) > 0) \ \&\& \ (\text{compare}(y, z) > 0))$ implies $\text{compare}(x, z) > 0$.

Finally, the implementer must ensure that $\text{compare}(x, y) == 0$ implies that $\text{sgn}(\text{compare}(x, z)) == \text{sgn}(\text{compare}(y, z))$ for all z.

It is generally the case, but not strictly required that $(\text{compare}(x, y) == 0) == (x == y)$. Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

<i>o1</i>	The first object to be compared
<i>o2</i>	The second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implemented in **decaf::util::comparators::Less< E >** (p. 1613).

6.134.3.2 `template<typename T> virtual bool decaf::util::Comparator< T >::operator() (const T & left, const T & right) const` [pure virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 888) to be passed to an STL **Map** (p. 1768) for use as the sorting criteria.

Parameters

<i>left</i>	The Left hand side operand.
<i>right</i>	The Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implemented in **decaf::util::comparators::Less< E >** (p. 1614).

*Adds a new **CompositeTask** (p. 892) to the Set of Tasks that this class manages.*
- void **removeTask** (**CompositeTask** *task)
*Removes a **CompositeTask** (p. 892) that was added previously.*
- virtual void **shutdown** (unsigned int timeout)
Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()
*Shutdown once the task has finished and the **TaskRunner** (p. 2677)'s thread has exited.*
- virtual void **wakeup** ()
*Signal the **TaskRunner** (p. 2677) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2676) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()
Run method - called by the Thread class in the context of the thread.
- virtual bool **iterate** ()
Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.137.1 Detailed Description

A **Task** (p. 2676) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

Since

3.0

6.137.2 Constructor & Destructor Documentation

6.137.2.1 **activemq::threads::CompositeTaskRunner::CompositeTaskRunner** ()

6.137.2.2 **virtual activemq::threads::CompositeTaskRunner::~~CompositeTaskRunner** () `[virtual]`

6.137.3 Member Function Documentation

6.137.3.1 void **activemq::threads::CompositeTaskRunner::addTask** (
CompositeTask * *task*)

Adds a new **CompositeTask** (p. 892) to the Set of Tasks that this class manages.

Parameters

<i>task</i>	- Pointer to a CompositeTask (p. 892) instance.
-------------	--

6.137.3.2 virtual bool **activemq::threads::CompositeTaskRunner::iterate** ()
[protected, virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implements **activemq::threads::Task** (p. 2676).

6.137.3.3 void **activemq::threads::CompositeTaskRunner::removeTask** (
CompositeTask * *task*)

Removes a **CompositeTask** (p. 892) that was added previously.

Parameters

<i>task</i>	- Pointer to a CompositeTask (p. 892) instance.
-------------	--

6.137.3.4 virtual void **activemq::threads::CompositeTaskRunner::run** ()
[protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2312).

6.137.3.5 virtual void **activemq::threads::CompositeTaskRunner::shutdown** (
unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

<i>timeout</i>	- Time in Milliseconds to wait for the task to stop.
----------------	--

Implements **activemq::threads::TaskRunner** (p. 2677).

6.137.3.6 virtual void **activemq::threads::CompositeTaskRunner::shutdown** ()
[virtual]

Shutdown once the task has finished and the **TaskRunner** (p. 2677)'s thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2678).

6.137.3.7 virtual void **activemq::threads::CompositeTaskRunner::wakeup** ()
[virtual]

Signal the **TaskRunner** (p. 2677) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2676) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2678).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**CompositeTaskRunner.h**

6.138 activemq::transport::CompositeTransport Class Reference

A Composite **Transport** (p. 2790) is a **Transport** (p. 2790) implementation that is composed of several Transports.

```
#include <src/main/activemq/transport/CompositeTransport.h>
```

Inheritance diagram for **activemq::transport::CompositeTransport**:

Public Member Functions

- virtual **~CompositeTransport** ()
- virtual void **addURI** (bool rebalance, const **List**< **URI** > &uris)=0
*Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2790) is a composite of.*
- virtual void **removeURI** (bool rebalance, const **List**< **URI** > &uris)=0
*Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2790) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2790) should result in that **Transport** (p. 2790) being disposed of.*

6.138.1 Detailed Description

A Composite **Transport** (p. 2790) is a **Transport** (p. 2790) implementation that is composed of several Transports.

The composition could be such that only one **Transport** (p. 2790) exists for each URI that is composed or there could be many active Transports working at once.

6.138.3 Member Function Documentation

6.138.3.1 virtual void **activemq::transport::CompositeTransport::addURI** (bool *rebalance*, const List< URI > & *uris*) [pure virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2790) is a composite of.

Parameters

<i>rebalance</i>	Indicates if the addition should cause a forced reconnect or not.
<i>uris</i>	The new URI set to add to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1308).

6.138.3.2 virtual void **activemq::transport::CompositeTransport::removeURI** (bool *rebalance*, const List< URI > & *uris*) [pure virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2790) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2790) should result in that **Transport** (p. 2790) being disposed of.

Parameters

<i>rebalance</i>	Indicates if the removal should cause a forced reconnect or not.
<i>uris</i>	The new URI set to remove to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1314).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**CompositeTransport.h**

6.139 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > Class Template Reference

Interface for a **Map** (p. 1768) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1768) interface.

```
#include <src/main/decaf/util/concurrent/ConcurrentMap.h>
```

Inheritance diagram for decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >:

Public Member Functions

- virtual **~ConcurrentMap** ()
- virtual bool **putIfAbsent** (const K &key, const V &value)=0
If the specified key is not already associated with a value, associate it with the given value.
- virtual bool **remove** (const K &key, const V &value)=0
Remove entry for key only if currently mapped to given value.
- virtual bool **replace** (const K &key, const V &oldValue, const V &newValue)=0
Replace entry for key only if currently mapped to given value.
- virtual V **replace** (const K &key, const V &value)=0
Replace entry for key only if currently mapped to some value.

6.139.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR>class decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >
```

Interface for a **Map** (p. 1768) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1768) interface.

Since

1.0

6.139.2 Constructor & Destructor Documentation

6.139.2.1 `template<typename K, typename V, typename COMPARATOR> virtual
 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
 >::~~ConcurrentMap() [inline, virtual]`

6.139.3 Member Function Documentation

6.139.3.1 `template<typename K, typename V, typename COMPARATOR> virtual
 bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
 >::putIfAbsent (const K & key, const V & value) [pure virtual]`

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	The key to map the value to.
<i>value</i>	The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

<i>Unsupported- OperationException</i>	if the put operation is not supported by this map
--	---

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p.915), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p.915), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p.915), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p.915), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p.915), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransaction-`

Id::COMPARATOR > (p.915), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p.915).

6.139.3.2 `template<typename K, typename V, typename COMPARATOR> virtual bool
decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::remove (
const K & key, const V & value) [pure virtual]`

Remove entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == value ) ) ) {  
    map.remove( key );  
    return true;  
} else {  
    return false;  
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p.917), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p.917).

6.139.3.3 `template<typename K, typename V, typename COMPARATOR> virtual bool
decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (
const K & key, const V & oldValue, const V & newValue) [pure virtual]`

Replace entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>oldValue</i>	value expected to be associated with the specified key.
<i>newValue</i>	value to be associated with the specified key.

Returns

true if the value was replaced

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p.917), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p.917), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p.917).

6.139.3.4 `template<typename K, typename V, typename COMPARATOR> virtual V
 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (
 const K & key, const V & value) [pure virtual]`

Replace entry for key only if currently mapped to some value.

Acts as

```
if( ( map.containsKey( key ) ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException (p.1984) (...);
};
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an **NoSuchElementException** (p. 1984) if there was no mapping for key.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if there was no previous mapping.
---	-----------------------------------

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 918), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 918), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 918), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 918), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 918), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 918), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 918).

Copy Constructor.

- **ConcurrentModificationException** (const ConcurrentModificationException &ex) throw ()

Copy Constructor.

- **ConcurrentModificationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- **ConcurrentModificationException** (const std::exception *cause) throw ()

Constructor.

- **ConcurrentModificationException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor.

- virtual **ConcurrentModificationException** * clone () const

Clones this exception.

- virtual ~**ConcurrentModificationException** () throw ()

6.140.1 Constructor & Destructor Documentation

6.140.1.1 decaf::util::ConcurrentModificationException::ConcurrentModificationException () throw ()

Default Constructor.

6.140.1.2 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.140.1.3 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const ConcurrentModificationException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.140.1.4 `decaf::util::ConcurrentModificationException::ConcurrentModificationException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.140.1.5 `decaf::util::ConcurrentModificationException::ConcurrentModificationException (const std::exception * cause) throw ()` `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.140.1.6 `decaf::util::ConcurrentModificationException::ConcurrentModificationException (const char * file, const int lineNumber, const char * msg, ...) throw ()` `[inline]`

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.140.1.7 `virtual decaf::util::ConcurrentModificationException::~ConcurrentModificationException () throw ()` `[virtual]`

6.140.2 Member Function Documentation

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 905

6.140.2.1 virtual **ConcurrentModificationException*** decaf::util::
ConcurrentModificationException::clone () const [inline,
virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::RuntimeException** (p. 2317).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**ConcurrentModificationException.h**

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 1768) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

```

Map.h>
```

Inheritance diagram for decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >:

Public Member Functions

- **ConcurrentStlMap** ()
Default constructor - does nothing.
- **ConcurrentStlMap** (const **ConcurrentStlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **ConcurrentStlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual ~**ConcurrentStlMap** ()
- virtual bool **equals** (const **ConcurrentStlMap** &source) const
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (const **ConcurrentStlMap** &source)
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
Copies the content of the source map into this map.

- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException	<i>if this map is unmodifiable.</i>
-------------------------------	-------------------------------------

- virtual bool **containsKey** (const K &key) const

Indicates whether or this map contains a value for the given key.

Parameters

key	<i>The key to look up.</i>
-----	----------------------------

Returns

true if this map contains the value, otherwise false.

- virtual bool **containsValue** (const V &value) const

Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value	<i>The Value to look up.</i>
-------	------------------------------

Returns

true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const

Returns

*if the **Map** (p. 1768) contains any element or not, TRUE or FALSE*

- virtual int **size** () const

Returns

The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key)

*Gets the value mapped to the specified key in the **Map** (p. 1768).*

*If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.*

Parameters

key	<i>The search key.</i>
-----	------------------------

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException (p. 1984)	<i>if the key requests doesn't exist in the Map (p. 1768).</i>
--	---

- virtual const V & **get** (const K &key) const

*Gets the value mapped to the specified key in the **Map** (p. 1768).*

*If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.*

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 907

Parameters

key	<i>The search key.</i>
-----	------------------------

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException (p. 1984)	<i>if the key requests doesn't exist in the Map (p. 1768).</i>
--	---

- virtual void **put** (const K &key, const V &value)

Sets the value for the specified key.

Parameters

key	<i>The target key.</i>
value	<i>The value to be set.</i>

Exceptions

UnsupportedOperationException	<i>if this map is unmodifiable.</i>
-------------------------------	-------------------------------------

- virtual void **putAll** (const **ConcurrentStlMap**< K, V, COMPARATOR > &other)
- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other)

*Stores a copy of the Mappings contained in the other **Map** (p. 1768) in this one.*

Parameters

other	<i>A Map (p. 1768) instance whose elements are to all be inserted in this Map (p. 1768).</i>
-------	--

Exceptions

UnsupportedOperationException	<i>If the implementing class does not support the putAll operation.</i>
-------------------------------	---

- virtual V **remove** (const K &key)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key	<i>The search key.</i>
-----	------------------------

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException (p. 1984)	<i>if this key is not in the Map (p. 1768).</i>
UnsupportedOperationException	<i>if this map is unmodifiable.</i>

- virtual std::vector< K > **keySet** () const

Returns a **Set** (p. 2397) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1560), **Set.remove** (p. 861), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns

the entire set of keys in this map as a `std::vector`.

- virtual `std::vector< V > values () const`

Returns

the entire set of values in this map as a `std::vector`.

- bool **putIfAbsent** (const K &key, const V &value)

If the specified key is not already associated with a value, associate it with the given value.

- bool **remove** (const K &key, const V &value)

Remove entry for key only if currently mapped to given value.

- bool **replace** (const K &key, const V &oldValue, const V &newValue)

Replace entry for key only if currently mapped to given value.

- V **replace** (const K &key, const V &value)

Replace entry for key only if currently mapped to some value.

- virtual void **lock** ()

Locks the object.

- virtual bool **tryLock** ()

Attempts to **Lock** (p. 1682) the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

Unlocks the object.

- virtual void **wait** ()

Waits on a signal from this object, which is generated by a call to **Notify**.

- virtual void **wait** (long long millisecs)

Waits on a signal from this object, which is generated by a call to **Notify**.

- virtual void **wait** (long long millisecs, int nanos)

Waits on a signal from this object, which is generated by a call to **Notify**.

- virtual void **notify** ()

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

Signals the waiters on this object that it can now wake up and continue.

6.141.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>class decaf::util-
::concurrent::ConcurrentStlMap< K, V, COMPARATOR >
```

Map (p. 1768) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

This version of **Map** (p. 1768) extends the **ConcurrentMap** (p. 898) interface and implements all the methods defined in that interface. Unlike a Java ConcurrentHashMap this implementations synchronizes all methods such that any call to this class will block if another thread is already holding a lock, much like the Java HashTable.

Since

1.0

6.141.2 Constructor & Destructor Documentation

6.141.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::ConcurrentStlMap () [inline]`

Default constructor - does nothing.

6.141.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::ConcurrentStlMap (const ConcurrentStlMap< K, V, COMPARATOR > &
 source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

<i>source</i>	The source map.
---------------	-----------------

6.141.2.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::ConcurrentStlMap (const Map< K, V, COMPARATOR > & source)
 [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

<i>source</i>	The source map.
---------------	-----------------

6.141.2.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR

OR >::remove()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId
>, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace()`.

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 911

6.141.3.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::containsValue (const V & value) const [inline, virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

<i>value</i>	The Value to look up.
--------------	-----------------------

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1771).

6.141.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::copy (const ConcurrentStlMap< K, V, COMPARATOR > & source)
[inline, virtual]`

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::ConcurrentStlMap()`.

6.141.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::copy (const Map< K, V, COMPARATOR > & source) [inline,
virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

<i>source</i>	The source object to copy from.
---------------	---------------------------------

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1772).

6.141.3.6 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::equals (const ConcurrentStlMap< K, V, COMPARATOR > & source) const
[inline, virtual]`

```
6.141.3.7  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
            >::equals ( const Map< K, V, COMPARATOR > & source ) const  [inline,
            virtual]
```

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

<i>source</i>	- Map (p. 1768) to compare to this one.
---------------	--

Returns

true if the **Map** (p. 1768) passed is equal in value to this one.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1772).

```
6.141.3.8  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
            >::get ( const K & key ) [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 1768).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException (p. 1984)	if the key requests doesn't exist in the Map (p. 1768).
--	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1773).

```
6.141.3.9  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual const V& decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR >::get ( const K & key ) const  [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 1768).

6.141 `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` Class Template Reference 913

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

A {const} reference to the value for the given key.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if the key requests doesn't exist in the Map (p. 1768).
---	--

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1774).

```
6.141.3.10  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR>::isEmpty( ) const [inline, virtual]
```

Returns

if the **Map** (p. 1768) contains any element or not, TRUE or FALSE

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1774).

```
6.141.3.11  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<K> decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR>::keySet( ) const [inline, virtual]
```

Returns a **Set** (p. 2397) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1560), **Set.remove** (p. 861), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns

the entire set of keys in this map as a `std::vector`.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1775).

6.141.3.12 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::lock () [inline, virtual]`

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2640).

6.141.3.13 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::notify () [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2641).

6.141.3.14 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::notifyAll () [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2642).

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 915

6.141.3.15 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::put (const K & key, const V & value) [inline,
virtual]`

Sets the value for the specified key.

Parameters

<i>key</i>	The target key.
<i>value</i>	The value to be set.

Exceptions

<i>Unsupported- OperationException</i>	if this map is unmodifiable.
--	------------------------------

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1776).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace()`.

6.141.3.16 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::putAll (const ConcurrentStlMap< K, V, COMPARATOR > &
other) [inline, virtual]`

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy()`.

6.141.3.17 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other)
[inline, virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1768) in this one.

Parameters

<i>other</i>	A Map (p. 1768) instance whose elements are to all be inserted in this Map (p. 1768).
--------------	---

Exceptions

<i>Unsupported- OperationException</i>	If the implementing class does not support the putAll operation.
--	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1777).

6.141.3.18 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::putIfAbsent (const K & key, const V & value) [inline, virtual]`

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	The key to map the value to.
<i>value</i>	The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

<i>Unsupported- OperationException</i>	if the put operation is not supported by this map
--	---

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 899).

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 917

6.141.3.19 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::remove (const K & key) [inline, virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

a copy of the element that was previously mapped to the given key

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if this key is not in the Map (p. 1768).
<i>UnsupportedOperationException</i>	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1777).

6.141.3.20 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::remove (const K & key, const V & value) [inline, virtual]`

Remove entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == value ) ) {  
    map.remove( key );  
    return true;  
} else {  
    return false;  
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implements **decaf::util::concurrent::ConcurrentMap**< K, V, COMPARATOR > (p. 900).

```
6.141.3.21  template<typename K, typename V, typename COMPARATOR = std::less<K>>
             bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
             >::replace ( const K & key, const V & oldValue, const V & newValue )
             [inline, virtual]
```

Replace entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>oldValue</i>	value expected to be associated with the specified key.
<i>newValue</i>	value to be associated with the specified key.

Returns

true if the value was replaced

Implements **decaf::util::concurrent::ConcurrentMap**< K, V, COMPARATOR > (p. 900).

```
6.141.3.22  template<typename K, typename V, typename COMPARATOR = std::less<K>>
             V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
             >::replace ( const K & key, const V & value ) [inline, virtual]
```

Replace entry for key only if currently mapped to some value.

Acts as

```
if( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
```

6.141 `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` Class Template Reference 919

```
        throw NoSuchElementException (p.1984) (...);  
    };
```

except that the action is performed atomically.

Parameters

<i>key</i>	key with which the specified value is associated.
<i>value</i>	value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an **NoSuchElementException** (p. 1984) if there was no mapping for key.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if there was no previous mapping.
---	-----------------------------------

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >` (p.901).

```
6.141.3.23  template<typename K, typename V, typename COMPARATOR = std::less<K>>  
            virtual int decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR  
            >::size( ) const [inline, virtual]
```

Returns

The number of elements (key/value pairs) in this map.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1778).

```
6.141.3.24  template<typename K, typename V, typename COMPARATOR = std::less<K>>  
            virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V,  
            COMPARATOR>::tryLock( ) [inline, virtual]
```

Attempts to **Lock** (p. 1682) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2643).

```
6.141.3.25  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR >::unlock ( ) [inline, virtual]
```

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2645).

```
6.141.3.26  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<V> decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR >::values ( ) const [inline, virtual]
```

Returns

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1779).

Referenced by **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::values()**.

```
6.141.3.27  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
            COMPARATOR >::wait ( ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2646).

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference 921

6.141.3.28 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::wait (long long millisecs) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2647).

6.141.3.29 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::wait (long long millisecs, int nanos) [inline,
virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2648).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ConcurrentStlMap.h**

6.142 decaf::util::concurrent::locks::Condition Class Reference

Condition (p. 921) factors out the **Mutex** (p. 1960) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1684) implementations.

6.142.1 Detailed Description

Condition (p. 921) factors out the **Mutex** (p. 1960) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1684) implementations.

Where a **Lock** (p. 1684) replaces the use of synchronized statements, a **Condition** (p. 921) replaces the use of the Object monitor methods.

Conditions (also known as condition queues or condition variables) provide a means for one thread to suspend execution (to "wait") until notified by another thread that some state condition may now be true. Because access to this shared state information occurs

in different threads, it must be protected, so a lock of some form is associated with the condition. The key property that waiting for a condition provides is that it atomically releases the associated lock and suspends the current thread.

A **Condition** (p. 921) instance is intrinsically bound to a lock. To obtain a **Condition** (p. 921) instance for a particular **Lock** (p. 1684) instance use its `newCondition()` method.

As an example, suppose we have a bounded buffer which supports put and take methods. If a take is attempted on an empty buffer, then the thread will block until an item becomes available; if a put is attempted on a full buffer, then the thread will block until a space becomes available. We would like to keep waiting put threads and take threads in separate wait-sets so that we can use the optimization of only notifying a single thread at a time when items or spaces become available in the buffer. This can be achieved using two **Condition** (p. 921) instances.

```
class BoundedBuffer { Lock* lock = new ReentrantLock(); Condition* notFull = lock->newCondition(); Condition* notEmpty = lock->newCondition();
```

```
Object* items = new Object[100]; int putptr, takeptr, count;
```

```
public void put( Object* x ) throw( InterruptedException ) { lock->lock(); try { while( count == 100 ) notFull->await() (p. 923); items[putptr] = x; if (++putptr == 100) putptr = 0; ++count; notEmpty->signal() (p. 927); } catch(...) { lock->unlock(); } }
```

```
public Object take() throw( InterruptedException ) { lock->lock(); try { while(count == 0) notEmpty->await() (p. 923); Object x = items[takeptr]; if (++takeptr == 100) takeptr = 0; --count; notFull->signal() (p. 927); return x; } catch(...) { lock->unlock(); } }
```

(The `ArrayBlockingQueue` class provides this functionality, so there is no reason to implement this sample usage class.)

Implementation Considerations

When waiting upon a **Condition** (p. 921), a "spurious wakeup" is permitted to occur, in general, as a concession to the underlying platform semantics. This has little practical impact on most application programs as a **Condition** (p. 921) should always be waited upon in a loop, testing the state predicate that is being waited for. An implementation is free to remove the possibility of spurious wakeups but it is recommended that applications programmers always assume that they can occur and so always wait in a loop.

The three forms of condition waiting (interruptible, non-interruptible, and timed) may differ in their ease of implementation on some platforms and in their performance characteristics. In particular, it may be difficult to provide these features and maintain specific semantics such as ordering guarantees. Further, the ability to interrupt the actual suspension of the thread may not always be feasible to implement on all platforms.

Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of waiting, nor is it required to support interruption of the actual suspension of the thread.

An implementation is required to clearly document the semantics and guarantees provided by each of the waiting methods, and when an implementation does support interruption of thread suspension then it must obey the interruption semantics as defined in this interface.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

1.0

6.142.2 Constructor & Destructor Documentation

6.142.2.1 `virtual decaf::util::concurrent::locks::Condition::~Condition ()`
`[inline, virtual]`

6.142.3 Member Function Documentation

6.142.3.1 `virtual void decaf::util::concurrent::locks::Condition::await ()` `[pure virtual]`

Causes the current thread to wait until it is signaled or interrupted.

The lock associated with this **Condition** (p. 921) is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- * Some other thread invokes the **signal()** (p. 927) method for this **Condition** (p. 921) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 927) method for this **Condition** (p. 921); or
- * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting and interruption of thread suspension is supported,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 921) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal. In that case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 921).
<i>InterruptedException</i>	if the current thread is interrupted (and interruption of thread suspension is supported)
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

6.142.3.2 `virtual bool decaf::util::concurrent::locks::Condition::await (long long time,
const TimeUnit & unit) [pure virtual]`

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

This method is behaviorally equivalent to:

`awaitNanos(unit.toNanos(time)) > 0`

Parameters

<i>time</i>	- the maximum time to wait
<i>unit</i>	- the time unit of the time argument

Returns

false if the waiting time detectably elapsed before return from the method, else true

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 921).
<i>InterruptedException</i>	if the current thread is interrupted (and interruption of thread suspension is supported)
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

6.142.3.3 `virtual long long decaf::util::concurrent::locks::Condition::awaitNanos (long long nanosTimeout) [pure virtual]`

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of five things happens:

* Some other thread invokes the **signal()** (p. 927) method for this **Condition** (p. 921) and the current thread happens to be chosen as the thread to be awakened; or * Some

other thread invokes the **signalAll()** (p. 927) method for this **Condition** (p. 921); or * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or * The specified waiting time elapses; or * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting and interruption of thread suspension is supported,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

The method returns an estimate of the number of nanoseconds remaining to wait given the supplied `nanosTimeout` value upon return, or a value less than or equal to zero if it timed out. This value can be used to determine whether and how long to re-wait in cases where the wait returns but an awaited condition still does not hold. Typical uses of this method take the following form:

```
synchronized boolean aMethod( long timeout, const TimeUnit& unit ) { long nanos-
Timeout = unit.toNanos(timeout); while (!conditionBeingWaitedFor) { if (nanosTimeout
> 0) nanosTimeout = theCondition->awaitNanos(nanosTimeout); else return false; } //
... }
```

Design note: This method requires a nanosecond argument so as to avoid truncation errors in reporting remaining times. Such precision loss would make it difficult for programmers to ensure that total waiting times are not systematically shorter than specified when re-waits occur.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 921) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal, or over indicating the elapse of the specified waiting time. In either case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Parameters

<i>nanos-Timeout</i>	- the maximum time to wait, in nanoseconds
----------------------	--

Returns

an estimate of the `nanosTimeout` value minus the time spent waiting upon return from this method. A positive value may be used as the argument to a subsequent call to this method to finish waiting out the desired time. A value less than or equal to zero indicates that no time remains.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 921).
<i>InterruptedException</i>	if the current thread is interrupted (and interruption of thread suspension is supported)
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

6.142.3.4 virtual void decaf::util::concurrent::locks::Condition::awaitUninterruptibly () [pure virtual]

Causes the current thread to wait until it is signalled.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes the **signal()** (p. 927) method for this **Condition** (p. 921) and the current thread happens to be chosen as the thread to be awakened; or * Some other thread invokes the **signalAll()** (p. 927) method for this **Condition** (p. 921); or * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread's interrupted status is set when it enters this method, or it is interrupted while waiting, it will continue to wait until signalled. When it finally returns from this method its interrupted status will still be set.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 921) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as *IllegalMonitorStateException*) and the implementation must document that fact.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 921).
<i>IllegalMonitorStateException</i>	if the caller is not the lock owner.

6.142.3.5 virtual bool decaf::util::concurrent::locks::Condition::awaitUntil (const Date & deadline) [pure virtual]

6.142.3.6 virtual void decaf::util::concurrent::locks::Condition::signal () [pure virtual]

Wakes up one waiting thread.

If any threads are waiting on this condition then one is selected for waking up. That thread must then re-acquire the lock before returning from await.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 921).
-------------------------	--

6.142.3.7 `virtual void decaf::util::concurrent::locks::Condition::signalAll ()`
`[pure virtual]`

Wakes up all waiting threads.

If any threads are waiting on this condition then they are all woken up. Each thread must re-acquire the lock before it can return from await.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while trying to wait on the Condition (p. 921).
-------------------------	--

Static Public Member Functions

- static `decaf::util::concurrent::ConditionHandle * create (decaf::util-
::concurrent::MutexHandle *mutex)`

Creates the Condition object and attaches it to the given MutexHandle.

- static void **destroy** (**decaf::util::concurrent::ConditionHandle** *handle)
Destroy a previously create Condition instance.
- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition)
Waits for the condition to be signaled.
- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition, long long mills, long long nanos)
Waits for the condition to be signaled or for the time specified to ellapse.
- static void **notify** (**decaf::util::concurrent::ConditionHandle** *condition)
Signals one Thread that is waiting on this condition to wake up.
- static void **notifyAll** (**decaf::util::concurrent::ConditionHandle** *condition)
Signals all Threads that is waiting on this condition to wake up.

6.144.1 Member Function Documentation

6.144.1.1 **static decaf::util::concurrent::ConditionHandle* decaf::internal::util::concurrent::ConditionImpl::create (decaf::util::concurrent::MutexHandle * mutex) [static]**

Creates the Condition object and attaches it to the given MutexHandle.

Parameters

<i>mutex</i>	the Mutex handle that this Condition is attached to.
--------------	--

Returns

a newly constructed Condition handle that is attached to the given handle.

6.144.1.2 **static void decaf::internal::util::concurrent::ConditionImpl::destroy (decaf::util::concurrent::ConditionHandle * handle) [static]**

Destroy a previously create Condition instance.

Parameters

<i>handle</i>	The Condition handle to be destroyed.
---------------	---------------------------------------

6.144.1.3 **static void decaf::internal::util::concurrent::ConditionImpl::notify (decaf::util::concurrent::ConditionHandle * condition) [static]**

Signals one Thread that is waiting on this condition to wake up.

Parameters

<i>condition</i>	the handle to the condition to wait on.
------------------	---

6.144.1.4 static void decaf::internal::util::concurrent::ConditionImpl::notifyAll (decaf::util::concurrent::ConditionHandle * *condition*) [static]

Signals all Threads that is waiting on this condition to wake up.

Parameters

<i>condition</i>	the handle to the condition to wait on.
------------------	---

6.144.1.5 static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * *condition*) [static]

Waits for the condition to be signaled.

Parameters

<i>condition</i>	the handle to the condition to wait on.
------------------	---

6.144.1.6 static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * *condition*, long long *mills*, long long *nanos*) [static]

Waits for the condition to be signaled or for the time specified to ellapse.

Parameters

<i>condition</i>	the handle to the condition to wait on.
<i>mills</i>	the time in milliseconds to wait for the condition to be signaled.
<i>nanos</i>	additional time in nanoseconds to wait for the thread to be signaled.

The documentation for this class was generated from the following file:

6.145 decaf::net::ConnectException Class Reference

```
#include <src/main/decaf/net/ConnectException.h>
```

Inheritance diagram for decaf::net::ConnectException:

Public Member Functions

- **ConnectException** () throw ()
Default Constructor.
- **ConnectException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **ConnectException** (const **ConnectException** &ex) throw ()
Copy Constructor.
- **ConnectException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ConnectException** (const std::exception ***cause**) throw ()
Constructor.
- **ConnectException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ConnectException** * **clone** () const
Clones this exception.
- virtual ~**ConnectException** () throw ()

6.145.1 Constructor & Destructor Documentation

6.145.1.1 **decaf::net::ConnectException::ConnectException ()** throw ()
[inline]

Default Constructor.

6.145.1.2 **decaf::net::ConnectException::ConnectException (const Exception & ex)** throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
-----------	--

6.145.1.3 **decaf::net::ConnectException::ConnectException (const ConnectException & ex)** throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception
-----------	--

6.145.1.4 `decaf::net::ConnectException::ConnectException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()`
`[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.145.1.5 `decaf::net::ConnectException::ConnectException (const std::exception * cause) throw ()` `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.145.1.6 `decaf::net::ConnectException::ConnectException (const char * file, const int lineNumber, const char * msg, ...) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.145.1.7 `virtual decaf::net::ConnectException::~~ConnectException () throw ()`
`[inline, virtual]`

6.145.2 Member Function Documentation

6.145.2.1 `virtual ConnectException* decaf::net::ConnectException::clone () const`
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::net::SocketException` (p. 2473).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ConnectException.h`

6.146 cms::Connection Class Reference

The client's connection to its provider.

```
#include <src/main/cms/Connection.h>
```

Inheritance diagram for `cms::Connection`:

Public Member Functions

- virtual `~Connection ()` throw ()
- virtual void `close ()=0`
Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).
- virtual const `ConnectionMetaData * getMetaData ()` const =0
Gets the metadata for this connection.
- virtual `Session * createSession ()=0`
Creates an AUTO_ACKNOWLEDGE Session (p. 2361).
- virtual `Session * createSession (Session::AcknowledgeMode ackMode)=0`
Creates a new Session (p. 2361) to work for this Connection (p. 933) using the specified acknowledgment mode.
- virtual `std::string getClientID ()` const =0
Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.
- virtual void `setClientID (const std::string &clientID)=0`
Sets the client identifier for this connection.
- virtual `ExceptionListener * getExceptionListener ()` const =0

Gets the registered Exception Listener for this connection.

- virtual void **setExceptionListener** (**ExceptionListener** *listener)=0

Sets the registered Exception Listener for this connection.

6.146.1 Detailed Description

The client's connection to its provider.

Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a **ConnectionMetaData** (p. 978) object.
- It supports an optional **ExceptionListener** (p. 1286) object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavy-weight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The CMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A CMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's start method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

Since

1.0

6.146.2 Constructor & Destructor Documentation

6.146.2.1 virtual cms::Connection::~Connection () throw () [virtual]

6.146.3 Member Function Documentation

6.146.3.1 `virtual void cms::Connection::close ()` [pure virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

<i>CMSException</i> (p. 826)
--

Implements **cms::Closeable** (p. 816).

Implemented in **activemq::core::ActiveMQConnection** (p. 195).

6.146.3.2 `virtual Session* cms::Connection::createSession ()` [pure virtual]

Creates an AUTO_ACKNOWLEDGE **Session** (p. 2361).

Exceptions

<i>CMSException</i> (p. 826)
--

Implemented in **activemq::core::ActiveMQConnection** (p. 196).

6.146.3.3 `virtual Session* cms::Connection::createSession (Session::AcknowledgeMode ackMode)` [pure virtual]

Creates a new **Session** (p. 2361) to work for this **Connection** (p. 933) using the specified acknowledgment mode.

Parameters

<i>ackMode</i>	the Acknowledgment Mode to use.
----------------	---------------------------------

Exceptions

<i>CMSException</i> (p. 826)
--

Implemented in **activemq::core::ActiveMQConnection** (p. 196), and **activemq::core::ActiveMQXAConnection** (p. 433).

6.146.3.4 `virtual std::string cms::Connection::getClientID () const [pure virtual]`

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the `setClientID` method.

Returns

Client Id String for this **Connection** (p. 933).

Exceptions

<i>CMSEException</i> (p. 826)	if the provider fails to return the client id or an internal error occurs.
---	--

Implemented in **activemq::core::ActiveMQConnection** (p. 198).

6.146.3.5 `virtual ExceptionListener* cms::Connection::getExceptionListener () const [pure virtual]`

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

Implemented in **activemq::core::ActiveMQConnection** (p. 199).

6.146.3.6 `virtual const ConnectionMetaData* cms::Connection::getMetaData () const [pure virtual]`

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

<i>CMSEException</i> (p. 826)	if the provider fails to get the connection metadata for this connection.
---	---

See also

ConnectionMetaData (p. 978)

Since

2.0

Implemented in **activemq::core::ActiveMQConnection** (p. 200).

6.146.3.7 **virtual void cms::Connection::setClientID (const std::string & clientID)**
[pure virtual]

Sets the client identifier for this connection.

The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 955) object and transparently assigned to the **Connection** (p. 933) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1419).

Parameters

<i>clientID</i>	The unique client identifier to assign to the Connection (p. 933).
-----------------	---

Exceptions

CMSException (p. 826)	if the provider fails to set the client id due to some internal error.
<i>InvalidClientID-Exception</i>	if the id given is somehow invalid or is a duplicate.
IllegalStateException (p. 1419)	if the client tries to set the id after a Connection (p. 933) method has been called.

Implemented in **activemq::core::ActiveMQConnection** (p. 207).

6.146.3.8 **virtual void cms::Connection::setExceptionListener (ExceptionListener * listener)** [pure virtual]

Sets the registered Exception Listener for this connection.

Parameters

<i>listener</i>	pointer to and ExceptionListener (p. 1286)
-----------------	---

Implemented in **activemq::core::ActiveMQConnection** (p. 209).

The documentation for this class was generated from the following file:

- src/main/cms/**Connection.h**

6.147 activemq::commands::ConnectionControl Class Reference

```
#include <src/main/activemq/commands/ConnectionControl.h>
```

Inheritance diagram for activemq::commands::ConnectionControl:

Public Member Functions

- **ConnectionControl** ()

6.147.1 Constructor & Destructor Documentation

6.147.1.1 **activemq::commands::ConnectionControl::ConnectionControl** ()

6.147.1.2 **virtual activemq::commands::ConnectionControl::~~ConnectionControl** () [virtual]

6.147.2 Member Function Documentation

6.147.2.1 **virtual ConnectionControl*** **activemq::commands::ConnectionControl::cloneDataStructure** () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.147.2.2 `virtual void activemq::commands::ConnectionControl::copyDataStructure (const DataStructure * src)`
[virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 493).

6.147.2.3 `virtual bool activemq::commands::ConnectionControl::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure` (p. 1133)'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 494).

6.147.2.4 `virtual const std::string& activemq::commands::ConnectionControl::getConnectedBrokers () const`
[virtual]

6.147.2.5 `virtual std::string& activemq::commands::ConnectionControl::getConnectedBrokers ()` [virtual]

6.147.2.6 `virtual unsigned char activemq::commands::ConnectionControl::getDataStructureType () const` [virtual]

Get the `DataStructure` (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements `activemq::commands::DataStructure` (p. 1137).

6.147.2.7 `virtual const std::string& activemq::commands::ConnectionControl::getReconnectTo () const` [virtual]

- 6.147.2.8 `virtual std::string& activemq::commands::ConnectionControl::get-ReconnectTo () [virtual]`
- 6.147.2.9 `virtual bool activemq::commands::ConnectionControl::isClose () const [virtual]`
- 6.147.2.10 `virtual bool activemq::commands::ConnectionControl::isConnectionControl () const [inline, virtual]`

Returns

an answer of true to the **isConnectionControl()** (p. 941) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 495).

- 6.147.2.11 `virtual bool activemq::commands::ConnectionControl::isExit () const [virtual]`
- 6.147.2.12 `virtual bool activemq::commands::ConnectionControl::isFaultTolerant () const [virtual]`
- 6.147.2.13 `virtual bool activemq::commands::ConnectionControl::isRebalance-Connection () const [virtual]`
- 6.147.2.14 `virtual bool activemq::commands::ConnectionControl::isResume () const [virtual]`
- 6.147.2.15 `virtual bool activemq::commands::ConnectionControl::isSuspend () const [virtual]`
- 6.147.2.16 `virtual void activemq::commands::ConnectionControl::setClose (bool close) [virtual]`
- 6.147.2.17 `virtual void activemq::commands::ConnectionControl::set-ConnectedBrokers (const std::string & connectedBrokers) [virtual]`
- 6.147.2.18 `virtual void activemq::commands::ConnectionControl::setExit (bool exit) [virtual]`
- 6.147.2.19 `virtual void activemq::commands::ConnectionControl::setFaultTolerant (bool faultTolerant) [virtual]`
- 6.147.2.20 `virtual void activemq::commands::ConnectionControl::setRebalanceConnection (bool rebalanceConnection) [virtual]`

6.147.2.21 `virtual void activemq::commands::ConnectionControl::setReconnectTo (const std::string & reconnectTo) [virtual]`

6.147.2.22 `virtual void activemq::commands::ConnectionControl::setResume (bool resume) [virtual]`

6.147.2.23 `virtual void activemq::commands::ConnectionControl::setSuspend (bool suspend) [virtual]`

6.147.2.24 `virtual std::string activemq::commands::ConnectionControl::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.147.2.25 `virtual Pointer<Command> activemq::commands::ConnectionControl::visit (activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.147.3 Field Documentation

6.147.3.1 `bool activemq::commands::ConnectionControl::close [protected]`

6.148.2.1 **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::ConnectionControlMarshaller** ()
[inline]

6.148.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::~~ConnectionControlMarshaller** ()
[inline, virtual]

6.148.3 Member Function Documentation

6.148.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::createObject** ()
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.148.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::generated-
::ConnectionControlMarshaller::getDataStructureType () const
[virtual]`

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.148.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::-
ConnectionControlMarshaller::looseMarshal (OpenWireFormat * format,
commands::DataStructure * command, decaf::io::DataOutputStream * ds
) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-
CommandMarshaller** (p. 500).

6.148.3.4 `virtual void activemq::wireformat::openwire::marshal-
::generated::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * format,
commands::DataStructure * command,
decaf::io::DataInputStream * dis) [virtual]`

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

6.148 activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller Class

Reference

947

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 501).

6.148.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 503).

6.148.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 504).

```
6.148.3.7 virtual void activemq::wireformat::openwire::marshal-
::generated::ConnectionControlMarshaller::tightUnmarshal (
OpenWireFormat * format, commands::DataStructure * command,
decaf::io::DataInputStream * dis, utils::BooleanStream * bs )
[virtual]
```

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

The documentation for this class was generated from the following file:

6.149 activemq::commands::ConnectionError Class Reference

```
#include <src/main/activemq/commands/ConnectionError.h>
```

Inheritance diagram for activemq::commands::ConnectionError:

Public Member Functions

- **ConnectionError** ()
- virtual **~ConnectionError** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ConnectionError** * **cloneDataStructure** () const
Clone this obbect and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const
*Returns a string containing the information for this **DataSetructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataSetructure** *value) const
*Compares the **DataSetructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer** < **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()
- virtual void **setException** (const **Pointer**< **BrokerError** > &exception)
- virtual const **Pointer** < **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONNECTIONERROR** = 16

Protected Attributes

- **Pointer**< **BrokerError** > **exception**
- **Pointer**< **ConnectionId** > **connectionId**

6.149.1 Constructor & Destructor Documentation

6.149.1.1 **activemq::commands::ConnectionError::ConnectionError** ()

6.149.1.2 **virtual activemq::commands::ConnectionError::~~ConnectionError** ()
[virtual]

6.149.2 Member Function Documentation

6.149.2.1 **virtual ConnectionError* activemq::commands::-ConnectionError::cloneDataSetructure** () const
[virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataSetructure** (p. 1133).

6.149.2.2 `virtual void activemq::commands::ConnectionError::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 493).

6.149.2.3 `virtual bool activemq::commands::ConnectionError::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 494).

6.149.2.4 `virtual const Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () const [virtual]`

6.149.2.5 `virtual Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () [virtual]`

6.149.2.6 `virtual unsigned char activemq::commands::ConnectionError::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements `activemq::commands::DataStructure` (p. 1137).

6.149.2.7 `virtual const Pointer<BrokerError>& activemq::commands::ConnectionError::getException () const [virtual]`

6.149.2.8 virtual **Pointer**<**BrokerError**>& **activemq::commands::ConnectionError::getException** () [virtual]

6.149.2.9 virtual void **activemq::commands::ConnectionError::setConnectionId** (const **Pointer**< **ConnectionId** > & *connectionId*) [virtual]

6.149.2.10 virtual void **activemq::commands::ConnectionError::setException** (const **Pointer**< **BrokerError** > & *exception*) [virtual]

6.149.2.11 virtual std::string **activemq::commands::ConnectionError::toString** () const [virtual]

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.149.2.12 virtual **Pointer**<**Command**> **activemq::commands::ConnectionError::visit** (**activemq::state::CommandVisitor** * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.149.3 Field Documentation

6.149.3.1 **Pointer**<**ConnectionId**> **activemq::commands::ConnectionError::connectionId** [protected]

6.149.3.2 **Pointer**<**BrokerError**> **activemq::commands::ConnectionError::exception** [protected]

6.149.3.3 const unsigned char **activemq::commands::ConnectionError::ID_CONNECTIONERROR** = 16 [static]

6.150.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p. 951).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.150 activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller Class

Reference

953

6.150.2 Constructor & Destructor Documentation

6.150.2.1 **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::ConnectionErrorMarshaller ()**
[inline]

6.150.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::~~ConnectionErrorMarshaller ()**
[inline, virtual]

6.150.3 Member Function Documentation

6.150.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::createObject ()**
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.150.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::getDataStructureType () const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.150.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 500).

6.150.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis) [virtual]`

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.150.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) [virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.150 activemq::wireformat::openwire::marshal::generated::ConnectionError-Marshaller Class

Reference

955

6.150.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.150.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).
