6.404.3.11 static util::PrimitiveMap* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalMap (decaf::io::DataInputStream & dataIn) [static]

Unmarshal a PrimitiveMap from the provided DataInputStream.

Parameters

<i>dataIn</i>	The DataInputStream instance to read the marshaled PrimitiveMap from.
---------------	---

Returns

a pointer to a newly allocated PrimitiveMap instance.

Exceptions

<i>Exception</i>	if an error occurs during the unmarshal process.
------------------	--

6.404.3.12 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & dataIn) [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters

<i>dataIn</i>	- DataInputStream to read from.
---------------	---------------------------------

Returns

a PrimitiveValueNode containing the data.

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

6.404.3.13 **static void activemq::wireformat::openwire::marshal::PrimitiveTypes-Marshaller::unmarshalPrimitiveList (decaf::io::DataInputStream & dataIn, decaf::util::LinkedList< util::PrimitiveValueNode > & list)** [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

<i>dataIn</i>	- DataInputStream to read from.
<i>list</i>	- the ValueNode to write.

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

6.404.3.14 **static void activemq::wireformat::openwire::marshal::PrimitiveTypes-Marshaller::unmarshalPrimitiveMap (decaf::io::DataInputStream & dataIn, util::PrimitiveMap & map)** [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

<i>dataIn</i>	- DataInputStream to read from.
<i>map</i>	- the map to fill with data.

Exceptions

<i>IOException</i>	if an I/O error occurs during this operation.
--------------------	---

The documentation for this class was generated from the following file:

6.405 activemq::util::PrimitiveValueNode::PrimitiveValue Union - Reference

Define a union type comprised of the various types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

Data Fields

- bool **boolValue**
- unsigned char **byteValue**
- char **charValue**
- short **shortValue**
- int **intValue**
- long long **longValue**
- double **doubleValue**
- float **floatValue**
- std::string * **stringValue**
- std::vector< unsigned char > * **byteArrayValue**
- **decaf::util::List** < **PrimitiveValueNode** > * **listValue**
- **decaf::util::Map**< std::string, **PrimitiveValueNode** > * **mapValue**

6.405.1 Detailed Description

Define a union type comprised of the various types.

6.405.2 Field Documentation

6.405.2.1 bool **activemq::util::PrimitiveValueNode::PrimitiveValue::boolValue**

6.405.2.2 **std::vector<unsigned char>*** **activemq::util::PrimitiveValueNode::PrimitiveValue::byteArrayValue**

6.405.2.3 unsigned char **activemq::util::PrimitiveValueNode::PrimitiveValue::byteValue**

6.405.2.4 char **activemq::util::PrimitiveValueNode::PrimitiveValue::charValue**

6.405.2.5 double **activemq::util::PrimitiveValueNode::PrimitiveValue::doubleValue**

6.405.2.6 float **activemq::util::PrimitiveValueNode::PrimitiveValue::floatValue**

6.405.2.7 int **activemq::util::PrimitiveValueNode::PrimitiveValue::intValue**

6.405.2.8 **decaf::util::List<PrimitiveValueNode>*** **activemq::util::PrimitiveValueNode::PrimitiveValue::listValue**

6.405.2.9 long long **activemq::util::PrimitiveValueNode::PrimitiveValue::longValue**

6.405.2.10 **decaf::util::Map<std::string, PrimitiveValueNode>*** **activemq::util::PrimitiveValueNode::PrimitiveValue::mapValue**

6.405.2.11 short **activemq::util::PrimitiveValueNode::PrimitiveValue::shortValue**

6.405.2.12 `std::string*` `activemq::util::PrimitiveValueNode::PrimitiveValue::stringValue`

The documentation for this union was generated from the following file:

- `src/main/activemq/util/PrimitiveValueNode.h`

6.406 `activemq::util::PrimitiveValueConverter` Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2145) from one type to another.

```
#include <src/main/activemq/util/PrimitiveValueConverter.h>
```

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual **~PrimitiveValueConverter** ()
- `template<typename TO >`
TO convert (const **PrimitiveValueNode** &value) const

6.406.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2145) from one type to another.

If the conversion is supported then calling the convert method will throw an `UnsupportedOperationException` to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

		boolean	byte	short	int	long	float	double	String	-----				
-----		boolean	X X	byte	X X X X X	short	X X X X	int	X X X	long	X X	float	X X	
X		double	X X	String	X X X X X X X X		-----							

Since

3.0

6.406.3 Member Function Documentation

6.406.3.1 `std::vector< unsigned char > activemq::util::PrimitiveValueConverter::convert(const PrimitiveValueNode & value) const [inline]`

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveValueConverter.h`

6.407 activemq::util::PrimitiveValueNode Class Reference

Class that wraps around a single value of one of the many types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

Data Structures

- union **PrimitiveValue**
Define a union type comprised of the various types.

Public Types

- enum **PrimitiveType** { **NULL_TYPE** = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3, **SHORT_TYPE** = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7, **FLOAT_TYPE** = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **MAP_TYPE** = 11, **LIST_TYPE** = 12, **BIG_STRING_TYPE** = 13 }
- Enumeration for the various primitive types.*

Public Member Functions

- **PrimitiveValueNode** ()
Default Constructor, creates a value of the NULL_TYPE.
- **PrimitiveValueNode** (bool value)
Boolean Value Constructor.
- **PrimitiveValueNode** (unsigned char value)
Byte Value Constructor.
- **PrimitiveValueNode** (char value)
Char Value Constructor.
- **PrimitiveValueNode** (short value)

Short Value Constructor.

- **PrimitiveValueNode** (int value)

Int Value Constructor.

- **PrimitiveValueNode** (long long value)

Long Value Constructor.

- **PrimitiveValueNode** (float value)

Float Value Constructor.

- **PrimitiveValueNode** (double value)

Double Value Constructor.

- **PrimitiveValueNode** (const char *value)

String Value Constructor.

- **PrimitiveValueNode** (const std::string &value)

String Value Constructor.

- **PrimitiveValueNode** (const std::vector< unsigned char > &value)

Byte Array Value Constructor.

- **PrimitiveValueNode** (const **decaf::util::List**< **PrimitiveValueNode** > &value)

Primitive List Constructor.

- **PrimitiveValueNode** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

Primitive Map Value Constructor.

- **PrimitiveValueNode** (const **PrimitiveValueNode** &node)

Copy constructor.

- **~PrimitiveValueNode** ()

- **PrimitiveValueNode & operator=** (const **PrimitiveValueNode** &node)

Assignment operator, copies the data from the other node.

- bool **operator==** (const **PrimitiveValueNode** &node) const

Comparison Operator, compares this node to the other node.

- **PrimitiveType** **getType** () const

Gets the Value Type of this type wrapper.

- **PrimitiveValue** **getValue** () const

Gets the internal Primitive Value object from this wrapper.

- void **setValue** (const **PrimitiveValue** &value, **PrimitiveType** valueType)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

- void **clear** ()

Clears the value from this wrapper converting it back to a blank NULL_ TYPE value.

- void **setBool** (bool value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- bool **getBool** () const

Gets the Boolean value of this Node.

- void **setByte** (unsigned char value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- unsigned char **getByte** () const
Gets the Byte value of this Node.
- void **setChar** (char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- char **getChar** () const
Gets the Character value of this Node.
- void **setShort** (short value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- short **getShort** () const
Gets the Short value of this Node.
- void **setInt** (int value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- int **getInt** () const
Gets the Integer value of this Node.
- void **setLong** (long long value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- long long **getLong** () const
Gets the Long value of this Node.
- void **setFloat** (float value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- float **getFloat** () const
Gets the Float value of this Node.
- void **setDouble** (double value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- double **getDouble** () const
Gets the Double value of this Node.
- void **setString** (const std::string &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::string **getString** () const
Gets the String value of this Node.
- void **setByteArray** (const std::vector< unsigned char > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::vector< unsigned char > **getByteArray** () const
Gets the Byte Array value of this Node.
- void **setList** (const decaf::util::List< PrimitiveValueNode > &value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- const **decaf::util::List** < **PrimitiveValueNode** > & **getList** () const

Gets the Primitive List value of this Node.

- void **setMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- const **decaf::util::Map** < std::string, **PrimitiveValueNode** > & **getMap** () const

Gets the Primitive Map value of this Node.

- std::string **toString** () const

Creates a string representation of this value.

6.407.1 Detailed Description

Class that wraps around a single value of one of the many types.

Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.407.2 Member Enumeration Documentation

6.407.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

Enumerator:

NULL_TYPE
BOOLEAN_TYPE
BYTE_TYPE
CHAR_TYPE
SHORT_TYPE
INTEGER_TYPE
LONG_TYPE
DOUBLE_TYPE
FLOAT_TYPE
STRING_TYPE
BYTE_ARRAY_TYPE
MAP_TYPE
LIST_TYPE
BIG_STRING_TYPE

6.407.3 Constructor & Destructor Documentation

6.407.3.1 `activemq::util::PrimitiveValueNode::PrimitiveValueNode ()`

Default Constructor, creates a value of the NULL_TYPE.

6.407.3.2 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool value)`

Boolean Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.3 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char value)`

Byte Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.4 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (char value)`

Char Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.5 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (short value)`

Short Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.6 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (int value)`

Int Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.7 **activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long *value*)**

Long Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.8 **activemq::util::PrimitiveValueNode::PrimitiveValueNode (float *value*)**

Float Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.9 **activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)**

Double Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.10 **activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)**

String Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.11 **activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & *value*)**

String Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.12 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const
std::vector< unsigned char > & value)`

Byte Array Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.13 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const
decaf::util::List< PrimitiveValueNode > & value)`

Primitive List Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.14 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const
decaf::util::Map< std::string, PrimitiveValueNode > & value)`

Primitive Map Value Constructor.

Parameters

<i>value</i>	- the new value to store.
--------------	---------------------------

6.407.3.15 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const
PrimitiveValueNode & node)`

Copy constructor.

Parameters

<i>node</i>	The instance of another node to copy to this one.
-------------	---

6.407.3.16 `activemq::util::PrimitiveValueNode::~~PrimitiveValueNode ()
[inline]`

6.407.4 Member Function Documentation

6.407.4.1 void activemq::util::PrimitiveValueNode::clear ()

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.407.4.2 bool activemq::util::PrimitiveValueNode::getBool () const

Gets the Boolean value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.3 unsigned char activemq::util::PrimitiveValueNode::getByte () const

Gets the Byte value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.4 std::vector<unsigned char> activemq::util::PrimitiveValueNode::getByteArray () const

Gets the Byte Array value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.5 char activemq::util::PrimitiveValueNode::getChar () const

Gets the Character value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.6 double activemq::util::PrimitiveValueNode::getDouble () const

Gets the Double value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.7 float activemq::util::PrimitiveValueNode::getFloat () const

Gets the Float value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.8 int activemq::util::PrimitiveValueNode::getInt () const

Gets the Integer value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.9 `const decaf::util::List<PrimitiveValueNode>&
activemq::util::PrimitiveValueNode::getList () const`

Gets the Primitive List value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.10 `long long activemq::util::PrimitiveValueNode::getLong () const`

Gets the Long value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.11 `const decaf::util::Map<std::string, PrimitiveValueNode>&
activemq::util::PrimitiveValueNode::getMap () const`

Gets the Primitive Map value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.12 short activemq::util::PrimitiveValueNode::getShort () const

Gets the Short value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.13 std::string activemq::util::PrimitiveValueNode::getString () const

Gets the String value of this Node.

Returns

value contained at the given index

Exceptions

<i>NoSuchElementException</i>	this node cannot be returned as the requested type.
-------------------------------	---

6.407.4.14 PrimitiveType activemq::util::PrimitiveValueNode::getType () const
[inline]

Gets the Value Type of this type wrapper.

Returns

the PrimitiveType value for this wrapper.

6.407.4.15 PrimitiveValue activemq::util::PrimitiveValueNode::getValue () const
[inline]

Gets the internal Primitive Value object from this wrapper.

Returns

a copy of the contained **PrimitiveValue** (p. 2142)

6.407.4.16 `PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator= (const PrimitiveValueNode & node)`

Assignment operator, copies the data from the other node.

Parameters

<i>node</i>	The instance of another node to copy to this one.
-------------	---

6.407.4.17 `bool activemq::util::PrimitiveValueNode::operator== (const PrimitiveValueNode & node) const`

Comparison Operator, compares this node to the other node.

Returns

true if the values are the same false otherwise.

6.407.4.18 `void activemq::util::PrimitiveValueNode::setBool (bool value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.19 `void activemq::util::PrimitiveValueNode::setByte (unsigned char value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.20 void **activemq::util::PrimitiveValueNode::setByteArray** (const
std::vector< unsigned char > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.21 void **activemq::util::PrimitiveValueNode::setChar** (char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.22 void **activemq::util::PrimitiveValueNode::setDouble** (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.23 void **activemq::util::PrimitiveValueNode::setFloat** (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.24 void **activemq::util::PrimitiveValueNode::setInt** (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.25 `void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.26 `void activemq::util::PrimitiveValueNode::setLong (long long value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.27 `void activemq::util::PrimitiveValueNode::setMap (const decaf::util::Map< std::string, PrimitiveValueNode > & value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.28 `void activemq::util::PrimitiveValueNode::setShort (short value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.29 `void activemq::util::PrimitiveValueNode::setString (const std::string & value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

<i>value</i>	- the new value to assign to the element at index
--------------	---

6.407.4.30 void **activemq::util::PrimitiveValueNode::setValue** (const **PrimitiveValue** & *value*, **PrimitiveType** *valueType*)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters

<i>value</i>	The value to set as the value contained in this Node.
<i>valueType</i>	The type of the value being set into this one.

6.407.4.31 std::string **activemq::util::PrimitiveValueNode::toString** () const

Creates a string representation of this value.

Returns

string value of this type wrapper.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveValueNode.h**

6.408 decaf::security::Principal Class Reference

Base interface for a principal, which can represent an individual or organization.

```
#include <src/main/decaf/security/Principal.h>
```

Inheritance diagram for decaf::security::Principal:

Public Member Functions

- virtual ~**Principal** ()
- virtual bool **equals** (const **Principal** &another) const =0
Compares two principals to see if they are the same.
- virtual std::string **getName** () const =0
Provides the name of this principal.

6.408.1 Detailed Description

Base interface for a principal, which can represent an individual or organization.

6.408.2 Constructor & Destructor Documentation

6.408.2.1 `virtual decaf::security::Principal::~Principal () [inline, virtual]`

6.408.3 Member Function Documentation

6.408.3.1 `virtual bool decaf::security::Principal::equals (const Principal & another) const [pure virtual]`

Compares two principals to see if they are the same.

Parameters

<i>another</i>	A principal to be tested for equality to this one.
----------------	--

Returns

true if the given principal is equivalent to this one.

6.408.3.2 `virtual std::string decaf::security::Principal::getName () const [pure virtual]`

Provides the name of this principal.

Returns

the name of this principal.

Implemented in `decaf::security::auth::x500::X500Principal` (p. 2914).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/Principal.h`

6.409 decaf::util::PriorityQueue< E > Class Template Reference

An unbounded priority queue based on a binary heap algorithm.

```
#include <src/main/decaf/util/PriorityQueue.h>
```

Inheritance diagram for `decaf::util::PriorityQueue< E >`:

Data Structures

- class **ConstPriorityQueueIterator**
- class **PriorityQueueIterator**

Public Member Functions

- **PriorityQueue** ()
*Creates a **Priority Queue** (p. 2222) with the default initial capacity.*
- **PriorityQueue** (int initialCapacity)
*Creates a **Priority Queue** (p. 2222) with the capacity value supplied.*
- **PriorityQueue** (int initialCapacity, **Comparator**< E > *comparator)
*Creates a **Priority Queue** (p. 2222) with the default initial capacity.*
- **PriorityQueue** (const **Collection**< E > &source)
*Creates a **PriorityQueue** (p. 2160) containing the elements in the specified **Collection** (p. 851).*
- **PriorityQueue** (const **PriorityQueue**< E > &source)
*Creates a **PriorityQueue** (p. 2160) containing the elements in the specified priority queue.*
- virtual **~PriorityQueue** ()
- **PriorityQueue**< E > & **operator=** (const **Collection**< E > &source)
*Assignment operator, assign another **Collection** (p. 851) to this one.*
- **PriorityQueue**< E > & **operator=** (const **PriorityQueue**< E > &source)
*Assignment operator, assign another **PriorityQueue** (p. 2160) to this one.*
- virtual **decaf::util::Iterator** < E > * **iterator** ()
- virtual **decaf::util::Iterator** < E > * **iterator** () const
- virtual int **size** () const
Returns the number of elements in this collection.
- virtual void **clear** ()
*Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the - **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.
Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection
--------------------------------	--

This implementation repeatedly invokes poll until it returns false.

- virtual bool **offer** (const E &value)
Inserts the specified element into the queue provided that the condition allows such an operation.
- virtual bool **poll** (E &result)

Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const

Gets but not removes the element in the head of the queue.

- virtual E **remove** ()

Gets and removes the element in the head of the queue.

*Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.*

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	<i>if there is no element in the queue.</i>
--	---

This implementation returns the result of poll unless the queue is empty.

- virtual bool **remove** (const E &value)

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	<i>The reference to the element to remove from this Collection (p. 851).</i>
-------	---

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>

This implementation iterates over the collection looking for the specified element. - If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **add** (const E &value)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false).

This preserves the invariant that a collection always contains the specified element

after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this Collection (p. 851).
-------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

UnsupportedOperationException	if this is an unmodifiable collection.
NullPointerException	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an *IllegalStateException*.

- **decaf::lang::Pointer < Comparator< E > > comparator () const**

obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 2160) is using to compare the elements in the queue with.

Friends

- class **PriorityQueueIterator**

6.409.1 Detailed Description

```
template<typename E>class decaf::util::PriorityQueue< E >
```

An unbounded priority queue based on a binary heap algorithm.

The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 888) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. - If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an internal capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 851) and **Iterator** (p. 1559) interfaces. The **Iterator** (p. 1559) provided in method **iterator()** (p. 2167) is not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort(pq.toArray())`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 2160) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe `PriorityBlockingQueue` class.

Implementation note: this implementation provides $O(\log(n))$ time for the enqueueing and dequeuing methods (`offer`, `poll`, **`remove()`** (p. 2169) and `add`); linear time for the `remove(-Object)` and `contains(Object)` methods; and constant time for the retrieval methods (`peek`, `element`, and `size`).

Since

1.0

6.409.2 Constructor & Destructor Documentation

6.409.2.1 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ()`
[inline]

Creates a **Priority Queue** (p. 2222) with the default initial capacity.

6.409.2.2 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (int
initialCapacity)` [inline]

Creates a **Priority Queue** (p. 2222) with the capacity value supplied.

Parameters

<i>initial-Capacity</i>	The initial number of elements allocated to this PriorityQueue (p. 2160).
-------------------------	--

6.409.2.3 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (int
initialCapacity, Comparator< E > * comparator)` [inline]

Creates a **Priority Queue** (p. 2222) with the default initial capacity.

This new **PriorityQueue** (p. 2160) takes ownership of the passed **Comparator** (p. 888) instance and uses that to determine the ordering of the elements in the **Queue** (p. 2222).

Parameters

<i>initial-Capacity</i>	The initial number of elements allocated to this PriorityQueue (p. 2160).
<i>comparator</i>	The Comparator (p. 888) instance to use in sorting the elements in the Queue (p. 2222).

Exceptions

<i>NullPointerException</i>	if the passed Comparator (p. 888) is NULL.
-----------------------------	---

6.409.2.4 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const Collection< E > & source) [inline]`

Creates a **PriorityQueue** (p. 2160) containing the elements in the specified **Collection** (p. 851).

Parameters

<i>source</i>	the Collection (p. 851) whose elements are to be placed into this priority queue
---------------	---

6.409.2.5 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const PriorityQueue< E > & source) [inline]`

Creates a **PriorityQueue** (p. 2160) containing the elements in the specified priority queue.

This priority queue will be ordered according to the same ordering as the given priority queue.

Parameters

<i>source</i>	the priority queue whose elements are to be placed into this priority queue
---------------	---

6.409.2.6 `template<typename E> virtual decaf::util::PriorityQueue< E >::~~PriorityQueue () [inline, virtual]`

6.409.3 Member Function Documentation

6.409.3.1 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::add (const E & value) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an `IllegalStateException`.

This implementation returns true if offer succeeds, else throws an `IllegalStateException`.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 139).

References `DECAF_CATCH_EXCEPTION_CONVERT`, `DECAF_CATCH_RETHROW`, `DECAF_CATCHALL_THROW`, and `decaf::util::PriorityQueue< E >::offer()`.

6.409.3.2 `template<typename E> virtual void decaf::util::PriorityQueue< E >::clear ()`
`[inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>Unsupported- OperationException</i>	if the clear operation is not supported by this collection
--	--

This implementation repeatedly invokes poll until it returns false.

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 141).

6.409.3.3 `template<typename E> decaf::lang::Pointer< Comparator<E> >
decaf::util::PriorityQueue< E >::comparator () const [inline]`

obtains a Copy of the Pointer instance that this **PriorityQueue** (p.2160) is using to compare the elements in the queue with.

The returned value is a copy, the caller cannot change the value if the internal Pointer value.

Returns

a copy of the **Comparator** (p. 888) Pointer being used by this **Queue** (p. 2222).

6.409.3.4 `template<typename E> virtual decaf::util::Iterator<E>*
decaf::util::PriorityQueue< E >::iterator () [inline, virtual]`

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1557).

References **decaf::util::PriorityQueue< E >::PriorityQueueIterator**.

6.409.3.5 `template<typename E> virtual decaf::util::Iterator<E>*
decaf::util::PriorityQueue< E >::iterator () const [inline,
virtual]`

Implements **decaf::lang::Iterable< E >** (p. 1558).

6.409.3.6 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (
const E & value) [inline, virtual]`

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

Parameters

<i>value</i>	the specified element to insert into the queue.
--------------	---

Returns

true if the operation succeeds and false if it fails.

Exceptions

<i>NullPointerException</i>	if the Queue (p. 2222) implementation does not allow Null values to be inserted into the Queue (p. 2222).
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2224).

Referenced by **decaf::util::PriorityQueue< E >::add()**.

```
6.409.3.7  template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E
>::operator= ( const Collection< E > & source )  [inline]
```

Assignment operator, assign another **Collection** (p. 851) to this one.

Parameters

<i>source</i>	The Collection (p. 851) to copy to this one.
---------------	---

```
6.409.3.8  template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E
>::operator= ( const PriorityQueue< E > & source )  [inline]
```

Assignment operator, assign another **PriorityQueue** (p. 2160) to this one.

Parameters

<i>source</i>	The PriorityQueue (p. 2160) to copy to this one.
---------------	---

```
6.409.3.9  template<typename E> virtual bool decaf::util::PriorityQueue< E >::peek ( E
& result ) const  [inline, virtual]
```

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2225).

References **decaf::util::AbstractCollection< E >::isEmpty()**.

6.409.3.10 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::poll (E & result) [inline, virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 2222) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2225).

References **decaf::util::AbstractCollection< E >::isEmpty()**.

6.409.3.11 `template<typename E> virtual E decaf::util::PriorityQueue< E >::remove () [inline, virtual]`

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	if there is no element in the queue.
--	--------------------------------------

This implementation returns the result of poll unless the queue is empty.

This implementation returns the result of poll unless the queue is empty.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 142).

References **decaf::util::AbstractCollection< E >::isEmpty()**.

6.409.3.12 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::remove
(const E & value) [inline, virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (*value* == NULL ? *e* == NULL : *value* == *e*), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	The reference to the element to remove from this Collection (p. 851).
--------------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 116).

6.409.3.13 `template<typename E> virtual int decaf::util::PriorityQueue< E >::size ()
const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements `decaf::util::Collection< E >` (p. 864).

6.409.4 Friends And Related Function Documentation

6.409.4.1 `template<typename E> friend class PriorityQueueIterator [friend]`

6.410.1 Constructor & Destructor Documentation

6.410.1.1 **activemq::commands::ProducerAck::ProducerAck** ()

6.410.1.2 **virtual activemq::commands::ProducerAck::~~ProducerAck** ()
[virtual]

6.410.2 Member Function Documentation

6.410.2.1 **virtual ProducerAck* activemq::commands::ProducerAck::cloneDataSet** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataSet** (p. 1133).

6.410.2.2 `virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

6.410.2.3 `virtual bool activemq::commands::ProducerAck::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.410.2.4 `virtual unsigned char activemq::commands::ProducerAck::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.410.2.5 `virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () const [virtual]`

6.410.2.6 `virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () [virtual]`

6.410.2.7 `virtual int activemq::commands::ProducerAck::getSize () const [virtual]`

6.410.2.8 `virtual bool activemq::commands::ProducerAck::isProducerAck () const [inline, virtual]`

Returns

an answer of true to the **isProducerAck()** (p. 2173) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 496).

6.410.2.9 **virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & producerId)** [virtual]

6.410.2.10 **virtual void activemq::commands::ProducerAck::setSize (int size)** [virtual]

6.410.2.11 **virtual std::string activemq::commands::ProducerAck::toString () const** [virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.410.2.12 **virtual Pointer<Command> activemq::commands::ProducerAck::visit (activemq::state::CommandVisitor * visitor)** [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.411.3.3 virtual void **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::looseMarshal** (**OpenWireFormat** * *format*,
commands::DataStructure * *command*, **decaf::io::DataOutputStream** * *ds*
) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 500).

6.411.3.4 virtual void **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::looseUnmarshal** (**OpenWireFormat** * *format*,
commands::DataStructure * *command*, **decaf::io::DataInputStream** * *dis*)
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.411.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightMarshal1** (**OpenWireFormat** * *format*,
commands::DataStructure * *command*, **utils::BooleanStream** * *bs*)
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 503).

6.411.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 504).

6.411.3.7 `virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs) [virtual]`

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ProducerAck-Marshaller.h**

6.412 activemq::cmsutil::ProducerCallback Class Reference

Callback for sending a message to a CMS destination.

```
#include <src/main/activemq/cmsutil/ProducerCallback.h>
```

Inheritance diagram for activemq::cmsutil::ProducerCallback:

Public Member Functions

- virtual **~ProducerCallback** () throw ()
- virtual void **doInCms** (**cms::Session** *session, **cms::MessageProducer** *producer)=0

Execute an action given a session and producer.

6.412.1 Detailed Description

Callback for sending a message to a CMS destination.

6.412.2 Constructor & Destructor Documentation

6.412.2.1 virtual **activemq::cmsutil::ProducerCallback::~ProducerCallback** ()
throw () [inline, virtual]

6.412.3 Member Function Documentation

6.412.3.1 virtual void **activemq::cmsutil::ProducerCallback::doInCms** (
cms::Session * session, **cms::MessageProducer** * producer) [pure
virtual]

Execute an action given a session and producer.

Parameters

<i>session</i>	the CMS <code>Session</code>
<i>producer</i>	the CMS <code>Producer</code>

Exceptions

<code>cms::CMS-Exception</code> (p. 826)	if thrown by CMS API methods
--	------------------------------

Implemented in **`activemq::cmsutil::CmsTemplate::SendExecutor`** (p. 2342).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/ProducerCallback.h`

6.413 **`activemq::cmsutil::CmsTemplate::ProducerExecutor` Class - Reference**

```
#include <src/main/activemq/cmsutil/CmsTemplate.h>
```

Inheritance diagram for `activemq::cmsutil::CmsTemplate::ProducerExecutor`:

Public Member Functions

- **`ProducerExecutor`** (`ProducerCallback *action`, `CmsTemplate *parent`, `cms::Destination *destination`)
- virtual **`~ProducerExecutor`** () throw ()
- virtual void **`doInCms`** (`cms::Session *session`)
Execute any number of operations against the supplied CMS session.
- virtual **`cms::Destination * getDestination`** (`cms::Session *session` AMQCPP-UNUSED)

Protected Attributes

- **`ProducerCallback * action`**
- **`CmsTemplate * parent`**
- **`cms::Destination * destination`**

6.413.1 Constructor & Destructor Documentation

6.413 activemq::cmsutil::CmsTemplate::ProducerExecutor Class Reference 2187

6.413.1.1 `activemq::cmsutil::CmsTemplate::ProducerExecutor::ProducerExecutor (ProducerCallback * action, CmsTemplate * parent, cms::Destination * destination)` `[inline]`

6.413.1.2 `virtual activemq::cmsutil::CmsTemplate::Producer-Executor::~~ProducerExecutor () throw ()` `[inline, virtual]`

6.413.2 Member Function Documentation

6.413.2.1 `virtual void activemq::cmsutil::CmsTemplate::Producer-Executor::doInCms (cms::Session * session)` `[virtual]`

Execute any number of operations against the supplied CMS session.

Parameters

<i>session</i>	the CMS Session
----------------	-----------------

Exceptions

<i>CMSException</i>	if thrown by CMS API methods
---------------------	------------------------------

Implements `activemq::cmsutil::SessionCallback` (p. 2377).

6.413.2.2 `virtual cms::Destination* activemq::cmsutil::CmsTemplate::Producer-Executor::getDestination (cms::Session *session AMQCPP_UNUSED)` `[inline, virtual]`

6.414.2.5 `virtual activemq::commands::ProducerId::~~ProducerId ()
[virtual]`

6.414.3 Member Function Documentation

6.414.3.1 `virtual ProducerId* activemq::commands::ProducerId::cloneData-
Structure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1133).

6.414.3.2 `virtual int activemq::commands::ProducerId::compareTo (const
ProducerId & value) const [virtual]`

6.414.3.3 `virtual void activemq::commands::ProducerId::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1134).

6.414.3.4 `virtual bool activemq::commands::ProducerId::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure` (p. 1133)'s are Equal.

Implements `activemq::commands::DataStructure` (p. 1135).

6.414.3.5 `virtual bool activemq::commands::ProducerId::equals (const ProducerId & value) const [virtual]`

6.414.3.6 `virtual const std::string& activemq::commands::ProducerId::getConnectionId () const [virtual]`

6.414.3.7 `virtual std::string& activemq::commands::ProducerId::getConnectionId () [virtual]`

6.414.3.8 `virtual unsigned char activemq::commands::ProducerId::getDataStructureType () const [virtual]`

Get the `DataStructure` (p. 1133) Type as defined in `CommandTypes.h`.

Returns

The type of the data structure

Implements `activemq::commands::DataStructure` (p. 1137).

- 6.414.3.9 `const Pointer<SessionId>& activemq::commands::ProducerId::getParentId () const`
- 6.414.3.10 `virtual long long activemq::commands::ProducerId::getSessionId () const [virtual]`
- 6.414.3.11 `virtual long long activemq::commands::ProducerId::getValue () const [virtual]`
- 6.414.3.12 `virtual bool activemq::commands::ProducerId::operator< (const ProducerId & value) const [virtual]`
- 6.414.3.13 `ProducerId& activemq::commands::ProducerId::operator= (const ProducerId & other)`
- 6.414.3.14 `virtual bool activemq::commands::ProducerId::operator== (const ProducerId & value) const [virtual]`
- 6.414.3.15 `virtual void activemq::commands::ProducerId::setConnectionId (const std::string & connectionId) [virtual]`
- 6.414.3.16 `void activemq::commands::ProducerId::setProducerSessionKey (std::string sessionKey)`
- 6.414.3.17 `virtual void activemq::commands::ProducerId::setSessionId (long long sessionId) [virtual]`
- 6.414.3.18 `virtual void activemq::commands::ProducerId::setValue (long long value) [virtual]`
- 6.414.3.19 `virtual std::string activemq::commands::ProducerId::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 531).

6.414.4 Field Documentation

- 6.414.4.1 `std::string activemq::commands::ProducerId::connectionId [protected]`

6.414.4.2 `const unsigned char activemq::commands::ProducerId::ID_PRODUCERID = 123 [static]`

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.414.4.3 `long long activemq::commands::ProducerId::sessionId [protected]`

6.414.4.4 `long long activemq::commands::ProducerId::value [protected]`

The documentation for this class was generated from the following file:

ProducerIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::generated::-`
`ProducerIdMarshaller`:

Public Member Functions

- `ProducerIdMarshaller ()`
- `virtual ~ProducerIdMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of the class that this class is a marshaling director for.
- `virtual unsigned char getDataStructureType () const`
Gets the DataStructureType that this class marshals/unmarshals.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs)`
Tight Un-marhsal to the given stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs)`
Tight Marhsal to the given stream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs)`
Tight Marhsal to the given stream.

6.415

activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller

Class Reference

2193

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

Tight Marhsal to the given stream.

6.415.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2186).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.415.2 Constructor & Destructor Documentation

6.415.2.1 **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::ProducerIdMarshaller** ()
[inline]

6.415.2.2 virtual **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::~~ProducerIdMarshaller** () [inline, virtual]

6.415.3 Member Function Documentation

6.415.3.1 virtual **commands::DataStructure*** **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::createObject** () const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.415.3.2 virtual unsigned char **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::getDataStructureType** () const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.415.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::-
ProducerIdMarshaller::looseMarshal (OpenWireFormat * *format*,
commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*
) [virtual]**

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1123).

6.415.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::-
ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*,
commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)
[virtual]**

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1125).

6.415

activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller

Class Reference

2195

6.415.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightMarshal1** (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

6.415.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightMarshal2** (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

6.415.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightUnmarshal** (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

6.416.1.1 **activemq::commands::ProducerInfo::ProducerInfo** ()

6.416.1.2 **virtual activemq::commands::ProducerInfo::~~ProducerInfo** ()
[virtual]

6.416.2 Member Function Documentation

6.416.2.1 **virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.416.2.2 **virtual void activemq::commands::ProducerInfo::copyDataStructure (const DataStructure * src) [virtual]**

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

6.416.2.3 **Pointer<RemoveInfo> activemq::commands::ProducerInfo::createRemoveCommand () const**

6.416.2.4 **virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * value) const [virtual]**

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.416.2.5 **virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () const [virtual]**

6.416.2.6 **virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () [virtual]**

6.416.2.7 **virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType () const [virtual]**

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.416.2.8 **virtual const Pointer<ActiveMQDestination>& activemq-
::commands::ProducerInfo::getDestination () const**
[virtual]

6.416.2.9 **virtual Pointer<ActiveMQDestination>& activemq-
::commands::ProducerInfo::getDestination ()**
[virtual]

6.416.2.10 **virtual const Pointer<ProducerId>& activemq-
::commands::ProducerInfo::getProducerId () const**
[virtual]

6.416.2.11 **virtual Pointer<ProducerId>& activemq::commands::ProducerInfo-
::getProducerId ()** [virtual]

6.416.2.12 **virtual int activemq::commands::ProducerInfo::getWindowSize () const**
[virtual]

6.416.2.13 **virtual bool activemq::commands::ProducerInfo::isDispatchAsync ()**
const [virtual]

6.416.2.14 **virtual bool activemq::commands::ProducerInfo::isProducerInfo ()**
const [inline, virtual]

Returns

an answer of true to the **isProducerInfo()** (p. 2193) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 496).

6.416.2.15 **virtual void activemq::commands::ProducerInfo::setBrokerPath (**
const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)
[virtual]

6.416.2.16 **virtual void activemq::commands::ProducerInfo::setDestination (const**
Pointer< ActiveMQDestination > & destination) [virtual]

6.416.2.17 **virtual void activemq::commands::ProducerInfo::setDispatchAsync (**
bool dispatchAsync) [virtual]

6.416.2.18 **virtual void activemq::commands::ProducerInfo::setProducerId (const**
Pointer< ProducerId > & producerId) [virtual]

6.416.2.19 `virtual void activemq::commands::ProducerInfo::setWindowSize (int windowSize) [virtual]`

6.416.2.20 `virtual std::string activemq::commands::ProducerInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.416.2.21 `virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.417.3 Member Function Documentation

6.417.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire-
::marshal::generated::ProducerInfoMarshaller::createObject ()** const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1120).

6.417.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal-
::generated::ProducerInfoMarshaller::getDataStructureType ()** const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.417

activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller

Class Reference

2203

6.417.3.3 virtual void **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::looseMarshal** (**OpenWireFormat** * *format*,
commands::DataStructure * *command*, **decaf::io::DataOutputStream** * *ds*
) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 500).

6.417.3.4 virtual void **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::looseUnmarshal** (**OpenWireFormat** * *format*,
commands::DataStructure * *command*, **decaf::io::DataInputStream** * *dis*)
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.417.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightMarshal1** (**OpenWireFormat** * *format*,
commands::DataStructure * *command*, **utils::BooleanStream** * *bs*)
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.417.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.417.3.7 `virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs) [virtual]`

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<code>IOException</code>	if an error occurs.
--------------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller` (p. 505).

6.419 `decaf::util::Properties` Class Reference

Java-like properties class for mapping string names to string values.

```
#include <src/main/decaf/util/Properties.h>
```

Public Member Functions

- **Properties** ()
- **Properties** (const **Properties** &src)
- virtual **~Properties** ()
- **Properties & operator=** (const **Properties** &src)
Assignment Operator.
- bool **isEmpty** () const
Returns true if the properties object is empty.
- int **size** () const
- const char * **getProperty** (const std::string &name) const
Looks up the value for the given property.
- std::string **getProperty** (const std::string &name, const std::string &defaultValue) const
Looks up the value for the given property.
- std::string **setProperty** (const std::string &name, const std::string &value)
Sets the value for a given property.
- bool **hasProperty** (const std::string &name) const
Check to see if the Property exists in the set.
- std::string **remove** (const std::string &name)
Removes the property with the given name.
- std::vector< std::string > **propertyNames** () const
Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.
- std::vector< std::pair < std::string, std::string > > **toArray** () const
Method that serializes the contents of the property map to an array.
- void **copy** (const **Properties** &source)
*Copies the contents of the given properties object to this one, if the given **Properties** (p. 2200) instance is NULL then this **List** (p. 1658) is not modified.*
- **Properties** * **clone** () const
Clones this object.

- void **clear** ()
Clears all properties from the map.
- bool **equals** (const **Properties** &source) const
*Test whether two **Properties** (p. 2200) objects are equivalent.*
- std::string **toString** () const
*Formats the contents of the **Properties** (p. 2200) Object into a string that can be logged, etc.*
- void **load** (decaf::io::InputStream *stream)
Reads a property list (key and element pairs) from the input byte stream.
- void **load** (decaf::io::Reader *reader)
Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.
- void **store** (decaf::io::OutputStream *out, const std::string &comment)
*Writes this property list (key and element pairs) in this **Properties** (p. 2200) table to the output stream in a format suitable for loading into a **Properties** (p. 2200) table using the load(InputStream) method.*
- void **store** (decaf::io::Writer *writer, const std::string &comments)
*Writes this property list (key and element pairs) in this **Properties** (p. 2200) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- decaf::lang::Pointer< **Properties** > **defaults**
Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.419.1 Detailed Description

Java-like properties class for mapping string names to string values.

The **Properties** (p. 2200) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 2200) instance can contain an internal - **Properties** (p. 2200) list that contains default values for keys not found in the **Properties** (p. 2200) **List** (p. 1658).

The **Properties** (p. 2200) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since

1.0

6.419.2 Constructor & Destructor Documentation

6.419.2.1 decaf::util::Properties::Properties ()

6.419.2.2 **decaf::util::Properties::Properties** (**const Properties & src**)

6.419.2.3 **virtual decaf::util::Properties::~~Properties** () [virtual]

6.419.3 Member Function Documentation

6.419.3.1 **void decaf::util::Properties::clear** ()

Clears all properties from the map.

6.419.3.2 **Properties* decaf::util::Properties::clone** () **const**

Clones this object.

Returns

a replica of this object.

6.419.3.3 **void decaf::util::Properties::copy** (**const Properties & source**)

Copies the contents of the given properties object to this one, if the given **Properties** (p. 2200) instance is NULL then this **List** (p. 1658) is not modified.

Parameters

<i>source</i>	The source properties object.
---------------	-------------------------------

6.419.3.4 **bool decaf::util::Properties::equals** (**const Properties & source**) **const**

Test whether two **Properties** (p. 2200) objects are equivalent.

Two **Properties** (p. 2200) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters

<i>source</i>	The Properties (p. 2200) object to compare this instance to.
---------------	---

Returns

true if the contents of the two **Properties** (p. 2200) objects are the same.

6.419.3.5 `const char* decaf::util::Properties::getProperty (const std::string & name)`
`const`

Looks up the value for the given property.

Parameters

<i>name</i>	The name of the property to be looked up.
-------------	---

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

6.419.3.6 `std::string decaf::util::Properties::getProperty (const std::string & name,`
`const std::string & defaultValue) const`

Looks up the value for the given property.

Parameters

<i>name</i>	The name of the property to be looked up.
<i>defaultValue</i>	The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

6.419.3.7 `bool decaf::util::Properties::hasProperty (const std::string & name) const`

Check to see if the Property exists in the set.

Parameters

<i>name</i>	The property name to check for in this properties set.
-------------	--

Returns

true if property exists, false otherwise.

6.419.3.8 `bool decaf::util::Properties::isEmpty () const`

Returns true if the properties object is empty.

Returns

true if empty

6.419.3.9 void decaf::util::Properties::load (decaf::io::InputStream * *stream*)

Reads a property list (key and element pairs) from the input byte stream.

The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters

<i>stream</i>	The stream to read the properties data from.
---------------	--

Exceptions

<i>IOException</i>	if there is an error while reading from the stream.
<i>IllegalArgument-Exception</i>	if malformed data is found while reading the properties.
<i>NullPointerException</i>	if the passed stream is Null.

6.419.3.10 void decaf::util::Properties::load (decaf::io::Reader * *reader*)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

Properties (p. 2200) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character \. Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab (""), and form feed ("") to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of

the following line have no affect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of $2n$ contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

```
\:|=
```

would be the two-character key "=:=". Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=' or ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

```
Truth = Beauty Truth:Beauty Truth :Beauty
```

As another example, the following three lines specify a single property:

```
fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango
```

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

```
cheeses
```

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those used for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.

- The method does not treat a backslash character, `\`, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence `"\z"` would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence `"\b"` as equivalent to the single character `'b'`.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters

<i>reader</i>	The Reader that provides an character stream as input.
---------------	--

Exceptions

<i>IOException</i>	if there is an error while reading from the stream.
<i>IllegalArgument-Exception</i>	if malformed data is found while reading the properties.
<i>NullPointerException</i>	if the passed stream is Null.

6.419.3.11 **Properties&** `decaf::util::Properties::operator= (const Properties & src)`

Assignment Operator.

Parameters

<i>src</i>	The Properties (p. 2200) list to copy to this List (p. 1658).
------------	---

Returns

a reference to this **List** (p. 1658) for use in chaining.

6.419.3.12 `std::vector<std::string> decaf::util::Properties::propertyNames () const`

Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

Returns

a set of keys in this property list where the key and its corresponding value are strings, including the keys in the default property list.

6.419.3.13 `std::string decaf::util::Properties::remove (const std::string & name)`

Removes the property with the given name.

Parameters

<i>name</i>	The name of the property to remove.
-------------	-------------------------------------

Returns

the previous value of the property if set, or empty string.

6.419.3.14 `std::string decaf::util::Properties::setProperty (const std::string & name, const std::string & value)`

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

<i>name</i>	The name of the value to be written.
<i>value</i>	The value to be written.

Returns

the old value of the property or empty string if not set.

6.419.3.15 `int decaf::util::Properties::size () const`**Returns**

The number of **Properties** (p. 2200) in this **Properties** (p. 2200) Object.

6.419.3.16 `void decaf::util::Properties::store (decaf::io::OutputStream * out, const std::string & comment)`

Writes this property list (key and element pairs) in this **Properties** (p. 2200) table to the output stream in a format suitable for loading into a **Properties** (p. 2200) table using the load(InputStream) method.

Properties (p. 2200) from the defaults table of this **Properties** (p. 2200) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in store(Writer), with the following differences:

- The stream is written using the ISO 8859-1 character encoding.

- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value xxxx.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value xxxx.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

<i>out</i>	The OutputStream instance to write the properties to.
<i>comment</i>	A description of these properties that is written to the output stream.

Exceptions

<i>IOException</i>	if there is an error while writing from the stream.
<i>NullPointerException</i>	if the passed stream is Null.

6.419.3.17 `void decaf::util::Properties::store (decaf::io::Writer * writer, const std::string & comments)`

Writes this property list (key and element pairs) in this **Properties** (p. 2200) table to the output character stream in a format that can be read by the load(Reader) method.

Properties (p. 2200) from the defaults table of this **Properties** (p. 2200) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII # character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed (

'), a carriage return ("), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character # or character ! then an ASCII # is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII # character, the current date and time (as if produced by the toString method of **Date** (p. 1139) for the current time), and a line separator as generated by the Writer.

Then every entry in this **Properties** (p. 2200) table is written out, one per line. For each entry the key string is written, then an ASCII =, then the associated element string. For the key, all space characters are written with a preceding \ character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding \ character. The key and element characters #, !, =, and : are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

<i>writer</i>	The Writer instance to use to output the properties.
<i>comments</i>	A description of these properties that is written before writing the properties.

Exceptions

<i>IOException</i>	if there is an error while writing from the stream.
<i>NullPointerException</i>	if the passed stream is Null.

6.419.3.18 `std::vector< std::pair< std::string, std::string > >`
`decaf::util::Properties::toArray () const`

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

6.419.3.19 `std::string decaf::util::Properties::toString () const`

Formats the contents of the **Properties** (p. 2200) Object into a string that can be logged, etc.

Returns

string value of this object.

6.419.4 Field Documentation

6.419.4.1 `decaf::lang::Pointer<Properties> decaf::util::Properties::defaults`
`[protected]`

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.421.1 Constructor & Destructor Documentation

6.421.1.1 decaf::net::ProtocolException::ProtocolException () throw ()
[inline]

Default Constructor.

6.421.1.2 **decaf::net::ProtocolException::ProtocolException (const Exception & ex) throw () [inline]**

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.421.1.3 **decaf::net::ProtocolException::ProtocolException (const ProtocolException & ex) throw () [inline]**

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.421.1.4 **decaf::net::ProtocolException::ProtocolException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]**

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.421.1.5 **decaf::net::ProtocolException::ProtocolException (const std::exception * cause) throw () [inline]**

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.421.1.6 **decaf::net::ProtocolException::ProtocolException** (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.421.1.7 **virtual decaf::net::ProtocolException::~~ProtocolException** () throw () [inline, virtual]

6.421.2 Member Function Documentation

6.421.2.1 **virtual ProtocolException* decaf::net::ProtocolException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1547).

The documentation for this class was generated from the following file:

6.423 decaf::io::PushbackInputStream Class Reference

A **PushbackInputStream** (p. 2214) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

```
#include <src/main/decaf/io/PushbackInputStream.h>
```

Inheritance diagram for `decaf::io::PushbackInputStream`:

Public Member Functions

- **PushbackInputStream (InputStream *stream, bool own=false)**
*Creates a **PushbackInputStream** (p. 2214) and saves its argument, the input stream in, for later use.*
- **PushbackInputStream (InputStream *stream, int bufSize, bool own=false)**
*Creates a **PushbackInputStream** (p. 2214) and saves its argument, the input stream in, for later use.*
- virtual `~PushbackInputStream ()`
- void **unread** (unsigned char value)
Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.
- void **unread** (const unsigned char *buffer, int size)
Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

- void **unread** (const unsigned char *buffer, int size, int offset, int length)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

- virtual int **available** () const

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
------------------------------	--------------------------------

- virtual long long **skip** (long long num)

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

*The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	<i>The number of bytes to skip.</i>
-----	-------------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 1545)	<i>if an I/O error occurs.</i>
UnsupportedOperationException	<i>if the concrete stream class does not support skipping bytes.</i>

- virtual void **mark** (int readLimit)

*Does nothing except throw an **IOException** (p. 1545).*

- virtual void **reset** ()

*Does nothing except throw an **IOException** (p. 1545).*

- virtual bool **markSupported** () const

*Does nothing except throw an **IOException** (p. 1545).*

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.423.1 Detailed Description

A **PushbackInputStream** (p. 2214) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

This is useful in situations where it is convenient for a fragment of code to read an indefinite number of data bytes that are delimited by a particular byte value; after reading the terminating byte, the code fragment can "unread" it, so that the next read operation on the input stream will reread the byte that was pushed back. For example, bytes representing the characters constituting an identifier might be terminated by a byte representing an operator character; a method whose job is to read just an identifier can read until it sees the operator and then push the operator back to be re-read.

Since

1.0

6.423.2 Constructor & Destructor Documentation

6.423.2.1 `decaf::io::PushbackInputStream::PushbackInputStream (InputStream * stream, bool own = false)`

Creates a **PushbackInputStream** (p. 2214) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

Parameters

<i>stream</i>	The InputStream (p. 1464) instance to wrap.
<i>Boolean</i>	value indicating if this FilterInputStream (p. 1334) owns the wrapped stream.

6.423.2.2 `decaf::io::PushbackInputStream::PushbackInputStream (InputStream * stream, int bufSize, bool own = false)`

Creates a **PushbackInputStream** (p. 2214) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

Parameters

<i>stream</i>	The InputStream (p. 1464) instance to wrap.
<i>bufSize</i>	The number of byte to allocate for pushback into this stream.
<i>Boolean</i>	value indicating if this FilterInputStream (p. 1334) owns the wrapped stream.

Exceptions

<i>IllegalArgumentException</i>	if the bufSize argument is < zero.
---------------------------------	------------------------------------

6.423.2.3 virtual **decaf::io::PushbackInputStream::~~PushbackInputStream** ()
[virtual]

6.423.3 Member Function Documentation

6.423.3.1 virtual int **decaf::io::PushbackInputStream::available** () const
[virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
---------------------------------	-------------------------

Returns the sum of the number of pushed back bytes if any and the amount of bytes available in the underlying stream via a call to available.

Reimplemented from **decaf::io::FilterInputStream** (p. 1337).

6.423.3.2 virtual int **decaf::io::PushbackInputStream::doReadArrayBounded** (
unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected,
virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1338).

6.423.3.3 virtual int **decaf::io::PushbackInputStream::doReadByte** ()
[protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1338).

6.423.3.4 `virtual void decaf::io::PushbackInputStream::mark (int readLimit)`
`[virtual]`

Does nothing except throw an **IOException** (p. 1545).

Marks the current position in the stream. A subsequent call to the `reset` method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the `reset` method is called so long the `readLimit` is not reached.

Calling `mark` on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

<i>readLimit</i>	The max bytes read before marked position is invalid.
------------------	---

Reimplemented from **decaf::io::FilterInputStream** (p. 1338).

6.423.3.5 `virtual bool decaf::io::PushbackInputStream::markSupported () const`
`[inline, virtual]`

Does nothing except throw an **IOException** (p. 1545).

Determines if this input stream supports the `mark` and `reset` methods.

Whether or not `mark` and `reset` are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns `false`.

Returns

`true` if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1339).

6.423.3.6 `virtual void decaf::io::PushbackInputStream::reset ()` `[virtual]`

Does nothing except throw an **IOException** (p. 1545).

Repositions this stream to the position at the time the `mark` method was last called on this input stream.

If the method `markSupported` returns `true`, then: * If the method `mark` has not been called since the stream was created, or the number of bytes read from the stream since `mark` was last called is larger than the argument to `mark` at that last call, then an **IOException** (p. 1545) might be thrown. * If such an **IOException** (p. 1545) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent

call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1545). * If an **IOException** (p. 1545) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1545).

Exceptions

IOException (p. 1545)	if an I/O error occurs.
---------------------------------	-------------------------

Reimplemented from **decaf::io::FilterInputStream** (p. 1339).

6.423.3.7 virtual long long decaf::io::PushbackInputStream::skip (long long num)
[virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

IOException (p. 1545)	if an I/O error occurs.
<i>UnsupportedOperationException</i>	if the concrete stream class does not support skipping bytes.

This method first skips bytes in the local pushed back buffer before attempting to complete the request by calling the underlying stream skip method with the remainder of

bytes that needs to be skipped.

Reimplemented from **decaf::io::FilterInputStream** (p. 1340).

6.423.3.8 void decaf::io::PushbackInputStream::unread (unsigned char *value*)

Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

Parameters

<i>value</i>	The byte that is to be placed at the front of the push back buffer.
--------------	---

Exceptions

<i>IOException</i> (p. 1545)	if there is not enough space in the pushback buffer or this stream has already been closed.
--	---

6.423.3.9 void decaf::io::PushbackInputStream::unread (const unsigned char * *buffer*, int *size*)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters

<i>buffer</i>	The bytes to copy to the front of push back buffer.
<i>size</i>	The size of the array to be copied.

Exceptions

<i>NullPointerException</i>	if the buffer passed is NULL.
<i>IndexOutOfBoundsException</i>	if the size value given is negative.
<i>IOException</i> (p. 1545)	if there is not enough space in the pushback buffer or this stream has already been closed.

6.423.3.10 void decaf::io::PushbackInputStream::unread (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters

<i>buffer</i>	The bytes to copy to the front of push back buffer.
<i>size</i>	The size of the array to be copied.

<i>offset</i>	The position in the buffer to start copying from.
<i>length</i>	The number of bytes to push back from the passed buffer.

Exceptions

<i>NullPointerException</i>	if the buffer passed is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length is greater than the buffer size.
IOException (p. 1545)	if there is not enough space in the pushback buffer or this stream has already been closed.

6.424 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

```
#include <src/main/cms/Queue.h>
```

Inheritance diagram for cms::Queue:

Public Member Functions

- virtual \sim **Queue** () throw ()
- virtual std::string **getQueueName** () const =0

Gets the name of this queue.

6.424.1 Detailed Description

An interface encapsulating a provider-specific queue name.

Messages sent to a **Queue** (p. 2221) are sent to a Single Subscriber on that **Queue** (p. 2221) **Destination** (p. 1210). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 1839) in a **Queue** (p. 2221) is not defined by the CMS API, consult your Provider documentation for this information.

- `virtual bool offer (const E &value)=0`
Inserts the specified element into the queue provided that the condition allows such an operation.
- `virtual bool poll (E &result)=0`
Gets and removes the element in the head of the queue.
- `virtual E remove ()=0`
Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const =0
Gets but not removes the element in the head of the queue.
- virtual E **element** () const =0
Gets but not removes the element in the head of the queue.

6.425.1 Detailed Description

template<typename E>class decaf::util::Queue< E >

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 2222) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Unlike the Java **Queue** (p. 2222) interface the methods of this class cannot return null to indicate that a **Queue** (p. 2222) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java - **Queue** (p. 2222) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 2222) must be *assignable* in order to utilize these methods.

Since

1.0

6.425.2 Constructor & Destructor Documentation

6.425.2.1 template<typename E> virtual decaf::util::Queue< E >::~~Queue ()
[inline, virtual]

6.425.3 Member Function Documentation

6.425.3.1 template<typename E> virtual E decaf::util::Queue< E >::element () const
[pure virtual]

Gets but not removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if there is no element in the queue.
---	--------------------------------------

Implemented in **decaf::util::LinkedList< E >** (p. 1645), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1645), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1645), **decaf::util::LinkedList< CompositeTask * >** (p. 1645), **decaf::util::LinkedList< URI >** (p. 1645), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1645), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1645), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1645), **decaf::util::LinkedList< Pointer< Command > >** (p. 1645), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1645), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1645), **decaf::util::LinkedList< cms::Destination * >** (p. 1645), **decaf::util::LinkedList< cms::Session * >** (p. 1645), **decaf::util::LinkedList< cms::Connection * >** (p. 1645), and **decaf::util::AbstractQueue< E >** (p. 142).

6.425.3.2 `template<typename E> virtual bool decaf::util::Queue< E >::offer (const E & value) [pure virtual]`

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

Parameters

<i>value</i>	the specified element to insert into the queue.
--------------	---

Returns

true if the operation succeeds and false if it fails.

Exceptions

<i>NullPointerException</i>	if the Queue (p. 2222) implementation does not allow Null values to be inserted into the Queue (p. 2222).
<i>IllegalArgument-Exception</i>	if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1627), **decaf::util::LinkedList< E >** (p. 1649), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1649), **decaf::util::LinkedList< CompositeTask * >** (p. 1649), **decaf::util::LinkedList< URI >** (p. 1649), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1649), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1649),

decaf::util::LinkedList< PrimitiveValueNode > (p. 1649), **decaf::util::LinkedList< Pointer< Command > >** (p. 1649), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1649), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1649), **decaf::util::LinkedList< cms::Destination * >** (p. 1649), **decaf::util::LinkedList< cms::Session * >** (p. 1649), **decaf::util::LinkedList< cms::Connection * >** (p. 1649), **decaf::util::PriorityQueue< E >** (p. 2167), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2662).

Referenced by **decaf::util::AbstractQueue< E >::add()**.

6.425.3.3 `template<typename E> virtual bool decaf::util::Queue< E >::peek (E & result) const [pure virtual]`

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1628), **decaf::util::LinkedList< E >** (p. 1651), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1651), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1651), **decaf::util::LinkedList< CompositeTask * >** (p. 1651), **decaf::util::LinkedList< URI >** (p. 1651), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1651), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1651), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1651), **decaf::util::LinkedList< Pointer< Command > >** (p. 1651), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1651), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1651), **decaf::util::LinkedList< cms::Destination * >** (p. 1651), **decaf::util::LinkedList< cms::Session * >** (p. 1651), **decaf::util::LinkedList< cms::Connection * >** (p. 1651), and **decaf::util::PriorityQueue< E >** (p. 2168).

Referenced by **decaf::util::AbstractQueue< E >::element()**.

6.425.3.4 `template<typename E> virtual bool decaf::util::Queue< E >::poll (E & result) [pure virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 2222) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

<i>result</i>	Reference to an instance of the contained type to assigned the removed value to.
---------------	--

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in `decaf::util::concurrent::LinkedBlockingQueue< E >` (p. 1629), `decaf::util::LinkedList< E >` (p. 1652), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1652), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1652), `decaf::util::LinkedList< CompositeTask * >` (p. 1652), `decaf::util::LinkedList< URI >` (p. 1652), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1652), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1652), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1652), `decaf::util::LinkedList< Pointer< Command > >` (p. 1652), `decaf::util::LinkedList< Pointer< BackupTransport > >` (p. 1652), `decaf::util::LinkedList< cms::MessageProducer * >` (p. 1652), `decaf::util::LinkedList< cms::Destination * >` (p. 1652), `decaf::util::LinkedList< cms::Session * >` (p. 1652), `decaf::util::LinkedList< cms::Connection * >` (p. 1652), `decaf::util::PriorityQueue< E >` (p. 2169), and `decaf::util::concurrent::SynchronousQueue< E >` (p. 2663).

Referenced by `decaf::util::AbstractQueue< E >::clear()`, and `decaf::util::AbstractQueue< E >::remove()`.

6.425.3.5 `template<typename E> virtual E decaf::util::Queue< E >::remove ()`
[pure virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1984) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1984)	if there is no element in the queue.
--	--------------------------------------

Implemented in `decaf::util::LinkedList< E >` (p. 1655), `decaf::util::LinkedList< Pointer< Transport > >` (p. 1655), `decaf::util::LinkedList< cms::MessageConsumer * >` (p. 1655), `decaf::util::LinkedList< CompositeTask * >` (p. 1655), `decaf::util::LinkedList< URI >` (p. 1655), `decaf::util::LinkedList< Pointer< MessageDispatch > >` (p. 1655), `decaf::util::LinkedList< Pointer< DestinationInfo > >` (p. 1655), `decaf::util::LinkedList< PrimitiveValueNode >` (p. 1655),

decaf::util::LinkedList< **Pointer**< **Command** > > (p. 1655), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1655), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1655), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1655), **decaf::util::LinkedList**< **cms::Session** * > (p. 1655), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1655), **decaf::util::PriorityQueue**< **E** > (p. 2169), and **decaf::util::AbstractQueue**< **E** > (p. 142).

6.426 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p. 2221) without removing them.

```
#include <src/main/cms/QueueBrowser.h>
```

Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- virtual **~QueueBrowser** () throw ()
- virtual const **Queue** * **getQueue** () const =0
- virtual std::string **getMessageSelector** () const =0
- virtual **cms::MessageEnumeration** * **getEnumeration** ()=0

*Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 2221) in the order that a client would receive them.*

6.426.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p. 2221) without removing them.

To browse the contents of the **Queue** (p. 2221) the client calls the `getEnumeration` method to retrieve a new instance of a **Queue** (p. 2221) Enumerator. The client then calls the `hasMoreMessages` method of the Enumeration, if it returns true the client can safely call the `nextMessage` method of the Enumeration instance.

```
Enumeration* enumeration = queueBrowser->getEnumeration() (p. 2228);
```

```
while( enumeration->hasMoreMessages() ) { cms::Message (p. 1839)* message =
enumeration->nextMessage();
```

```
// ... Do something with the Message (p. 1839).
```

```
delete message; }
```

6.426.3 Member Function Documentation

6.426.3.1 `virtual cms::MessageEnumeration* cms::QueueBrowser::get-Enumeration ()` [pure virtual]

Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 2221) in the order that a client would receive them.

The pointer returned is owned by the browser and should not be deleted by the client application.

Returns

a pointer to a **Queue** (p. 2221) Enumeration, this Pointer is owned by the **Queue-Browser** (p. 2227) and should not be deleted by the client.

Exceptions

CMSEException (p. 826)	if an internal error occurs.
----------------------------------	------------------------------

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 327).

6.426.3.2 `virtual std::string cms::QueueBrowser::getMessageSelector () const` [pure virtual]

Returns

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions

CMSEException (p. 826)	if an internal error occurs.
----------------------------------	------------------------------

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 327).

6.426.3.3 `virtual const Queue* cms::QueueBrowser::getQueue () const` `[pure virtual]`

Returns

the **Queue** (p. 2221) that this browser is listening on.

Exceptions

<i>CMSException</i> (p. 826)	if an internal error occurs.
--	------------------------------

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 328).

The documentation for this class was generated from the following file:

- `src/main/cms/QueueBrowser.h`

6.427 decaf::util::Random Class Reference

Random (p. 2229) Value Generator which is used to generate a stream of pseudorandom numbers.

```
#include <src/main/decaf/util/Random.h>
```

Inheritance diagram for `decaf::util::Random`:

Public Member Functions

- **Random** ()
Construct a random generator with the current time of day in milliseconds as the initial state.
- **Random** (unsigned long long seed)
*Construct a random generator with the given *seed* as the initial state.*
- virtual **~Random** ()
- bool **nextBoolean** ()
Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.
- double **nextDouble** ()
Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.
- float **nextFloat** ()
Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.
- double **nextGaussian** ()

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the polar method of G.

- `int nextInt ()`

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

- `int nextInt (int n)`

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

- `long long nextLong ()`

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

- `virtual void nextBytes (std::vector< unsigned char > &buf)`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

- `virtual void nextBytes (unsigned char *buf, int size)`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

- `virtual void setSeed (unsigned long long seed)`

*Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2, Section 3.2.1.**

Protected Member Functions

- `virtual int next (int bits)`

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

6.427.1 Detailed Description

Random (p. 2229) Value Generator which is used to generate a stream of pseudorandom numbers.

The algorithms implemented by class **Random** (p. 2229) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since

1.0

6.427.2 Constructor & Destructor Documentation

6.427.2.1 `decaf::util::Random::Random ()`

Construct a random generator with the current time of day in milliseconds as the initial state.

See also

setSeed (p. 2235)

6.427.2.2 decaf::util::Random::Random (unsigned long long *seed*)

Construct a random generator with the given *seed* as the initial state.

Parameters

<i>seed</i>	the seed that will determine the initial state of this random number generator
-------------	--

See also

setSeed (p. 2235)

6.427.2.3 virtual decaf::util::Random::~~Random () [virtual]

6.427.3 Member Function Documentation

6.427.3.1 virtual int decaf::util::Random::next (int *bits*) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument *bits* as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

`int` a pseudo-random generated `int` number

Parameters

<i>bits</i>	number of bits of the returned value
-------------	--------------------------------------

See also

nextBytes (p. 2232)

nextDouble (p. 2233)

nextFloat (p. 2233)

nextInt() (p. 2234)

nextInt(int) (p. 2234)

nextGaussian (p. 2233)

nextLong (p. 2234)

Reimplemented in **decaf::security::SecureRandom** (p. 2323).

6.427.3.2 `bool decaf::util::Random::nextBoolean ()`

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns

boolean a pseudo-random, uniformly distributed boolean value

6.427.3.3 `virtual void decaf::util::Random::nextBytes (std::vector< unsigned char > & buf) [virtual]`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

See also

next (p. 2231)

Reimplemented in **decaf::security::SecureRandom** (p. 2324).

6.427.3.4 `virtual void decaf::util::Random::nextBytes (unsigned char * buf, int size) [virtual]`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

See also

next (p. 2231)

Exceptions

<i>NullPointerException</i>	if <i>buf</i> is NULL
<i>IllegalArgumentException</i>	if <i>size</i> is negative

Reimplemented in **decaf::security::SecureRandom** (p. 2324).

6.427.3.5 double decaf::util::Random::nextDouble ()

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns

double

See also

nextFloat (p. 2233)

6.427.3.6 float decaf::util::Random::nextFloat ()

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns

float a random float number between 0.0 and 1.0

See also

nextDouble (p. 2233)

6.427.3.7 double decaf::util::Random::nextGaussian ()

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the *polar method* of G.

E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns

double

See also

nextDouble (p. 2233)

6.427.3.8 int decaf::util::Random::nextInt ()

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

Returns

`int` uniformly distributed `int` value

See also

next (p. 2231)

nextLong (p. 2234)

6.427.3.9 int decaf::util::Random::nextInt (int n)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

Parameters

<code>n</code>	The <code>int</code> value that defines the max value of the return.
----------------	--

Returns

the next pseudo random `int` value.

Exceptions

<i>IllegalArgumentException</i>	if <code>n</code> is less than or equal to zero.
---------------------------------	--

6.427.3.10 long long decaf::util::Random::nextLong ()

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

Returns

64-bit `int` random number

See also

next (p. 2231)

nextInt() (p. 2234)

nextInt(int) (p. 2234)

6.427.3.11 virtual void **decaf::util::Random::setSeed** (unsigned long long *seed*)
[virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

<i>seed</i>	the seed that alters the state of the random number generator
-------------	---

See also

next (p. 2231)
Random() (p. 2230)
#Random(long)

Reimplemented in **decaf::security::SecureRandom** (p. 2324).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Random.h**

6.428 decaf::lang::Readable Class Reference

A **Readable** (p. 2235) is a source of characters.

```
#include <src/main/decaf/lang/Readable.h>
```

Inheritance diagram for decaf::lang::Readable:

Public Member Functions

- virtual **~Readable** ()
- virtual int **read** (**decaf::nio::CharBuffer** *charBuffer)=0
Attempts to read characters into the specified character buffer.

6.428.1 Detailed Description

A **Readable** (p. 2235) is a source of characters.

Characters from a **Readable** (p. 2235) are made available to callers of the read method via a CharBuffer.

Since

1.0

6.428.2 Constructor & Destructor Documentation

6.428.2.1 `virtual decaf::lang::Readable::~Readable () [inline, virtual]`

6.428.3 Member Function Documentation

6.428.3.1 `virtual int decaf::lang::Readable::read (decaf::nio::CharBuffer * charBuffer) [pure virtual]`

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

<i>charBuffer</i>	The Buffer to read Characters into.
-------------------	-------------------------------------

Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions

<i>IOException</i>	if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.
<i>ReadOnlyBuffer-Exception</i>	if <i>charBuffer</i> is a read only buffer.

Implemented in **decaf::io::Reader** (p. 2242).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Readable.h`

6.429 activemq::transport::inactivity::ReadChecker Class Reference

Runnable class that is used by the {.

```
#include <src/main/activemq/transport/inactivity/Read-Checker.h>
```

Inheritance diagram for `activemq::transport::inactivity::ReadChecker`:

Public Member Functions

- **ReadChecker** (**InactivityMonitor** *parent)
- virtual ~**ReadChecker** ()
- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.429.1 Detailed Description

Runnable class that is used by the {.

[virtual]

6.429.3 Member Function Documentation

6.429.3.1 virtual void **activemq::transport::inactivity::ReadChecker::run** ()
[virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2312).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/inactivity/**ReadChecker.h**

6.430 decaf::io::Reader Class Reference

```
#include <src/main/decaf/io/Reader.h>
```

Inheritance diagram for decaf::io::Reader:

Public Member Functions

- virtual **~Reader** ()
- virtual void **mark** (int readAheadLimit)
Marks the present position in the stream.
- virtual bool **markSupported** () const
*Tells whether this stream supports the **mark()** (p. 2239) operation.*
- virtual bool **ready** () const
Tells whether this stream is ready to be read.
- virtual void **reset** ()
Resets the stream.
- virtual long long **skip** (long long count)
Skips characters.
- virtual int **read** (std::vector< char > &buffer)
Reads characters into an array.
- virtual int **read** (char *buffer, int size)
Reads characters into an array, the method will attempt to read as much data as the size of the array.
- virtual int **read** (char *buffer, int size, int offset, int length)
Reads characters into a portion of an array.
- virtual int **read** ()
Reads a single character.
- virtual int **read** (decaf::nio::CharBuffer *charBuffer)
Attempts to read characters into the specified character buffer.

Protected Member Functions

- **Reader** ()
- virtual int **doReadArrayBounded** (char *buffer, int size, int offset, int length)=0
Override this method to customize the functionality of the method read(unsigned char buffer, int size, int offset, int length).*
- virtual int **doReadVector** (std::vector< char > &buffer)
Override this method to customize the functionality of the method read(std::vector<char> & buffer) (p. 2240).
- virtual int **doReadArray** (char *buffer, int length)
Override this method to customize the functionality of the method read(char buffer, std::size_t length).*
- virtual int **doReadChar** ()
Override this method to customize the functionality of the method read() (p. 2242).
- virtual int **doReadCharBuffer** (decaf::nio::CharBuffer *charBuffer)
Override this method to customize the functionality of the method read(CharBuffer charBuffer).*

6.430.1 Constructor & Destructor Documentation

6.430.1.1 `decaf::io::Reader::Reader ()` [protected]

6.430.1.2 `virtual decaf::io::Reader::~~Reader ()` [virtual]

6.430.2 Member Function Documentation

6.430.2.1 `virtual int decaf::io::Reader::doReadArray (char * buffer, int length)`
[protected, virtual]

Override this method to customize the functionality of the method `read(char* buffer, std::size_t length)`.

6.430.2.2 `virtual int decaf::io::Reader::doReadArrayBounded (char * buffer, int size, int offset, int length)` [protected, pure virtual]

Override this method to customize the functionality of the method `read(unsigned char* buffer, int size, int offset, int length)`.

All subclasses must override this method to provide the basic **Reader** (p. 2237) functionality.

Implemented in **decaf::io::InputStreamReader** (p. 1476).

6.430.2.3 `virtual int decaf::io::Reader::doReadChar ()` [protected, virtual]

Override this method to customize the functionality of the method **read()** (p. 2242).

6.430.2.4 `virtual int decaf::io::Reader::doReadCharBuffer (decaf::nio::CharBuffer * charBuffer)` [protected, virtual]

Override this method to customize the functionality of the method `read(CharBuffer* charBuffer)`.

6.430.2.5 `virtual int decaf::io::Reader::doReadVector (std::vector< char > & buffer)`
[protected, virtual]

Override this method to customize the functionality of the method **read(std::vector<char>& buffer)** (p. 2240).

6.430.2.6 `virtual void decaf::io::Reader::mark (int readAheadLimit)` [virtual]

Marks the present position in the stream.

Subsequent calls to **reset()** (p. 2243) will attempt to reposition the stream to this point. Not all character-input streams support the **mark()** (p. 2239) operation.

Parameters

<i>readAhead-Limit</i>	Limit on the number of characters that may be read while still preserving the mark. After reading this many characters, attempting to reset the stream may fail.
------------------------	--

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs, or the stream does not support mark.
--	--

6.430.2.7 `virtual bool decaf::io::Reader::markSupported () const [inline, virtual]`

Tells whether this stream supports the **mark()** (p. 2239) operation.

The default implementation always returns false. Subclasses should override this method.

Returns

true if and only if this stream supports the mark operation.

6.430.2.8 `virtual int decaf::io::Reader::read (std::vector< char > & buffer) [virtual]`

Reads characters into an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

<i>buffer</i>	The buffer to read characters into.
---------------	-------------------------------------

Returns

The number of characters read, or -1 if the end of the stream has been reached

Exceptions

<i>IOException</i> (p. 1545)	thrown if an I/O error occurs.
--	--------------------------------

6.430.2.9 virtual int decaf::io::Reader::read (char * *buffer*, int *size*) [virtual]

Reads characters into an array, the method will attempt to read as much data as the size of the array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

<i>buffer</i>	The target char buffer.
<i>size</i>	The size in bytes of the target buffer.

Returns

The number of bytes read or -1 if the end of stream is reached.

Exceptions

<i>IOException</i> (p. 1545)	thrown if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.

6.430.2.10 virtual int decaf::io::Reader::read (char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Reads characters into a portion of an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

<i>buffer</i>	The target char buffer.
<i>size</i>	The size in bytes of the target buffer.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The maximum number of bytes to read.

Returns

The number of bytes read or -1 if the end of stream is reached.

Exceptions

<i>IOException</i> (p. 1545)	thrown if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if the offset + length is greater than the array size.

6.430.2.11 `virtual int decaf::io::Reader::read ()` [virtual]

Reads a single character.

This method will block until a character is available, an I/O error occurs, or the end of the stream is reached.

Subclasses that intend to support efficient single-character input should override this method.

Returns

The character read, as an integer in the range 0 to 65535 (0x00-0xffff), or -1 if the end of the stream has been reached.

Exceptions

<i>IOException</i> (p. 1545)	thrown if an I/O error occurs.
--	--------------------------------

6.430.2.12 `virtual int decaf::io::Reader::read (decaf::nio::CharBuffer * charBuffer)`
[virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

<i>charBuffer</i>	The Buffer to read Characters into.
-------------------	-------------------------------------

Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.
<i>ReadOnlyBuffer-Exception</i>	if charBuffer is a read only buffer.

Implements **decaf::lang::Readable** (p. 2236).

6.430.2.13 `virtual bool decaf::io::Reader::ready () const` `[virtual]`

Tells whether this stream is ready to be read.

Returns

True if the next **read()** (p. 2242) is guaranteed not to block for input, false otherwise.
Note that returning false does not guarantee that the next read will block.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

Reimplemented in **decaf::io::InputStreamReader** (p. 1477).

6.430.2.14 `virtual void decaf::io::Reader::reset ()` `[virtual]`

Resets the stream.

If the stream has been marked, then attempt to reposition it at the mark. If the stream has not been marked, then attempt to reset it in some way appropriate to the particular stream, for example by repositioning it to its starting point. Not all character-input streams support the **reset()** (p. 2243) operation, and some support **reset()** (p. 2243) without supporting **mark()** (p. 2239).

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

6.430.2.15 `virtual long long decaf::io::Reader::skip (long long count)` `[virtual]`

Skips characters.

This method will block until some characters are available, an I/O error occurs, or the end of the stream is reached.

Parameters

<i>count</i>	The number of character to skip.
--------------	----------------------------------

Returns

the number of Character actually skipped.

Exceptions

<i>IOException</i> if an I/O error occurs. (p. 1545)
--

6.431 decaf::nio::ReadOnlyBufferException Class Reference

```
#include <src/main/decaf/nio/ReadOnlyBufferException.h>
```

Inheritance diagram for decaf::nio::ReadOnlyBufferException:

Public Member Functions

- **ReadOnlyBufferException** () throw ()
Default Constructor.
- **ReadOnlyBufferException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **ReadOnlyBufferException** (const ReadOnlyBufferException &ex) throw ()
Copy Constructor.
- **ReadOnlyBufferException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ReadOnlyBufferException** (const std::exception *cause) throw ()
Constructor.
- **ReadOnlyBufferException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **ReadOnlyBufferException * clone** () const
Clones this exception.
- virtual ~**ReadOnlyBufferException** () throw ()

6.431.1 Constructor & Destructor Documentation

6.431.1.1 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ()
throw () [inline]

Default Constructor.

6.431.1.2 **decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (**
const lang::Exception & ex) throw () `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.431.1.3 **decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (**
const ReadOnlyBufferException & ex) throw () `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.431.1.4 **decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (**
const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.431.1.5 **decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (**
const std::exception * cause) throw () `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.431.1.6 **decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException**
 (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()
 [inline]

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.431.1.7 **virtual decaf::nio::ReadOnlyBufferException::~~ReadOnlyBufferException** () throw () [inline, virtual]

6.431.2 Member Function Documentation

6.431.2.1 **virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::UnsupportedOperationException** (p. 2827).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**ReadOnlyBufferException.h**

6.432 decaf::util::concurrent::locks::ReadWriteLock Class - Reference

A **ReadWriteLock** (p. 2246) maintains a pair of associated locks, one for read-only operations and one for writing.

```
#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>
```

Public Member Functions

- virtual **~ReadWriteLock** ()

- virtual **Lock & readLock** ()=0
Returns the lock used for reading.
- virtual **Lock & writeLock** ()=0
Returns the lock used for writing.

6.432.1 Detailed Description

A **ReadWriteLock** (p. 2246) maintains a pair of associated locks, one for read-only operations and one for writing.

The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 2246) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 1684) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

- * Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-

lived as expected. Fair, or "in-order" implementations are also possible. * Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency. * Determining whether the locks are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant? * Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

6.434.1 Detailed Description

Interface for a **RedeliveryPolicy** (p. 2250) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.

Since

3.2.0

6.434.2 Constructor & Destructor Documentation

6.434.2.1 `activemq::core::RedeliveryPolicy::RedeliveryPolicy ()` [protected]

6.434.2.2 `virtual activemq::core::RedeliveryPolicy::~~RedeliveryPolicy ()`
[virtual]

6.434.3 Member Function Documentation

6.434.3.1 `virtual RedeliveryPolicy* activemq::core::RedeliveryPolicy::clone ()`
`const` [pure virtual]

Create a copy of this Policy and return it.

Returns

pointer to a new **RedeliveryPolicy** (p. 2250) that is a copy of this one.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1151).

6.434.3.2 `virtual void activemq::core::RedeliveryPolicy::configure (const`
`decaf::util::Properties & properties)` [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix `cms.RedeliveryPolicy.XXX` where XXX is the name of a property with a public setter method. For instance `cms.RedeliveryPolicy.useExponentialBackOff` will be used to set the value of the use exponential back off toggle.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters

<i>properties</i>	The Properties object used to configure this object.
-------------------	--

Exceptions

<i>NumberFormatException</i>	if a property that is numeric cannot be converted
<i>IllegalArgument-Exception</i>	if a property can't be converted to the correct type.

6.434.3.3 **virtual double** **activemq::core::RedeliveryPolicy::getBackOffMultiplier ()**
const [pure virtual]

Returns

The value of the Back-Off Multiplier for Message Redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1151).

6.434.3.4 **virtual short** **activemq::core::RedeliveryPolicy::getCollisionAvoidancePercent ()** **const** [pure virtual]

Returns

the currently set Collision Avoidance percentage.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1151).

6.434.3.5 **virtual long long** **activemq::core::RedeliveryPolicy::getInitialRedeliveryDelay ()** **const** [pure virtual]

Gets the initial time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed initially.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1152).

6.434.3.6 **virtual int** **activemq::core::RedeliveryPolicy::getMaximumRedeliveries ()** **const** [pure virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns

maximum allowed redeliveries for a message.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1152).

6.434.3.7 `virtual long long activemq::core::RedeliveryPolicy::getNextRedeliveryDelay (long long previousDelay)` [pure virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters

<i>previous-Delay</i>	The last delay that was used between message redeliveries.
-----------------------	--

Returns

the new delay to use before attempting another redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1152).

6.434.3.8 `virtual long long activemq::core::RedeliveryPolicy::getRedeliveryDelay ()`
`const` [pure virtual]

Gets the time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1152).

6.434.3.9 `virtual bool activemq::core::RedeliveryPolicy::isUseCollisionAvoidance ()`
`const` [pure virtual]

Returns

whether or not collision avoidance is enabled for this Policy.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1153).

6.434.3.10 `virtual bool activemq::core::RedeliveryPolicy::isUseExponentialBackOff ()`
`const` [pure virtual]

Returns

whether or not the exponential back off option is enabled.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1153).

6.434.3.11 virtual void **activemq::core::RedeliveryPolicy::setBackOffMultiplier** (double *value*) [pure virtual]

Sets the Back-Off Multiplier for Message Redelivery.

Parameters

<i>value</i>	The new value for the back-off multiplier.
--------------	--

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1153).

6.434.3.12 virtual void **activemq::core::RedeliveryPolicy::setCollisionAvoidancePercent** (short *value*) [pure virtual]

Parameters

<i>value</i>	The collision avoidance percentage setting.
--------------	---

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1153).

6.434.3.13 virtual void **activemq::core::RedeliveryPolicy::setInitialRedeliveryDelay** (long long *value*) [pure virtual]

Sets the initial time that redelivery will be delayed.

Parameters

<i>value</i>	Time in Milliseconds to wait before starting redelivery.
--------------	--

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1154).

6.434.3.14 virtual void **activemq::core::RedeliveryPolicy::setMaximumRedeliveries** (int *maximumRedeliveries*) [pure virtual]

Sets the Maximum allowable redeliveries for a Message.

Parameters

<i>maximum-Redeliveries</i>	The maximum number of times that a message will be redelivered.
-----------------------------	---

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1154).

6.434.3.15 virtual void **activemq::core::RedeliveryPolicy::setRedeliveryDelay** (long *value*) [pure virtual]

Sets the time that redelivery will be delayed.

Parameters

<i>value</i>	Time in Milliseconds to wait before the next redelivery.
--------------	--

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1154).

6.434.3.16 `virtual void activemq::core::RedeliveryPolicy::setUseCollisionAvoidance (bool value) [pure virtual]`

Parameters

<i>value</i>	Enable or Disable collision avoidance for this Policy.
--------------	--

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1154).

6.434.3.17 `virtual void activemq::core::RedeliveryPolicy::setUseExponentialBackOff (bool value) [pure virtual]`

Parameters

<i>value</i>	Enable or Disable the exponential back off multiplier option.
--------------	---

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 1155).

6.435 decaf::util::concurrent::locks::ReentrantLock Class Reference

A reentrant mutual exclusion **Lock** (p. 1684) with extended capabilities.

```
#include <src/main/decaf/util/concurrent/locks/ReentrantLock.h>
```

Inheritance diagram for `decaf::util::concurrent::locks::ReentrantLock`:

Public Member Functions

- **ReentrantLock** ()

- virtual `~ReentrantLock ()`
- virtual void `lock ()`
Acquires the lock.
- virtual void `lockInterruptibly ()`
Acquires the lock unless the current thread is interrupted.
- virtual bool `tryLock ()`
Acquires the lock only if it is not held by another thread at the time of invocation.
- virtual bool `tryLock (long long time, const TimeUnit &unit)`
Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.
- virtual void `unlock ()`
Attempts to release this lock.
- virtual `Condition * newCondition ()`
*Returns a **Condition** (p. 921) instance for use with this **Lock** (p. 1684) instance.*
- int `getHoldCount ()` const
Queries the number of holds on this lock by the current thread.
- bool `isHeldByCurrentThread ()` const
Queries if this lock is held by the current thread.
- bool `isLocked ()` const
Queries if this lock is held by any thread.
- bool `isFair ()` const
Returns true if this lock has fairness set true.
- std::string `toString ()` const
Returns a string identifying this lock, as well as its lock state.

6.435.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 1684) with extended capabilities.

A **ReentrantLock** (p. 2256) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking `lock` will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods `isHeldByCurrentThread()` (p. 2259), and `getHoldCount()` (p. 2258).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, locks favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair locks accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain locks and guarantee lack of starvation. Note however, that fairness of locks does not guarantee fairness of thread scheduling. Thus, one of many threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the lock. Also note that the untimed `tryLock` method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

```
class X { private:
```

```
    ReentrantLock (p. 2256) lock; // ...
```

```
public:
```

```
void m() { lock.lock(); // block until condition holds
```

```
try { // ... method body } finally { lock.unlock() } } }
```

In addition to implementing the **Lock** (p. 1684) interface, this class defines methods is-Locked and getLockQueueLength, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

Since

1.0

6.435.2 Constructor & Destructor Documentation

6.435.2.1 `decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ()`

6.435.2.2 `virtual decaf::util::concurrent::locks::ReentrantLock::~~ReentrantLock () [virtual]`

6.435.3 Member Function Documentation

6.435.3.1 `int decaf::util::concurrent::locks::ReentrantLock::getHoldCount () const`

Queries the number of holds on this lock by the current thread.

A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of code should not be entered with the lock already held then we can assert that fact:

```
class X { private:
```

```
    ReentrantLock (p. 2256) lock; // ...
```

```
public:
```

```
void m() { assert( lock.getHoldCount() == 0 ); lock.lock(); try { // ... method body }
catch(...) { lock.unlock(); } } }
```

Returns

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.435.3.2 bool decaf::util::concurrent::locks::ReentrantLock::isFair () const

Returns true if this lock has fairness set true.

Returns

true if this lock has fairness set true

6.435.3.3 bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread () const

Queries if this lock is held by the current thread.

This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

```
class X { private: ReentrantLock (p. 2256) lock; // ...  
public: void m() { assert( lock.isHeldByCurrentThread() ); // ... method body } }
```

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

```
class X { private: ReentrantLock (p. 2256) lock; // ...  
public: void m() { assert !lock.isHeldByCurrentThread() (p. 2259); lock.lock(); try { // ...  
method body } finally { lock.unlock(); } } }
```

Returns

true if current thread holds this lock and false otherwise

6.435.3.4 bool decaf::util::concurrent::locks::ReentrantLock::isLocked () const

Queries if this lock is held by any thread.

This method is designed for use in monitoring of the system state, not for synchronization control.

Returns

true if any thread holds this lock and false otherwise

6.435.3.5 virtual void decaf::util::concurrent::locks::ReentrantLock::lock () [virtual]

Acquires the lock.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

Implements **decaf::util::concurrent::locks::Lock** (p. 1686).

6.435.3.6 **virtual void decaf::util::concurrent::locks::ReentrantLock::lock-Interruptibly ()** [virtual]

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

<i>InterruptedException</i>	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).
-----------------------------	--

Implements **decaf::util::concurrent::locks::Lock** (p. 1686).

6.435.3.7 virtual **Condition*** decaf::util::concurrent::locks::ReentrantLock::new-Condition () [virtual]

Returns a **Condition** (p. 921) instance for use with this **Lock** (p. 1684) instance.

The returned **Condition** (p. 921) instance supports the same usages as do the **Mutex** (p. 1960) Class' methods (wait, notify, and notifyAll).

* If this lock is not held when any of the **Condition** (p. 921) waiting or signalling methods are called, then an `IllegalMonitorStateException` is thrown. * When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called. * If a thread is interrupted while waiting then the wait will terminate, an `InterruptedException` will be thrown, and the thread's interrupted status will be cleared. * Waiting threads are signaled in FIFO order. * The ordering of lock reacquisition for threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair locks favors those threads that have been waiting the longest.

Exceptions

<i>RuntimeException</i>	if an error occurs while creating the Condition (p. 921).
<i>UnsupportedOperationException</i>	if this Lock (p. 1684) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 1687).

6.435.3.8 std::string decaf::util::concurrent::locks::ReentrantLock::toString () const

Returns a string identifying this lock, as well as its lock state.

The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

Returns

a string identifying this lock, as well as its lock state

6.435.3.9 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock () [virtual]

Acquires the lock only if it is not held by another thread at the time of invocation.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 2261) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you

want to honor the fairness setting for this lock, then use `tryLock(0, TimeUnit.SECONDS (p. 2764))` which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

Returns

true if the lock was acquired and false otherwise

Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

Implements **decaf::util::concurrent::locks::Lock** (p. 1687).

6.435.3.10 `virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock (long long time, const TimeUnit & unit) [virtual]`

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 2261) method. If you want a timed `tryLock` that does permit barging on a fair lock then combine the timed and un-timed forms together:

```
if (lock.tryLock() || lock.tryLock(timeout, unit) ) { ... }
```

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * The lock is acquired by the current thread; or
- * Some other thread interrupts the current thread; or
- * The specified waiting time elapses

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while acquiring the lock,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less

6.436 decaf::util::concurrent::RejectedExecutionException Class Reference 2269

than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

Parameters

<i>time</i>	the maximum time to wait for the lock
<i>unit</i>	the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
<i>InterruptedException</i>	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 1688).

6.435.3.11 virtual void **decaf::util::concurrent::locks::ReentrantLock::unlock** ()
[virtual]

Attempts to release this lock.

If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then *IllegalMonitorStateException* is thrown.

Exceptions

<i>RuntimeException</i>	if an error occurs while acquiring the lock.
-------------------------	--

Implements **decaf::util::concurrent::locks::Lock** (p. 1689).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/locks/**ReentrantLock.h**

6.436 decaf::util::concurrent::RejectedExecutionException Class - Reference

6.436.1 Constructor & Destructor Documentation

6.436.1.1 **decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException** () throw () `[inline]`

Default Constructor.

6.436.1.2 **decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException** (const **Exception** & ex) throw () `[inline]`

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
-----------	--

6.436 decaf::util::concurrent::RejectedExecutionException Class Reference 2271

6.436.1.3 **decaf::util::concurrent::RejectedExecutionException::Rejected-
ExecutionException** (const RejectedExecutionException & *ex*) throw ()
[inline]

Copy Constructor.

Parameters

<i>ex</i>	- The Exception to copy in this new instance.
-----------	---

6.436.1.4 **decaf::util::concurrent::RejectedExecutionException::Rejected-
ExecutionException** (const std::exception * *cause*) throw ()
[inline]

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.436.1.5 **decaf::util::concurrent::RejectedExecutionException::Rejected-
ExecutionException** (const char * *file*, const int *lineNumber*, const char * *msg*,
...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>msg</i>	- The message to report
...	- list of primitives that are formatted into the message

6.436.1.6 **decaf::util::concurrent::RejectedExecutionException::Rejected-
ExecutionException** (const char * *file*, const int *lineNumber*, const
std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	- The file name where exception occurs
<i>lineNumber</i>	- The line number where the exception occurred.
<i>cause</i>	- The exception that was the cause for this one to be thrown.
<i>msg</i>	- The message to report
<i>...</i>	- list of primitives that are formatted into the message

6.436.1.7 `virtual decaf::util::concurrent::RejectedExecutionException::~~RejectedExecutionException () throw () [inline, virtual]`

6.436.2 Member Function Documentation

6.436.2.1 `virtual RejectedExecutionException* decaf::util::concurrent::RejectedExecutionException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance this exception type with a copy the current state.

Reimplemented from **decaf::lang::Exception** (p. 1282).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/RejectedExecutionException.h`

6.437 decaf::util::concurrent::RejectedExecutionHandler Class - Reference

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 2715).

```
#include <src/main/decaf/util/concurrent/RejectedExecutionHandler.h>
```

Inheritance diagram for `decaf::util::concurrent::RejectedExecutionHandler`:

6.437 decaf::util::concurrent::RejectedExecutionHandler Class Reference 2273

- virtual `~RejectedExecutionHandler()`
- virtual void `rejectedExecution (decaf::lang::Runnable *r, ThreadPoolExecutor *executer)=0`

*Method that may be invoked by a **ThreadPoolExecutor** (p. 2715) when **execute** (p. 2724) cannot accept a task.*

6.437.1 Detailed Description

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 2715).

Since

1.0

6.437.2 Constructor & Destructor Documentation

6.437.2.1 `decaf::util::concurrent::RejectedExecutionHandler::RejectedExecutionHandler()`

6.437.2.2 `virtual decaf::util::concurrent::RejectedExecutionHandler::~~RejectedExecutionHandler()` [virtual]

6.437.3 Member Function Documentation

6.437.3.1 `virtual void decaf::util::concurrent::RejectedExecutionHandler::rejectedExecution (decaf::lang::Runnable * r, ThreadPoolExecutor * executer)`
[pure virtual]

Method that may be invoked by a **ThreadPoolExecutor** (p. 2715) when **execute** (p. 2724) cannot accept a task.

This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p. 1297).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p. 2263), which will be propagated to the caller of **execute** (p. 2724).

Parameters

<i>r</i>	The pointer to the runnable task requested to be executed.
<i>executer</i>	The pointer to the executor attempting to execute this task.

Exceptions

RejectedExecutionException (p. 2263)	if there is no remedy.
--	------------------------

Implemented in **decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy** (p. 1225).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**RejectedExecutionHandler.h**

6.438 activemq::commands::RemoveInfo Class Reference

- virtual void **setLastDeliveredSequenceId** (long long lastDeliveredSequenceId)
- virtual bool **isRemoveInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REMOVEINFO** = 12

Protected Attributes

- `Pointer< DataStructure >` **objectId**
- long long **lastDeliveredSequenceId**

6.438.1 Constructor & Destructor Documentation

6.438.1.1 `activemq::commands::RemoveInfo::RemoveInfo ()`

6.438.1.2 `virtual activemq::commands::RemoveInfo::~~RemoveInfo ()`
[virtual]

6.438.2 Member Function Documentation

6.438.2.1 `virtual RemoveInfo* activemq::commands::RemoveInfo::cloneData-
Structure () const` [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1133).

6.438.2.2 `virtual void activemq::commands::RemoveInfo::copyDataStructure (`
`const DataStructure * src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 493).

6.438.2.3 `virtual bool activemq::commands::RemoveInfo::equals (const`
`DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.438.2.4 **virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType () const** [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.438.2.5 **virtual long long activemq::commands::RemoveInfo::getLastDeliveredSequenceld () const** [virtual]

6.438.2.6 **virtual const Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId () const** [virtual]

Referenced by **activemq::state::CommandVisitorAdapter::processRemoveInfo()**.

6.438.2.7 **virtual Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId ()** [virtual]

6.438.2.8 **virtual bool activemq::commands::RemoveInfo::isRemoveInfo () const** [inline, virtual]

Returns

an answer of true to the **isRemoveInfo()** (p. 2270) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 496).

6.438.2.9 **virtual void activemq::commands::RemoveInfo::setLastDeliveredSequenceld (long long lastDeliveredSequenceld)** [virtual]

6.438.2.10 **virtual void activemq::commands::RemoveInfo::setObjectId (const Pointer< DataStructure > & objectId)** [virtual]

6.439

activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller

Class Reference

2277

6.438.2.11 `virtual std::string activemq::commands::RemoveInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.438.2.12 `virtual Pointer<Command> activemq::commands::RemoveInfo::visit (`
`activemq::state::CommandVisitor * visitor)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.438.3 Field Documentation

6.438.3.1 `const unsigned char activemq::commands::RemoveInfo::ID_REMOVEINFO`
`= 12` [static]

Class Reference

2279

6.439.2.2 `virtual activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::~~RemoveInfoMarshaller () [inline, virtual]`

6.439.3 Member Function Documentation

6.439.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::createObject () const [virtual]`

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.439.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::getDataStructureType () const [virtual]`

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.439.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 500).

6.439.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)`
`[virtual]`

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.439.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs)`
`[virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.439

activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller

Class Reference

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.439.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

6.440.2 Member Function Documentation

6.440.2.1 **virtual RemoveSubscriptionInfo* activemq::commands::RemoveSubscriptionInfo::cloneDataStructure** () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.440.2.2 **virtual void activemq::commands::RemoveSubscriptionInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

6.440.2.3 **virtual bool activemq::commands::RemoveSubscriptionInfo::equals** (const **DataStructure** * *value*) const [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.440.2.4 `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () const [virtual]`

6.440.2.5 `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () [virtual]`

6.440.2.7 `virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () [virtual]`

6.440.2.8 `virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.440.2.9 `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName () const [virtual]`

6.440.2.10 `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName () [virtual]`

6.440.2.11 `virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo () const [inline, virtual]`

Returns

an answer of true to the **isRemoveSubscriptionInfo()** (p. 2278) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 497).

6.440.2.12 `virtual void activemq::commands::RemoveSubscriptionInfo::setClientId (const std::string & clientId) [virtual]`

6.440.2.13 `virtual void activemq::commands::RemoveSubscriptionInfo::set-ConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`

6.440.2.14 `virtual void activemq::commands::RemoveSubscriptionInfo::setSubscriptionName (const std::string & subscriptionName) [virtual]`

6.440.2.15 `virtual std::string activemq::commands::RemoveSubscriptionInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.440.2.16 `virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit (activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

[inline, virtual]

6.441.3 Member Function Documentation

6.441.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::createObject** () const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1120).

6.441.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::getDataStructureType** () const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1122).

6.441.3.3 `virtual void activemq::wireformat::openwire::marshal::generated-
::RemoveSubscriptionInfoMarshaller::looseMarshal (`
`OpenWireFormat * format, commands::DataStructure * command,`
`decaf::io::DataOutputStream * ds) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-
CommandMarshaller** (p. 500).

6.441.3.4 `virtual void activemq::wireformat::openwire::marshal::generated-
::RemoveSubscriptionInfoMarshaller::looseUnmarshal (`
`OpenWireFormat * format, commands::DataStructure * command,`
`decaf::io::DataInputStream * dis) [virtual]`

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-
CommandMarshaller** (p. 501).

6.441.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::Remove-
SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * format,`
`commands::DataStructure * command, utils::BooleanStream * bs)`
`[virtual]`

Tight Marshal to the given stream.

6.441 activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller Class

Reference

2289

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 503).

```
6.441.3.6 virtual void activemq::wireformat::openwire::marshal::generated-  
::RemoveSubscriptionInfoMarshaller::tightMarshal2 (  
    OpenWireFormat * format, commands::DataStructure * command,  
    decaf::io::DataOutputStream * ds, utils::BooleanStream * bs )  
[virtual]
```

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 504).

```
6.441.3.7 virtual void activemq::wireformat::openwire::marshal::generated-  
::RemoveSubscriptionInfoMarshaller::tightUnmarshal (  
    OpenWireFormat * format, commands::DataStructure * command,  
    decaf::io::DataInputStream * dis, utils::BooleanStream * bs )  
[virtual]
```

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i> if an error occurs.
--

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

The documentation for this class was generated from the following file:

6.442 **activemq::commands::ReplayCommand** Class Reference

```
#include <src/main/activemq/commands/ReplayCommand.h>
```

Inheritance diagram for **activemq::commands::ReplayCommand**:

Public Member Functions

- **ReplayCommand** ()
- virtual **~ReplayCommand** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **ReplayCommand** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual int **getFirstNakNumber** () const
- virtual void **setFirstNakNumber** (int firstNakNumber)
- virtual int **getLastNakNumber** () const
- virtual void **setLastNakNumber** (int lastNakNumber)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REPLAYCOMMAND** = 65

Protected Attributes

- int **firstNakNumber**
- int **lastNakNumber**

6.442.1 Constructor & Destructor Documentation

6.442.1.1 `activemq::commands::ReplayCommand::ReplayCommand ()`

6.442.1.2 `virtual activemq::commands::ReplayCommand::~~ReplayCommand ()`
[virtual]

6.442.2 Member Function Documentation

6.442.2.1 `virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure () const`
[virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.442.2.2 `virtual void activemq::commands::ReplayCommand::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

6.442.2.3 `virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.442.2.4 `virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.442.2.5 `virtual int activemq::commands::ReplayCommand::getFirstNakNumber () const [virtual]`

6.442.2.6 `virtual int activemq::commands::ReplayCommand::getLastNakNumber () const [virtual]`

6.442.2.7 `virtual void activemq::commands::ReplayCommand::setFirstNakNumber (int firstNakNumber) [virtual]`

6.442.2.8 `virtual void activemq::commands::ReplayCommand::setLastNakNumber (int lastNakNumber) [virtual]`

6.442.2.9 `virtual std::string activemq::commands::ReplayCommand::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.442.2.10 `virtual Pointer<Command> activemq::commands::ReplayCommand::visit (activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

6.443 activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller Class

Reference

2293

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.442.3 Field Documentation

6.442.3.1 **int activemq::commands::ReplayCommand::firstNakNumber**
[protected]

6.442.3.2 **const unsigned char activemq::commands::ReplayCommand::ID_REPLAYCOMMAND = 65** [static]

6.442.3.3 **int activemq::commands::ReplayCommand::lastNakNumber**
[protected]

The documentation for this class was generated from the following file:

6.443 activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2287).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-  
ReplayCommandMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller:

Public Member Functions

- **ReplayCommandMarshaller ()**
- virtual **~ReplayCommandMarshaller ()**
- virtual **commands::DataStructure * createObject ()** const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType ()** const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs)**

Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **utils::BooleanStream** *bs)

Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

Tight Marhsal to the given stream.

6.443.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2287).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.443.2 Constructor & Destructor Documentation

6.443.2.1 **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::ReplayCommandMarshaller ()**
[inline]

6.443.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::~~ReplayCommandMarshaller ()** [inline, virtual]

6.443.3 Member Function Documentation

6.443.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::createObject ()**
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.443 activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller Class

Reference

2295

```
6.443.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::getDataStructureType ( ) const  
[virtual]
```

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

```
6.443.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::looseMarshal ( OpenWireFormat * format,  
commands::DataStructure * command, decaf::io::DataOutputStream * ds  
) [virtual]
```

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 500).

```
6.443.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::looseUnmarshal ( OpenWireFormat * format,  
commands::DataStructure * command, decaf::io::DataInputStream * dis )  
[virtual]
```

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.443.3.5 **virtual int activemq::wireformat::openwire::marshal::generated::Replay-CommandMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)**
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.443.3.6 **virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.444 activemq::cmsutil::CmsTemplate::ResolveProducerExecutor Class Reference

2297

6.443.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 505).

The documentation for this class was generated from the following file:

```

Inheritance diagram for decaf::internal::util::Resource:

Public Member Functions

- virtual ~Resource ()

6.446.1 Detailed Description

Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown.

Since

1.0

6.446.2 Constructor & Destructor Documentation

6.446.2.1 virtual decaf::internal::util::Resource::~~Resource () [virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/Resource.h

6.447 activemq::cmsutil::ResourceLifecycleManager Class Reference

Manages the lifecycle of a set of CMS resources.

```
#include <src/main/activemq/cmsutil/ResourceLifecycle-
Manager.h>
```

Public Member Functions

- **ResourceLifecycleManager** ()
- virtual **~ResourceLifecycleManager** ()
Destructor - calls `destroy`
- void **addConnection** (**cms::Connection** *connection)
Adds a connection so that its life will be managed by this object.
- void **addSession** (**cms::Session** *session)
Adds a session so that its life will be managed by this object.
- void **addDestination** (**cms::Destination** *dest)
Adds a destination so that its life will be managed by this object.
- void **addMessageProducer** (**cms::MessageProducer** *producer)
Adds a message producer so that its life will be managed by this object.
- void **addMessageConsumer** (**cms::MessageConsumer** *consumer)
Adds a message consumer so that its life will be managed by this object.
- void **destroy** ()
Closes and destroys the contained CMS resources.
- void **releaseAll** ()
Releases all of the contained resources so that this object will no longer control their lifetimes.

Protected Member Functions

- **ResourceLifecycleManager** (const **ResourceLifecycleManager** &)
- **ResourceLifecycleManager** & **operator=** (const **ResourceLifecycleManager** &)

6.447.1 Detailed Description

Manages the lifecycle of a set of CMS resources.

A call to `destroy` will close and destroy all of the contained resources in the appropriate manner.

6.447.2 Constructor & Destructor Documentation

6.447.2.1 **activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager** (const **ResourceLifecycleManager** &)
[protected]

6.447.2.2 **activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager ()**

6.447.2.3 **virtual activemq::cmsutil::ResourceLifecycleManager::~~ResourceLifecycleManager ()** [virtual]

Destructor - calls `destroy`

6.447.3 Member Function Documentation

6.447.3.1 **void activemq::cmsutil::ResourceLifecycleManager::addConnection (cms::Connection * *connection*)**

Adds a connection so that its life will be managed by this object.

Parameters

<i>connection</i>	the object to be managed
-------------------	--------------------------

Exceptions

<i>CMSEException</i>	if an error occurs while performing this operation.
----------------------	---

6.447.3.2 **void activemq::cmsutil::ResourceLifecycleManager::addDestination (cms::Destination * *dest*)**

Adds a destination so that its life will be managed by this object.

Parameters

<i>dest</i>	the object to be managed
-------------	--------------------------

Exceptions

<i>CMSEException</i>	if an error occurs while performing this operation.
----------------------	---

6.447.3.3 **void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer (cms::MessageConsumer * *consumer*)**

Adds a message consumer so that its life will be managed by this object.

Parameters

<i>consumer</i>	the object to be managed
-----------------	--------------------------

Exceptions

<i>CMSEException</i>	if an error occurs while performing this operation.
----------------------	---

6.447.3.4 **void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer (cms::MessageProducer * *producer*)**

Adds a message producer so that its life will be managed by this object.

Parameters

<i>producer</i>	the object to be managed
-----------------	--------------------------

Exceptions

<i>CMSEException</i>	if an error occurs while performing this operation.
----------------------	---

6.447.3.5 **void activemq::cmsutil::ResourceLifecycleManager::addSession (cms::Session * *session*)**

Adds a session so that its life will be managed by this object.

Parameters

<i>session</i>	the object to be managed
----------------	--------------------------

Exceptions

<i>CMSEException</i>	if an error occurs while performing this operation.
----------------------	---

6.447.3.6 **void activemq::cmsutil::ResourceLifecycleManager::destroy ()**

Closes and destroys the contained CMS resources.

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	thrown if an error occurs.
--	----------------------------

6.447.3.7 **ResourceLifecycleManager& activemq::cmsutil::ResourceLifecycleManager::operator= (const ResourceLifecycleManager &)**
[protected]

6.447.3.8 void activemq::cmsutil::ResourceLifecycleManager::releaseAll ()

Releases all of the contained resources so that this object will no longer control their lifetimes.

6.449.1 Constructor & Destructor Documentation

6.449.1.1 **activemq::commands::Response::Response** ()

6.449.1.2 **virtual activemq::commands::Response::~~Response** () [virtual]

6.449.2 Member Function Documentation

6.449.2.1 **virtual Response* activemq::commands::Response::cloneDataStructure**
() const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1070), **activemq::commands::DataResponse** (p. 1113), **activemq::commands::ExceptionResponse** (p. 1289), and **activemq::commands::IntegerResponse** (p. 1517).

6.449.2.2 **virtual void activemq::commands::Response::copyDataStructure** (const **DataStructure* src**) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1070), **activemq::commands::DataResponse** (p. 1113), **activemq::commands::ExceptionResponse** (p. 1289), and **activemq::commands::IntegerResponse** (p. 1517).

6.449.2.3 **virtual bool activemq::commands::Response::equals** (const **DataStructure* value**) const [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1070), **activemq::commands::DataResponse** (p. 1114), **activemq::commands::ExceptionResponse** (p. 1289), and **activemq::commands::IntegerResponse** (p. 1518).

6.449.2.4 `virtual int activemq::commands::Response::getCorrelationId () const`
[virtual]

6.449.2.5 `virtual unsigned char activemq::commands::Response::getDataStructure-`
`Type () const` [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1071), **activemq::commands::DataResponse** (p. 1114), **activemq::commands::ExceptionResponse** (p. 1289), and **activemq::commands::IntegerResponse** (p. 1518).

6.449.2.6 `virtual bool activemq::commands::Response::isResponse () const`
[inline, virtual]

Returns

an answer of true to the **isResponse()** (p. 2300) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 497).

6.449.2.7 `virtual void activemq::commands::Response::setCorrelationId (int`
`correlationId)` [virtual]

6.449.2.8 `virtual std::string activemq::commands::Response::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 498).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1071), `activemq::commands::DataResponse` (p. 1114), `activemq::commands::ExceptionResponse` (p. 1290), and `activemq::commands::IntegerResponse` (p. 1518).

6.449.2.9 `virtual Pointer<Command> activemq::commands::Response::visit (activemq::state::CommandVisitor * visitor)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 871).

6.449.3 Field Documentation

6.449.3.1 `int activemq::commands::Response::correlationId` [protected]

6.449.3.2 `const unsigned char activemq::commands::Response::ID_RESPONSE = 30` [static]

The documentation for this class was generated from the following file:

6.450 `activemq::transport::mock::ResponseBuilder` Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

```
#include <src/main/activemq/transport/mock/ResponseBuilder.h>
```

Inheritance diagram for `activemq::transport::mock::ResponseBuilder`:

Public Member Functions

- virtual **~ResponseBuilder** ()
- virtual **Pointer< Response > buildResponse** (const **Pointer< Command >** &command)=0
Given a Command, check if it requires a response and return the appropriate - Response that the Broker would send for this Command.
- virtual void **buildIncomingCommands** (const **Pointer< Command >** &command, **decaf::util::LinkedList< Pointer< Command >** &queue)=0
*When called the **ResponseBuilder** (p. 2301) must construct all the Responses or - Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

6.450.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.450.2 Constructor & Destructor Documentation

- 6.450.2.1 virtual **activemq::transport::mock::ResponseBuilder::~ResponseBuilder** () [inline, virtual]

6.450.3 Member Function Documentation

- 6.450.3.1 virtual void **activemq::transport::mock::ResponseBuilder::buildIncomingCommands** (const **Pointer< Command >** & command, **decaf::util::LinkedList< Pointer< Command >** & queue) [pure virtual]

When called the **ResponseBuilder** (p. 2301) must construct all the Responses or - Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

<i>command</i>	- The Command being sent to the Broker.
<i>queue</i>	- Queue of Command sent back from the broker.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2065).

6.451 activemq::transport::correlator::ResponseCorrelator Class Reference 2309

6.450.3.2 virtual **Pointer**<**Response**> **activemq::transport::mock::ResponseBuilder::buildResponse** (const **Pointer**< **Command** > & *command*)
[pure virtual]

Given a **Command**, check if it requires a response and return the appropriate **Response** that the **Broker** would send for this **Command**.

Parameters

<i>command</i>	- The command to build a response for
----------------	---------------------------------------

Returns

A **Response** object pointer, or **NULL** if no response.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2066).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**ResponseBuilder.h**

6.451 activemq::transport::correlator::ResponseCorrelator Class - Reference

This type of transport filter is responsible for correlating asynchronous responses with requests.

```
#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>
```

Inheritance diagram for **activemq::transport::correlator::ResponseCorrelator**:

Public Member Functions

- **ResponseCorrelator** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual ~**ResponseCorrelator** ()
- virtual void **oneway** (const **Pointer**< **Command** > &command)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command)
Sends the given command to the broker and then waits for the response.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout)

Sends the given command to the broker and then waits for the response.

- virtual void **start** ()

*Starts the **Transport** (p. 2790), the send methods of a **Transport** (p. 2790) will throw an exception if used before the **Transport** (p. 2790) is started.*

- virtual void **close** ()

Closes this object and deallocates the appropriate resources.

- virtual void **onCommand** (const **Pointer**< **Command** > &command)

This is called in the context of the nested transport's reading thread.

- virtual void **onTransportException** (**Transport** *source, const **decaf::lang::Exception** &ex)

Event handler for an exception from a command transport.

6.451.1 Detailed Description

This type of transport filter is responsible for correlating asynchronous responses with requests.

Non-response messages are simply sent directly to the CommandListener. It owns the transport that it

6.451.2 Constructor & Destructor Documentation

6.451.2.1 **activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator** (const **Pointer**< **Transport** > &next)

Constructor.

Parameters

<i>next</i>	the next transport in the chain
-------------	---------------------------------

6.451.2.2 **virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator** () [virtual]

6.451.3 Member Function Documentation

6.451.3.1 **virtual void activemq::transport::correlator::ResponseCorrelator::close** () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

6.451 activemq::transport::correlator::ResponseCorrelator Class Reference 2311

Exceptions

<i>IOException</i>	if an error occurs while closing.
--------------------	-----------------------------------

Reimplemented from **activemq::transport::TransportFilter** (p. 2802).

6.451.3.2 `virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > & command)`
[virtual]

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

<i>command</i>	The received from the nested transport.
----------------	---

Reimplemented from **activemq::transport::TransportFilter** (p. 2805).

6.451.3.3 `virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > & command)` [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

<i>command</i>	The command to be sent.
----------------	-------------------------

Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2806).

6.451.3.4 `virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException (Transport * source, const decaf::lang::Exception & ex)` [virtual]

Event handler for an exception from a command transport.

Parameters

<i>source</i>	The source of the exception.
<i>ex</i>	The exception that was caught.

6.451.3.5 **virtual Pointer<Response> activemq::transport::correlator::Response-Correlator::request (const Pointer< Command > & *command*)**
 [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

Returns

the response from the broker.

Exceptions

<i>IOException</i>	if an exception occurs during the read of the command.
<i>Unsupported-OperationException</i>	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2807).

6.451.3.6 **virtual Pointer<Response> activemq::transport::correlator::Response-Correlator::request (const Pointer< Command > & *command*, unsigned int *timeout*)** [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

<i>command</i>	The command to be sent.
<i>timeout</i>	The time to wait for this response.

Returns

the response from the broker.

Exceptions

<i>IOException</i>	if an exception occurs during the read of the command.
<i>Unsupported-OperationException</i>	if this method is not implemented by this transport.

6.452 activemq::wireformat::openwire::marshal::generated::ResponseMarshaller Class Reference 2313

Reimplemented from **activemq::transport::TransportFilter** (p. 2807).

6.451.3.7 virtual void **activemq::transport::correlator::ResponseCorrelator::start** (
) [virtual]

Starts the **Transport** (p. 2790), the send methods of a **Transport** (p. 2790) will throw an exception if used before the **Transport** (p. 2790) is started.

Exceptions

<i>IOException</i>	if and error occurs while starting the Transport (p. 2790).
--------------------	--

Reimplemented from **activemq::transport::TransportFilter** (p. 2808).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**ResponseCorrelator.h**

6.452 activemq::wireformat::openwire::marshal::generated::-ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2307).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-  
ResponseMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::generated::-ResponseMarshaller**:

Public Member Functions

- **ResponseMarshaller** ()
- virtual **~ResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::-DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::-BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marshal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marshal to the given stream.

6.452.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2307).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.452.2 Constructor & Destructor Documentation

- 6.452.2.1 **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::ResponseMarshaller** ()
[inline]
- 6.452.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::~~ResponseMarshaller** () [inline, virtual]

6.452.3 Member Function Documentation

- 6.452.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::createObject** () const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1073), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1116), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1292), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1520).

6.452.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::getDataStructureType () const`
`[virtual]`

Gets the `DataStreamType` that this class marshals/unmarshals.

Returns

byte Id of this classes `DataStreamType`

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1122).

Reimplemented in `activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller` (p. 1073), `activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller` (p. 1117), `activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller` (p. 1292), and `activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller` (p. 1520).

6.452.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds)` `[virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The <code>OpenWireFormat</code> properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- <code>DataOutputStream</code> to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller` (p. 500).

Reimplemented in `activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller` (p. 1073), `activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller` (p. 1117), `activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller` (p. 1292), and `activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller` (p. 1521).

6.452.3.4 `virtual void activemq::wireformat::openwire::marshal::generated-
::ResponseMarshaller::looseUnmarshal (OpenWireFormat * format,
commands::DataStructure * command, decaf::io::DataInputStream * dis)
[virtual]`

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1074), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1117), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1293), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1521).

6.452.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::-
ResponseMarshaller::tightMarshal1 (OpenWireFormat * format,
commands::DataStructure * command, utils::BooleanStream * bs)
[virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1074), **activemq::wireformat::openwire-**

6.452 activemq::wireformat::openwire::marshal::generated::ResponseMarshaller Class Reference 2317

activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller (p. 1118), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1293), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1521).

6.452.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 504).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1075), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1118), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1293), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1522).

6.452.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i> if an error occurs.
--

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 505).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 1075), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 1119), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1294), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1522).

The documentation for this class was generated from the following file:

6.453 decaf::lang::Runnable Class Reference

Interface for a runnable object - defines a task that can be run by a thread.

```
#include <src/main/decaf/lang/Runnable.h>
```

Inheritance diagram for `decaf::lang::Runnable`:

Public Member Functions

- virtual **~Runnable** ()
- virtual void **run** ()=0

*Run method - called by the **Thread** (p. 2703) class in the context of the thread.*

6.453.1 Detailed Description

Interface for a runnable object - defines a task that can be run by a thread.

6.453.2 Constructor & Destructor Documentation

6.453.2.1 virtual `decaf::lang::Runnable::~~Runnable ()` [`inline`, `virtual`]

6.453.3 Member Function Documentation

6.453.3.1 virtual void `decaf::lang::Runnable::run ()` [`pure virtual`]

Run method - called by the **Thread** (p. 2703) class in the context of the thread.

Implemented in `activemq::transport::IOTransport` (p. 1554), `decaf::lang::Thread` (p. 2710), `activemq::threads::CompositeTaskRunner` (p. 895), `activemq::threads::DedicatedTaskRunner` (p. 1145), `activemq::transport::mock::InternalCommandListener` (p. 1528), `activemq::transport::inactivity::WriteChecker` (p. 2908), `activemq::transport::inactivity::ReadChecker` (p. 2237), and `activemq::threads::SchedulerTimerTask` (p. 2320).

Referenced by `decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::rejectedExecution()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Runnable.h`

6.454 decaf::lang::Runtime Class Reference

```
#include <src/main/decaf/lang/Runtime.h>
```

Inheritance diagram for `decaf::lang::Runtime`:

Public Member Functions

- virtual `~Runtime()`

Static Public Member Functions

- static `Runtime * getRuntime()`
*Gets the single instance of the Decaf **Runtime** (p. 2313) for this Process.*
- static void `initializeRuntime(int argc, char **argv)`
Initialize the Decaf Library passing it the args that were passed to the application at startup.
- static void `initializeRuntime()`
Initialize the Decaf Library.
- static void `shutdownRuntime()`
Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

6.454.1 Constructor & Destructor Documentation

6.454.1.1 `virtual decaf::lang::Runtime::~~Runtime()` [`inline`, `virtual`]

6.454.2 Member Function Documentation

6.454.2.1 `static Runtime* decaf::lang::Runtime::getRuntime () [static]`

Gets the single instance of the Decaf **Runtime** (p. 2313) for this Process.

Returns

pointer to the single Decaf **Runtime** (p. 2313) instance that exists for this process

6.454.2.2 `static void decaf::lang::Runtime::initializeRuntime (int argc, char ** argv) [static]`

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters

<i>argc</i>	- The number of args passed
<i>argv</i>	- Array of char* values passed to the Process on start.

Exceptions

<i>runtime_error</i>	if the library is already initialized or an error occurs during initialization.
----------------------	---

6.454.2.3 `static void decaf::lang::Runtime::initializeRuntime () [static]`

Initialize the Decaf Library.

Exceptions

<i>runtime_error</i>	if the library is already initialized or an error occurs during initialization.
----------------------	---

6.454.2.4 `static void decaf::lang::Runtime::shutdownRuntime () [static]`

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions

<i>runtime_error</i>	if the library has not already been initialized or an error occurs during shutdown.
----------------------	---

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Runtime.h`

6.455 decaf::lang::exceptions::RuntimeException Class Reference

```
#include <src/main/decaf/lang/exceptions/RuntimeException.h>
```

Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** () throw ()
Default Constructor.
- **RuntimeException** (const **Exception** &ex) throw ()
Conversion Constructor from some other ActiveMQException.
- **RuntimeException** (const **RuntimeException** &ex) throw ()
Copy Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **RuntimeException** (const std::exception *cause) throw ()
Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **RuntimeException** * clone () const
Clones this exception.
- virtual ~**RuntimeException** () throw ()

6.455.1 Constructor & Destructor Documentation

6.455.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException ()
throw () [inline]

Default Constructor.

6.455.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const
Exception & ex) throw () [inline]

Conversion Constructor from some other ActiveMQException.

Parameters

ex	The Exception (p. 1279) whose data is to be copied into this one.
----	--

6.455.1.3 **decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & ex) throw ()** `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	The Exception (p. 1279) whose data is to be copied into this one.
-----------	--

6.455.1.4 **decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()** `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.455.1.5 **decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception * cause) throw ()** `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer (p. 2083) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	---

6.455.1.6 **decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const char * msg, ...) throw ()** `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.

<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.455.1.7 virtual **decaf::lang::exceptions::RuntimeException::~~RuntimeException**
() throw() [inline, virtual]

6.455.2 Member Function Documentation

6.455.2.1 virtual **RuntimeException*** **decaf::lang::exceptions-
::RuntimeException::clone** () const [inline,
virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1279) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1282).

Reimplemented in **decaf::util::NoSuchElementException** (p. 1986), and **decaf::util-
::ConcurrentModificationException** (p. 904).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**RuntimeException.h**

6.456 activemq::threads::Scheduler Class Reference

Scheduler (p. 2317) class for use in executing Runnable Tasks either periodically or one time only with optional delay.

```
#include <src/main/activemq/threads/Scheduler.h>
```

Inheritance diagram for activemq::threads::Scheduler:

Public Member Functions

- **Scheduler** (const std::string &name)
- virtual **~Scheduler** ()
- void **executePeriodically** (decaf::lang::Runnable *task, long long period, bool ownsTask=true)

- void **schedualPeriodically** (decaf::lang::Runnable *task, long long period, bool ownsTask=true)
- void **cancel** (decaf::lang::Runnable *task)
- void **executeAfterDelay** (decaf::lang::Runnable *task, long long delay, bool ownsTask=true)
- void **shutdown** ()

Protected Member Functions

- virtual void **doStart** ()
Performs the actual start operation on the service, acquiring all the resources needed to run the service.
- virtual void **doStop** (activemq::util::ServiceStopper *stopper)
Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

6.456.1 Detailed Description

Scheduler (p. 2317) class for use in executing Runnable Tasks either periodically or one time only with optional delay.

Since

3.3.0

6.456.2 Constructor & Destructor Documentation

6.456.2.1 `activemq::threads::Scheduler::Scheduler (const std::string & name)`

6.456.2.2 `virtual activemq::threads::Scheduler::~~Scheduler ()` [virtual]

6.456.3 Member Function Documentation

6.456.3.1 `void activemq::threads::Scheduler::cancel (decaf::lang::Runnable * task)`

6.456.3.2 `virtual void activemq::threads::Scheduler::doStart ()` [protected, virtual]

Performs the actual start operation on the service, acquiring all the resources needed to run the service.

Must be implemented in derived class.

Implements **activemq::util::ServiceSupport** (p. 2360).

6.456.3.3 `virtual void activemq::threads::Scheduler::doStop (`
`activemq::util::ServiceStopper * stopper) [protected, virtual]`

Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

Implements `activemq::util::ServiceSupport` (p. 2360).

6.456.3.4 `void activemq::threads::Scheduler::executeAfterDelay (`
`decaf::lang::Runnable * task, long long delay, bool ownsTask = true)`

6.456.3.5 `void activemq::threads::Scheduler::executePeriodically (`
`decaf::lang::Runnable * task, long long period, bool ownsTask = true)`

6.456.3.6 `void activemq::threads::Scheduler::schedulingPeriodically (`
`decaf::lang::Runnable * task, long long period, bool ownsTask = true)`

6.456.3.7 `void activemq::threads::Scheduler::shutdown ()`

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/Scheduler.h`

6.457 `activemq::threads::SchedulerTimerTask` Class Reference

Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.

```
#include <src/main/activemq/threads/SchedulerTimerTask.h>
```

Inheritance diagram for `activemq::threads::SchedulerTimerTask`:

Public Member Functions

- `SchedulerTimerTask (decaf::lang::Runnable *task, bool ownsTask=true)`
- `virtual ~SchedulerTimerTask ()`
- `virtual void run ()`

Run method - called by the Thread class in the context of the thread.

6.457.1 Detailed Description

Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.

Since

3.3.0

6.457.2 Constructor & Destructor Documentation

6.457.2.1 `activemq::threads::SchedulerTimerTask::SchedulerTimerTask (
 decaf::lang::Runnable * task, bool ownsTask = true)`

6.457.2.2 `virtual activemq::threads::SchedulerTimerTask::~~SchedulerTimerTask (
) [virtual]`

6.457.3 Member Function Documentation

6.457.3.1 `virtual void activemq::threads::SchedulerTimerTask::run ()
 [virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2312).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/SchedulerTimerTask.h`

6.458 decaf::security::SecureRandom Class Reference

```
#include <src/main/decaf/security/SecureRandom.h>
```

Inheritance diagram for `decaf::security::SecureRandom`:

Public Member Functions

- **SecureRandom** ()
Creates a new instance of a secure random number generator that implements the default random number algorithm.
- **SecureRandom** (const std::vector< unsigned char > &seed)
Creates a new instance of a secure random number generator that implements the default random number algorithm.
- **SecureRandom** (const unsigned char *seed, int size)
Creates a new instance of a secure random number generator that implements the default random number algorithm.
- virtual ~**SecureRandom** ()
- virtual void **nextBytes** (std::vector< unsigned char > &buf)
Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf	non-null array to contain the new random bytes
-----	--

See also

next (p. 2231)

- virtual void **nextBytes** (unsigned char *buf, int size)

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf	non-null array to contain the new random bytes
-----	--

See also

next (p. 2231)

Exceptions

NullPointerException	if buff is NULL
IllegalArgumentException	if size is negative

- virtual void **setSeed** (unsigned long long seed)

Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.

Parameters

seed	the seed that alters the state of the random number generator
------	---

See also

next (p. 2231)**Random()** (p. 2230)

#Random(long)

- virtual void **setSeed** (const std::vector< unsigned char > &seed)

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

- virtual void **setSeed** (const unsigned char *seed, int size)

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Protected Member Functions

- virtual int **next** (int bits)

Answers a pseudo-random uniformly distributed int value of the number of bits specified by the argument bits as described by Donald E.

Knuth in The Art of Computer Programming, Volume 2: Seminumerical Algorithms, section 3.2.1.

Returns

int a pseudo-random generated int number

Parameters

bits	number of bits of the returned value
------	--------------------------------------

6.458.1 Detailed Description

Since

1.0

6.458.2 Constructor & Destructor Documentation

6.458.2.1 `decaf::security::SecureRandom::SecureRandom ()`

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 2320) instance that is created with this constructor is unseeded and can be seeded by calling the `setSeed` method. Calls to `nextBytes` on an unseeded **SecureRandom** (p. 2320) result in the object seeding itself.

6.458.2.2 `decaf::security::SecureRandom::SecureRandom (const std::vector< unsigned char > & seed)`

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 2320) instance created by this constructor is seeded using the passed byte array.

Parameters

<i>seed</i>	The seed bytes to use to seed this secure random number generator.
-------------	--

6.458.2.3 `decaf::security::SecureRandom::SecureRandom (const unsigned char * seed, int size)`

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 2320) instance created by this constructor is seeded using the passed byte array.

Parameters

<i>seed</i>	The seed bytes to use to seed this secure random number generator.
<i>size</i>	The number of bytes in the seed buffer.

Exceptions

<i>NullPointerException</i>	if the seed buffer is NULL.
<i>IllegalArgument-Exception</i>	if the size value is negative.

6.458.2.4 `virtual decaf::security::SecureRandom::~SecureRandom ()`
[virtual]

6.458.3 Member Function Documentation

6.458.3.1 `virtual int decaf::security::SecureRandom::next (int bits)`
[protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

`int` a pseudo-random generated `int` number

Parameters

<i>bits</i>	number of bits of the returned value
-------------	--------------------------------------

See also

nextBytes (p. 2232)
nextDouble (p. 2233)
nextFloat (p. 2233)
nextInt() (p. 2234)
nextInt(int) (p. 2234)
nextGaussian (p. 2233)
nextLong (p. 2234)

Reimplemented from **decaf::util::Random** (p. 2231).

6.458.3.2 `virtual void decaf::security::SecureRandom::nextBytes (std::vector< unsigned char > & buf) [virtual]`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

See also

next (p. 2231)

Reimplemented from **decaf::util::Random** (p. 2232).

6.458.3.3 `virtual void decaf::security::SecureRandom::nextBytes (unsigned char * buf, int size) [virtual]`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

<i>buf</i>	non-null array to contain the new random bytes
------------	--

See also

next (p. 2231)

Exceptions

<i>NullPointerException</i>	if <i>buff</i> is NULL
<i>IllegalArgumentException</i>	if <i>size</i> is negative

Reimplemented from **decaf::util::Random** (p. 2232).

6.458.3.4 `virtual void decaf::security::SecureRandom::setSeed (unsigned long long seed) [virtual]`

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

<i>seed</i>	the seed that alters the state of the random number generator
-------------	---

See also

`next` (p. 2231)
`Random()` (p. 2230)
`#Random(long)`

Reimplemented from `decaf::util::Random` (p. 2235).

6.458.3.5 `virtual void decaf::security::SecureRandom::setSeed (const std::vector< unsigned char > & seed) [virtual]`

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters

<i>seed</i>	A vector of bytes that is used update the seed of the RNG.
-------------	--

6.458.3.6 `virtual void decaf::security::SecureRandom::setSeed (const unsigned char * seed, int size) [virtual]`

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters

<i>seed</i>	The seed bytes to use to seed this secure random number generator.
<i>size</i>	The number of bytes in the seed buffer.

Exceptions

<i>NullPointerException</i>	if the seed buffer is NULL.
<i>IllegalArgumentException</i>	if the size value is negative.

6.459.3 Member Function Documentation

6.459.3.1 `virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int numBytes)` `[virtual]`

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

<i>numBytes</i>	The number of bytes that should be generated for the new seed array.
-----------------	--

Implements `decaf::security::SecureRandomSpi` (p. 2330).

6.459.3.2 `virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int numBytes)` `[virtual]`

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

<i>numBytes</i>	The number of bytes that should be generated for the new seed array.
-----------------	--

Implements `decaf::security::SecureRandomSpi` (p. 2330).

6.459.3.3 **virtual void decaf::internal::security::SecureRandomImpl-
::providerNextBytes (unsigned char * *bytes*, int *numBytes*)**
[virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

<i>bytes</i>	The array that will be filled with random bytes equal to size.
<i>numBytes</i>	The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 2330).

6.459.3.4 **virtual void decaf::internal::security::SecureRandomImpl-
::providerNextBytes (unsigned char * *bytes*, int *numBytes*)**
[virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

<i>bytes</i>	The array that will be filled with random bytes equal to size.
<i>numBytes</i>	The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 2330).

6.459.3.5 **virtual void decaf::internal::security::SecureRandomImpl-
::providerSetSeed (const unsigned char * *seed*, int *size*)**
[virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

<i>seed</i>	The array of bytes used to update the generators seed.
<i>size</i>	The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 2331).

6.459.3.6 virtual void **decaf::internal::security::SecureRandomImpl-
::providerSetSeed** (const unsigned char * *seed*, int *size*)
[virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

<i>seed</i>	The array of bytes used to update the generators seed.
<i>size</i>	The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 2331).

6.460.3.1 **virtual unsigned char* decaf::security::SecureRandomSpi::providerGenerateSeed (int *numBytes*)** [pure virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

<i>numBytes</i>	The number of bytes that should be generated for the new seed array.
-----------------	--

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 2327), and **decaf::internal::security::SecureRandomImpl** (p. 2327).

6.460.3.2 **virtual void decaf::security::SecureRandomSpi::providerNextBytes (unsigned char * *bytes*, int *numBytes*)** [pure virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

<i>bytes</i>	The array that will be filled with random bytes equal to size.
<i>numBytes</i>	The number of bytes to generate and write into the bytes array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 2328), and **decaf::internal::security::SecureRandomImpl** (p. 2328).

6.460.3.3 virtual void **decaf::security::SecureRandomSpi::providerSetSeed** (const unsigned char * *seed*, int *size*) [pure virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

<i>seed</i>	The array of bytes used to update the generators seed.
<i>size</i>	The size of the passed byte array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 2329), and **decaf::internal::security::SecureRandomImpl** (p. 2329).

6.461 decaf::util::concurrent::Semaphore Class Reference

A counting semaphore.

```
#include <src/main/decaf/util/concurrent/Semaphore.h>
```

Public Member Functions

- **Semaphore** (int permits)
*Creates a **Semaphore** (p. 2331) with the given number of permits and nonfair fairness setting.*
- **Semaphore** (int permits, bool fair)
*Creates a **Semaphore** (p. 2331) with the given number of permits and the given fairness setting.*
- virtual **~Semaphore** ()
- void **acquire** ()
Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.
- void **acquireUninterruptibly** ()
Acquires a permit from this semaphore, blocking until one is available.
- bool **tryAcquire** ()
Acquires a permit from this semaphore, only if one is available at the time of invocation.
- bool **tryAcquire** (long long timeout, const **TimeUnit** &unit)
Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.
- void **release** ()
Releases a permit, returning it to the semaphore.
- void **acquire** (int permits)

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

- void **acquireUninterruptibly** (int permits)

Acquires the given number of permits from this semaphore, blocking until all are available.

- bool **tryAcquire** (int permits)

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

- bool **tryAcquire** (int permits, long long timeout, const **TimeUnit** &unit)

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

- void **release** (int permits)

Releases the given number of permits, returning them to the semaphore.

- int **availablePermits** () const

Returns the current number of permits available in this semaphore.

- int **drainPermits** ()

Acquires and returns all permits that are immediately available.

- bool **isFair** () const

- std::string **toString** () const

Returns a string identifying this semaphore, as well as its state.

6.461.1 Detailed Description

A counting semaphore.

Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 2334) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 2337) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 2331) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

```
class Pool { private:
```

```
static const int MAX_AVAILABLE = 100; Semaphore (p. 2331) available;
```

```
std::vector<std::string> items; std::vector<bool> used;
```

```
Mutex (p. 1960) lock;
```

```
public:
```

```
Pool() : available( MAX_AVAILABLE, true ) { used.resize( MAX_AVAILABLE ); items.-  
resize( MAX_AVAILABLE ); }
```

```
std::string getItem() throws InterruptedException { available.acquire(); return getNext-  
AvailableItem(); }
```

```
void putItem( std::string x ) { if( markAsUnused(x) ) { available.release(); } }
```

```
std::string getNextAvailableItem() {
```

```
synchronized( &lock ) (p. 3231) { for( int i = 0; i < MAX_AVAILABLE; ++i ) { if( !used[i] ) { used[i] = true; return items[i]; } }
```

```
return std::string(); // not reached }
```

```
bool markAsUnused( const std::string& item ) { synchronized( &lock ) (p. 3231) { for( int i = 0; i < MAX_AVAILABLE; ++i ) { if( item == items[i] ) { if( used[i] ) { used[i] = false; return true; } else return false; } } } return false; } };
```

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back to the pool and a permit is returned to the semaphore, allowing another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 2334) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this way, the binary semaphore has the property (unlike many **Lock** (p. 1682) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 2334) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific internal points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinite postponement when these methods are used without fairness set true.

Since

1.0

6.461.2 Constructor & Destructor Documentation

6.461.2.1 `decaf::util::concurrent::Semaphore::Semaphore (int permits)`

Creates a **Semaphore** (p. 2331) with the given number of permits and nonfair fairness setting.

Parameters

<i>permits</i>	the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.
----------------	---

6.461.2.2 `decaf::util::concurrent::Semaphore::Semaphore (int permits, bool fair)`

Creates a **Semaphore** (p. 2331) with the given number of permits and the given fairness setting.

Parameters

<i>permits</i>	the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.
<i>fair</i>	true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

6.461.2.3 `virtual decaf::util::concurrent::Semaphore::~~Semaphore ()` [virtual]

6.461.3 Member Function Documentation

6.461.3.1 `void decaf::util::concurrent::Semaphore::acquire ()`

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes the **release()** (p. 2337) method for this semaphore and the current thread is next to be assigned a permit; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Exceptions

<i>InterruptedException</i>	- if the current thread is interrupted.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).

6.461.3.2 void decaf::util::concurrent::Semaphore::acquire (int *permits*)

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then *InterruptedException* is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 2337).

Parameters

<i>permits</i>	the number of permits to acquire.
----------------	-----------------------------------

Exceptions

<i>InterruptedException</i>	if the current thread is interrupted.
<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).

6.461.3.3 void decaf::util::concurrent::Semaphore::acquireUninterruptibly ()

Acquires a permit from this semaphore, blocking until one is available.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread schedul-

ing purposes and lies dormant until some other thread invokes the **release()** (p. 2337) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).
-------------------------	---

6.461.3.4 void decaf::util::concurrent::Semaphore::acquireUninterruptibly (int permits)

Acquires the given number of permits from this semaphore, blocking until all are available.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

Parameters

<i>permits</i>	the number of permits to acquire.
----------------	-----------------------------------

Exceptions

<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).

6.461.3.5 int decaf::util::concurrent::Semaphore::availablePermits () const

Returns the current number of permits available in this semaphore.

This method is typically used for debugging and testing purposes.

Returns

the number of permits available in this semaphore

6.461.3.6 int decaf::util::concurrent::Semaphore::drainPermits ()

Acquires and returns all permits that are immediately available.

Returns

the number of permits acquired

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while draining the Semaphore (p. 2331).
-------------------------	--

6.461.3.7 bool decaf::util::concurrent::Semaphore::isFair () const**Returns**

true if this semaphore has fairness set true

6.461.3.8 void decaf::util::concurrent::Semaphore::release ()

Releases a permit, returning it to the semaphore.

Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 2334). Correct usage of a semaphore is established by programming convention in the application.

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while releasing the Semaphore (p. 2331).
-------------------------	---

6.461.3.9 void decaf::util::concurrent::Semaphore::release (int permits)

Releases the given number of permits, returning them to the semaphore.

Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given

the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes; otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

Parameters

<i>permits</i>	the number of permits to release
----------------	----------------------------------

Exceptions

<i>IllegalArgument-Exception</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while releasing the Semaphore (p. 2331).

6.461.3.10 `std::string decaf::util::concurrent::Semaphore::toString () const`

Returns a string identifying this semaphore, as well as its state.

The state, in brackets, includes the String "Permits =" followed by the number of permits.

Returns

a string identifying this semaphore, as well as its state

6.461.3.11 `bool decaf::util::concurrent::Semaphore::tryAcquire ()`

Acquires a permit from this semaphore, only if one is available at the time of invocation.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 2338) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use `tryAcquire(0, TimeUnit.SECONDS)` (p. 2764) which is almost equivalent (it also detects interruption).

Returns

true if a permit was acquired and false otherwise

Exceptions

<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).
-------------------------	---

6.461.3.12 `bool decaf::util::concurrent::Semaphore::tryAcquire (long long timeout,
const TimeUnit & unit)`

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes the **release()** (p. 2337) method for this semaphore and the current thread is next to be assigned a permit; or * Some other thread interrupts the current thread; or * The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting to acquire a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

<i>timeout</i>	the maximum time to wait for a permit
<i>unit</i>	the time unit of the timeout argument

Returns

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

Exceptions

<i>InterruptedException</i>	if the current thread is interrupted.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).

6.461.3.13 `bool decaf::util::concurrent::Semaphore::tryAcquire (int permits)`

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to try-Acquire will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use try-Acquire(permits, 0, **TimeUnit.SECONDS** (p. 2764)) which is almost equivalent (it also detects interruption).

Parameters

<i>permits</i>	the number of permits to acquire
----------------	----------------------------------

Returns

true if the permits were acquired and false otherwise.

Exceptions

<i>IllegalArgument-Exception</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).

6.461.3.14 `bool decaf::util::concurrent::Semaphore::tryAcquire (int permits, long long timeout, const TimeUnit & unit)`

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread; or * The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by

a call to **release()** (p. 2337).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2337).

Parameters

<i>permits</i>	the number of permits to acquire
<i>timeout</i>	the maximum amount of time to wait to acquire the permits.
<i>unit</i>	the units that the timeout param represents.

Returns

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

Exceptions

<i>IllegalArgumentException</i>	if the permits argument is negative.
<i>RuntimeException</i>	if an unexpected error occurs while acquiring the Semaphore (p. 2331).

6.462 activemq::cmsutil::CmsTemplate::SendExecutor Class - Reference

```
#include <src/main/activemq/cmsutil/CmsTemplate.h>
```

Inheritance diagram for activemq::cmsutil::CmsTemplate::SendExecutor:

Public Member Functions

- **SendExecutor** (**MessageCreator** *messageCreator, **CmsTemplate** *parent)
- virtual ~**SendExecutor** () throw ()
- virtual void **doInCms** (**cms::Session** *session, **cms::MessageProducer** *producer)

Execute an action given a session and producer.

6.462.1 Constructor & Destructor Documentation

6.462.1.1 `activemq::cmsutil::CmsTemplate::SendExecutor::SendExecutor (MessageCreator * messageCreator, CmsTemplate * parent) [inline]`

6.462.1.2 `virtual activemq::cmsutil::CmsTemplate::SendExecutor::~~SendExecutor () throw () [inline, virtual]`

6.462.2 Member Function Documentation

6.462.2.1 `virtual void activemq::cmsutil::CmsTemplate::SendExecutor::doInCms (cms::Session * session, cms::MessageProducer * producer) [inline, virtual]`

Execute an action given a session and producer.

Parameters

<i>session</i>	the CMS Session
<i>producer</i>	the CMS Producer

Exceptions

<i>cms::CMS-Exception</i> (p. 826)	if thrown by CMS API methods
--	------------------------------

Implements `activemq::cmsutil::ProducerCallback` (p. 2179).

6.463 decaf::net::ServerSocket Class Reference

This class implements server sockets.

```
#include <src/main/decaf/net/ServerSocket.h>
```

Inheritance diagram for `decaf::net::ServerSocket`:

Public Member Functions

- **`ServerSocket ()`**
Creates a non-bound server socket.

- **ServerSocket** (int port)
Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.
- **ServerSocket** (int port, int backlog)
Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.
- **ServerSocket** (int port, int backlog, const **InetAddress** *address)
Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.
- virtual **~ServerSocket** ()
Releases socket handle if **close()** (p. 2348) hasn't been called.
- virtual void **bind** (const std::string &host, int port)
Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.
- virtual void **bind** (const std::string &host, int port, int backlog)
Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.
- virtual **Socket** * **accept** ()
Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 2342), the caller blocks until a connection is made.
- virtual void **close** ()
Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.
- virtual bool **isClosed** () const
- virtual bool **isBound** () const
- virtual int **getReceiveBufferSize** () const
Gets the receive buffer size for this socket, **SO_RCVBUF**.
- virtual void **setReceiveBufferSize** (int size)
Sets the receive buffer size for this socket, **SO_RCVBUF**.
- virtual bool **getReuseAddress** () const
Gets the reuse address flag, **SO_REUSEADDR**.
- virtual void **setReuseAddress** (bool reuse)
Sets the reuse address flag, **SO_REUSEADDR**.
- virtual int **getSoTimeout** () const
Gets the timeout for socket operations, **SO_TIMEOUT**.
- virtual void **setSoTimeout** (int timeout)
Sets the timeout for socket operations, **SO_TIMEOUT**.
- virtual int **getLocalPort** () const
Gets the port number on the Local machine that this **ServerSocket** (p. 2342) is bound to.
- virtual std::string **toString** () const

Static Public Member Functions

- static void **setSocketImplFactory** (**SocketImplFactory** *factory)
*Sets the instance of a **SocketImplFactory** (p. 2487) that the **ServerSocket** (p. 2342) class should use when new instances of this class are created.*

Protected Member Functions

- **ServerSocket** (**SocketImpl** *impl)
*Creates a **ServerSocket** (p. 2342) wrapping the provided **SocketImpl** (p. 2479) instance, this **Socket** (p. 2452) is considered unconnected.*
- virtual void **implAccept** (**Socket** *socket)
*Virtual method that allows a **ServerSocket** (p. 2342) subclass to override the accept call and provide its own **SocketImpl** (p. 2479) for the socket.*
- virtual int **getDefaultBacklog** ()
Allows a subclass to override what is considered the default backlog.
- void **checkClosed** () const
- void **ensureCreated** () const
- void **setupSocketImpl** (int port, int backlog, const **InetAddress** *ifAddress)

6.463.1 Detailed Description

This class implements server sockets.

A server socket waits for requests to come in over the network.

The actual work of the server socket is performed by an instance of the **SocketImpl** (p. 2479) class. An application can change the socket factory that creates the socket implementation to configure itself to create sockets of a particular type.

Since

1.0

6.463.2 Constructor & Destructor Documentation

6.463.2.1 `decaf::net::ServerSocket::ServerSocket ()`

Creates a non-bound server socket.

6.463.2.2 `decaf::net::ServerSocket::ServerSocket (int port)`

Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 2487) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2479) is created.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
-------------	--

Exceptions

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgument-Exception</i>	if the port value is negative or greater than 65535.

6.463.2.3 decaf::net::ServerSocket::ServerSocket (int *port*, int *backlog*)

Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2487) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2479) is created.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.

Exceptions

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgument-Exception</i>	if the port value is negative or greater than 65535.

6.463.2.4 decaf::net::ServerSocket::ServerSocket (int *port*, int *backlog*, const InetAddress * *address*)

Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2487) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 2479) is created.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.
<i>ifAddress</i>	The IP Address to bind to on the local machine.

Exceptions

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgumentException</i>	if the port value is negative or greater than 65535.

6.463.2.5 `virtual decaf::net::ServerSocket::~ServerSocket ()` [virtual]

Releases socket handle if `close()` (p. 2348) hasn't been called.

6.463.2.6 `decaf::net::ServerSocket::ServerSocket (SocketImpl * impl)` [protected]

Creates a **ServerSocket** (p. 2342) wrapping the provided **SocketImpl** (p. 2479) instance, this **Socket** (p. 2452) is considered unconnected.

The **ServerSocket** (p. 2342) class takes ownership of this **SocketImpl** (p. 2479) pointer and will delete it when the **Socket** (p. 2452) class is destroyed.

Parameters

<i>impl</i>	The SocketImpl (p. 2479) instance to wrap.
-------------	---

Exceptions

<i>NullPointerException</i>	if the passed SocketImpl (p. 2479) is Null.
-----------------------------	--

6.463.3 Member Function Documentation

6.463.3.1 `virtual Socket* decaf::net::ServerSocket::accept ()` [virtual]

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 2342), the caller blocks until a connection is made.

If the `SO_TIMEOUT` option is set this method could throw a **SocketTimeoutException** (p. 2493) if the operation times out.

Returns

a new **Socket** (p. 2452) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions

<i>IOException</i>	if an I/O error occurs while binding the socket.
SocketException (p. 2471)	if an error occurs while blocking on the accept call.
SocketTimeoutException (p. 2493)	if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2006).

6.463.3.2 `virtual void decaf::net::ServerSocket::bind (const std::string & host, int port)`
[virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

Parameters

<i>host</i>	The IP address or host name.
<i>port</i>	The TCP port between 1..65535.

Exceptions

<i>IOException</i>	if an I/O error occurs while binding the socket.
<i>IllegalArgumentException</i>	if the parameters are not valid.

6.463.3.3 `virtual void decaf::net::ServerSocket::bind (const std::string & host, int port, int backlog)` [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

If the backlog is greater than zero it will be used instead of the default value, otherwise the default value is used and no error is generated.

Parameters

<i>host</i>	The IP address or host name.
-------------	------------------------------

<i>port</i>	The TCP port between 1..65535.
<i>backlog</i>	The size of listen backlog.

Exceptions

<i>IOException</i>	if an I/O error occurs while binding the socket.
<i>IllegalArgument-Exception</i>	if the parameters are not valid.

6.463.3.4 **void decaf::net::ServerSocket::checkClosed () const** [protected]

6.463.3.5 **virtual void decaf::net::ServerSocket::close ()** [virtual]

Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

6.463.3.6 **void decaf::net::ServerSocket::ensureCreated () const** [protected]

6.463.3.7 **virtual int decaf::net::ServerSocket::getDefaultBacklog ()**
[protected, virtual]

Allows a subclass to override what is considered the default backlog.

Returns

the default backlog for connections.

6.463.3.8 **virtual int decaf::net::ServerSocket::getLocalPort () const** [virtual]

Gets the port number on the Local machine that this **ServerSocket** (p. 2342) is bound to.

Returns

the port number of this machine that is bound, if not bound returns -1.

6.463.3.9 **virtual int decaf::net::ServerSocket::getReceiveBufferSize () const**
[virtual]

Gets the receive buffer size for this socket, SO_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

Returns

the receive buffer size in bytes.

Exceptions

<i>SocketException</i> (p. 2471)	if the operation fails.
--	-------------------------

6.463.3.10 virtual bool decaf::net::ServerSocket::getReuseAddress () const
[virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns

True if the address can be reused.

Exceptions

<i>SocketException</i> (p. 2471)	if the operation fails.
--	-------------------------

6.463.3.11 virtual int decaf::net::ServerSocket::getSoTimeout () const
[virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns

The timeout in milliseconds for socket operations.

Exceptions

<i>SocketException</i> (p. 2471)	Thrown if unable to retrieve the information.
--	---

6.463.3.12 virtual void decaf::net::ServerSocket::implAccept (Socket * socket)
[protected, virtual]

Virtual method that allows a **ServerSocket** (p.2342) subclass to override the accept call and provide its own **SocketImpl** (p. 2479) for the socket.

Parameters

<i>socket</i>	The socket object whose SocketImpl (p. 2479) should be used for the accept call.
---------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

6.463.3.13 `virtual bool decaf::net::ServerSocket::isBound () const` [virtual]

Returns

true if the server socket is bound.

6.463.3.14 `virtual bool decaf::net::ServerSocket::isClosed () const` [virtual]

Returns

true if the close method has been called on the **ServerSocket** (p. 2342).

6.463.3.15 `virtual void decaf::net::ServerSocket::setReceiveBufferSize (int size)`
[virtual]

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters

<i>size</i>	Number of bytes to set the receive buffer to.
-------------	---

Exceptions

SocketException (p. 2471)	if the operation fails.
<i>IllegalArgumentException</i>	if the value is zero or negative.

6.463.3.16 `virtual void decaf::net::ServerSocket::setReuseAddress (bool reuse)`
[virtual]

Sets the reuse address flag, SO_REUSEADDR.

Parameters

<i>reuse</i>	If true, sets the flag.
--------------	-------------------------

Exceptions

SocketException (p. 2471)	if the operation fails.
-------------------------------------	-------------------------

6.463.3.17 static void decaf::net::ServerSocket::setSocketImplFactory (SocketImplFactory * *factory*) [static]

Sets the instance of a **SocketImplFactory** (p. 2487) that the **ServerSocket** (p. 2342) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

Parameters

<i>factory</i>	The instance of a SocketImplFactory (p. 2487) to use when new - SocketImpl (p. 2479) objects are created.
----------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
SocketException (p. 2471)	if this method has already been called with a valid factory.

6.463.3.18 virtual void decaf::net::ServerSocket::setSoTimeout (int *timeout*) [virtual]

Sets the timeout for socket operations, SO_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

Parameters

<i>timeout</i>	The timeout in milliseconds for socket operations.
----------------	--

Exceptions

SocketException (p. 2471)	Thrown if unable to set the information.
<i>IllegalArgumentException</i>	if the timeout value is negative.

6.463.3.19 void decaf::net::ServerSocket::setupSocketImpl (int *port*, int *backlog*, const InetAddress * *ifAddress*) [protected]

6.463.3.20 `virtual std::string decaf::net::ServerSocket::toString () const`
`[virtual]`

Returns

a string representing this **ServerSocket** (p. 2342).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ServerSocket.h`

6.464 decaf::net::ServerSocketFactory Class Reference

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

```
#include <src/main/decaf/net/ServerSocketFactory.h>
```

Inheritance diagram for `decaf::net::ServerSocketFactory`:

6.464.1 Detailed Description

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

Since

1.0

6.464.2 Constructor & Destructor Documentation

6.464.2.1 **decaf::net::ServerSocketFactory::ServerSocketFactory** ()
[protected]

6.464.2.2 **virtual decaf::net::ServerSocketFactory::~~ServerSocketFactory** ()
[virtual]

6.464.3 Member Function Documentation

6.464.3.1 **virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket** () [virtual]

Create a new **ServerSocket** (p. 2342) that is unbound.

The **ServerSocket** (p. 2342) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 2342) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 2342) cannot be created for some reason.
--------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2012), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1167), and **decaf::internal::net::DefaultServerSocketFactory** (p. 1157).

6.464.3.2 **virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket** (int *port*) [pure virtual]

Create a new **ServerSocket** (p. 2342) that is bound to the given port.

The **ServerSocket** (p. 2342) will have been configured with the defaults from the factory.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
-------------	--

Returns

new **ServerSocket** (p. 2342) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 2342) cannot be created for some reason.
--------------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2012), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1168), and **decaf::internal::net::DefaultServerSocketFactory** (p. 1157).

```
6.464.3.3  virtual ServerSocket* decaf::net::ServerSocketFactory-
           ::createServerSocket ( int port, int backlog ) [pure
           virtual]
```

Create a new **ServerSocket** (p. 2342) that is bound to the given port.

The **ServerSocket** (p. 2342) will have been configured with the defaults from the factory.

The **ServerSocket** (p. 2342) will use the specified connection backlog setting.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
<i>backlog</i>	The number of pending connect request the ServerSocket (p. 2342) can queue.

Returns

new **ServerSocket** (p. 2342) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 2342) cannot be created for some reason.
--------------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2012), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1168), and **decaf::internal::net::DefaultServerSocketFactory** (p. 1158).

```
6.464.3.4  virtual ServerSocket* decaf::net::ServerSocketFactory::createServer-
           Socket ( int port, int backlog, const InetAddress * address ) [pure
           virtual]
```

Create a new **ServerSocket** (p. 2342) that is bound to the given port.

The **ServerSocket** (p. 2342) will have been configured with the defaults from the factory. The **ServerSocket** (p. 2342) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 2342) will listen on all interfaces.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
<i>backlog</i>	The number of pending connect request the ServerSocket (p. 2342) can queue.
<i>address</i>	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 2342) pointer that is owned by the caller.

Exceptions

<i>IOException</i>	if the ServerSocket (p. 2342) cannot be created for some reason.
--------------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2013), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1169), and **decaf::internal::net::DefaultServerSocketFactory** (p. 1158).

6.464.3.5 static ServerSocketFactory* decaf::net::ServerSocketFactory::get-Default () [static]

Returns the Default **ServerSocket** (p. 2342) factory, the pointer is owned by the Decaf runtime and should not be deleted by the caller.

Only one default **ServerSocketFactory** (p. 2352) exists for the lifetime of the - Application.

Returns

the default **ServerSocketFactory** (p. 2352) for this application.

Reimplemented in **decaf::net::ssl::SSLServerSocketFactory** (p. 2512).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ServerSocketFactory.h**

6.465 activemq::util::Service Class Reference

Base interface for all classes that run as a **Service** (p. 2355) inside the application.

```
#include <src/main/activemq/util/Service.h>
```

Inheritance diagram for `activemq::util::Service`:

Public Member Functions

- virtual `~Service()`
- virtual void `start()`=0
- virtual void `stop()`=0

6.465.1 Detailed Description

Base interface for all classes that run as a **Service** (p. 2355) inside the application.

Since

3.3.0

6.465.2 Constructor & Destructor Documentation

6.465.2.1 virtual `activemq::util::Service::~Service()` [virtual]

6.465.3 Member Function Documentation

6.465.3.1 virtual void `activemq::util::Service::start()` [pure virtual]

Implemented in `activemq::util::ServiceSupport` (p. 2361).

6.465.3.2 virtual void `activemq::util::Service::stop()` [pure virtual]

Implemented in `activemq::util::ServiceSupport` (p. 2361).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/Service.h`

6.466 `activemq::util::ServiceListener` Class Reference

Listener interface for observers of **Service** (p. 2355) related events.

```
#include <src/main/activemq/util/ServiceListener.h>
```

Public Member Functions

- virtual `~ServiceListener()`
- virtual void **started** (const **Service** *target)=0
indicates that the target service has completed its start operation.
- virtual void **stopped** (const **Service** *target)=0
indicates that the target service has completed its stop operation.

6.466.1 Detailed Description

Listener interface for observers of **Service** (p. 2355) related events.

Since

3.3.0

6.466.2 Constructor & Destructor Documentation

6.466.2.1 virtual `activemq::util::ServiceListener::~ServiceListener()`
[virtual]

6.466.3 Member Function Documentation

6.466.3.1 virtual void `activemq::util::ServiceListener::started (const Service * target)` [pure virtual]

indicates that the target service has completed its start operation.

Parameters

<i>target</i>	The service that triggered this notification.
---------------	---

6.466.3.2 virtual void `activemq::util::ServiceListener::stopped (const Service * target)` [pure virtual]

indicates that the target service has completed its stop operation.

Parameters

<i>target</i>	The service that triggered this notification.
---------------	---

The documentation for this class was generated from the following file:

- `src/main/activemq/util/ServiceListener.h`

6.467 activemq::util::ServiceStopper Class Reference

```
#include <src/main/activemq/util/ServiceStopper.h>
```

Public Member Functions

- **ServiceStopper** ()
- virtual **~ServiceStopper** ()
- void **stop** (**Service** *service)
- void **throwFirstException** ()
- virtual void **onException** (**Service** *service, **decaf::lang::Exception** &ex)

6.467.1 Constructor & Destructor Documentation

6.467.1.1 **activemq::util::ServiceStopper::ServiceStopper** ()

6.467.1.2 **virtual activemq::util::ServiceStopper::~~ServiceStopper** ()
[virtual]

6.467.2 Member Function Documentation

6.467.2.1 **virtual void activemq::util::ServiceStopper::onException** (**Service** *
service, **decaf::lang::Exception** & *ex*) [virtual]

6.467.2.2 **void activemq::util::ServiceStopper::stop** (**Service** * *service*)

6.467.2.3 **void activemq::util::ServiceStopper::throwFirstException** ()

The documentation for this class was generated from the following file:

6.468 activemq::util::ServiceSupport Class Reference

Provides a base class for **Service** (p. 2355) implementations.

```
#include <src/main/activemq/util/ServiceSupport.h>
```

Inheritance diagram for **activemq::util::ServiceSupport**:

Public Member Functions

- **ServiceSupport** (const **ServiceSupport** &)

- **ServiceSupport & operator=** (const **ServiceSupport** &)
- **ServiceSupport** ()
- virtual **~ServiceSupport** ()
- void **start** ()
*Starts the **Service** (p. 2355), notifying any registered listeners of the start if it is successful.*
- void **stop** ()
*Stops the **Service** (p. 2355).*
- bool **isStarted** () const
- bool **isStopping** () const
- bool **isStopped** () const
- void **addServiceListener** (**ServiceListener** *listener)
*Adds the given listener to this **Service** (p. 2355)'s list of listeners, call retains ownership of the pointer.*
- void **removeServiceListener** (**ServiceListener** *listener)
*Removes the given listener to this **Service** (p. 2355)'s list of listeners, call retains ownership of the pointer.*

Static Public Member Functions

- static void **dispose** (**Service** *service)
Safely shuts down a service.

Protected Member Functions

- virtual void **doStop** (**ServiceStopper** *stopper)=0
Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.
- virtual void **doStart** ()=0
Performs the actual start operation on the service, acquiring all the resources needed to run the service.

6.468.1 Detailed Description

Provides a base class for **Service** (p. 2355) implementations.

Since

3.3.0

6.468.2 Constructor & Destructor Documentation

6.468.2.1 `activemq::util::ServiceSupport::ServiceSupport (const ServiceSupport &)`

6.468.2.2 `activemq::util::ServiceSupport::ServiceSupport ()`

6.468.2.3 `virtual activemq::util::ServiceSupport::~~ServiceSupport ()`
[virtual]

6.468.3 Member Function Documentation

6.468.3.1 `void activemq::util::ServiceSupport::addServiceListener (ServiceListener * listener)`

Adds the given listener to this **Service** (p. 2355)'s list of listeners, call retains ownership of the pointer.

6.468.3.2 `static void activemq::util::ServiceSupport::dispose (Service * service)`
[static]

Safely shuts down a service.

Parameters

<i>service</i>	The service to stop.
----------------	----------------------

6.468.3.3 `virtual void activemq::util::ServiceSupport::doStart ()` [protected, pure virtual]

Performs the actual start operation on the service, acquiring all the resources needed to run the service.

Must be implemented in derived class.

Implemented in **activemq::threads::Scheduler** (p. 2318).

6.468.3.4 `virtual void activemq::util::ServiceSupport::doStop (ServiceStopper * stopper)` [protected, pure virtual]

Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

Implemented in **activemq::threads::Scheduler** (p. 2319).

6.468.3.5 `bool activemq::util::ServiceSupport::isStarted () const`

Returns

true if this service has been started

6.468.3.6 **bool** `activemq::util::ServiceSupport::isStopped ()` **const**

Returns

true if this service is closed

6.468.3.7 **bool** `activemq::util::ServiceSupport::isStopping ()` **const**

Returns

true if this service is in the process of closing

6.468.3.8 **ServiceSupport&** `activemq::util::ServiceSupport::operator= (const ServiceSupport &)`

6.468.3.9 **void** `activemq::util::ServiceSupport::removeServiceListener (ServiceListener * listener)`

Removes the given listener to this **Service** (p. 2355)'s list of listeners, call retains ownership of the pointer.

6.468.3.10 **void** `activemq::util::ServiceSupport::start ()` `[virtual]`

Starts the **Service** (p. 2355), notifying any registered listeners of the start if it is successful.

Implements **activemq::util::Service** (p. 2356).

6.468.3.11 **void** `activemq::util::ServiceSupport::stop ()` `[virtual]`

Stops the **Service** (p. 2355).

Implements **activemq::util::Service** (p. 2356).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/ServiceSupport.h`

6.469 cms::Session Class Reference

A **Session** (p. 2361) object is a single-threaded context for producing and consuming messages.

```
#include <src/main/cms/Session.h>
```

Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** { **AUTO_ACKNOWLEDGE**, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_ACKNOWLEDGE**, **SESSION_TRANSACTED**, **INDIVIDUAL_ACKNOWLEDGE** }

Public Member Functions

- virtual **~Session** () throw ()
- virtual void **close** ()=0
Closes this session as well as any active child consumers or producers.
- virtual void **commit** ()=0
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()=0
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** ()=0
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination)=0

*Creates a **MessageConsumer** (p. 1877) for the specified destination.*
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector)=0
*Creates a **MessageConsumer** (p. 1877) for the specified destination, using a message selector.*
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector, bool noLocal)=0
*Creates a **MessageConsumer** (p. 1877) for the specified destination, using a message selector.*
- virtual **MessageConsumer** * **createDurableConsumer** (const **Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)=0
*Creates a durable subscriber to the specified topic, using a **Message** (p. 1839) selector.*
- virtual **MessageProducer** * **createProducer** (const **Destination** *destination=NULL)=0
*Creates a **MessageProducer** (p. 1924) to send messages to the specified destination.*
- virtual **QueueBrowser** * **createBrowser** (const cms::Queue *queue)=0
*Creates a new **QueueBrowser** (p. 2227) to peek at Messages on the given **Queue** (p. 2221).*

- virtual **QueueBrowser** * **createBrowser** (const cms::Queue *queue, const std::string &selector)=0
*Creates a new **QueueBrowser** (p. 2227) to peek at Messages on the given **Queue** (p. 2221).*
- virtual **Queue** * **createQueue** (const std::string &queueName)=0
*Creates a queue identity given a **Queue** (p. 2221) name.*
- virtual **Topic** * **createTopic** (const std::string &topicName)=0
*Creates a topic identity given a **Queue** (p. 2221) name.*
- virtual **TemporaryQueue** * **createTemporaryQueue** ()=0
*Creates a **TemporaryQueue** (p. 2698) object.*
- virtual **TemporaryTopic** * **createTemporaryTopic** ()=0
*Creates a **TemporaryTopic** (p. 2700) object.*
- virtual **Message** * **createMessage** ()=0
*Creates a new **Message** (p. 1839).*
- virtual **BytesMessage** * **createBytesMessage** ()=0
*Creates a **BytesMessage** (p. 718).*
- virtual **BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize)=0
*Creates a **BytesMessage** (p. 718) and sets the payload to the passed value.*
- virtual **StreamMessage** * **createStreamMessage** ()=0
*Creates a new **StreamMessage** (p. 2606).*
- virtual **TextMessage** * **createTextMessage** ()=0
*Creates a new **TextMessage** (p. 2701).*
- virtual **TextMessage** * **createTextMessage** (const std::string &text)=0
*Creates a new **TextMessage** (p. 2701) and set the text to the value given.*
- virtual **MapMessage** * **createMapMessage** ()=0
*Creates a new **MapMessage** (p. 1779).*
- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0
Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const =0
*Gets if the Sessions is a Transacted **Session** (p. 2361).*
- virtual void **unsubscribe** (const std::string &name)=0
Unsubscribes a durable subscription that has been created by a client.

6.469.1 Detailed Description

A **Session** (p. 2361) object is a single-threaded context for producing and consuming messages.

A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.

- It is a factory for `TemporaryTopics` and `TemporaryQueues`.
- It provides a way to create **Queue** (p. 2221) or **Topic** (p. 2764) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 1877) until a message arrives. The thread may then use one or more of the **Session** (p. 2361)'s `MessageProducers`.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's `close` method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 2361) method that can be called concurrently.
- Invoking any other **Session** (p. 2361) method on a closed session must throw an **IllegalStateException** (p. 1419). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 2361) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 2361) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 2361). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 1924) this implies that all messages sent by the producer are not sent to the Provider until the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 1877) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all

Consumed **Message** (p. 1839) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 1839).

While the **Session** (p.2361) interface implements the **Startable** (p.2534) and **Stoppable** (p.2602) interfaces it is not required to implement these methods and can throw an `UnsupportedOperationException` exception if they are not available for the given CMS provider.

Since

1.0

6.469.2 Member Enumeration Documentation

6.469.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's `acknowledge` method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 1839) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.469.3 Constructor & Destructor Documentation

6.469.3.1 virtual cms::Session::~~Session () throw () [virtual]

6.469.4 Member Function Documentation

6.469.4.1 virtual void cms::Session::close () [pure virtual]

Closes this session as well as any active child consumers or producers.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implements **cms::Closeable** (p. 816).

Implemented in **activemq::core::ActiveMQSession** (p. 338), and **activemq::cmsutil::PooledSession** (p. 2095).

6.469.4.2 `virtual void cms::Session::commit()` [pure virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>IllegalStateException</i> (p. 1419)	- if the method is not called by a transacted session.

Implemented in **activemq::core::ActiveMQSession** (p. 338), **activemq::cmsutil::PooledSession** (p. 2095), and **activemq::core::ActiveMQXASession** (p. 437).

Referenced by **activemq::cmsutil::PooledSession::commit()**.

6.469.4.3 `virtual QueueBrowser* cms::Session::createBrowser(const cms::Queue * queue)` [pure virtual]

Creates a new **QueueBrowser** (p. 2227) to peek at Messages on the given **Queue** (p. 2221).

Parameters

<i>queue</i>	the Queue (p. 2221) to browse
--------------	--------------------------------------

Returns

New **QueueBrowser** (p. 2227) that is owned by the caller.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>InvalidDestinationException</i> (p. 1535)	- if the destination given is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 339), and **activemq::cmsutil::PooledSession** (p. 2096).

6.469.4.4 virtual **QueueBrowser*** cms::Session::createBrowser (const cms::Queue * queue, const std::string & selector) [pure virtual]

Creates a new **QueueBrowser** (p. 2227) to peek at Messages on the given **Queue** (p. 2221).

Parameters

<i>queue</i>	the Queue (p. 2221) to browse
<i>selector</i>	the Message (p. 1839) selector to filter which messages are browsed.

Returns

New **QueueBrowser** (p. 2227) that is owned by the caller.

Exceptions

CMSException (p. 826)	- If an internal error occurs.
InvalidDestination-Exception (p. 1535)	- if the destination given is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 339), and **activemq::cmsutil::PooledSession** (p. 2096).

6.469.4.5 virtual **BytesMessage*** cms::Session::createBytesMessage () [pure virtual]

Creates a **BytesMessage** (p. 718).

Exceptions

CMSException (p. 826)	- If an internal error occurs.
---------------------------------	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 340), and **activemq::cmsutil::PooledSession** (p. 2097).

Referenced by **activemq::cmsutil::PooledSession::createBytesMessage()**.

6.469.4.6 `virtual BytesMessage* cms::Session::createBytesMessage (const unsigned char * bytes, int bytesSize) [pure virtual]`

Creates a **BytesMessage** (p. 718) and sets the payload to the passed value.

Parameters

<i>bytes</i>	an array of bytes to set in the message
<i>bytesSize</i>	the size of the bytes array, or number of bytes to use

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 340), and **activemq::cmsutil::PooledSession** (p. 2097).

6.469.4.7 `virtual MessageConsumer* cms::Session::createConsumer (const Destination * destination) [pure virtual]`

Creates a **MessageConsumer** (p. 1877) for the specified destination.

Parameters

<i>destination</i>	the Destination (p. 1210) that this consumer receiving messages for.
--------------------	---

Returns

pointer to a new **MessageConsumer** (p. 1877) that is owned by the caller (caller deletes)

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>InvalidDestinationException</i> (p. 1535)	- if an invalid destination is specified.

Implemented in **activemq::core::ActiveMQSession** (p. 340), and **activemq::cmsutil::PooledSession** (p. 2098).

Referenced by `activemq::cmsutil::PooledSession::createConsumer()`.

6.469.4.8 virtual **MessageConsumer*** cms::Session::createConsumer (const **Destination** * *destination*, const std::string & *selector*) [pure virtual]

Creates a **MessageConsumer** (p. 1877) for the specified destination, using a message selector.

Parameters

<i>destination</i>	the Destination (p. 1210) that this consumer receiving messages for.
<i>selector</i>	the Message (p. 1839) Selector to use

Returns

pointer to a new **MessageConsumer** (p. 1877) that is owned by the caller (caller deletes)

Exceptions

CMSException (p. 826)	- If an internal error occurs.
InvalidDestination-Exception (p. 1535)	- if an invalid destination is specified.
InvalidSelector-Exception (p. 1541)	- if the message selector is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 341), and **activemq::cmsutil::PooledSession** (p. 2099).

6.469.4.9 virtual **MessageConsumer*** cms::Session::createConsumer (const **Destination** * *destination*, const std::string & *selector*, bool *noLocal*) [pure virtual]

Creates a **MessageConsumer** (p. 1877) for the specified destination, using a message selector.

Parameters

<i>destination</i>	the Destination (p. 1210) that this consumer receiving messages for.
<i>selector</i>	the Message (p. 1839) Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new **MessageConsumer** (p. 1877) that is owned by the caller (caller deletes)

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>InvalidDestinationException</i> (p. 1535)	- if an invalid destination is specified.
<i>InvalidSelectorException</i> (p. 1541)	- if the message selector is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 341), and **activemq::cmsutil::PooledSession** (p. 2099).

6.469.4.10 **virtual MessageConsumer* cms::Session::createDurableConsumer (**
const Topic * destination, const std::string & name, const std::string & selector,
bool noLocal = false) [pure virtual]

Creates a durable subscriber to the specified topic, using a **Message** (p. 1839) selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

<i>destination</i>	the topic to subscribe to
<i>name</i>	The name used to identify the subscription
<i>selector</i>	the Message (p. 1839) Selector to use
<i>noLocal</i>	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable **MessageConsumer** (p. 1877) that is owned by the caller
 (caller deletes)

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>InvalidDestinationException</i> (p. 1535)	- if an invalid destination is specified.
<i>InvalidSelectorException</i> (p. 1541)	- if the message selector is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 342), and **activemq::cmsutil::PooledSession** (p. 2100).

Referenced by `activemq::cmsutil::PooledSession::createDurableConsumer()`.

6.469.4.11 `virtual MapMessage* cms::Session::createMapMessage ()` [pure virtual]

Creates a new **MapMessage** (p. 1779).

Exceptions

CMSEException (p. 826)	- If an internal error occurs.
----------------------------------	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 342), and **activemq::cmsutil::PooledSession** (p. 2101).

Referenced by `activemq::cmsutil::PooledSession::createMapMessage()`.

6.469.4.12 `virtual Message* cms::Session::createMessage ()` [pure virtual]

Creates a new **Message** (p. 1839).

Exceptions

CMSEException (p. 826)	- If an internal error occurs.
----------------------------------	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 343), and **activemq::cmsutil::PooledSession** (p. 2101).

Referenced by `activemq::cmsutil::PooledSession::createMessage()`.

6.469.4.13 `virtual MessageProducer* cms::Session::createProducer (const Destination * destination = NULL)` [pure virtual]

Creates a **MessageProducer** (p. 1924) to send messages to the specified destination.

Parameters

<i>destination</i>	the Destination (p. 1210) to send on
--------------------	---

Returns

New **MessageProducer** (p. 1924) that is owned by the caller.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>InvalidDestinationException</i> (p. 1535)	- if an invalid destination is specified.

Implemented in **activemq::core::ActiveMQSession** (p. 343), and **activemq::cmsutil::PooledSession** (p. 2101).

Referenced by `activemq::cmsutil::PooledSession::createProducer()`.

6.469.4.14 `virtual Queue* cms::Session::createQueue (const std::string & queueName) [pure virtual]`

Creates a queue identity given a **Queue** (p. 2221) name.

Parameters

<i>queueName</i>	the name of the new Queue (p. 2221)
------------------	--

Returns

new **Queue** (p. 2221) pointer that is owned by the caller.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 343), and **activemq::cmsutil::PooledSession** (p. 2102).

Referenced by `activemq::cmsutil::PooledSession::createQueue()`.

6.469.4.15 `virtual StreamMessage* cms::Session::createStreamMessage () [pure virtual]`

Creates a new **StreamMessage** (p. 2606).

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 344), and **activemq::cmsutil::PooledSession** (p. 2102).

Referenced by `activemq::cmsutil::PooledSession::createStreamMessage()`.

6.469.4.16 `virtual TemporaryQueue* cms::Session::createTemporaryQueue ()`
`[pure virtual]`

Creates a **TemporaryQueue** (p. 2698) object.

Returns

new **TemporaryQueue** (p. 2698) pointer that is owned by the caller.

Exceptions

<i>CMSEException</i> (p. 826)	- If an internal error occurs.
---	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 344), and **activemq::cmsutil::PooledSession** (p. 2102).

Referenced by `activemq::cmsutil::PooledSession::createTemporaryQueue()`.

6.469.4.17 `virtual TemporaryTopic* cms::Session::createTemporaryTopic ()`
`[pure virtual]`

Creates a **TemporaryTopic** (p. 2700) object.

Exceptions

<i>CMSEException</i> (p. 826)	- If an internal error occurs.
---	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 344), and **activemq::cmsutil::PooledSession** (p. 2103).

Referenced by `activemq::cmsutil::PooledSession::createTemporaryTopic()`.

6.469.4.18 `virtual TextMessage* cms::Session::createTextMessage ()` `[pure virtual]`

Creates a new **TextMessage** (p. 2701).

Exceptions

<i>CMSEException</i> (p. 826)	- If an internal error occurs.
---	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 345), and **activemq::cmsutil::PooledSession** (p. 2103).

Referenced by `activemq::cmsutil::PooledSession::createTextMessage()`.

6.469.4.19 `virtual TextMessage* cms::Session::createTextMessage (const std::string & text) [pure virtual]`

Creates a new **TextMessage** (p. 2701) and set the text to the value given.

Parameters

<i>text</i>	the initial text for the message
-------------	----------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **`activemq::core::ActiveMQSession`** (p. 345), and **`activemq::cmsutil::PooledSession`** (p. 2103).

6.469.4.20 `virtual Topic* cms::Session::createTopic (const std::string & topicName) [pure virtual]`

Creates a topic identity given a **Queue** (p. 2221) name.

Parameters

<i>topicName</i>	the name of the new Topic (p. 2764)
------------------	--

Returns

new **Topic** (p. 2764) pointer that is owned by the caller.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **`activemq::core::ActiveMQSession`** (p. 345), and **`activemq::cmsutil::PooledSession`** (p. 2104).

Referenced by `activemq::cmsutil::PooledSession::createTopic()`.

6.469.4.21 `virtual AcknowledgeMode cms::Session::getAcknowledgeMode () const [pure virtual]`

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 347), and **activemq::cmsutil::PooledSession** (p. 2104).

Referenced by `activemq::cmsutil::PooledSession::getAcknowledgeMode()`.

6.469.4.22 `virtual bool cms::Session::isTransacted () const [pure virtual]`

Gets if the Sessions is a Transacted **Session** (p. 2361).

Returns

transacted true - false.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 349), **activemq::cmsutil::PooledSession** (p. 2105), and **activemq::core::ActiveMQXASession** (p. 438).

Referenced by `activemq::cmsutil::PooledSession::isTransacted()`.

6.469.4.23 `virtual void cms::Session::recover () [pure virtual]`

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "re-delivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to stop and restart message delivery due to some internal error.
<i>IllegalStateException</i> (p. 1419)	- if the method is called by a transacted session.

Implemented in **activemq::core::ActiveMQSession** (p. 350), and **activemq::cmsutil::PooledSession** (p. 2105).

Referenced by `activemq::cmsutil::PooledSession::recover()`.

6.469.4.24 `virtual void cms::Session::rollback () [pure virtual]`

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
<i>IllegalStateException</i> (p. 1419)	- if the method is not called by a transacted session.

Implemented in **activemq::core::ActiveMQSession** (p. 351), **activemq::cmsutil::PooledSession** (p. 2106), and **activemq::core::ActiveMQXASession** (p. 439).

Referenced by `activemq::cmsutil::PooledSession::rollback()`.

6.469.4.25 `virtual void cms::Session::unsubscribe (const std::string & name) [pure virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 1877) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

<i>name</i>	The name used to identify this subscription
-------------	---

Exceptions

<i>CMSException</i> (p. 826)	- If an internal error occurs.
--	--------------------------------

Implemented in **activemq::core::ActiveMQSession** (p. 353), and **activemq::cmsutil::PooledSession** (p. 2107).

Referenced by `activemq::cmsutil::PooledSession::unsubscribe()`.

The documentation for this class was generated from the following file:

- `src/main/cms/Session.h`

6.470 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

```
#include <src/main/activemq/cmsutil/SessionCallback.h>
```

Inheritance diagram for `activemq::cmsutil::SessionCallback`:

Public Member Functions

- virtual `~SessionCallback()`
- virtual void `doInCms(cms::Session *session)=0`
Execute any number of operations against the supplied CMS session.

6.470.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

6.470.2 Constructor & Destructor Documentation

6.470.2.1 virtual `activemq::cmsutil::SessionCallback::~SessionCallback()`
[inline, virtual]

6.470.3 Member Function Documentation

6.470.3.1 virtual void `activemq::cmsutil::SessionCallback::doInCms(cms::Session * session)` [pure virtual]

Execute any number of operations against the supplied CMS session.

Parameters

<i>session</i>	the CMS Session
----------------	-----------------

Exceptions

<i>CMSEException</i> if thrown by CMS API methods

Implemented in **activemq::cmsutil::CmsTemplate::ReceiveExecutor** (p. 2249), and **activemq::cmsutil::CmsTemplate::ProducerExecutor** (p. 2181).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**SessionCallback.h**

6.471 activemq::commands::SessionId Class Reference

```
#include <src/main/activemq/commands/SessionId.h>
```

Inheritance diagram for activemq::commands::SessionId:

Public Types

- typedef **decaf::lang::PointerComparator** < **SessionId** > **COMPARATOR**

Public Member Functions

- **SessionId** ()
- **SessionId** (const **SessionId** &other)

6.471.3 Member Function Documentation

6.471.3.1 `virtual SessionId* activemq::commands::SessionId::cloneDataStructure () const [virtual]`

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.471.3.2 `virtual int activemq::commands::SessionId::compareTo (const SessionId & value) const [virtual]`

6.471.3.3 `virtual void activemq::commands::SessionId::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1134).

6.471.3.4 `virtual bool activemq::commands::SessionId::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 1135).

6.471.3.5 `virtual bool activemq::commands::SessionId::equals (const SessionId & value) const [virtual]`

6.471.3.6 `virtual const std::string& activemq::commands::SessionId::getConnectionId () const [virtual]`

6.471.3.7 virtual std::string& activemq::commands::SessionId::getConnectionId ()
[virtual]

6.471.3.8 virtual unsigned char activemq::commands::SessionId::getDataStructure-
Type () const [virtual]

Get the **DataSet** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataSet** (p. 1137).

6.471.3.9 const Pointer<ConnectionId>& activemq::commands::SessionId::get-
ParentId () const

6.471.3.10 virtual long long activemq::commands::SessionId::getValue () const
[virtual]

6.471.3.11 virtual bool activemq::commands::SessionId::operator< (const SessionId & *value*
) const [virtual]

6.471.3.12 SessionId& activemq::commands::SessionId::operator= (const SessionId &
other)

6.471.3.13 virtual bool activemq::commands::SessionId::operator== (const SessionId &
value) const [virtual]

6.471.3.14 virtual void activemq::commands::SessionId::setConnectionId (const
std::string & *connectionId*) [virtual]

6.471.3.15 virtual void activemq::commands::SessionId::setValue (long long *value*)
[virtual]

6.471.3.16 virtual std::string activemq::commands::SessionId::toString () const
[virtual]

Returns a string containing the information for this **DataSet** (p. 1133) such as its
type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 531).

6.471.4 Field Documentation

6.471.4.1 `std::string activemq::commands::SessionId::connectionId`
[protected]

6.471.4.2 `const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121`
[static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.471.4.3 `long long activemq::commands::SessionId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/SessionId.h`

6.472 `activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller` Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2382).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/SessionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller`:

Public Member Functions

- **SessionIdMarshaller** ()
- virtual **~SessionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tight Marshal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

Loose Un-marshal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::Data-Structure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

Tight Marshal to the given stream.

6.472.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2382).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.472.2 Constructor & Destructor Documentation

6.472.2.1 **activemq::wireformat::openwire::marshal::generated-
::SessionIdMarshaller::SessionIdMarshaller ()**
[inline]

6.472.2.2 **virtual activemq::wireformat::openwire::marshal::generated:-
SessionIdMarshaller::~~SessionIdMarshaller ()** [inline,
virtual]

6.472.3 Member Function Documentation

6.472.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire-
::marshal::generated::SessionIdMarshaller::createObject ()** const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1120).

6.472.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal-
::generated::SessionIdMarshaller::getDataStructureType () const
[virtual]`

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.472.3.3 `virtual void activemq::wireformat::openwire::marshal::generated-
::SessionIdMarshaller::looseMarshal (OpenWireFormat * format,
commands::DataStructure * command, decaf::io::DataOutputStream * ds
) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1123).

6.472.3.4 `virtual void activemq::wireformat::openwire::marshal::generated-
::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * format,
commands::DataStructure * command, decaf::io::DataInputStream * dis)
[virtual]`

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

6.472 activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller

Class Reference

2391

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1125).

6.472.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightMarshal1** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **utils::BooleanStream** * *bs*)
[virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

6.472.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

6.472.3.7 virtual void activemq::wireformat::openwire::marshal::generated-
::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*,
commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*,
utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1131).

The documentation for this class was generated from the following file:

6.473 activemq::commands::SessionInfo Class Reference

```
#include <src/main/activemq/commands/SessionInfo.h>
```

Inheritance diagram for activemq::commands::SessionInfo:

Public Member Functions

- **SessionInfo** ()
- virtual **~SessionInfo** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **SessionInfo** * **cloneDataStructure** () const
Clone this obbect and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

- virtual bool **equals** (const **DataSet** *value) const
Compares the **DataSet** (p. 1133) passed in to this one, and returns if they are equivalent.
- unsigned int **getAckMode** () const
- void **setAckMode** (unsigned int mode)
- **Pointer**< **RemoveInfo** > **createRemoveCommand** () const
- virtual const **Pointer** < **SessionId** > & **getSessionId** () const
- virtual **Pointer**< **SessionId** > & **getSessionId** ()
- virtual void **setSessionId** (const **Pointer**< **SessionId** > &sessionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SESSIONINFO** = 4

Protected Attributes

- **Pointer**< **SessionId** > **sessionId**

6.473.1 Constructor & Destructor Documentation

6.473.1.1 **activemq::commands::SessionInfo::SessionInfo** ()

6.473.1.2 virtual **activemq::commands::SessionInfo::~~SessionInfo** ()
[virtual]

6.473.2 Member Function Documentation

6.473.2.1 virtual **SessionInfo*** **activemq::commands::SessionInfo::cloneDataSet** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataSet** (p. 1133).

6.473.2.2 `virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 493).

6.473.2.3 `Pointer<RemoveInfo> activemq::commands::SessionInfo::createRemoveCommand () const`

6.473.2.4 `virtual bool activemq::commands::SessionInfo::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 494).

6.473.2.5 `unsigned int activemq::commands::SessionInfo::getAckMode () const [inline]`

6.473.2.6 `virtual unsigned char activemq::commands::SessionInfo::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements `activemq::commands::DataStructure` (p. 1137).

6.473.2.7 `virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () const [virtual]`

Referenced by `activemq::state::ConnectionState::addSession()`.

6.473.2.8 virtual `Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ()` [virtual]

6.473.2.9 void `activemq::commands::SessionInfo::setAckMode (unsigned int mode)` [inline]

6.473.2.10 virtual void `activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & sessionId)` [virtual]

6.473.2.11 virtual `std::string activemq::commands::SessionInfo::toString ()` const [virtual]

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 498).

6.473.2.12 virtual `Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * visitor)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 871).

6.473.3 Field Documentation

6.473.3.1 const unsigned char `activemq::commands::SessionInfo::ID_SESSIONINFO = 4` [static]

6.473.3.2 `Pointer<SessionId> activemq::commands::SessionInfo::sessionId` [protected]

The documentation for this class was generated from the following file:

[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1120).

6.474.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal-
::generated::SessionInfoMarshaller::getDataStructureType ()** const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.474.3.3 **virtual void activemq::wireformat::openwire::marshal::generated-
::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *format*,
commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*
)** [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Generated on Tue Feb 28 2012 17:47:25 for activemq-cpp-3.4.1 by Doxygen

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 500).

6.474.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis)`
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.474.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs)`
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.474

activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller

Class Reference

2399

6.474.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.474.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

6.475 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

```
#include <src/main/activemq/cmsutil/SessionPool.h>
```

Public Member Functions

- **SessionPool** (**cms::Connection** *connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** *resourceLifecycleManager)
Constructs a session pool.
- virtual **~SessionPool** ()
Destroys the pooled session objects, but not the underlying session resources.
- virtual **PooledSession** * **takeSession** ()
Takes a session from the pool, creating one if necessary.
- virtual void **returnSession** (**PooledSession** *session)
Returns a session to the pool.
- **ResourceLifecycleManager** * **getResourceLifecycleManager** ()

6.475.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode.

Internal session resources are managed through a provided **ResourceLifecycleManager** (p. 2293), not by this pool. This class is thread-safe.

6.475.2 Constructor & Destructor Documentation

- 6.475.2.1 **activemq::cmsutil::SessionPool::SessionPool** (**cms::Connection** * connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** * resourceLifecycleManager)

Constructs a session pool.

Parameters

<i>connection</i>	the connection to be used for creating all sessions.
<i>ackMode</i>	the acknowledge mode to be used for all sessions
<i>resource-Lifecycle-Manager</i>	the object responsible for managing the lifecycle of any allocated cms::Session (p. 2361) resources.

6.475.2.2 virtual **activemq::cmsutil::SessionPool::~~SessionPool**() [virtual]

Destroys the pooled session objects, but not the underlying session resources.

That is the job of the **ResourceLifecycleManager** (p. 2293).

6.475.3 Member Function Documentation

6.475.3.1 **ResourceLifecycleManager*** **activemq::cmsutil::SessionPool::getResourceLifecycleManager**()
[inline]

6.475.3.2 virtual void **activemq::cmsutil::SessionPool::returnSession**(
PooledSession * *session*) [virtual]

Returns a session to the pool.

Parameters

<i>session</i>	the session to be returned.
----------------	-----------------------------

6.475.3.3 virtual **PooledSession*** **activemq::cmsutil::SessionPool::takeSession**()
[virtual]

Takes a session from the pool, creating one if necessary.

Returns

the pooled session object

Exceptions

<i>CMSEException</i>	if an error occurred
----------------------	----------------------

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**SessionPool.h**

6.476 activemq::state::SessionState Class Reference

6.477 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

```
#include <src/main/decaf/util/Set.h>
```

Inheritance diagram for `decaf::util::Set< E >`:

Public Member Functions

- `virtual ~Set ()`

6.477.1 Detailed Description

```
template<typename E> class decaf::util::Set< E >
```

A collection that contains no duplicate elements.

More formally, sets contain no pair of elements e_1 and e_2 such that $e_1 == e_2$, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since

1.0

6.477.2 Constructor & Destructor Documentation

6.477.2.1 `template<typename E> virtual decaf::util::Set< E >::~~Set () [inline, virtual]`

6.478 decaf::lang::Short Class Reference

```
#include <src/main/decaf/lang/Short.h>
```

Inheritance diagram for `decaf::lang::Short`:

Public Member Functions

- **Short** (short value)
- **Short** (const std::string &value)
- virtual **~Short** ()
- virtual int **compareTo** (const **Short** &s) const
*Compares this **Short** (p. 2398) instance with another.*
- bool **equals** (const **Short** &s) const
- virtual bool **operator==** (const **Short** &s) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Short** &s) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const short &s) const
*Compares this **Short** (p. 2398) instance with another.*

- bool **equals** (const short &s) const
- virtual bool **operator==** (const short &s) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const short &s) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value)
*Decodes a **String** (p. 2620) into a **Short** (p. 2398).*
- static short **reverseBytes** (short value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.
- static short **parseShort** (const std::string &s, int radix)
Parses the string argument as a signed short in the radix specified by the second argument.
- static short **parseShort** (const std::string &s)
Parses the string argument as a signed decimal short.
- static **Short valueOf** (short value)
*Returns a **Short** (p. 2398) instance representing the specified short value.*
- static **Short valueOf** (const std::string &value)
*Returns a **Short** (p. 2398) object holding the value given by the specified std::string.*
- static **Short valueOf** (const std::string &value, int radix)
*Returns a **Short** (p. 2398) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 16
Size of this objects primitive type in bits.
- static const short **MAX_VALUE** = (short)0x7FFF
Max Value for this Object's primitive type.
- static const short **MIN_VALUE** = (short)0x8000
Max Value for this Object's primitive type.

6.478.1 Constructor & Destructor Documentation

6.478.1.1 decaf::lang::Short::Short (short value)

Parameters

<i>value</i>	- short to wrap
--------------	-----------------

6.478.1.2 decaf::lang::Short::Short (const std::string & value)

Parameters

<i>value</i>	The string value to convert to short and wrap.
--------------	--

Exceptions

<i>NumberFormatException</i>	if the string is not well formed number value.
------------------------------	--

6.478.1.3 virtual decaf::lang::Short::~~Short () [inline, virtual]

6.478.2 Member Function Documentation

6.478.2.1 virtual unsigned char decaf::lang::Short::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1993).

6.478.2.2 `virtual int decaf::lang::Short::compareTo (const Short & s) const`
[virtual]

Compares this **Short** (p. 2398) instance with another.

Parameters

<code>s</code>	- the Short (p. 2398) instance to be compared
----------------	--

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Short** > (p. 886).

6.478.2.3 `virtual int decaf::lang::Short::compareTo (const short & s) const`
[virtual]

Compares this **Short** (p. 2398) instance with another.

Parameters

<code>s</code>	- the Short (p. 2398) instance to be compared
----------------	--

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **short** > (p. 886).

6.478.2.4 `static Short decaf::lang::Short::decode (const std::string & value)`
[static]

Decodes a **String** (p. 2620) into a **Short** (p. 2398).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p. 2405) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a **NumberFormatException** will be thrown. The result is negated if first character of the specified **String** (p. 2620) is the minus sign. No whitespace characters are permitted in the string.

Parameters

<i>value</i>	- The string to decode
--------------	------------------------

Returns

a **Short** (p. 2398) object containing the decoded value

Exceptions

<i>NumberFormatException</i>	if the string is not formatted correctly.
------------------------------	---

6.478.2.5 `virtual double decaf::lang::Short::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.478.2.6 `bool decaf::lang::Short::equals (const Short & s) const [inline, virtual]`

Returns

true if the two **Short** (p. 2398) Objects have the same value.

Implements **decaf::lang::Comparable< Short >** (p. 887).

6.478.2.7 `bool decaf::lang::Short::equals (const short & s) const [inline, virtual]`

Returns

true if the two **Short** (p. 2398) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p. 887).

6.478.2.8 `virtual float decaf::lang::Short::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.478.2.9 `virtual int decaf::lang::Short::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1993).

6.478.2.10 `virtual long long decaf::lang::Short::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1994).

6.478.2.11 `virtual bool decaf::lang::Short::operator< (const Short & s) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s	- the value to be compared to this one.
----------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Short** > (p. 887).

6.478.2.12 `virtual bool decaf::lang::Short::operator< (const short & s) const` `[inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<code>s</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **short** > (p. 887).

6.478.2.13 `virtual bool decaf::lang::Short::operator== (const Short & s) const` `[inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<code>s</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Short** > (p. 888).

6.478.2.14 `virtual bool decaf::lang::Short::operator== (const short & s) const` `[inline, virtual]`

Compares equality between this object and the one passed.

Parameters

<code>s</code>	- the value to be compared to this one.
----------------	---

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **short** > (p. 888).

6.478.2.15 static short decaf::lang::Short::parseShort (const std::string & s, int radix)
[static]

Parses the string argument as a signed short in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 768) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type **NumberFormatException** is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 773) or larger than **Character.MAX_RADIX** (p. 772). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type short.

Parameters

s	- the String (p. 2620) containing the short representation to be parsed
radix	- the radix to be used while parsing s

Returns

the short represented by the string argument in the specified radix.

Exceptions

<i>NumberFormatException</i>	- If String (p. 2620) does not contain a parsable short.
------------------------------	---

6.478.2.16 static short decaf::lang::Short::parseShort (const std::string & s)
[static]

Parses the string argument as a signed decimal short.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the **parseShort(const std::string, int)** method.

Parameters

<i>s</i>	- String (p. 2620) to convert to a short
----------	---

Returns

the converted short value

Exceptions

<i>NumberFormatException</i>	if the string is not a short.
------------------------------	-------------------------------

6.478.2.17 `static short decaf::lang::Short::reverseBytes (short value)` `[static]`

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters

<i>value</i>	- the short whose bytes we are to reverse
--------------	---

Returns

the reversed short.

6.478.2.18 `virtual short decaf::lang::Short::shortValue () const` `[inline, virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1994).

6.478.2.19 `std::string decaf::lang::Short::toString () const`

Returns

this **Short** (p. 2398) Object as a **String** (p. 2620) Representation

6.478.2.20 `static std::string decaf::lang::Short::toString (short value)` `[static]`

Returns

a string representing the primitive value as Base 10

6.478.2.21 static **Short** decaf::lang::Short::valueOf (short *value*) [static]

Returns a **Short** (p. 2398) instance representing the specified short value.

Parameters

<i>value</i>	- the short to wrap
--------------	---------------------

Returns

the new **Short** (p. 2398) object wrapping value.

6.478.2.22 static **Short** decaf::lang::Short::valueOf (const std::string & *value*)
[static]

Returns a **Short** (p. 2398) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the parseShort(std::string) method. The result is a **Short** (p. 2398) object that represents the short value specified by the string.

Parameters

<i>value</i>	- std::string to parse as base 10
--------------	-----------------------------------

Returns

new **Short** (p. 2398) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i>	if the string is not a decimal short.
------------------------------	---------------------------------------

6.478.2.23 static **Short** decaf::lang::Short::valueOf (const std::string & *value*, int *radix*)
[static]

Returns a **Short** (p. 2398) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the parseShort(std-

::string, int) method. The result is a **Short** (p. 2398) object that represents the short value specified by the string.

Parameters

<i>value</i>	- std::string to parse as base (radix)
<i>radix</i>	- base of the string to parse.

Returns

new **Short** (p. 2398) Object wrapping the primitive

Exceptions

<i>NumberFormatException</i>	if the string is not a valid short.
------------------------------	-------------------------------------

6.478.3 Field Documentation

6.478.3.1 `const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF` [static]

Max Value for this Object's primitive type.

6.478.3.2 `const short decaf::lang::Short::MIN_VALUE = (short)0x8000` [static]

Max Value for this Object's primitive type.

6.478.3.3 `const int decaf::lang::Short::SIZE = 16` [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Short.h**

6.479 decaf::internal::nio::ShortArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (int size, bool readOnly=false)
Creates a **ShortArrayBuffer** (p. 2408) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.
- **ShortArrayBuffer** (short *array, int size, int offset, int length, bool readOnly=false)
Creates a **ShortArrayBuffer** (p. 2408) object that wraps the given array.
- **ShortArrayBuffer** (const decaf::lang::Pointer< **ByteArrayAdapter** > &array, int offset, int length, bool readOnly=false)
Creates a byte buffer that wraps the passed **ByteArrayAdapter** and start at the given offset.
- **ShortArrayBuffer** (const **ShortArrayBuffer** &other)
Create a **ShortArrayBuffer** (p. 2408) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayAdapter** and when changes are made to that data it is reflected in both.
- virtual ~**ShortArrayBuffer** ()
- virtual short * array ()
Returns the short array that backs this buffer (optional operation).
Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.
Returns
the array that backs this **Buffer** (p. 582)

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	if this Buffer (p. 582) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

- virtual int arrayOffset ()
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.
Returns
The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	if this Buffer (p. 582) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

- virtual **ShortBuffer** * asReadOnlyBuffer () const
Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

- virtual **ShortBuffer & compact ()**

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **ShortBuffer** (p. 2419).*

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>
--	-------------------------------------

- virtual **ShortBuffer * duplicate ()**

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new short **Buffer** (p. 582) which the caller owns.*

- virtual short **get ()**

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

BufferUnderflow-Exception (p. 611)	<i>if there no more data to return.</i>
--	---

- virtual short **get (int index) const**

Absolute get method.

Reads the value at the given index.

Parameters

index	<i>The index in the Buffer (p. 582) where the short is to be read.</i>
-------	---

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBoundsException	<i>if index is not smaller than the buffer's limit, or the index is negative.</i>
---------------------------	---

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual **ShortBuffer** & **put** (short value)

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value	<i>The shorts value to be written.</i>
-------	--

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	<i>if this buffer's current position is not smaller than its limit.</i>
ReadOnlyBuffer-Exception (p. 2244)	<i>if this buffer is read-only.</i>

- virtual **ShortBuffer** & **put** (int index, short value)

Writes the given shorts into this buffer at the given index.

Parameters

index	<i>The position in the Buffer (p. 582) to write the data.</i>
value	<i>The shorts to write.</i>

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.

- virtual **ShortBuffer * slice ()** const

Creates a new **ShortBuffer** (p. 2419) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 2419) which the caller owns.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

Sets this **ShortArrayBuffer** (p. 2408) as Read-Only.

6.479.1 Constructor & Destructor Documentation

6.479.1.1 **decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer** (int size, bool readOnly = false)

Creates a **ShortArrayBuffer** (p. 2408) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>IllegalArgument-Exception</i>	if the capacity value is negative.
----------------------------------	------------------------------------

6.479.1.2 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * array, int size, int offset, int length, bool readOnly = false)

Creates a **ShortArrayBuffer** (p. 2408) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

<i>array</i>	The actual array to wrap.
<i>size</i>	The size of the given array.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if buffer is NULL
<i>IndexOutOfBoundsException</i>	if offset is greater than array capacity.

6.479.1.3 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & array, int offset, int length, bool readOnly = false)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **ShortArrayBuffer** (p. 2408) will be that of the remaining capacity of the passed buffer.

Parameters

<i>array</i>	The ByteArrayAdapter to wrap.
<i>offset</i>	The position that is this buffers start position.
<i>length</i>	The limit of how many bytes into the array this Buffer can write.
<i>readOnly</i>	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

<i>NullPointerException</i>	if array is NULL
<i>IndexOutOfBoundsException</i>	if offset + length is greater than array size.

6.479.1.4 `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & other)`

Create a **ShortArrayBuffer** (p. 2408) that mirrors this one, meaning it shares a reference to this buffers `ByteArrayAdapter` and when changes are made to that data it is reflected in both.

Parameters

<i>other</i>	The ShortArrayBuffer (p. 2408) this one is to mirror.
--------------	--

6.479.1.5 `virtual decaf::internal::nio::ShortArrayBuffer::~~ShortArrayBuffer ()` [virtual]

6.479.2 Member Function Documentation

6.479.2.1 `virtual short* decaf::internal::nio::ShortArrayBuffer::array ()` [virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 582)

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>Unsupported-OperationException</i>	if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2422).

6.479.2.2 `virtual int decaf::internal::nio::ShortArrayBuffer::arrayOffset ()` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2244)	if this Buffer (p. 582) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2422).

6.479.2.3 virtual **ShortBuffer*** **decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer ()** const [virtual]

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 2423).

6.479.2.4 virtual **ShortBuffer&** **decaf::internal::nio::ShortArrayBuffer::compact ()** [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 587) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 586) - 1 is copied to index $n = \text{limit}()$ (p. 586) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 2419).

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.
---	------------------------------

Implements **decaf::nio::ShortBuffer** (p. 2423).

6.479.2.5 **virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate ()**
[virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 582) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2424).

6.479.2.6 **virtual short decaf::internal::nio::ShortArrayBuffer::get ()** [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there no more data to return.
---	----------------------------------

Implements **decaf::nio::ShortBuffer** (p. 2424).

6.479.2.7 `virtual short decaf::internal::nio::ShortArrayBuffer::get (int index) const`
[virtual]

Absolute get method.

Reads the value at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the short is to be read.
--------------	--

Returns

the short that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or the index is negative.
----------------------------------	--

Implements **decaf::nio::ShortBuffer** (p. 2425).

6.479.2.8 `virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray () const`
[inline, virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ShortBuffer** (p. 2426).

6.479.2.9 `virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly () const`
[inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 586).

6.479.2.10 `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (short value) [virtual]`

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The shorts value to be written.
--------------	---------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflow-Exception</i> (p. 609)	if this buffer's current position is not smaller than its limit.
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 2429).

6.479.2.11 `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (int index, short value) [virtual]`

Writes the given shorts into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The shorts to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written.
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 2429).

6.479.2.12 virtual void **decaf::internal::nio::ShortArrayBuffer::setReadOnly** (bool *value*) [inline, protected, virtual]

Sets this **ShortArrayBuffer** (p. 2408) as Read-Only.

Parameters

<i>value</i>	Boolean value, true if this buffer is to be read-only, false otherwise.
--------------	---

6.479.2.13 virtual **ShortBuffer*** **decaf::internal::nio::ShortArrayBuffer::slice** ()
const [virtual]

Creates a new **ShortBuffer** (p. 2419) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 2419) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2430).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ShortArrayBuffer.h**

6.480 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:

```
#include <src/main/decaf/nio/ShortBuffer.h>
```

Inheritance diagram for decaf::nio::ShortBuffer:

Public Member Functions

- virtual **~ShortBuffer** ()
- virtual std::string **toString** () const
- virtual short * **array** ()=0

Returns the short array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **ShortBuffer** * **asReadOnlyBuffer** () const =0

Creates a new, read-only short buffer that shares this buffer's content.

- virtual **ShortBuffer** & **compact** ()=0

Compacts this buffer.

- virtual **ShortBuffer** * **duplicate** ()=0

Creates a new short buffer that shares this buffer's content.

- virtual short **get** ()=0

Relative get method.

- virtual short **get** (int index) const =0

Absolute get method.

- **ShortBuffer** & **get** (std::vector< short > buffer)

Relative bulk get method.

- **ShortBuffer** & **get** (short *buffer, int size, int offset, int length)

Relative bulk get method.

- virtual bool **hasArray** () const =0

Tells whether or not this buffer is backed by an accessible short array.

- **ShortBuffer** & **put** (**ShortBuffer** &src)

This method transfers the shorts remaining in the given source buffer into this buffer.

- **ShortBuffer** & **put** (const short *buffer, int size, int offset, int length)

This method transfers shorts into this buffer from the given source array.

- **ShortBuffer** & **put** (std::vector< short > &buffer)

This method transfers the entire content of the given source shorts array into this buffer.

- virtual **ShortBuffer** & **put** (short value)=0

Writes the given shorts into this buffer at the current position, and then increments the position.

- virtual **ShortBuffer** & **put** (int index, short value)=0

Writes the given shorts into this buffer at the given index.

- virtual **ShortBuffer** * **slice** () const =0

*Creates a new **ShortBuffer** (p. 2419) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **ShortBuffer** &value) const

- virtual bool **equals** (const **ShortBuffer** &value) const

- virtual bool **operator==** (const **ShortBuffer** &value) const

- virtual bool **operator<** (const **ShortBuffer** &value) const

Static Public Member Functions

- static **ShortBuffer** * **allocate** (int **capacity**)
Allocates a new Double buffer.
- static **ShortBuffer** * **wrap** (short ***array**, int **size**, int **offset**, int **length**)
*Wraps the passed buffer with a new **ShortBuffer** (p. 2419).*
- static **ShortBuffer** * **wrap** (std::vector< short > &**buffer**)
*Wraps the passed STL short Vector in a **ShortBuffer** (p. 2419).*

Protected Member Functions

- **ShortBuffer** (int **capacity**)
*Creates a **ShortBuffer** (p. 2419) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.480.1 Detailed Description

This class defines four categories of operations upon short buffers:

o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.480.2 Constructor & Destructor Documentation

6.480.2.1 decaf::nio::ShortBuffer::ShortBuffer (int *capacity*) [protected]

Creates a **ShortBuffer** (p. 2419) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

<i>capacity</i>	The size and limit of the Buffer (p. 582) in doubles
-----------------	---

Exceptions

<i>IllegalArgument-Exception</i>	if capacity is negative.
----------------------------------	--------------------------

6.480.2.2 `virtual decaf::nio::ShortBuffer::~~ShortBuffer () [inline, virtual]`

6.480.3 Member Function Documentation

6.480.3.1 `static ShortBuffer* decaf::nio::ShortBuffer::allocate (int capacity) [static]`

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

<i>capacity</i>	The size of the Double buffer in shorts.
-----------------	--

Returns

the **ShortBuffer** (p. 2419) that was allocated, caller owns.

6.480.3.2 `virtual short* decaf::nio::ShortBuffer::array () [pure virtual]`

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 582)

Exceptions

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>Unsupported-OperationException</i>	if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2414).

6.480.3.3 virtual int decaf::nio::ShortBuffer::arrayOffset () [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

<i>ReadOnlyBufferException</i> (p. 2244)	if this Buffer (p. 582) is read only.
<i>UnsupportedOperationException</i>	if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2414).

6.480.3.4 virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2415).

6.480.3.5 virtual ShortBuffer& decaf::nio::ShortBuffer::compact () [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 587) is copied to

index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index `limit()` (p. 586) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 2419).

Exceptions

ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only.
--	------------------------------

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2415).

6.480.3.6 `virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & value)`
`const [virtual]`

6.480.3.7 `virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate ()` [pure
`virtual]`

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 582) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2416).

6.480.3.8 `virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & value)`
`const [virtual]`

6.480.3.9 `virtual short decaf::nio::ShortBuffer::get ()` [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there no more data to return.
---	----------------------------------

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2416).

6.480.3.10 virtual short decaf::nio::ShortBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

<i>index</i>	The index in the Buffer (p. 582) where the short is to be read.
--------------	--

Returns

the short that is located at the given index.

Exceptions

<i>IndexOutOfBoundsException</i>	if index is not smaller than the buffer's limit, or the index is negative.
---	--

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2416).

6.480.3.11 ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > *buffer*)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **Buffer** (p. 582).

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are fewer than length shorts remaining in this buffer.
---	---

6.480.3.12 ShortBuffer& decaf::nio::ShortBuffer::get (short * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method.

This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 588), then no bytes are transferred and a **BufferUnderflow-Exception** (p. 611) is thrown.

Otherwise, this method copies length shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

<i>buffer</i>	The pointer to an allocated buffer to fill.
<i>size</i>	The size of the buffer provided.
<i>offset</i>	The position in the buffer to start filling.
<i>length</i>	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 582).

Exceptions

<i>BufferUnderflow-Exception</i> (p. 611)	if there are fewer than length shorts remaining in this buffer
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.480.3.13 virtual bool decaf::nio::ShortBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2417).

6.480.3.14 virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & value)
const [virtual]

6.480.3.15 virtual bool decaf::nio::ShortBuffer::operator== (const ShortBuffer & value)
const [virtual]

6.480.3.16 ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & src)

This method transfers the shorts remaining in the given source buffer into this buffer.

If there are more shorts remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 588), then no shorts are transferred and a **BufferOverflowException** (p. 609) is thrown.

Otherwise, this method copies `n = src.remaining()` shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src	The buffer to take shorts from an place in this one.
-----	--

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 609)	if there is insufficient space in this buffer for the remaining shorts in the source buffer.
<i>IllegalArgumentException</i>	if the source buffer is this buffer.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

6.480.3.17 ShortBuffer& decaf::nio::ShortBuffer::put (const short * buffer, int size, int offset, int length)

This method transfers shorts into this buffer from the given source array.

If there are more shorts to be copied from the array than remain in this buffer, that is,

if `length > remaining()` (p. 588), then no shorts are transferred and a **BufferOverflow-Exception** (p. 609) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

<i>buffer</i>	The array from which shorts are to be read.
<i>size</i>	The size of the buffer passed.
<i>offset</i>	The offset within the array of the first char to be read.
<i>length</i>	The number of shorts to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there is insufficient space in this buffer
ReadOnlyBuffer-Exception (p. 2244)	if this buffer is read-only
<i>NullPointerException</i>	if the passed buffer is null.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.480.3.18 ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > & buffer)

This method transfers the entire content of the given source shorts array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`.

Parameters

<i>buffer</i>	The buffer whose contents are copied to this ShortBuffer (p. 2419).
---------------	--

Returns

a reference to this buffer.

Exceptions

BufferOverflow-Exception (p. 609)	if there is insufficient space in this buffer.
---	--

<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.
---	------------------------------

6.480.3.19 virtual **ShortBuffer&** decaf::nio::ShortBuffer::put (short *value*) [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

<i>value</i>	The shorts value to be written.
--------------	---------------------------------

Returns

a reference to this buffer.

Exceptions

<i>BufferOverflow-Exception</i> (p. 609)	if this buffer's current position is not smaller than its limit.
<i>ReadOnlyBuffer-Exception</i> (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2417).

6.480.3.20 virtual **ShortBuffer&** decaf::nio::ShortBuffer::put (int *index*, short *value*) [pure virtual]

Writes the given shorts into this buffer at the given index.

Parameters

<i>index</i>	The position in the Buffer (p. 582) to write the data.
<i>value</i>	The shorts to write.

Returns

a reference to this buffer.

Exceptions

<i>IndexOutOfBoundsException</i>	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException (p. 2244)	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2418).

6.480.3.21 `virtual ShortBuffer* decaf::nio::ShortBuffer::slice () const` [pure virtual]

Creates a new **ShortBuffer** (p. 2419) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 2419) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2419).

6.480.3.22 `virtual std::string decaf::nio::ShortBuffer::toString () const` [virtual]

Returns

a std::string describing this object

6.480.3.23 `static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * array, int size, int offset, int length)` [static]

Wraps the passed buffer with a new **ShortBuffer** (p. 2419).

The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>array</i>	The array that will back the new buffer.
<i>size</i>	The size of the passed in array.
<i>offset</i>	The offset of the subarray to be used.
<i>length</i>	The length of the subarray to be used.

Returns

a new **ShortBuffer** (p. 2419) that is backed by buffer, caller owns.

Exceptions

<i>NullPointerException</i>	if the array pointer is NULL.
<i>IndexOutOfBoundsException</i>	if the preconditions of size, offset, or length are not met.

6.480.3.24 `static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & buffer) [static]`

Wraps the passed STL short Vector in a **ShortBuffer** (p. 2419).

The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

<i>buffer</i>	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).
---------------	--

Returns

a new **ShortBuffer** (p. 2419) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**ShortBuffer.h**

6.481 activemq::commands::ShutdownInfo Class Reference

```
#include <src/main/activemq/commands/ShutdownInfo.h>
```

Inheritance diagram for activemq::commands::ShutdownInfo:

Public Member Functions

- **ShutdownInfo** ()
- virtual **~ShutdownInfo** ()
- virtual unsigned char **getDataStructureType** () const

Get the **DataSet** (p. 1133) Type as defined in *CommandTypes.h*.

- virtual **ShutdownInfo** * **cloneDataSet** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataSet** (const **DataSet** *src)

Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const

Returns a string containing the information for this **DataSet** (p. 1133) such as its type and value of its elements.

- virtual bool **equals** (const **DataSet** *value) const

Compares the **DataSet** (p. 1133) passed in to this one, and returns if they are equivalent.

- virtual bool **isShutdownInfo** () const

- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SHUTDOWNINFO** = 11

6.481.1 Constructor & Destructor Documentation

- 6.481.1.1 **activemq::commands::ShutdownInfo::ShutdownInfo** ()

- 6.481.1.2 virtual **activemq::commands::ShutdownInfo::~~ShutdownInfo** ()
[virtual]

6.481.2 Member Function Documentation

- 6.481.2.1 virtual **ShutdownInfo*** **activemq::commands::ShutdownInfo::cloneDataSet** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataSet** (p. 1133).

6.481.2.2 virtual void **activemq::commands::ShutdownInfo::copyDataStructure** (
const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

6.481.2.3 virtual bool **activemq::commands::ShutdownInfo::equals** (const
DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.481.2.4 virtual unsigned char **activemq::commands::ShutdownInfo::getData-**
StructureType () const [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.481.2.5 virtual bool **activemq::commands::ShutdownInfo::isShutdownInfo** ()
const [inline, virtual]

Returns

an answer of true to the **isShutdownInfo()** (p. 2433) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 497).

6.481.2.6 `virtual std::string activemq::commands::ShutdownInfo::toString () const`
`[virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.481.2.7 `virtual Pointer<Command> activemq::commands::ShutdownInfo::visit (`
`activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.481.3 Field Documentation

6.481.3.1 `const unsigned char activemq::commands::ShutdownInfo::ID_SHUTDOWN-`
`INFO = 11 [static]`

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller

Class Reference

2441

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual **~ShutdownInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marshal to the given stream.

6.482.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2434).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.482.2 Constructor & Destructor Documentation

6.482.2.1 **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::ShutdownInfoMarshaller** ()
[inline]

6.482.2.2 **virtual activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller** () [inline, virtual]

6.482.3 Member Function Documentation

6.482.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire-
::marshal::generated::ShutdownInfoMarshaller::createObject () const`
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1120).

6.482.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal-
::generated::ShutdownInfoMarshaller::getDataStructureType () const`
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.482.3.3 `virtual void activemq::wireformat::openwire::marshal::generated:-
ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * format,
commands::DataStructure * command, decaf::io::DataOutputStream * ds
)` [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-
CommandMarshaller** (p. 500).

6.482

activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller

Class Reference

2443

6.482.3.4 virtual void **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::looseUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*)
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 501).

6.482.3.5 virtual int **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightMarshal1** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **utils::BooleanStream** * *bs*)
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.482.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.482.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

The documentation for this class was generated from the following file:

6.483 decaf::security::SignatureException Class Reference

```
#include <src/main/decaf/security/SignatureException.h>
```

Inheritance diagram for `decaf::security::SignatureException`:

Public Member Functions

- **SignatureException** () throw ()
Default Constructor.
- **SignatureException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **SignatureException** (const **SignatureException** &ex) throw ()
Copy Constructor.
- **SignatureException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SignatureException** (const std::exception *cause) throw ()
Constructor.
- **SignatureException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SignatureException** * clone () const
Clones this exception.
- virtual ~**SignatureException** () throw ()

6.483.1 Constructor & Destructor Documentation

6.483.1.1 **decaf::security::SignatureException::SignatureException** () throw ()
[inline]

Default Constructor.

6.483.1.2 **decaf::security::SignatureException::SignatureException** (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
----	--

6.483.1.3 **decaf::security::SignatureException::SignatureException** (const **SignatureException** & ex) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception
----	--

6.483.1.4 **decaf::security::SignatureException::SignatureException** (*const char * file*, *const int lineNumber*, *const std::exception * cause*, *const char * msg*, ...) *throw ()* [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.483.1.5 **decaf::security::SignatureException::SignatureException** (*const std::exception * cause*) *throw ()* [inline]

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.483.1.6 **decaf::security::SignatureException::SignatureException** (*const char * file*, *const int lineNumber*, *const char * msg*, ...) *throw ()* [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	name where exception occurs
<i>lineNumber</i>	line number where the exception occurred.
<i>msg</i>	message to report
...	list of primitives that are formatted into the message

6.483.1.7 **virtual decaf::security::SignatureException::~SignatureException** () *throw ()* [inline, virtual]

6.483.2 Member Function Documentation

6.483.2.1 virtual **SignatureException*** **decaf::security::SignatureException::clone** (
) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1397).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SignatureException.h**

6.484 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 1719) in a human readable format.

```
#include <src/main/decaf/util/logging/SimpleFormatter.h>
```

Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual **~SimpleFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const
Format the given log record and return the formatted string.

6.484.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 1719) in a human readable format.

The summary will typically be 1 or 2 lines.

Since

1.0

6.484.2 Constructor & Destructor Documentation

6.486 `activemq::core::SimplePriorityMessageDispatchChannel` - Class Reference

```
#include <src/main/activemq/core/SimplePriorityMessageDispatchChannel.h>
```

Inheritance diagram for `activemq::core::SimplePriorityMessageDispatchChannel`:

Public Member Functions

- `SimplePriorityMessageDispatchChannel ()`
- `virtual ~SimplePriorityMessageDispatchChannel ()`
- `virtual void enqueue (const Pointer< MessageDispatch > &message)`
Add a Message to the Channel behind all pending message.
- `virtual void enqueueFirst (const Pointer< MessageDispatch > &message)`
Add a message to the front of the Channel.
- `virtual bool isEmpty () const`
- `virtual bool isClosed () const`
- `virtual bool isRunning () const`
- `virtual Pointer< MessageDispatch > dequeue (long long timeout)`
Used to get an enqueued message.
- `virtual Pointer< MessageDispatch > dequeueNoWait ()`
Used to get an enqueued message if there is one queued right now.
- `virtual Pointer< MessageDispatch > peek () const`
Peek in the Queue and return the first message in the Channel without removing it from the channel.
- `virtual void start ()`
Starts dispatch of messages from the Channel.

6.486 activemq::core::SimplePriorityMessageDispatchChannel Class Reference

- virtual void **stop** ()
Stops dispatch of message from the Channel.
- virtual void **close** ()
Close this channel no messages will be dispatched after this method is called.
- virtual void **clear** ()
Clear the Channel, all pending messages are removed.
- virtual int **size** () const
- virtual std::vector< **Pointer** < **MessageDispatch** > > **removeAll** ()
Remove all messages that are currently in the Channel and return them as a list of Messages.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.486.1 Constructor & Destructor Documentation

6.486.1.1 **activemq::core::SimplePriorityMessageDispatchChannel::SimplePriorityMessageDispatchChannel** ()

6.486.1.2 **virtual activemq::core::SimplePriorityMessageDispatchChannel::~SimplePriorityMessageDispatchChannel** ()
[virtual]

6.486.2 Member Function Documentation

6.486.2.1 **virtual void activemq::core::SimplePriorityMessageDispatchChannel::clear ()** [virtual]

Clear the Channel, all pending messages are removed.

Implements **activemq::core::MessageDispatchChannel** (p. 1887).

6.486.2.2 **virtual void activemq::core::SimplePriorityMessageDispatchChannel::close ()** [virtual]

Close this channel no messages will be dispatched after this method is called.

Implements **activemq::core::MessageDispatchChannel** (p. 1887).

6.486.2.3 **virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::dequeue (long long timeout)** [virtual]

Used to get an enqueued message.

The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will be consumed by this method.

Returns

null if we timeout or if the consumer is closed.

Exceptions

<i>ActiveMQException</i>

Implements **activemq::core::MessageDispatchChannel** (p. 1887).

6.486.2.4 **virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::dequeueNoWait ()** [virtual]

Used to get an enqueued message if there is one queued right now.

If there is no waiting message then this method returns Null.

Returns

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 1888).

6.486 `activemq::core::SimplePriorityMessageDispatchChannel` Class Reference 2453

6.486.2.5 `virtual void activemq::core::SimplePriorityMessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & message)`
[virtual]

Add a Message to the Channel behind all pending message.

Parameters

<i>message</i>	- The message to add to the Channel.
----------------	--------------------------------------

Implements `activemq::core::MessageDispatchChannel` (p. 1888).

6.486.2.6 `virtual void activemq::core::SimplePriorityMessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & message)`
[virtual]

Add a message to the front of the Channel.

Parameters

<i>message</i>	- The Message to add to the front of the Channel.
----------------	---

Implements `activemq::core::MessageDispatchChannel` (p. 1888).

6.486.2.7 `virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isClosed () const` [inline, virtual]

Returns

has the Queue been closed.

Implements `activemq::core::MessageDispatchChannel` (p. 1888).

6.486.2.8 `virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isEmpty () const` [virtual]

Returns

true if there are no messages in the Channel.

Implements `activemq::core::MessageDispatchChannel` (p. 1889).

6.486.2.9 `virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isRunning () const` [inline, virtual]

Returns

true if the Channel currently running and will dequeue message.

Implements **activemq::core::MessageDispatchChannel** (p. 1889).

6.486.2.10 **virtual void activemq::core::SimplePriorityMessageDispatchChannel-
::lock () throw (decaf::lang::exceptions::RuntimeException)**
[inline, virtual]

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2640).

6.486.2.11 **virtual void activemq::core::SimplePriorityMessageDispatchChannel-
::notify () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException)** [inline,
virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2641).

6.486.2.12 **virtual void activemq::core::SimplePriorityMessageDispatchChannel-
::notifyAll () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException)** [inline,
virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

6.486 `activemq::core::SimplePriorityMessageDispatchChannel` Class Reference

Implements `decaf::util::concurrent::Synchronizable` (p. 2642).

6.486.2.13 `virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::peek () const`
[virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns

a message if there is one in the queue.

Implements `activemq::core::MessageDispatchChannel` (p. 1889).

6.486.2.14 `virtual std::vector< Pointer<MessageDispatch> > activemq::core::SimplePriorityMessageDispatchChannel::removeAll ()`
[virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns

a list of Messages that was previously in the Channel.

Implements `activemq::core::MessageDispatchChannel` (p. 1889).

6.486.2.15 `virtual int activemq::core::SimplePriorityMessageDispatchChannel::size () const` [virtual]

Returns

the number of Messages currently in the Channel.

Implements `activemq::core::MessageDispatchChannel` (p. 1890).

6.486.2.16 `virtual void activemq::core::SimplePriorityMessageDispatchChannel::start ()` [virtual]

Starts dispatch of messages from the Channel.

Implements `activemq::core::MessageDispatchChannel` (p. 1890).

6.486.2.17 `virtual void activemq::core::SimplePriorityMessageDispatchChannel::stop ()` [virtual]

Stops dispatch of message from the Channel.

Implements `activemq::core::MessageDispatchChannel` (p. 1890).

6.486.2.18 `virtual bool activemq::core::SimplePriorityMessageDispatchChannel-
::tryLock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2643).

6.486.2.19 `virtual void activemq::core::SimplePriorityMessageDispatchChannel-
::unlock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2645).

6.486.2.20 `virtual void activemq::core::SimplePriorityMessageDispatchChannel-
::wait () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline,
virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState- Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2646).

6.486 activemq::core::SimplePriorityMessageDispatchChannel Class Reference

6.486.2.21 `virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2647).

6.486.2.22 `virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2648).

The documentation for this class was generated from the following file:

6.487 decaf::net::Socket Class Reference

```
#include <src/main/decaf/net/Socket.h>
```

Inheritance diagram for decaf::net::Socket:

Public Member Functions

- **Socket ()**
*Creates an unconnected **Socket** (p. 2452) using the set **SocketImplFactory** (p. 2487) or if non is set than the default **SocketImpl** type is created.*
- **Socket (SocketImpl *impl)**
*Creates a **Socket** (p. 2452) wrapping the provided **SocketImpl** (p. 2479) instance, this **Socket** (p. 2452) is considered unconnected.*
- **Socket (const InetAddress *address, int port)**
*Creates a new **Socket** (p. 2452) instance and connects it to the given address and port.*
- **Socket (const InetAddress *address, int port, const InetAddress *localAddress, int localPort)**
*Creates a new **Socket** (p. 2452) instance and connects it to the given address and port.*
- **Socket (const std::string &host, int port)**
*Creates a new **Socket** (p. 2452) instance and connects it to the given host and port.*
- **Socket (const std::string &host, int port, const InetAddress *localAddress, int localPort)**
*Creates a new **Socket** (p. 2452) instance and connects it to the given host and port.*
- virtual **~Socket ()**
- virtual void **bind** (const std::string &ipaddress, int port)
*Binds this **Socket** (p. 2452) to the given local address and port.*

- virtual void **close** ()
*Closes the **Socket** (p. 2452).*
- virtual void **connect** (const std::string &host, int port)
Connects to the specified destination.
- virtual void **connect** (const std::string &host, int port, int timeout)
Connects to the specified destination, with a specified timeout value.
- bool **isConnected** () const
Indicates whether or not this socket is connected to an end point.
- bool **isClosed** () const
- bool **isBound** () const
- bool **isInputShutdown** () const
- bool **isOutputShutdown** () const
- virtual **decaf::io::InputStream** * **getInputStream** ()
Gets the InputStream for this socket if its connected.
- virtual **decaf::io::OutputStream** * **getOutputStream** ()
Gets the OutputStream for this socket if it is connected.
- int **getPort** () const
*Gets the on the remote host this **Socket** (p. 2452) is connected to.*
- int **getLocalPort** () const
Gets the local port the socket is bound to.
- std::string **getInetAddress** () const
Returns the address to which the socket is connected.
- std::string **getLocalAddress** () const
Gets the local address to which the socket is bound.
- virtual void **shutdownInput** ()
Shuts down the InputStream for this socket essentially marking it as EOF.
- virtual void **shutdownOutput** ()
Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OutputStream::write will throw an IOException.
- virtual int **getSoLinger** () const
Gets the linger time for the socket, SO_LINGER.
- virtual void **setSoLinger** (bool state, int timeout)
Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.
- virtual bool **getKeepAlive** () const
Gets the keep alive flag for this socket, SO_KEEPALIVE.
- virtual void **setKeepAlive** (bool keepAlive)
Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.
- virtual int **getReceiveBufferSize** () const
Gets the receive buffer size for this socket, SO_RCVBUF.
- virtual void **setReceiveBufferSize** (int size)
Sets the receive buffer size for this socket, SO_RCVBUF.
- virtual bool **getReuseAddress** () const
Gets the reuse address flag, SO_REUSEADDR.

- virtual void **setReuseAddress** (bool reuse)
Sets the reuse address flag, SO_REUSEADDR.
- virtual int **getSendBufferSize** () const
Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.
- virtual void **setSendBufferSize** (int size)
Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.
- virtual int **getSoTimeout** () const
Gets the timeout for socket operations, SO_TIMEOUT.
- virtual void **setSoTimeout** (int timeout)
Sets the timeout for socket operations, SO_TIMEOUT.
- virtual bool **getTcpNoDelay** () const
Gets the Status of the TCP_NODELAY setting for this socket.
- virtual void **setTcpNoDelay** (bool value)
*Sets the Status of the TCP_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 2452).*
- virtual int **getTrafficClass** () const
*Gets the Traffic Class setting for this **Socket** (p. 2452), sometimes referred to as Type of Service setting.*
- virtual void **setTrafficClass** (int value)
*Gets the Traffic Class setting for this **Socket** (p. 2452), sometimes referred to as Type of Service setting.*
- virtual bool **getOOBInline** () const
Gets the value of the OOBINLINE for this socket.
- virtual void **setOOBInline** (bool value)
Sets the value of the OOBINLINE for this socket, by default this option is disabled.
- virtual void **sendUrgentData** (int data)
*Sends on byte of urgent data to the **Socket** (p. 2452).*
- virtual std::string **toString** () const

Static Public Member Functions

- static void **setSocketImplFactory** (SocketImplFactory *factory)
*Sets the instance of a **SocketImplFactory** (p. 2487) that the **Socket** (p. 2452) class should use when new instances of this class are created.*

Protected Member Functions

- void **accepted** ()
- void **initSocketImpl** (const std::string &address, int port, const InetAddress *localAddress, int localPort)

6.487.1 Detailed Description

Since

1.0

6.487.2 Constructor & Destructor Documentation

6.487.2.1 decaf::net::Socket::Socket ()

Creates an unconnected **Socket** (p. 2452) using the set **SocketImplFactory** (p. 2487) or if non is set than the default **SocketImpl** type is created.

6.487.2.2 decaf::net::Socket::Socket (**SocketImpl** * *impl*)

Creates a **Socket** (p. 2452) wrapping the provided **SocketImpl** (p. 2479) instance, this **Socket** (p. 2452) is considered unconnected.

The **Socket** (p. 2452) class takes ownership of this **SocketImpl** (p. 2479) pointer and will delete it when the **Socket** (p. 2452) class is destroyed.

Parameters

<i>impl</i>	The SocketImpl (p. 2479) instance to wrap.
-------------	---

Exceptions

<i>NullPointerException</i>	if the passed SocketImpl (p. 2479) is Null.
-----------------------------	--

6.487.2.3 decaf::net::Socket::Socket (const **InetAddress** * *address*, int *port*)

Creates a new **Socket** (p. 2452) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 2487) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 2452) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>NullPointerException</i>	if the InetAddress (p. 1437) instance is NULL.
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

6.487.2.4 `decaf::net::Socket::Socket (const InetAddress * address, int port, const InetAddress * localAddress, int localPort)`

Creates a new **Socket** (p. 2452) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 2487) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 2452) implementation is used. The **Socket** (p. 2452) will also bind to the local address and port specified.

Parameters

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]
<i>localAddress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>NullPointerException</i>	if the InetAddress (p. 1437) instance is NULL.
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

6.487.2.5 `decaf::net::Socket::Socket (const std::string & host, int port)`

Creates a new **Socket** (p. 2452) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 2487) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 2452) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loop-back.
<i>port</i>	The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>IllegalArgumentException</i>	if the port if not in range [0...65535]

6.487.2.6 decaf::net::Socket::Socket (const std::string & *host*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **Socket** (p. 2452) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 2487) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 2452) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loop-back.
<i>port</i>	The port number to connect to [0...65535]
<i>localAddress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>IllegalArgumentException</i>	if the port if not in range [0...65535]

6.487.2.7 virtual decaf::net::Socket::~Socket () [virtual]

6.487.3 Member Function Documentation

6.487.3.1 `void decaf::net::Socket::accepted ()` [protected]

6.487.3.2 `virtual void decaf::net::Socket::bind (const std::string & ipaddress, int port)`
[virtual]

Binds this **Socket** (p. 2452) to the given local address and port.

If the **SocketAddress** (p. 2470) value is NULL then the **Socket** (p. 2452) will be bound to an available local address and port.

Parameters

<i>ipaddress</i>	The local address and port to bind the socket to.
<i>port</i>	The port on the local machine to bind to.

Exceptions

<i>IOException</i>	if an error occurs during the bind operation.
<i>IllegalArgument-Exception</i>	if the Socket (p.2452) can't process the subclass of Socket-Address (p. 2470) that has been provided.

6.487.3.3 `void decaf::net::Socket::checkClosed () const` [protected]

6.487.3.4 `virtual void decaf::net::Socket::close ()` [virtual]

Closes the **Socket** (p. 2452).

Once closed a **Socket** (p. 2452) cannot be connected or otherwise operated upon, a new **Socket** (p. 2452) instance must be created.

Exceptions

<i>IOException</i>	if an I/O error occurs while closing the Socket (p. 2452).
--------------------	---

Implements **decaf::io::Closeable** (p. 817).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2020).

6.487.3.5 `virtual void decaf::net::Socket::connect (const std::string & host, int port)`
[virtual]

Connects to the specified destination.

Parameters

<i>host</i>	The host name or IP address of the remote host to connect to.
<i>port</i>	The port on the remote host to connect to.

Exceptions

<i>IOException</i>	Thrown if a failure occurred in the connect.
<i>IllegalArgument-Exception</i>	if the timeout value is negative or the endpoint is invalid.

6.487.3.6 `virtual void decaf::net::Socket::connect (const std::string & host, int port, int timeout) [virtual]`

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 2493) is thrown. A timeout value of zero is treated as an infinite timeout.

Parameters

<i>host</i>	The host name or IP address of the remote host to connect to.
<i>port</i>	The port on the remote host to connect to.
<i>timeout</i>	The number of Milliseconds to wait before treating the connection as failed.

Exceptions

<i>IOException</i>	Thrown if a failure occurred in the connect.
SocketTimeout-Exception (p. 2493)	if the timeout for connection is exceeded.
<i>IllegalArgument-Exception</i>	if the timeout value is negative or the endpoint is invalid.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2020).

6.487.3.7 `void decaf::net::Socket::ensureCreated () const [protected]`

6.487.3.8 `std::string decaf::net::Socket::getInetAddress () const`

Returns the address to which the socket is connected.

Returns

the remote IP address to which this socket is connected, or null if the socket is not connected.

6.487.3.9 `virtual decaf::io::InputStream* decaf::net::Socket::getInputStream () [virtual]`

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 2452) and should not be deleted by the caller.

When the returned `InputStream` is performing a blocking operation and the underlying connection is closed or otherwise broken the read calls will normally throw an exception to indicate the failure.

Closing the `InputStream` will also close the underlying **Socket** (p. 2452).

Returns

The `InputStream` for this socket.

Exceptions

<i>IOException</i>	if an error occurs during creation of the <code>InputStream</code> , also if the - Socket (p. 2452) is not connected or the input has been shutdown previously.
---------------------------	--

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2022).

6.487.3.10 `virtual bool decaf::net::Socket::getKeepAlive () const` [virtual]

Gets the keep alive flag for this socket, `SO_KEEPALIVE`.

Returns

true if keep alive is enabled for this socket.

Exceptions

<i>SocketException</i> (p. 2471)	if the operation fails.
--	-------------------------

6.487.3.11 `std::string decaf::net::Socket::getLocalAddress () const`

Gets the local address to which the socket is bound.

Returns

the local address to which the socket is bound or `InetAddress.anyLocalAddress()` if the socket is not bound yet.

6.487.3.12 `int decaf::net::Socket::getLocalPort () const`

Gets the local port the socket is bound to.

Returns

the local port the socket was bound to, or -1 if the socket is not bound.

6.487.3.13 `virtual bool decaf::net::Socket::getOOBInline () const` [virtual]

Gets the value of the OOBINLINE for this socket.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

<i>SocketException</i> (p. 2471)	if an error is encountered while performing this operation.
--	---

6.487.3.14 `virtual decaf::io::OutputStream* decaf::net::Socket::getOutputStream ()` [virtual]

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 2452) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 2452) will also close the underlying **Socket** (p. 2452).

Returns

the OutputStream for this socket.

Exceptions

<i>IOException</i>	if an error occurs during the creation of this OutputStream, or if the Socket (p. 2452) is closed or the output has been shutdown previously.
---------------------------	--

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2022).

6.487.3.15 `int decaf::net::Socket::getPort () const`

Gets the on the remote host this **Socket** (p. 2452) is connected to.

Returns

the port on the remote host the socket is connected to, or 0 if not connected.

6.487.3.16 `virtual int decaf::net::Socket::getReceiveBufferSize () const` [virtual]

Gets the receive buffer size for this socket, SO_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

Returns

the receive buffer size in bytes.

Exceptions

SocketException (p. 2471)	if the operation fails.
-------------------------------------	-------------------------

6.487.3.17 `virtual bool decaf::net::Socket::getReuseAddress () const` [virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns

True if the address can be reused.

Exceptions

SocketException (p. 2471)	if the operation fails.
-------------------------------------	-------------------------

6.487.3.18 `virtual int decaf::net::Socket::getSendBufferSize () const` [virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Returns

the size in bytes of the send buffer.

Exceptions

SocketException (p. 2471)	if the operation fails.
-------------------------------------	-------------------------

6.487.3.19 `virtual int decaf::net::Socket::getSoLinger () const` [virtual]

Gets the linger time for the socket, SO_LINGER.

A return value of -1 indicates that the option is disabled.

Returns

The linger time in seconds.

Exceptions

SocketException (p. 2471)	if the operation fails.
-------------------------------------	-------------------------

6.487.3.20 `virtual int decaf::net::Socket::getSoTimeout () const` [virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 2471)	Thrown if unable to retrieve the information.
-------------------------------------	---

6.487.3.21 `virtual bool decaf::net::Socket::getTcpNoDelay () const` [virtual]

Gets the Status of the TCP_NODELAY setting for this socket.

Returns

true if TCP_NODELAY is enabled for the socket.

Exceptions

SocketException (p. 2471)	Thrown if unable to set the information.
-------------------------------------	--

6.487.3.22 `virtual int decaf::net::Socket::getTrafficClass () const` [virtual]

Gets the Traffic Class setting for this **Socket** (p. 2452), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 2452) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Returns

the bitset result of querying the traffic class setting.

Exceptions

SocketException (p. 2471)	if an error is encountered while performing this operation.
-------------------------------------	---

6.487.3.23 `void decaf::net::Socket::initSocketImpl (const std::string & address, int port, const InetAddress * localAddress, int localPort)` [protected]

6.487.3.24 `bool decaf::net::Socket::isBound () const` [inline]

Returns

true if this **Socket** (p. 2452) has been bound to a Local address.

6.487.3.25 `bool decaf::net::Socket::isClosed () const` [inline]

Returns

true if the **Socket** (p. 2452) has been closed.

6.487.3.26 `bool decaf::net::Socket::isConnected () const` [inline]

Indicates whether or not this socket is connected to an end point.

Returns

true if connected, false otherwise.

6.487.3.27 `bool decaf::net::Socket::isInputShutdown () const` [inline]

Returns

true if input on this **Socket** (p. 2452) has been shutdown.

6.487.3.28 `bool decaf::net::Socket::isOutputShutdown () const [inline]`

Returns

true if output on this **Socket** (p. 2452) has been shutdown.

6.487.3.29 `virtual void decaf::net::Socket::sendUrgentData (int data) [virtual]`

Sends on byte of urgent data to the **Socket** (p. 2452).

Parameters

<i>data</i>	The value to write as urgent data, only the lower eight bits are sent.
-------------	--

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2024).

6.487.3.30 `virtual void decaf::net::Socket::setKeepAlive (bool keepAlive) [virtual]`

Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.

Parameters

<i>keepAlive</i>	If true, enables the flag.
------------------	----------------------------

Exceptions

SocketException (p. 2471)	if the operation fails.
-------------------------------------	-------------------------

6.487.3.31 `virtual void decaf::net::Socket::setOOBInline (bool value) [virtual]`

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the **Socket** (p. 2452)'s InputStream, no notification is give.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

<i>SocketException</i> (p. 2471)	if an error is encountered while performing this operation.
--	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2026).

6.487.3.32 **virtual void decaf::net::Socket::setReceiveBufferSize (int *size*)**
[virtual]

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters

<i>size</i>	Number of bytes to set the receive buffer to.
-------------	---

Exceptions

<i>SocketException</i> (p. 2471)	if the operation fails.
<i>IllegalArgument-Exception</i>	if the value is zero or negative.

6.487.3.33 **virtual void decaf::net::Socket::setReuseAddress (bool *reuse*)**
[virtual]

Sets the reuse address flag, SO_REUSEADDR.

Parameters

<i>reuse</i>	If true, sets the flag.
--------------	-------------------------

Exceptions

<i>SocketException</i> (p. 2471)	if the operation fails.
--	-------------------------

6.487.3.34 **virtual void decaf::net::Socket::setSendBufferSize (int *size*)**
[virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Parameters

<i>size</i>	The number of bytes to set the send buffer to, must be larger than zero.
-------------	--

Exceptions

SocketException (p. 2471)	if the operation fails.
<i>IllegalArgument-Exception</i>	if the value is zero or negative.

6.487.3.35 static void decaf::net::Socket::setSocketImplFactory (SocketImplFactory * factory) [static]

Sets the instance of a **SocketImplFactory** (p. 2487) that the **Socket** (p. 2452) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

Parameters

<i>factory</i>	The instance of a SocketImplFactory (p. 2487) to use when new - Socket (p. 2452) objects are created.
----------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
SocketException (p. 2471)	if this method has already been called with a valid factory.

6.487.3.36 virtual void decaf::net::Socket::setSoLinger (bool state, int timeout) [virtual]

Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.

Parameters

<i>state</i>	The state of SO_LINGER, true is on.
<i>timeout</i>	The linger time in seconds, must be non-negative.

Exceptions

SocketException (p. 2471)	if the operation fails.
<i>IllegalArgument-Exception</i>	if state is true and timeout is negative.

6.487.3.37 virtual void **decaf::net::Socket::setSoTimeout** (int *timeout*) [virtual]

Sets the timeout for socket operations, SO_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

Parameters

<i>timeout</i>	The timeout in milliseconds for socket operations.
----------------	--

Exceptions

SocketException (p. 2471)	Thrown if unable to set the information.
IllegalArgument-Exception	if the timeout value is negative.

6.487.3.38 virtual void **decaf::net::Socket::setTcpNoDelay** (bool *value*)
[virtual]

Sets the Status of the TCP_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 2452).

Parameters

<i>value</i>	The setting for the socket's TCP_NODELAY option, true to enable.
--------------	--

Exceptions

SocketException (p. 2471)	Thrown if unable to set the information.
-------------------------------------	--

6.487.3.39 virtual void **decaf::net::Socket::setTrafficClass** (int *value*) [virtual]

Gets the Traffic Class setting for this **Socket** (p. 2452), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 2452) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Parameters

<i>value</i>	The integer value representing the traffic class setting bitset.
--------------	--

Exceptions

<i>SocketException</i> (p. 2471)	if an error is encountered while performing this operation.
<i>IllegalArgument-Exception</i>	if the value is not in the range [0..255].

6.487.3.40 virtual void **decaf::net::Socket::shutdownInput** () [virtual]

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
---------------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2027).

6.487.3.41 virtual void **decaf::net::Socket::shutdownOutput** () [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OutputStream::write will throw an IOException.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
---------------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2027).

6.487.3.42 virtual std::string **decaf::net::Socket::toString** () const [virtual]

Returns

a string representing this **Socket** (p. 2452).

6.487.4 Friends And Related Function Documentation

6.487.4.1 friend class **ServerSocket** [friend]

6.487.5 Field Documentation

6.487.5.1 **SocketImpl*** **decaf::net::Socket::impl** [mutable, protected]

The documentation for this class was generated from the following file:

- src/main/decaf/net/**Socket.h**

6.488 decaf::net::SocketAddress Class Reference

Base class for protocol specific **Socket** (p. 2452) addresses.

```
#include <src/main/decaf/net/SocketAddress.h>
```

Inheritance diagram for decaf::net::SocketAddress:

Public Member Functions

- virtual **~SocketAddress** ()

6.488.1 Detailed Description

Base class for protocol specific **Socket** (p. 2452) addresses.

These classes provide an immutable address object that is used by the **Socket** (p. 2452) classes.

Since

1.0

6.488.2 Constructor & Destructor Documentation

6.488.2.1 virtual **decaf::net::SocketAddress::~SocketAddress** () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketAddress.h**

6.489 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

```
#include <src/main/decaf/net/SocketError.h>
```

Static Public Member Functions

- static int **getErrorCode** ()
Gets the last error appropriate for the platform.
- static std::string **getErrorString** ()
Gets the string description for the last error.

6.489.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

6.489.2 Member Function Documentation

6.489.2.1 static int decaf::net::SocketError::getErrorCode () [static]

Gets the last error appropriate for the platform.

6.489.2.2 static std::string decaf::net::SocketError::getErrorString () [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketError.h**

6.490 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

```
#include <src/main/decaf/net/SocketException.h>
```

Inheritance diagram for decaf::net::SocketException:

Public Member Functions

- **SocketException** () throw ()
- **SocketException** (const lang::Exception &ex) throw ()
- **SocketException** (const SocketException &ex) throw ()
- **SocketException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketException** (const std::exception *cause) throw ()
Constructor.
- **SocketException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketException** * clone () const
Clones this exception.
- virtual ~**SocketException** () throw ()

6.490.1 Detailed Description

Exception for errors when manipulating sockets.

6.490.2 Constructor & Destructor Documentation

6.490.2.1 `decaf::net::SocketException::SocketException () throw () [inline]`

6.490.2.2 `decaf::net::SocketException::SocketException (const lang::Exception & ex) throw () [inline]`

6.490.2.3 `decaf::net::SocketException::SocketException (const SocketException & ex) throw () [inline]`

6.490.2.4 `decaf::net::SocketException::SocketException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.490.2.5 `decaf::net::SocketException::SocketException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.490.2.6 `decaf::net::SocketException::SocketException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the mes-

sage

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.490.2.7 `virtual decaf::net::SocketException::~~SocketException () throw ()`
`[inline, virtual]`

6.490.3 Member Function Documentation

6.490.3.1 `virtual SocketException* decaf::net::SocketException::clone () const`
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1547).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2032), **decaf::net::BindException** (p. 534), **decaf::net::ConnectException** (p. 933), **decaf::net::NoRouteToHostException** (p. 1981), and **decaf::net::PortUnreachableException** (p. 2109).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketException.h`

6.491 decaf::net::SocketFactory Class Reference

The **SocketFactory** (p. 2473) is used to create **Socket** (p. 2452) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

```
#include <src/main/decaf/net/SocketFactory.h>
```

Inheritance diagram for `decaf::net::SocketFactory`:

Public Member Functions

- virtual **~SocketFactory** ()
- virtual **Socket * createSocket** ()
*Creates an unconnected **Socket** (p. 2452) object.*
- virtual **Socket * createSocket** (const **InetAddress** *host, int port)=0
*Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).*
- virtual **Socket * createSocket** (const **InetAddress** *host, int port, const **InetAddress** *ifAddress, int localPort)=0
*Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).*
- virtual **Socket * createSocket** (const std::string &name, int port)=0
*Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).*
- virtual **Socket * createSocket** (const std::string &name, int port, const **InetAddress** *ifAddress, int localPort)=0
*Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).*

Static Public Member Functions

- static **SocketFactory * getDefault** ()
*Returns an pointer to the default **SocketFactory** (p. 2473) for this Application, there is only one default **SocketFactory** (p. 2473) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 2473) class and in not to be deleted by the caller.*

Protected Member Functions

- **SocketFactory** ()

6.491.1 Detailed Description

The **SocketFactory** (p. 2473) is used to create **Socket** (p. 2452) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

decaf.net.Socket (p. 2452)

Since

1.0

6.491.2 Constructor & Destructor Documentation

6.491.2.1 `decaf::net::SocketFactory::SocketFactory ()` [protected]

6.491.2.2 `virtual decaf::net::SocketFactory::~~SocketFactory ()` [virtual]

6.491.3 Member Function Documentation

6.491.3.1 `virtual Socket* decaf::net::SocketFactory::createSocket ()`
[virtual]

Creates an unconnected **Socket** (p. 2452) object.

Returns

a new **Socket** (p. 2452) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if the Socket (p. 2452) cannot be created.
--------------------	---

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2036), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1173), and **decaf::internal::net::DefaultSocketFactory** (p. 1161).

6.491.3.2 `virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * host, int port)` [pure virtual]

Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).

Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

Returns

a new **Socket** (p. 2452) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 2452) object.
UnknownHostException (p. 2816)	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2036), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1174), and **decaf::internal::net::DefaultSocketFactory** (p. 1161).

6.491.3.3 **virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * host, int port, const InetAddress * ifAddress, int localPort)**
[pure virtual]

Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).

The **Socket** (p. 2452) will be bound to the specified local address and port.

Parameters

<i>host</i>	The host to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the Socket (p. 2452) to.
<i>localPort</i>	The local port to bind the Socket (p. 2452) to.

Returns

a new **Socket** (p. 2452) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 2452) object.
UnknownHostException (p. 2816)	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2037), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1174), and **decaf::internal::net::DefaultSocketFactory** (p. 1162).

6.491.3.4 **virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & name, int port)** [pure virtual]

Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).

Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.

Returns

a new **Socket** (p. 2452) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 2452) object.
UnknownHostException (p. 2816)	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2037), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1175), and **decaf::internal::net::DefaultSocketFactory** (p. 1163).

6.491.3.5 virtual **Socket*** **decaf::net::SocketFactory::createSocket** (const std::string & *name*, int *port*, const InetAddress * *ifAddress*, int *localPort*) [pure virtual]

Creates a new **Socket** (p. 2452) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 2473).

Parameters

<i>host</i>	The host name or IP address to connect the socket to.
<i>port</i>	The port on the remote host to connect to.
<i>ifAddress</i>	The address on the local machine to bind the Socket (p. 2452) to.
<i>localPort</i>	The local port to bind the Socket (p. 2452) to.

Returns

a new **Socket** (p. 2452) object, caller must free this object when done.

Exceptions

<i>IOException</i>	if an I/O error occurs while creating the Socket (p. 2452) object.
UnknownHostException (p. 2816)	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2038), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1176), and **decaf::internal::net::DefaultSocketFactory** (p. 1163).

6.491.3.6 **static SocketFactory* decaf::net::SocketFactory::getDefault ()**
 [static]

Returns an pointer to the default **SocketFactory** (p. 2473) for this Application, there is only one default **SocketFactory** (p. 2473) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 2473) class and in not to be deleted by the caller.

Returns

pointer to the applications default **SocketFactory** (p. 2473).

Exceptions

SocketException (p. 2471)	if an error occurs while getting the default instance.
-------------------------------------	--

Reimplemented in **decaf::net::ssl::SSLSocketFactory** (p. 2523).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketFactory.h**

6.492 decaf::internal::net::SocketFileDescriptor Class Reference

File Descriptor type used internally by Decaf Socket objects.

```
#include <src/main/decaf/internal/net/SocketFileDescriptor.h>
```

Inheritance diagram for decaf::internal::net::SocketFileDescriptor:

Public Member Functions

- **SocketFileDescriptor** (long value)
- virtual **~SocketFileDescriptor** ()
- long **getValue** () const
Gets the OS Level FileDescriptor.

6.492.1 Detailed Description

File Descriptor type used internally by Decaf Socket objects.

Since

1.0

6.492.2 Constructor & Destructor Documentation

6.492.2.1 `decaf::internal::net::SocketFileDescriptor::SocketFileDescriptor (long value)`

6.492.2.2 `virtual decaf::internal::net::SocketFileDescriptor::~~SocketFileDescriptor () [virtual]`

6.492.3 Member Function Documentation

6.492.3.1 `long decaf::internal::net::SocketFileDescriptor::getValue () const`

Gets the OS Level FileDescriptor.

Returns

a FileDescriptor value.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/SocketFileDescriptor.h`

6.493 decaf::net::SocketImpl Class Reference

Acts as a base class for all physical **Socket** (p. 2452) implementations.

```
#include <src/main/decaf/net/SocketImpl.h>
```

Inheritance diagram for decaf::net::SocketImpl:

Public Member Functions

- **SocketImpl** ()
- virtual **~SocketImpl** ()
- virtual void **create** ()=0
*Creates the underlying platform **Socket** (p. 2452) data structures which allows for - **Socket** (p. 2452) options to be applied.*
- virtual void **accept** (**SocketImpl** *socket)=0
*Accepts a new connection on the given **Socket** (p. 2452).*
- virtual void **connect** (const std::string &hostname, int **port**, int timeout)=0
Connects this socket to the given host and port.
- virtual void **bind** (const std::string &ipaddress, int **port**)=0
*Binds this **Socket** (p. 2452) instance to the local ip address and port number given.*
- virtual void **listen** (int backlog)=0

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

- virtual **decaf::io::InputStream** * **getInputStream** ()=0
*Gets the InputStream linked to this **Socket** (p. 2452).*
- virtual **decaf::io::OutputStream** * **getOutputStream** ()=0
*Gets the OutputStream linked to this **Socket** (p. 2452).*
- virtual int **available** ()=0
*Gets the number of bytes that can be read from the **Socket** (p. 2452) without blocking.*
- virtual void **close** ()=0
Closes the socket, terminating any blocked reads or writes.
- virtual void **shutdownInput** ()=0
Places the input stream for this socket at "end of stream".
- virtual void **shutdownOutput** ()=0
Disables the output stream for this socket.
- virtual int **getOption** (int option) const =0
*Gets the specified **Socket** (p. 2452) option.*
- virtual void **setOption** (int option, int value)=0
*Sets the specified option on the **Socket** (p. 2452) if supported.*
- int **getPort** () const
Gets the port that this socket has been assigned.
- int **getLocalPort** () const
*Gets the value of this **SocketImpl** (p. 2479)'s local port field.*
- std::string **getInetAddress** () const
*Gets the value of this **SocketImpl** (p. 2479)'s address field.*
- const **decaf::io::FileDescriptor** * **getFileDescriptor** () const
*Gets the FileDescriptor for this **Socket** (p. 2452), the Object is owned by this **Socket** (p. 2452) and should not be deleted by the caller.*
- virtual std::string **getLocalAddress** () const =0
*Gets the value of the local Inet address the **Socket** (p. 2452) is bound to if bound, otherwise return the **InetAddress** (p. 1437) ANY value "0.0.0.0".*
- std::string **toString** () const
*Returns a string containing the address and port of this **Socket** (p. 2452) instance.*
- virtual bool **supportsUrgentData** () const
- virtual void **sendUrgentData** (int data)
*Sends on byte of urgent data to the **Socket** (p. 2452).*

Protected Attributes

- int **port**
*The remote port that this **Socket** (p. 2452) is connected to.*
- int **localPort**
*The port on the Local Machine that this **Socket** (p. 2452) is Bound to.*
- std::string **address**
*The Remote Address that the **Socket** (p. 2452) is connected to.*
- **io::FileDescriptor** * **fd**
*The File Descriptor for this **Socket** (p. 2452).*

6.493.1 Detailed Description

Acts as a base class for all physical **Socket** (p. 2452) implementations.

Since

1.0

6.493.2 Constructor & Destructor Documentation

6.493.2.1 `decaf::net::SocketImpl::SocketImpl ()`

6.493.2.2 `virtual decaf::net::SocketImpl::~~SocketImpl ()` [virtual]

6.493.3 Member Function Documentation

6.493.3.1 `virtual void decaf::net::SocketImpl::accept (SocketImpl * socket)`
[pure virtual]

Accepts a new connection on the given **Socket** (p. 2452).

Parameters

<i>socket</i>	The accepted connection.
---------------	--------------------------

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
SocketException (p. 2471)	if an error occurs while performing an Accept on the socket.
SocketTimeout-Exception (p. 2493)	if the accept call times out due to SO_TIMEOUT being set.

6.493.3.2 `virtual int decaf::net::SocketImpl::available ()` [pure virtual]

Gets the number of bytes that can be read from the **Socket** (p. 2452) without blocking.

Returns

the number of bytes that can be read from the **Socket** (p. 2452) without blocking.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2682).

6.493.3.3 virtual void **decaf::net::SocketImpl::bind** (const std::string & *ipaddress*, int *port*) [pure virtual]

Binds this **Socket** (p. 2452) instance to the local ip address and port number given.

Parameters

<i>ipaddress</i>	The address of local ip to bind to.
<i>port</i>	The port number on the host to bind to.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2682).

6.493.3.4 virtual void **decaf::net::SocketImpl::close** () [pure virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2683).

6.493.3.5 virtual void **decaf::net::SocketImpl::connect** (const std::string & *hostname*, int *port*, int *timeout*) [pure virtual]

Connects this socket to the given host and port.

Parameters

<i>hostname</i>	The name of the host to connect to, or IP address.
<i>port</i>	The port number on the host to connect to.
<i>timeout</i>	Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
SocketTimeout-Exception (p. 2493)	if the connect call times out due to timeout being set.
<i>IllegalArgument-Exception</i>	if a parameter has an illegal value.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2683).

6.493.3.6 virtual void **decaf::net::SocketImpl::create** () [pure virtual]

Creates the underlying platform **Socket** (p. 2452) data structures which allows for - **Socket** (p. 2452) options to be applied.

The created socket is in an unconnected state.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2683).

6.493.3.7 const **decaf::io::FileDescriptor*** **decaf::net::SocketImpl::getFileDescriptor** () const [inline]

Gets the FileDescriptor for this **Socket** (p. 2452), the Object is owned by this **Socket** (p. 2452) and should not be deleted by the caller.

Returns

a pointer to this **Socket** (p. 2452)'s FileDescriptor object.

6.493.3.8 std::string **decaf::net::SocketImpl::getInetAddress** () const [inline]

Gets the value of this **SocketImpl** (p. 2479)'s address field.

Returns

the value of the address field.

6.493.3.9 virtual **decaf::io::InputStream*** **decaf::net::SocketImpl::getInputStream** () [pure virtual]

Gets the InputStream linked to this **Socket** (p. 2452).

Returns

an InputStream pointer owned by the **Socket** (p. 2452) object.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2684).

6.493.3.10 `virtual std::string decaf::net::SocketImpl::getLocalAddress () const`
`[pure virtual]`

Gets the value of the local Inet address the **Socket** (p. 2452) is bound to if bound, otherwise return the **InetAddress** (p. 1437) ANY value "0.0.0.0".

Returns

the local address bound to, or ANY.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2684).

6.493.3.11 `int decaf::net::SocketImpl::getLocalPort () const` `[inline]`

Gets the value of this **SocketImpl** (p. 2479)'s local port field.

Returns

the value of localPort.

6.493.3.12 `virtual int decaf::net::SocketImpl::getOption (int option) const` `[pure virtual]`

Gets the specified **Socket** (p. 2452) option.

Parameters

<i>option</i>	The Socket (p. 2452) options whose value is to be retrieved.
---------------	---

Returns

the value of the given socket option.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2684).

6.493.3.13 `virtual decaf::io::OutputStream* decaf::net::SocketImpl::getOutputStream ()` `[pure virtual]`

Gets the OutputStream linked to this **Socket** (p. 2452).

Returns

an OutputStream pointer owned by the **Socket** (p. 2452) object.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2685).

6.493.3.14 `int decaf::net::SocketImpl::getPort () const` [inline]

Gets the port that this socket has been assigned.

Returns

the **Socket** (p. 2452)'s port number.

6.493.3.15 `virtual void decaf::net::SocketImpl::listen (int backlog)` [pure virtual]

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

<i>backlog</i>	The maximum length of the connection queue.
----------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2685).

6.493.3.16 `virtual void decaf::net::SocketImpl::sendUrgentData (int data)` [virtual]

Sends on byte of urgent data to the **Socket** (p. 2452).

Parameters

<i>data</i>	The value to write as urgent data, only the lower eight bits are sent.
-------------	--

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

6.493.3.17 `virtual void decaf::net::SocketImpl::setOption (int option, int value)`
`[pure virtual]`

Sets the specified option on the **Socket** (p. 2452) if supported.

Parameters

<i>option</i>	The Socket (p. 2452) option to set.
<i>value</i>	The value of the socket option to apply to the socket.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2686).

6.493.3.18 `virtual void decaf::net::SocketImpl::shutdownInput ()` `[pure virtual]`

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 2486) on the socket, the stream will return EOF.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2687).

6.493.3.19 `virtual void decaf::net::SocketImpl::shutdownOutput ()` `[pure virtual]`

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 2486) on the socket, the stream will throw an **IOException**.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2687).

6.493.3.20 `virtual bool decaf::net::SocketImpl::supportsUrgentData () const`
`[inline, virtual]`

Returns

true if this **SocketImpl** (p. 2479) supports sending Urgent Data. The default implementation always returns false.

6.493.3.21 `std::string decaf::net::SocketImpl::toString () const`

Returns a string containing the address and port of this **Socket** (p. 2452) instance.

Returns

a string containing the address and port of this socket.

6.493.4 Field Documentation

6.493.4.1 `std::string decaf::net::SocketImpl::address` `[protected]`

The Remote Address that the **Socket** (p. 2452) is connected to.

6.493.4.2 `io::FileDescriptor* decaf::net::SocketImpl::fd` `[protected]`

The File Descriptor for this **Socket** (p. 2452).

6.493.4.3 `int decaf::net::SocketImpl::localPort` `[protected]`

The port on the Local Machine that this **Socket** (p. 2452) is Bound to.

6.493.4.4 `int decaf::net::SocketImpl::port` `[protected]`

The remote port that this **Socket** (p. 2452) is connected to.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketImpl.h`

6.494 decaf::net::SocketImplFactory Class Reference

Factory class interface for a Factory that creates SocketImpl objects.

```
#include <src/main/decaf/net/SocketImplFactory.h>
```

Public Member Functions

- virtual `~SocketImplFactory()`
- virtual `SocketImpl * createSocketImpl()=0`

*Creates a new SokcetImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 2479).*

6.494.1 Detailed Description

Factory class interface for a Factory that creates SocketImpl objects.

These factories can be used to create various types of Sockets, e.g. Streaming, - Multicast, SSL, or platform specific variations of these types.

```

Inheritance diagram for decaf::net::SocketOptions:

Public Member Functions

- virtual `~SocketOptions()`

Static Public Attributes

- static const int **SOCKET_OPTION_TCP_NODELAY**
Disable Nagle's algorithm for this connection.
- static const int **SOCKET_OPTION_BINDADDR**
Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).
- static const int **SOCKET_OPTION_REUSEADDR**
Sets SO_REUSEADDR for a socket.
- static const int **SOCKET_OPTION_BROADCAST**
Sets SO_BROADCAST for a socket.
- static const int **SOCKET_OPTION_IP_MULTICAST_IF**
Set which outgoing interface on which to send multicast packets.
- static const int **SOCKET_OPTION_IP_MULTICAST_IF2**
Same as above.
- static const int **SOCKET_OPTION_IP_MULTICAST_LOOP**
This option enables or disables local loopback of multicast datagrams.
- static const int **SOCKET_OPTION_IP_TOS**
This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.
- static const int **SOCKET_OPTION_LINGER**
Specify a linger-on-close timeout.
- static const int **SOCKET_OPTION_TIMEOUT**
*Set a timeout on blocking **Socket** (p. 2452) operations.*
- static const int **SOCKET_OPTION_SNDBUF**
Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.
- static const int **SOCKET_OPTION_RCVBUF**
Set a hint the size of the underlying buffers used by the platform for incoming network I/O.
- static const int **SOCKET_OPTION_KEEPAIVE**
When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.
- static const int **SOCKET_OPTION_OOBINLINE**
When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

6.495.1 Detailed Description

Since

1.0

6.495.2 Constructor & Destructor Documentation

6.495.2.1 `virtual decaf::net::SocketOptions::~~SocketOptions ()` [virtual]

6.495.3 Field Documentation

6.495.3.1 `const int decaf::net::SocketOptions::SOCKET_OPTION_BINDADDR`
[static]

Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).

The default local address of a socket is `INADDR_ANY`, meaning any local address on a multi-homed host. A multi-homed host can use this option to accept connections to only one of its addresses (in the case of a **ServerSocket** (p. 2342) or `DatagramSocket`), or to specify its return address to the peer (for a **Socket** (p. 2452) or `DatagramSocket`). The parameter of this option is an **InetAddress** (p. 1437).

6.495.3.2 `const int decaf::net::SocketOptions::SOCKET_OPTION_BROADCAST`
[static]

Sets `SO_BROADCAST` for a socket.

This option enables and disables the ability of the process to send broadcast messages. It is supported for only datagram sockets and only on networks that support the concept of a broadcast message (e.g. Ethernet, token ring, etc.), and it is set by default for `DatagramSockets`.

6.495.3.3 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST-
_IF` [static]

Set which outgoing interface on which to send multicast packets.

Useful on hosts with multiple network interfaces, where applications want to use other than the system default. Takes/returns an **InetAddress** (p. 1437).

Valid for Multicast: `DatagramSocketImpl`.

6.495.3.4 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST-
_IF2` [static]

Same as above.

This option is introduced so that the behaviour with `IP_MULTICAST_IF` will be kept the same as before, while this new option can support setting outgoing interfaces with either IPv4 and IPv6 addresses.

6.495.3.5 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_LOOP` `[static]`

This option enables or disables local loopback of multicast datagrams.

This option is enabled by default for Multicast Sockets.

6.495.3.6 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_TOS` `[static]`

This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.

6.495.3.7 `const int decaf::net::SocketOptions::SOCKET_OPTION_KEEPAIVE` `[static]`

When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.

This probe is a TCP segment to which the peer must respond. One of three responses is expected: 1. The peer responds with the expected ACK. The application is not notified (since everything is OK). TCP will send another probe following another 2 hours of inactivity. 2. The peer responds with an RST, which tells the local TCP that the peer host has crashed and rebooted. The socket is closed. 3. There is no response from the peer. The socket is closed. The purpose of this option is to detect if the peer host crashes.

Valid only for TCP socket: **SocketImpl** (p. 2479)

6.495.3.8 `const int decaf::net::SocketOptions::SOCKET_OPTION_LINGER` `[static]`

Specify a linger-on-close timeout.

This option disables/enables immediate return from a `close()` of a TCP **Socket** (p. 2452). Enabling this option with a non-zero Integer timeout means that a `close()` will block pending the transmission and acknowledgment of all data written to the peer, at which point the socket is closed gracefully. Upon reaching the linger timeout, the socket is closed forcefully, with a TCP RST. Enabling the option with a timeout of zero does a forceful close immediately. If the specified timeout value exceeds 65,535 it will be reduced to 65,535.

Valid only for TCP: **SocketImpl** (p. 2479)

6.495.3.9 `const int decaf::net::SocketOptions::SOCKET_OPTION_OOBLINE`
[static]

When the OOBLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

When the option is disabled (which is the default) urgent data is silently discarded.

6.495.3.10 `const int decaf::net::SocketOptions::SOCKET_OPTION_RCVBUF`
[static]

Set a hint the size of the underlying buffers used by the platform for incoming network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be received over the socket. When used in get, this must return the size of the buffer actually used by the platform when receiving in data on this socket. Valid for all sockets: **SocketImpl** (p. 2479), **DatagramSocketImpl**.

6.495.3.11 `const int decaf::net::SocketOptions::SOCKET_OPTION_REUSEADDR`
[static]

Sets SO_REUSEADDR for a socket.

This is used only for MulticastSockets in decaf, and it is set by default for MulticastSockets.

6.495.3.12 `const int decaf::net::SocketOptions::SOCKET_OPTION_SNDBUF`
[static]

Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be sent over the socket. When used in get, this must return the size of the buffer actually used by the platform when sending out data on this socket. Valid for all sockets: **SocketImpl** (p. 2479), **DatagramSocketImpl**

6.495.3.13 `const int decaf::net::SocketOptions::SOCKET_OPTION_TCP_NODELAY`
[static]

Disable Nagle's algorithm for this connection.

Written data to the network is not buffered pending acknowledgment of previously written data. Valid for TCP sockets.

6.495.3.14 `const int decaf::net::SocketOptions::SOCKET_OPTION_TIMEOUT`
`[static]`

Set a timeout on blocking **Socket** (p. 2452) operations.

The option must be set prior to entering a blocking operation to take effect.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketOptions.h`

6.496 decaf::net::SocketTimeoutException Class Reference

```
#include <src/main/decaf/net/SocketTimeoutException.h>
```

Inheritance diagram for `decaf::net::SocketTimeoutException`:

Public Member Functions

- **SocketTimeoutException** () throw ()
Default Constructor.
- **SocketTimeoutException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **SocketTimeoutException** (const **SocketTimeoutException** &ex) throw ()
Copy Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketTimeoutException** (const std::exception *cause) throw ()
Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketTimeoutException** * clone () const
Clones this exception.
- virtual ~**SocketTimeoutException** () throw ()

6.496.1 Constructor & Destructor Documentation

6.496.1.1 `decaf::net::SocketTimeoutException::SocketTimeoutException ()`
`throw () [inline]`

Default Constructor.

6.496.1.2 **decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & ex) throw ()** `[inline]`

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.496.1.3 **decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & ex) throw ()** `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.496.1.4 **decaf::net::SocketTimeoutException::SocketTimeoutException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()** `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.496.1.5 **decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * cause) throw ()** `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.496.1.6 **decaf::net::SocketTimeoutException::SocketTimeoutException** (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.496.1.7 **virtual decaf::net::SocketTimeoutException::~~SocketTimeoutException** () throw () [inline, virtual]

6.496.2 Member Function Documentation

6.496.2.1 **virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p. 1533).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketTimeoutException.h**

6.497 decaf::net::ssl::SSLContext Class Reference

Represents on implementation of the Secure **Socket** (p.2452) Layer for streaming based sockets.

6.497.1 Detailed Description

Represents an implementation of the Secure **Socket** (p. 2452) Layer for streaming based sockets.

This class serves as a source of factories to be used to create new SSL **Socket** (p. 2452) instances.

Since

1.0

6.497.2 Constructor & Destructor Documentation

6.497.2.1 `decaf::net::ssl::SSLContext::SSLContext (SSLContextSpi * contextImpl)`

6.497.2.2 `virtual decaf::net::ssl::SSLContext::~~SSLContext ()` [virtual]

6.497.3 Member Function Documentation

6.497.3.1 `static SSLContext* decaf::net::ssl::SSLContext::getDefault ()`
 [static]

Gets the Default **SSLContext** (p. 2495).

The default instance of the **SSLContext** (p. 2495) should be immediately usable without any need for the client to initialize this context.

Returns

a pointer to the Default **SSLContext** (p. 2495) instance.

6.497.3.2 **SSLParameters*** decaf::net::ssl::SSLContext::getDefaultSSLParameters ()

Returns

a new instance of an **SSLParameters** (p. 2501) object containing the default set of settings for this **SSLContext** (p. 2495).

Exceptions

<i>UnsupportedOperationException</i>	if the parameters cannot be retrieved.
--------------------------------------	--

6.497.3.3 **ServerSocketFactory*** decaf::net::ssl::SSLContext::getServerSocketFactory ()

Returns an **ServerSocketFactory** (p. 2352) instance for use with this Context, the **ServerSocketFactory** (p. 2352) is owned by the Context and should not be deleted by the caller.

Returns

a pointer to this **SSLContext** (p. 2495)'s **ServerSocketFactory** (p. 2352) for creating **SSLServerSocket** (p. 2504) objects.

Exceptions

<i>IllegalStateException</i>	if the SSLContextSpi (p. 2498) requires initialization but it has not yet been initialized.
------------------------------	--

6.497.3.4 **SocketFactory*** decaf::net::ssl::SSLContext::getSocketFactory ()

Returns an **SocketFactory** (p. 2473) instance for use with this Context, the **SocketFactory** (p. 2473) is owned by the Context and should not be deleted by the caller.

Returns

a pointer to this **SSLContext** (p. 2495)'s **SocketFactory** (p. 2473) for creating **SSLSocket** (p. 2513) objects.

Exceptions

<i>IllegalStateException</i>	if the SSLContextSpi (p. 2498) requires initialization but it has not yet been initialized.
------------------------------	--

6.497.3.5 **SSLParameters*** **decaf::net::ssl::SSLContext::getSupportedSSLParameters ()**

Returns

a new instance of an **SSLParameters** (p. 2501) object containing the complete set of settings for this **SSLContext** (p. 2495).

Exceptions

<i>UnsupportedOperationException</i>	if the parameters cannot be retrieved.
--------------------------------------	--

6.497.3.6 **static void decaf::net::ssl::SSLContext::setDefault (SSLContext * context) [static]**

Sets the default **SSLContext** (p. 2495) to be returned from future calls to `getDefault`.

The set **SSLContext** (p. 2495) must be fully initialized and usable. The caller is responsible for deleting this object before the Library shutdown methods are called.

Exceptions

<i>NullPointerException</i>	if the context passed is NULL.
-----------------------------	--------------------------------

6.498.1 Detailed Description

Defines the interface that should be provided by an **SSLContext** (p. 2495) provider.

Since

1.0

6.498.2 Constructor & Destructor Documentation

6.498.2.1 virtual decaf::net::ssl::SSLContextSpi::~SSLContextSpi ()
[virtual]

6.498.3 Member Function Documentation

6.498.3.1 virtual **SSLParameters*** decaf::net::ssl::SSLContextSpi::providerGetDefaultSSLParameters () [virtual]

Creates a returns a new **SSLParameters** (p. 2501) instance that contains the default settings for this Providers **SSLContext** (p. 2495).

The returned **SSLParameters** (p. 2501) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns

new **SSLParameters** (p. 2501) instance with the **SSLContext** (p. 2495) defaults.

Exceptions

<i>Unsupported-OperationException</i>	if the defaults cannot be obtained.
---------------------------------------	-------------------------------------

6.498.3.2 **virtual ServerSocketFactory* decaf::net::ssl::SSLContextSpi::providerGetServerSocketFactory ()** [pure virtual]

Returns a **ServerSocketFactory** (p. 2352) instance that can be used to create new **SSLServerSocket** (p. 2504) objects.

The **ServerSocketFactory** (p. 2352) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 2473) instance that can be used to create new **SSLServerSockets**.

Exceptions

<i>IllegalStateException</i>	if the SSLContextSpi (p. 2498) object requires initialization but has not been initialized yet.
------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2000).

6.498.3.3 **virtual SocketFactory* decaf::net::ssl::SSLContextSpi::providerGetSocketFactory ()** [pure virtual]

Returns a **SocketFactory** (p. 2473) instance that can be used to create new **SSLSocket** (p. 2513) objects.

The **SocketFactory** (p. 2473) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 2473) instance that can be used to create new **SSLSockets**.

Exceptions

<i>IllegalStateException</i>	if the SSLContextSpi (p. 2498) object requires initialization but has not been initialized yet.
------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2000).

6.498.3.4 **virtual SSLParameters* decaf::net::ssl::SSLContextSpi::providerGetSupportedSSLParameters ()** [virtual]

Creates and returns a new **SSLParameters** (p. 2501) instance that contains the full set of supported parameters for this SSL Context.

The returned **SSLParameters** (p. 2501) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns

a new **SSLParameters** (p. 2501) instance with the full set of settings that are supported.

Exceptions

<i>Unsupported-OperationException</i>	if the supported parameters cannot be obtained.
---------------------------------------	---

6.498.3.5 virtual void decaf::net::ssl::SSLContextSpi::providerInit (security::SecureRandom * random) [pure virtual]

Perform the initialization of this Context.

Parameters

<i>random</i>	Pointer to an instance of a secure random number generator.
---------------	---

Exceptions

<i>NullPointerException</i>	if the SecureRandom instance is NULL.
<i>KeyManagement-Exception</i>	if an error occurs while initializing the context.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2000).

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLContextSpi.h**

6.499 decaf::net::ssl::SSLParameters Class Reference

```
#include <src/main/decaf/net/ssl/SSLParameters.h>
```

Public Member Functions

- **SSLParameters** ()
Creates a new **SSLParameters** (p. 2501) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.
- **SSLParameters** (const std::vector< std::string > &cipherSuites)

Creates a new **SSLParameters** (p. 2501) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.

- **SSLParameters** (const std::vector< std::string > &cipherSuites, const std::vector< std::string > &protocols)

Creates a new **SSLParameters** (p. 2501) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.

- virtual ~**SSLParameters** ()
- std::vector< std::string > **getCipherSuites** () const
- void **setCipherSuites** (const std::vector< std::string > &cipherSuites)

Sets the vector of ciphersuites.

- std::vector< std::string > **getProtocols** () const
- void **setProtocols** (const std::vector< std::string > &protocols)

Sets the vector of protocols.

- bool **getWantClientAuth** () const
- void **setWantClientAuth** (bool wantClientAuth)

Sets whether client authentication should be requested.

- bool **getNeedClientAuth** () const
- void **setNeedClientAuth** (bool needClientAuth)

Sets whether client authentication should be required.

6.499.1 Constructor & Destructor Documentation

6.499.1.1 decaf::net::ssl::SSLParameters::SSLParameters ()

Creates a new **SSLParameters** (p. 2501) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.

6.499.1.2 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & cipherSuites)

Creates a new **SSLParameters** (p. 2501) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.

Parameters

<i>cipherSuites</i>	The vector of cipherSuites for this SSLParameters (p. 2501) instance (can be empty).
---------------------	---

6.499.1.3 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & cipherSuites, const std::vector< std::string > & protocols)

Creates a new **SSLParameters** (p. 2501) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.

Parameters

<i>cipherSuites</i>	The vector of cipherSuites for this SSLParameters (p. 2501) instance (can be empty).
<i>protocols</i>	The vector of protocols for this SSLParameters (p. 2501) instance (can be empty).

6.499.1.4 **virtual decaf::net::ssl::SSLParameters::~~SSLParameters ()**
[virtual]

6.499.2 Member Function Documentation

6.499.2.1 **std::vector<std::string> decaf::net::ssl::SSLParameters::getCipherSuites () const** [inline]

Returns

a copy of the vector of ciphersuites or an empty vector if none have been set.

6.499.2.2 **bool decaf::net::ssl::SSLParameters::getNeedClientAuth () const**
[inline]

Returns

whether client authentication should be required.

6.499.2.3 **std::vector<std::string> decaf::net::ssl::SSLParameters::getProtocols () const** [inline]

Returns

a copy of the vector of protocols or an empty vector if none have been set.

6.499.2.4 **bool decaf::net::ssl::SSLParameters::getWantClientAuth () const**
[inline]

Returns

whether client authentication should be requested.

6.499.2.5 **void decaf::net::ssl::SSLParameters::setCipherSuites (const std::vector<std::string> & cipherSuites)** [inline]

Sets the vector of ciphersuites.

Parameters

<i>cipherSuites</i>	The vector of cipherSuites (can be an empty vector).
---------------------	--

6.499.2.6 void decaf::net::ssl::SSLParameters::setNeedClientAuth (bool
needClientAuth) [inline]

Sets whether client authentication should be required.

Calling this method clears the wantClientAuth flag.

Parameters

<i>needClientAuth</i>	whether client authentication should be required.
-----------------------	---

6.499.2.7 void decaf::net::ssl::SSLParameters::setProtocols (const std::vector<
std::string > & protocols) [inline]

Sets the vector of protocols.

Parameters

<i>protocols</i>	the vector of protocols (or an empty vector)
------------------	--

6.499.2.8 void decaf::net::ssl::SSLParameters::setWantClientAuth (bool
wantClientAuth) [inline]

Sets whether client authentication should be requested.

Calling this method clears the needClientAuth flag.

Parameters

<i>whether</i>	client authentication should be requested.
----------------	--

- **SSLServerSocket** (int port, int backlog, const **decaf::net::InetAddress** *address)

*Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.*

6.500.1 Detailed Description

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.

The main function of this class is to create **SSLSocket** (p. 2513) objects by accepting connections from client sockets over SSL.

Since

1.0

6.500.2 Constructor & Destructor Documentation

6.500.2.1 **decaf::net::ssl::SSLServerSocket::SSLServerSocket** () [protected]

Creates a non-bound server socket.

6.500.2.2 **decaf::net::ssl::SSLServerSocket::SSLServerSocket** (int port) [protected]

Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 2487) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2479) is created.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
-------------	--

Exceptions

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgument-Exception</i>	if the port value is negative or greater than 65535.

6.500.2.3 **decaf::net::ssl::SSLServerSocket::SSLServerSocket** (*int port*, *int backlog*) [protected]

Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2487) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2479) is created.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.

Exceptions

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgument-Exception</i>	if the port value is negative or greater than 65535.

6.500.2.4 **decaf::net::ssl::SSLServerSocket::SSLServerSocket** (*int port*, *int backlog*, *const decaf::net::InetAddress * address*) [protected]

Creates a new **ServerSocket** (p. 2342) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 2487) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 2479) is created.

Parameters

<i>port</i>	The port to bind the ServerSocket (p. 2342) to.
<i>backlog</i>	The the number of incoming connection attempts to queue before connections are refused.
<i>ifAddress</i>	The IP Address to bind to on the local machine.

Exceptions

<i>IOException</i>	if there is an I/O error while performing this operation.
<i>IllegalArgument-Exception</i>	if the port value is negative or greater than 65535.

6.500.2.5 `virtual decaf::net::ssl::SSLServerSocket::~SSLServerSocket ()`
[virtual]

6.500.3 Member Function Documentation

6.500.3.1 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledCipherSuites () const` [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 2504).

Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2006).

6.500.3.2 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledProtocols () const` [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 2504).

Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2006).

6.500.3.3 `virtual bool decaf::net::ssl::SSLServerSocket::getNeedClientAuth () const` [pure virtual]

Returns

true if the **Socket** (p. 2452) requires client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2007).

6.500.3.4 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedCipherSuites () const [pure virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 2504).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 2452).

Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2007).

6.500.3.5 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedProtocols () const [pure virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 2504) instance.

Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2007).

6.500.3.6 `virtual bool decaf::net::ssl::SSLServerSocket::getWantClientAuth () const [pure virtual]`

Returns

true if the **Socket** (p. 2452) request client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2007).

6.500.3.7 `virtual void decaf::net::ssl::SSLServerSocket::setEnabledCipherSuites (const std::vector< std::string > & suites) [pure virtual]`

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 2504) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

<i>suites</i>	An Vector of names for all the Cipher Suites that are to be enabled.
---------------	--

Exceptions

<i>IllegalArgument-Exception</i>	if the vector is empty or one of the names is invalid.
----------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2008).

6.500.3.8 `virtual void decaf::net::ssl::SSLServerSocket::setEnabledProtocols (const std::vector< std::string > & protocols) [pure virtual]`

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 2504) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

<i>protocols</i>	An Vector of names for all the Protocols that are to be enabled.
------------------	--

Exceptions

<i>IllegalArgument-Exception</i>	if the vector is empty or one of the names is invalid.
----------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2008).

6.500.3.9 `virtual void decaf::net::ssl::SSLServerSocket::setNeedClientAuth (bool value) [pure virtual]`

Sets whether or not this **Socket** (p. 2452) will require Client Authentication.

If set to true the **Socket** (p. 2452) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters

<i>value</i>	Whether the server socket should require client authentication.
--------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2009).

6.500.3.10 `virtual void decaf::net::ssl::SSLServerSocket::setWantClientAuth (bool value) [pure virtual]`

Sets whether or not this **Socket** (p. 2452) will request Client Authentication.

If set to true the **Socket** (p. 2452) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still

allow negotiation to continue.

Parameters

<i>value</i>	Whether the server socket should request client authentication.
--------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2009).

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLServerSocket.h**

6.501 decaf::net::ssl::SSLServerSocketFactory Class Reference

Factory class interface that provides methods to create SSL Server Sockets.

```
#include <src/main/decaf/net/ssl/SSLServerSocketFactory.h>
```

Inheritance diagram for decaf::net::ssl::SSLServerSocketFactory:

Public Member Functions

- virtual **~SSLServerSocketFactory** ()
- virtual std::vector< std::string > **getDefaultCipherSuites** ()=0
Returns the list of cipher suites which are enabled by default.
- virtual std::vector< std::string > **getSupportedCipherSuites** ()=0
Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Static Public Member Functions

- static **ServerSocketFactory** * **getDefault** ()
*Returns the current default SSL **ServerSocketFactory** (p. 2352), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

Protected Member Functions

- **SSLServerSocketFactory** ()

6.501.1 Detailed Description

Factory class interface that provides methods to create SSL Server Sockets.

Since

1.0

6.501.2 Constructor & Destructor Documentation

6.501.2.1 `decaf::net::ssl::SSLServerSocketFactory::SSLServerSocketFactory ()`
[protected]

6.501.2.2 `virtual decaf::net::ssl::SSLServerSocketFactory::~~SSLServerSocketFactory ()` [virtual]

6.501.3 Member Function Documentation

6.501.3.1 `static ServerSocketFactory* decaf::net::ssl::SSLServerSocketFactory::getDefault ()` [static]

Returns the current default SSL **ServerSocketFactory** (p. 2352), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns **SSLContext::getDefault()** (p. 2496)->**getServerSocketFactory()**. If that call fails, a non-functional factory is returned.

Returns

the default SSL **ServerSocketFactory** (p. 2352) pointer.

See also

decaf::net::ssl::SSLContext::getDefault() (p. 2496)

Reimplemented from **decaf::net::ServerSocketFactory** (p. 2355).

6.501.3.2 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getDefaultCipherSuites ()` [pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 2512)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2014), and **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1169).

6.501.3.3 `virtual std::vector<std::string> decaf::net::ssl::SSLServer-
SocketFactory::getSupportedCipherSuites () [pure
virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() (p. 2512)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2014), and **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1170).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLServerSocketFactory.h`

6.502 decaf::net::ssl::SSLSocket Class Reference

```

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.
- virtual void **setUseClientMode** (bool value)=0
Determines the mode that the socket uses when a handshake is initiated, client or server.
- virtual bool **getUseClientMode** () const =0

*Gets whether this **Socket** (p. 2452) is in Client or Server mode, true indicates that the mode is set to Client.*

- virtual void **setNeedClientAuth** (bool value)=0

*Sets the **Socket** (p. 2452) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

- virtual bool **getNeedClientAuth** () const =0

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

- virtual void **setWantClientAuth** (bool value)=0

*Sets the **Socket** (p. 2452) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

- virtual bool **getWantClientAuth** () const =0

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

6.502.1 Detailed Description

Since

1.0

6.502.2 Constructor & Destructor Documentation

6.502.2.1 decaf::net::ssl::SSLSocket::SSLSocket ()

6.502.2.2 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * address, int port)

Creates a new **SSLSocket** (p. 2513) instance and connects it to the given address and port.

If the host parameter is empty then the loop back address is used.

Parameters

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>NullPointerException</i>	if the InetAddress (p. 1437) instance is NULL.
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

6.502.2.3 `decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * address, int port, const InetAddress * localAddress, int localPort)`

Creates a new **SSLSocket** (p. 2513) instance and connects it to the given address and port.

The **Socket** (p. 2452) will also bind to the local address and port specified.

Parameters

<i>address</i>	The address to connect to.
<i>port</i>	The port number to connect to [0...65535]
<i>localAddress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>NullPointerException</i>	if the InetAddress (p. 1437) instance is NULL.
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

6.502.2.4 `decaf::net::ssl::SSLSocket::SSLSocket (const std::string & host, int port)`

Creates a new **SSLSocket** (p. 2513) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loop-back.
<i>port</i>	The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>IllegalArgumentException</i>	if the port is not in range [0...65535]

6.502.2.5 **decaf::net::ssl::SSLSocket::SSLSocket** (const std::string & *host*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **SSLSocket** (p. 2513) instance and connects it to the given host and port. If the host parameter is empty then the loop back address is used.

Parameters

<i>host</i>	The host name or IP address to connect to, empty string means loop-back.
<i>port</i>	The port number to connect to [0...65535]
<i>localAddress</i>	The IP address on the local machine to bind to.
<i>localPort</i>	The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 2816)	if the host cannot be resolved.
<i>IOException</i>	if an I/O error occurs while connecting the Socket (p. 2452).
<i>IllegalArgument-Exception</i>	if the port is not in range [0...65535]

6.502.2.6 virtual **decaf::net::ssl::SSLSocket::~~SSLSocket** () [virtual]

6.502.3 Member Function Documentation

6.502.3.1 virtual std::vector<std::string> **decaf::net::ssl::SSL-Socket::getEnabledCipherSuites** () const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 2452).

Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2021).

6.502.3.2 virtual std::vector<std::string> **decaf::net::ssl::SSL-Socket::getEnabledProtocols** () const [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 2452).

Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2021).

6.502.3.3 `virtual bool decaf::net::ssl::SSLSocket::getNeedClientAuth () const`
`[pure virtual]`

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2022).

6.502.3.4 `virtual SSLParameters decaf::net::ssl::SSLSocket::getSSLParameters () const`
`[virtual]`

Returns an **SSLParameters** (p. 2501) object for this **SSLSocket** (p. 2513) instance.

The cipherSuites and protocols vectors in the returned **SSLParameters** (p. 2501) reference will never be empty.

Returns

an **SSLParameters** (p. 2501) object with the settings in use for the **SSLSocket** (p. 2513).

6.502.3.5 `virtual std::vector<std::string> decaf::net::ssl::SSL-`
`Socket::getSupportedCipherSuites () const` `[pure`
`virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 2513).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 2452).

Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2023).

6.502.3.6 `virtual std::vector<std::string> decaf::net::ssl::SSL-
Socket::getSupportedProtocols () const [pure
virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 2513) instance.

Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2023).

6.502.3.7 `virtual bool decaf::net::ssl::SSLSocket::getUseClientMode () const
[pure virtual]`

Gets whether this **Socket** (p. 2452) is in Client or Server mode, true indicates that the mode is set to Client.

Returns

true if the **Socket** (p. 2452) is in Client mode, false otherwise.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2023).

6.502.3.8 `virtual bool decaf::net::ssl::SSLSocket::getWantClientAuth () const
[pure virtual]`

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2024).

6.502.3.9 `virtual void decaf::net::ssl::SSLSocket::setEnabledCipherSuites (const
std::vector< std::string > & suites) [pure virtual]`

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 2452) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

<i>suites</i>	An Vector of names for all the Cipher Suites that are to be enabled.
---------------	--

Exceptions

<i>IllegalArgument-Exception</i>	if the vector is empty or one of the names is invalid.
----------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2025).

6.502.3.10 `virtual void decaf::net::ssl::SSLSocket::setEnabledProtocols (const std::vector< std::string > & protocols) [pure virtual]`

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 2452) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

<i>protocols</i>	An Vector of names for all the Protocols that are to be enabled.
------------------	--

Exceptions

<i>IllegalArgument-Exception</i>	if the vector is empty or one of the names is invalid.
----------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2025).

6.502.3.11 `virtual void decaf::net::ssl::SSLSocket::setNeedClientAuth (bool value) [pure virtual]`

Sets the **Socket** (p. 2452) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters

<i>value</i>	The value indicating if a client is required to authenticate itself or not.
--------------	---

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2026).

6.502.3.12 virtual void decaf::net::ssl::SSLSocket::setSSLParameters (const
SSLParameters & value) [virtual]

Sets the **SSLParameters** (p. 2501) for this **SSLSocket** (p. 2513) using the supplied **SSLParameters** (p. 2501) instance.

If the cipherSuites vector in the **SSLParameters** (p. 2501) instance is not empty then the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 2501) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.

Parameters

value	The SSLParameters (p. 2501) instance that is used to update this SSLSocket (p. 2513)'s settings.
-------	--

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.
----------------------------------	---

6.502.3.13 virtual void decaf::net::ssl::SSLSocket::setUseClientMode (bool value)
[pure virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 2452), once a handshake has been initiated this socket remains in the set mode; client or server, for the life of this object.

Parameters

value	The mode setting, true for client or false for server.
-------	--

Exceptions

<i>IllegalArgument-Exception</i>	if the handshake process has begun and mode is locked.
----------------------------------	--

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2026).

6.502.3.14 `virtual void decaf::net::ssl::SSLSocket::setWantClientAuth (bool value)`
`[pure virtual]`

Sets the **Socket** (p.2452) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled and the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the `setNeedClientAuth` method.

Parameters

<i>value</i>	The value indicating if a client is requested to authenticate itself or not.
--------------	--

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p.2027).

6.502.3.15 `virtual void decaf::net::ssl::SSLSocket::startHandshake ()` `[pure virtual]`

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not required to support multiple handshakes and can throw an `IOException` to indicate an error.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing the Handshake
--------------------	---

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p.2028).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLSocket.h`

6.503 decaf::net::ssl::SSLSocketFactory Class Reference

Factory class interface for a **SocketFactory** (p.2473) that can create **SSLSocket** (p.2513) objects.

```
#include <src/main/decaf/net/ssl/SSLSocketFactory.h>
```

Inheritance diagram for `decaf::net::ssl::SSLSocketFactory`:

Public Member Functions

- virtual `~SSLSocketFactory()`
- virtual `std::vector< std::string > getDefaultCipherSuites()`
Returns the list of cipher suites which are enabled by default.
- virtual `std::vector< std::string > getSupportedCipherSuites()`
Returns the names of the cipher suites which could be enabled for use on an SSL connection.
- virtual `Socket * createSocket (Socket *socket, std::string host, int port, bool autoClose)=0`
Returns a socket layered over an existing socket connected to the named host, at the given port.

Static Public Member Functions

- static `SocketFactory * getDefault()`
*Returns the current default SSL **SocketFactory** (p. 2473), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

Protected Member Functions

- `SSLSocketFactory()`

6.503.1 Detailed Description

Factory class interface for a **SocketFactory** (p.2473) that can create **SSLSocket** (p.2513) objects.

Since

1.0

6.503.2 Constructor & Destructor Documentation

6.503.2.1 `decaf::net::ssl::SSLSocketFactory::SSLSocketFactory ()`
[protected]

6.503.2.2 `virtual decaf::net::ssl::SSLSocketFactory::~~SSLSocketFactory ()`
[virtual]

6.503.3 Member Function Documentation

6.503.3.1 **virtual Socket*** **decaf::net::ssl::SSLSocketFactory::createSocket**
(Socket * socket, std::string host, int port, bool autoClose) [pure
 virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

<i>socket</i>	The existing socket to layer over.
<i>host</i>	The server host the original Socket (p. 2452) is connected to.
<i>port</i>	The server port the original Socket (p. 2452) is connected to.
<i>autoClose</i>	Should the layered over Socket (p. 2452) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 2452) instance that wraps the given **Socket** (p. 2452).

Exceptions

<i>IOException</i>	if an I/O exception occurs while performing this operation.
UnknownHostException (p. 2816)	if the host is unknown.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2038), and **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1176).

6.503.3.2 **static SocketFactory*** **decaf::net::ssl::SSLSocketFactory::getDefault ()**
 [static]

Returns the current default SSL **SocketFactory** (p. 2473), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns **SSLContext::getDefault()** (p. 2496)->getSocketFactory(). If that call fails, a non-functional factory is returned.

Returns

the default SSL **SocketFactory** (p. 2473) pointer.

See also

decaf::net::ssl::SSLContext::getDefault() (p. 2496)

Reimplemented from **decaf::net::SocketFactory** (p. 2478).

6.503.3.3 `virtual std::vector<std::string> decaf::net::ssl::SSL-
SocketFactory::getDefaultCipherSuites () [pure
virtual]`

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 2524)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2039), and **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1177).

6.503.3.4 `virtual std::vector<std::string> decaf::net::ssl::SSLSocket-
Factory::getSupportedCipherSuites () [pure
virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() (p. 2524)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2040), and **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1177).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLSocketFactory.h`

6.504 activemq::transport::tcp::SslTransport Class Reference

Transport (p. 2790) for connecting to a Broker using an SSL Socket.

```
#include <src/main/activemq/transport/tcp/SslTransport.h>
```

Inheritance diagram for activemq::transport::tcp::SslTransport:

Public Member Functions

- **SslTransport** (const **Pointer**< **Transport** > &next)
*Creates a new instance of the **SslTransport** (p. 2525), the transport will not attempt to connect to a remote host until the connect method is called.*
- virtual ~**SslTransport** ()

Protected Member Functions

- virtual **decaf::net::Socket** * **createSocket** ()
Create an unconnected Socket instance to be used by the transport to communicate with the broker.
Returns

a newly created unconnected Socket instance.

Exceptions

IOException	<i>if there is an error while creating the unconnected Socket.</i>
--------------------	--

- virtual void **configureSocket** (**decaf::net::Socket** *socket, **decaf::util::Properties** &properties)

6.504.1 Detailed Description

Transport (p. 2790) for connecting to a Broker using an SSL Socket.

This transport simply wraps the **TcpTransport** (p. 2693) and provides the **TcpTransport** (p. 2693) an SSL based Socket pointer allowing the core **TcpTransport** (p. 2693) logic to be reused.

Since

3.2.0

6.504.2 Constructor & Destructor Documentation

6.504.2.1 `activemq::transport::tcp::SslTransport::SslTransport (const Pointer< Transport > & next)`

Creates a new instance of the **SslTransport** (p. 2525), the transport will not attempt to connect to a remote host until the connect method is called.

Parameters

<i>next</i>	the next transport in the chain
-------------	---------------------------------

6.504.2.2 `virtual activemq::transport::tcp::SslTransport::~SslTransport ()`
[virtual]

6.504.3 Member Function Documentation

6.504.3.1 `virtual void activemq::transport::tcp::SslTransport::configureSocket (decaf::net::Socket * socket, decaf::util::Properties & properties)`
[protected, virtual]

6.504.3.2 `virtual decaf::net::Socket* activemq::transport::tcp::SslTransport::createSocket ()` [protected, virtual]

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

Returns

a newly created unconnected Socket instance.

Exceptions

<i>IOException</i>	if there is an error while creating the unconnected Socket.
--------------------	---

Reimplemented from **activemq::transport::tcp::TcpTransport** (p. 2695).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/tcp/SslTransport.h`

6.505 activemq::transport::tcp::SslTransportFactory Class - Reference

```
#include <src/main/activemq/transport/tcp/SslTransport-Factory.h>
```

6.507 decaf::internal::io::StandardErrorOutputStream Class - Reference

Wrapper Around the Standard error Output facility on the current platform.

```
#include <src/main/decaf/internal/io/StandardErrorOutput-  
Stream.h>
```

Inheritance diagram for `decaf::internal::io::StandardErrorOutputStream`:

Public Member Functions

- `StandardErrorOutputStream ()`
- `virtual ~StandardErrorOutputStream ()`

- virtual void **flush** ()

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

IOException (p. 1545)	if an I/O error occurs.
------------------------------	-------------------------

The default implementation of this method does nothing.

- virtual void **close** ()

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException (p. 1545)	if an error occurs while closing.
------------------------------	-----------------------------------

The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.507.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform.

This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

6.507.2 Constructor & Destructor Documentation

6.507.2.1 **decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream ()**

6.507.2.2 **virtual decaf::internal::io::StandardErrorOutputStream::~~StandardErrorOutputStream ()** [virtual]

6.507.3 Member Function Documentation

6.507.3.1 **virtual void decaf::internal::io::StandardErrorOutputStream::close ()**
[virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException (p. 1545)	if an error occurs while closing.
---------------------------------	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.507.3.2 virtual void decaf::internal::io::StandardErrorOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)
[protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.507.3.3 virtual void decaf::internal::io::StandardErrorOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2069).

6.507.3.4 virtual void decaf::internal::io::StandardErrorOutputStream::flush ()
[virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2069).

The documentation for this class was generated from the following file:

```

Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()

- virtual `~StandardInputStream ()`
- virtual int **available** () const
Indicates the number of bytes available.

Protected Member Functions

- virtual int **doReadByte** ()

6.508.1 Constructor & Destructor Documentation

6.508.1.1 `decaf::internal::io::StandardInputStream::StandardInputStream ()`

6.508.1.2 `virtual decaf::internal::io::StandardInputStream::~~StandardInputStream () [virtual]`

6.508.2 Member Function Documentation

6.508.2.1 `virtual int decaf::internal::io::StandardInputStream::available () const [virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> if an I/O error occurs.
--

Reimplemented from `decaf::io::InputStream` (p. 1466).

6.508.2.2 `virtual int decaf::internal::io::StandardInputStream::doReadByte () [protected, virtual]`

Implements `decaf::io::InputStream` (p. 1467).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/io/StandardInputStream.h`

6.509 decaf::internal::io::StandardOutputStream Class Reference

6.509.2 Member Function Documentation

6.509.2.1 **virtual void decaf::internal::io::StandardOutputStream::close** () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i> (p. 1545)	if an error occurs while closing.
--	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.509.2.2 virtual void **decaf::internal::io::StandardOutputStream::doWriteArrayBounded** (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)
[protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.509.2.3 virtual void **decaf::internal::io::StandardOutputStream::doWriteByte** (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2069).

6.509.2.4 virtual void **decaf::internal::io::StandardOutputStream::flush** ()
[virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2069).

The documentation for this class was generated from the following file:

6.510 cms::Startable Class Reference

Interface for a class that implements the start method.

```
#include <src/main/cms/Startable.h>
```

Inheritance diagram for cms::Startable:

Public Member Functions

- virtual **~Startable** () throw ()
- virtual void **start** ()=0

Starts the service.

6.510.1 Detailed Description

Interface for a class that implements the start method.

An object that implements the **Startable** (p.2534) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since

1.0

6.510.2 Constructor & Destructor Documentation

6.510.2.1 virtual cms::Startable::~**~Startable** () throw () [virtual]

6.510.3 Member Function Documentation

6.510.3.1 virtual void cms::Startable::**start** () [pure virtual]

Starts the service.

Exceptions

CMSException (p. 826)	if an internal error occurs while starting.
---------------------------------	---

Implemented in **activemq::core::ActiveMQConnection** (p.211), **activemq::core::ActiveMQSession** (p.352), **activemq::core::ActiveMQConsumer** (p.244), **activemq::cmsutil::PooledSession** (p.2106), and **activemq::cmsutil::CachedConsumer** (p.738).

Referenced by activemq::cmsutil::PooledSession::start().

6.513 decaf::util::StlList< E > Class Template Reference

List (p. 1658) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

```
#include <src/main/decaf/util/StlList.h>
```

Inheritance diagram for `decaf::util::StlList< E >`:

Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

Public Member Functions

- **StlList** ()
Default constructor - does nothing.
- **StlList** (const **StlList** &source)
Copy constructor - copies the content of the given set into this one.
- **StlList** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual bool **equals** (const **Collection**< E > &collection) const
*Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.*

Parameters

collection	- The Collection (p. 851) to be compared to this one.
------------	--

Returns

*true if this **Collection** (p. 851) is equal to the one given.*

- virtual void **copy** (const **Collection**< E > &collection)

*Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).*

*The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 851)'s clear method.*

Parameters

collection	<i>The collection to mirror.</i>
------------	----------------------------------

Exceptions

UnsupportedOperation-Exception	<i>if this is an unmodifiable collection.</i>
IllegalStateException	<i>if the elements cannot be added at this time due to insertion restrictions.</i>

- virtual **Iterator**< E > * **iterator** ()

Returns

an iterator over a set of elements of type T.

- virtual **Iterator**< E > * **iterator** () const
- virtual **ListIterator**< E > * **listIterator** ()

Returns

a list iterator over the elements in this list (in proper sequence).

- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (int index)

Parameters

index	<i>index of first element to be returned from the list iterator (by a call to the next method).</i>
-------	---

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBoundsException	<i>if the index is out of range ($index < 0 \parallel index > \mathbf{size}()$ (p. 864))</i>
---------------------------	---

- virtual **ListIterator**< E > * **listIterator** (int index) const
- virtual void **clear** ()

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

*This implementation iterates over this collection, removing each element using the - **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.*

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	<i>if the clear operation is not supported by this collection</i>
--------------------------------	---

- virtual bool **isEmpty** () const

Returns true if this collection contains no elements.

*This implementation returns **size()** (p. 864) == 0.*

Returns

true if the size method return 0.

- virtual int **size** () const

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

- virtual E **get** (int index) const

Gets the element contained at position passed.

Parameters

index	<i>The position to get.</i>
-------	-----------------------------

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	<i>if the index given is less than zero or greater than the List (p. 1658) size.</i>
----------------------------	---

- virtual E **set** (int index, const E &element)

Replaces the element at the specified position in this list with the specified element.

Parameters

index	<i>The index of the element to replace.</i>
element	<i>The element to be stored at the specified position.</i>

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	<i>if the index given is less than zero or greater than the List (p. 1658) size.</i>
UnsupportedOperation-Exception	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of the element prevents it from being added to this collection</i>
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions.</i>

- virtual void **add** (int index, const E &element)

Inserts the specified element at the specified position in this list.

- virtual bool **add** (const E &value)

Returns true if this collection changed as a result of the call.

- virtual bool **addAll** (const **Collection**< E > &collection)

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The Collection (p. 851) whose elements are added to this one.
------------	--

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of an element prevents it from being added to this collection</i>
IllegalStateException	<i>if an element cannot be added at this time due to insertion restrictions.</i>

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, const **Collection**< E > &collection)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The Collection (p. 851) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException	<i>if the index given is less than zero or greater than the List (p. 1658) size.</i>
UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of the element prevents it from being added to this collection</i>
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions.</i>

- virtual bool **remove** (const E &value)

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that $(value == NULL ? e == NULL : value == e)$, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	<i>The reference to the element to remove from this Collection (p. 851).</i>
-------	---

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>

This implementation iterates over the collection looking for the specified element. - If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual E **removeAt** (int index)

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	<i>- the index of the element to be removed.</i>
-------	--

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBoundsException	<i>if the index given is less than zero or greater than the List (p. 1658) size.</i>
UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>

- virtual int **indexOf** (const E &value) const

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (const E &value) const

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual bool **contains** (const E &value) const

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that $(value == NULL ? e == NULL : value == e)$.

Parameters

value	<i>The value to check for presence in the collection.</i>
-------	---

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	<i>if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).</i>
----------------------	--

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

6.513.1 Detailed Description

```
template<typename E>class decaf::util::StlList< E >
```

List (p. 1658) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.513.2 Constructor & Destructor Documentation

6.513.2.1 `template<typename E> decaf::util::StlList< E >::StlList () [inline]`

Default constructor - does nothing.

6.513.2.2 `template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

<i>source</i>	The source set.
---------------	-----------------

References `decaf::util::StlList< E >::copy()`.

6.513.2.3 `template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

<i>source</i>	The source set.
---------------	-----------------

References `decaf::util::StlList< E >::copy()`.

6.513.3 Member Function Documentation

6.513.3.1 `template<typename E> virtual void decaf::util::StlList< E >::add (int index, const E & element) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

<i>index</i>	The index at which the specified element is to be inserted.
<i>element</i>	The element to be inserted in this List (p. 1658).

Exceptions

<i>IndexOutOfBoundsException</i>	if the index is greater than size of the List (p. 1658).
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements `decaf::util::List< E >` (p. 1660).

References `decaf::util::StlList< E >::size()`.

6.513.3.2 `template<typename E> virtual bool decaf::util::StlList< E >::add (const E & value) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the

collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 125).

6.513.3.3 `template<typename E> virtual bool decaf::util::StlList< E >::addAll(const Collection< E > & collection) [inline, virtual]`

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

<i>collection</i>	The Collection (p. 851) whose elements are added to this one.
-------------------	--

Returns

true if this collection changed as a result of the call

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of an element prevents it from being added to this collection

<i>IllegalStateException</i>	if an element cannot be added at this time due to insertion restrictions.
------------------------------	---

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 110).

References `decaf::util::Collection< E >::isEmpty()`, `decaf::util::StlList< E >::listIterator()`, and `decaf::util::Collection< E >::toArray()`.

6.513.3.4 `template<typename E> virtual bool decaf::util::StlList< E >::addAll (int index, const Collection< E > & collection) [inline, virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

<i>index</i>	The index at which to insert the first element from the specified collection
<i>source</i>	The Collection (p. 851) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

<i>IllegalArgument-Exception</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 126).

References **decaf::util::Collection< E >::isEmpty()**, **decaf::util::StlList< E >::list-iterator()**, **decaf::util::StlList< E >::size()**, and **decaf::util::Collection< E >::toArray()**.

6.513.3.5 `template<typename E> virtual void decaf::util::StlList< E >::clear ()`
`[inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>Unsupported-OperationException</i>	if the clear operation is not supported by this collection
---------------------------------------	--

Reimplemented from **decaf::util::AbstractList< E >** (p. 127).

6.513.3.6 `template<typename E> virtual bool decaf::util::StlList< E >::contains (const E & value) const` `[inline, virtual]`

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element `e` such that `(value == NULL ? e == NULL : value == e)`.

Parameters

<i>value</i>	The value to check for presence in the collection.
--------------	--

Returns

true if there is at least one of the elements in the collection

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 112).

6.513.3.7 `template<typename E> virtual void decaf::util::StlList< E >::copy (const Collection< E > & collection) [inline, virtual]`

Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 851)'s clear method.

Parameters

<i>collection</i>	The collection to mirror.
-------------------	---------------------------

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>IllegalStateException</i>	if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 113).

Referenced by decaf::util::StlList< E >::StlList().

6.513.3.8 `template<typename E> virtual bool decaf::util::StlList< E >::equals (const Collection< E > & collection) const [inline, virtual]`

Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.

Parameters

<i>collection</i>	- The Collection (p. 851) to be compared to this one.
-------------------	--

Returns

true if this **Collection** (p. 851) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 114).

6.513.3.9 `template<typename E> virtual E decaf::util::StlList< E >::get (int index)
const [inline, virtual]`

Gets the element contained at position passed.

Parameters

<i>index</i>	The position to get.
--------------	----------------------

Returns

value at index specified.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
----------------------------------	--

Implements **decaf::util::List**< **E** > (p. 1662).

References **decaf::util::StlList**< **E** >::size().

6.513.3.10 `template<typename E> virtual int decaf::util::StlList< E >::indexOf (const E
& value) const [inline, virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

<i>value</i>	The element to search for in this List (p. 1658).
--------------	--

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

Reimplemented from **decaf::util::AbstractList< E >** (p. 128).

6.513.3.11 `template<typename E> virtual bool decaf::util::StlList< E >::isEmpty ()
const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 864) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 114).

6.513.3.12 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E
>::iterator () [inline, virtual]`

Returns

an iterator over a set of elements of type T.

Reimplemented from **decaf::util::AbstractList< E >** (p. 128).

6.513.3.13 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E
>::iterator () const [inline, virtual]`

Reimplemented from **decaf::util::AbstractList< E >** (p. 129).

6.513.3.14 `template<typename E> virtual int decaf::util::StlList< E >::lastIndexOf (
const E & value) const [inline, virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that **get(i)** == value or -1 if there is no such index.

Parameters

<i>value</i>	The element to search for in this List (p. 1658).
--------------	--

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
-----------------------------	--

Reimplemented from **decaf::util::AbstractList< E >** (p. 129).

References decaf::util::StlList< E >::size().

6.513.3.15 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () [inline, virtual]`

Returns

a list iterator over the elements in this list (in proper sequence).

Reimplemented from **decaf::util::AbstractList< E >** (p. 130).

Referenced by decaf::util::StlList< E >::addAll().

6.513.3.16 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () const [inline, virtual]`

Reimplemented from **decaf::util::AbstractList< E >** (p. 131).

6.513.3.17 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (int index) [inline, virtual]`

Parameters

<i>index</i>	index of first element to be returned from the list iterator (by a call to the next method).
--------------	--

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index is out of range (<code>index < 0 index > size()</code>) (p. 864))
----------------------------------	---

Reimplemented from **decaf::util::AbstractList< E >** (p. 131).

References decaf::util::StlList< E >::size().

6.513.3.18 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (int index) const [inline, virtual]`

Reimplemented from **decaf::util::AbstractList< E >** (p. 132).

References **decaf::util::StlList< E >::size()**.

6.513.3.19 `template<typename E> virtual bool decaf::util::StlList< E >::remove (const E & value) [inline, virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (*value* == NULL ? *e* == NULL : *value* == *e*), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	The reference to the element to remove from this Collection (p. 851).
--------------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 116).

References **decaf::util::StlList< E >::size()**.

6.513.3.20 `template<typename E> virtual E decaf::util::StlList< E >::removeAt (int index) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

<i>index</i>	- the index of the element to be removed.
--------------	---

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.

Reimplemented from **decaf::util::AbstractList< E >** (p. 133).

References **decaf::util::StlList< E >::size()**.

6.513.3.21 `template<typename E> virtual E decaf::util::StlList< E >::set (int index ,
const E & element) [inline, virtual]`

Replaces the element at the specified position in this list with the specified element.

Parameters

<i>index</i>	The index of the element to replace.
<i>element</i>	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

<i>IndexOutOfBoundsException</i>	if the index given is less than zero or greater than the List (p. 1658) size.
<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1669).

References **decaf::util::StlList< E >::size()**.

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 2559

6.513.3.22 `template<typename E> virtual int decaf::util::StlList< E >::size () const`
`[inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection**< E > (p. 864).

Referenced by `decaf::util::StlList< E >::add()`, `decaf::util::StlList< E >::addAll()`, `decaf::util::StlList< E >::get()`, `decaf::util::StlList< E >::lastIndexOf()`, `decaf::util::StlList< E >::listIterator()`, `decaf::util::StlList< E >::remove()`, `decaf::util::StlList< E >::removeAt()`, and `decaf::util::StlList< E >::set()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlList.h`

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 1768) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

```
#include <src/main/decaf/util/StlMap.h>
```

Inheritance diagram for `decaf::util::StlMap< K, V, COMPARATOR >`:

Public Member Functions

- **StlMap** ()
Default constructor - does nothing.
- **StlMap** (const **StlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **StlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual **~StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source	- Map (p. 1768) to compare to this one.
--------	--

Returns

*true if the **Map** (p. 1768) passed is equal in value to this one.*

- virtual void **copy** (const **StlMap** &source)
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source	The source object to copy from.
--------	---------------------------------

- virtual void **clear** ()

Removes all keys and values from this map.

Exceptions

UnsupportedOperation-Exception	if this map is unmodifiable.
--------------------------------	------------------------------

- virtual bool **containsKey** (const K &key) const

Indicates whether or this map contains a value for the given key.

Parameters

key	The key to look up.
-----	---------------------

Returns

true if this map contains the value, otherwise false.

- virtual bool **containsValue** (const V &value) const

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value	The Value to look up.
-------	-----------------------

Returns

true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const

Returns

*if the **Map** (p. 1768) contains any element or not, TRUE or FALSE*

- virtual int **size** () const

Returns

The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key)

*Gets the value mapped to the specified key in the **Map** (p. 1768).*

*If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.*

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference2561

Parameters

key	<i>The search key.</i>
-----	------------------------

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException (p. 1984)	<i>if the key requests doesn't exist in the Map (p. 1768).</i>
--	---

- virtual const V & **get** (const K &key) const

*Gets the value mapped to the specified key in the **Map** (p. 1768).*

*If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.*

Parameters

key	<i>The search key.</i>
-----	------------------------

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException (p. 1984)	<i>if the key requests doesn't exist in the Map (p. 1768).</i>
--	---

- virtual void **put** (const K &key, const V &value)

Sets the value for the specified key.

Parameters

key	<i>The target key.</i>
value	<i>The value to be set.</i>

Exceptions

UnsupportedOperationException	<i>if this map is unmodifiable.</i>
--------------------------------------	-------------------------------------

- virtual void **putAll** (const **StlMap**< K, V, COMPARATOR > &other)

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other)

*Stores a copy of the Mappings contained in the other **Map** (p. 1768) in this one.*

Parameters

other	<i>A Map (p. 1768) instance whose elements are to all be inserted in this Map (p. 1768).</i>
-------	--

Exceptions

UnsupportedOperationException	<i>If the implementing class does not support the putAll operation.</i>
--------------------------------------	---

- virtual V **remove** (const K &key)

Removes the value (key/value pair) for the specified key from the map, returns a copy

of the value that was mapped to the key.

Parameters

key	The search key.
-----	-----------------

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException (p. 1984)	if this key is not in the Map (p. 1768).
UnsupportedOperationException	if this map is unmodifiable.

- virtual `std::vector< K > keySet ()` const

Returns a **Set** (p. 2397) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the `setValue` operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1560), **Set.remove** (p. 861), `removeAll`, `retainAll` and `clear` operations. It does not support the `add` or `addAll` operations.

Returns

the entire set of keys in this map as a `std::vector`.

- virtual `std::vector< V > values ()` const

Returns

the entire set of values in this map as a `std::vector`.

- virtual void **lock ()**

Locks the object.

- virtual bool **tryLock ()**

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock ()**

Unlocks the object.

- virtual void **wait ()**

Waits on a signal from this object, which is generated by a call to `Notify`.

- virtual void **wait** (long long millisecs)

Waits on a signal from this object, which is generated by a call to `Notify`.

- virtual void **wait** (long long millisecs, int nanos)

Waits on a signal from this object, which is generated by a call to `Notify`.

- virtual void **notify ()**

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll ()**

Signals the waiters on this object that it can now wake up and continue.

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 2563

6.514.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::StlMap< K, V, COMPARATOR >

Map (p. 1768) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

Since

1.0

6.514.2 Constructor & Destructor Documentation

6.514.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>>
decaf::util::StlMap< K, V, COMPARATOR >::StlMap () [inline]

Default constructor - does nothing.

6.514.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>>
decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V,
COMPARATOR > & source) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters

<i>source</i>	The source map.
---------------	-----------------

6.514.2.3 template<typename K, typename V, typename COMPARATOR = std::less<K>>
decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const Map< K, V,
COMPARATOR > & source) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters

<i>source</i>	The source map.
---------------	-----------------

6.514.2.4 template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual decaf::util::StlMap< K, V, COMPARATOR >::~~StlMap ()
[inline, virtual]

6.514.3 Member Function Documentation

```
6.514.3.1  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::clear ( )
            [inline, virtual]
```

Removes all keys and values from this map.

Exceptions

<i>Unsupported- OperationException</i>	if this map is unmodifiable.
--	------------------------------

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1770).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

```
6.514.3.2  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsKey ( const K
            & key ) const [inline, virtual]
```

Indicates whether or this map contains a value for the given key.

Parameters

<i>key</i>	The key to look up.
------------	---------------------

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1771).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals().

```
6.514.3.3  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsValue ( const
            V & value ) const [inline, virtual]
```

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

<i>value</i>	The Value to look up.
--------------	-----------------------

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 2565

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map**< K, V, COMPARATOR > (p. 1771).

```
6.514.3.4  template<typename K, typename V, typename COMPARATOR = std::less<K>>
           virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy ( const StlMap<
           K, V, COMPARATOR > & source ) [inline, virtual]
```

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::StlMap().

```
6.514.3.5  template<typename K, typename V, typename COMPARATOR = std::less<K>>
           virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy ( const Map< K,
           V, COMPARATOR > & source ) [inline, virtual]
```

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

<i>source</i>	The source object to copy from.
---------------	---------------------------------

Implements **decaf::util::Map**< K, V, COMPARATOR > (p. 1772).

```
6.514.3.6  template<typename K, typename V, typename COMPARATOR = std::less<K>>
           virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals ( const
           StlMap< K, V, COMPARATOR > & source ) const [inline, virtual]
```

```
6.514.3.7  template<typename K, typename V, typename COMPARATOR = std::less<K>>
           virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals ( const Map<
           K, V, COMPARATOR > & source ) const [inline, virtual]
```

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

<i>source</i>	- Map (p. 1768) to compare to this one.
---------------	--

Returns

true if the **Map** (p. 1768) passed is equal in value to this one.

Implements **decaf::util::Map**< K, V, COMPARATOR > (p. 1772).

```
6.514.3.8  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual V& decaf::util::StlMap< K, V, COMPARATOR >::get ( const K & key )
            [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 1768).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

A reference to the value for the given key.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if the key requests doesn't exist in the Map (p. 1768).
---	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1773).

```
6.514.3.9  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual const V& decaf::util::StlMap< K, V, COMPARATOR >::get ( const K & key
            )const [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 1768).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1984) is thrown.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

A {const} reference to the value for the given key.

Exceptions

<i>NoSuchElementException</i> (p. 1984)	if the key requests doesn't exist in the Map (p. 1768).
---	--

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1774).

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 2567

6.514.3.10 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual bool decaf::util::StlMap< K, V, COMPARATOR >::isEmpty () const
[inline, virtual]`

Returns

if the **Map** (p. 1768) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1774).

6.514.3.11 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual std::vector<K> decaf::util::StlMap< K, V, COMPARATOR >::keySet () const
[inline, virtual]`

Returns a **Set** (p. 2397) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1560), **Set.remove** (p. 861), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1775).

6.514.3.12 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::lock ()
[inline, virtual]`

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2640).

6.514.3.13 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::notify ()
[inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2641).

```
6.514.3.14  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::notifyAll ( )
[inline, virtual]
```

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2642).

```
6.514.3.15  template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::put ( const K & key,
const V & value ) [inline, virtual]
```

Sets the value for the specified key.

Parameters

<i>key</i>	The target key.
<i>value</i>	The value to be set.

Exceptions

<i>UnsupportedOperationException</i>	if this map is unmodifiable.
--------------------------------------	------------------------------

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1776).

Referenced by **decaf::util::StlMap< std::string, cms::Topic * >::putAll()**.

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 2569

6.514.3.16 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const
StlMap< K, V, COMPARATOR > & other) [inline, virtual]`

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

6.514.3.17 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map<
K, V, COMPARATOR > & other) [inline, virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1768) in this one.

Parameters

<i>other</i>	A Map (p. 1768) instance whose elements are to all be inserted in this Map (p. 1768).
--------------	---

Exceptions

<i>Unsupported- OperationException</i>	If the implementing class does not support the putAll operation.
--	--

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1777).

6.514.3.18 `template<typename K, typename V, typename COMPARATOR = std::less<K>>
virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove (const K & key)
[inline, virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

<i>key</i>	The search key.
------------	-----------------

Returns

a copy of the element that was previously mapped to the given key

Exceptions

<i>NoSuchElement- Exception</i> (p. 1984)	if this key is not in the Map (p. 1768).
<i>Unsupported- OperationException</i>	if this map is unmodifiable.

Implements **decaf::util::Map**< K, V, COMPARATOR > (p. 1777).

```
6.514.3.19  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual int decaf::util::StlMap< K, V, COMPARATOR >::size ( ) const
            [inline, virtual]
```

Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map**< K, V, COMPARATOR > (p. 1778).

```
6.514.3.20  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual bool decaf::util::StlMap< K, V, COMPARATOR >::tryLock ( )
            [inline, virtual]
```

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2643).

```
6.514.3.21  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::unlock ( )
            [inline, virtual]
```

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2645).

```
6.514.3.22  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual std::vector<V> decaf::util::StlMap< K, V, COMPARATOR >::values (
            ) const [inline, virtual]
```

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference 2571

Returns

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1779).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::values().

```
6.514.3.23  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait ( )
            [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2646).

```
6.514.3.24  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait ( long long
            millisecs ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2647).

```
6.514.3.25  template<typename K, typename V, typename COMPARATOR = std::less<K>>
            virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait ( long long
            milliseconds, int nanos ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>milliseconds</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2648).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**StlMap.h**

6.515 decaf::util::StlQueue< T > Class Template Reference

The **Queue** (p. 2222) class accepts messages with an psuh(m) command where m is the message to be queued.

```
#include <src/main/decaf/util/StlQueue.h>
```

Inheritance diagram for decaf::util::StlQueue< T >:

Data Structures

- class **QueueIterator**

Public Member Functions

- **StlQueue** ()
- virtual **~StlQueue** ()
- **Iterator**< T > * **iterator** ()
*Gets an **Iterator** (p. 1559) over this **Queue** (p. 2222).*
- void **clear** ()
Empties this queue.
- T & **front** ()
Returns a Reference to the element at the head of the queue.
- const T & **front** () const
Returns a Reference to the element at the head of the queue.
- T & **back** ()
Returns a Reference to the element at the tail of the queue.
- const T & **back** () const
Returns a Reference to the element at the tail of the queue.
- void **push** (const T &t)
Places a new Object at the Tail of the queue.
- void **enqueueFront** (const T &t)
Places a new Object at the front of the queue.
- T **pop** ()
Removes and returns the element that is at the Head of the queue.
- size_t **size** () const
*Gets the Number of elements currently in the **Queue** (p. 2222).*
- bool **empty** () const
*Checks if this **Queue** (p. 2222) is currently empty.*
- virtual std::vector< T > **toArray** () const
- void **reverse** (**StlQueue**< T > &target) const
Reverses the order of the contents of this queue and stores them in the target queue.
- virtual void **lock** ()
Locks the object.
- virtual bool **tryLock** ()
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** ()
Unlocks the object.
- virtual void **wait** ()
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()
Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

Signals the waiters on this object that it can now wake up and continue.

- T & **getSafeValue** ()

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.515.1 Detailed Description

```
template<typename T>class decaf::util::StlQueue< T >
```

The **Queue** (p. 2222) class accepts messages with an `push(m)` command where `m` is the message to be queued.

It destructively returns the message with **pop()** (p. 2570). **pop()** (p. 2570) returns messages in the order they were enqueued.

Queue (p. 2222) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the `pop` method actually reaturns a reference to the element popped. This frees the app from having to call the `front` method before calling `pop`.

```
Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues
a message m string s = sq.pop(); // dequeues a message
```

= DESIGN CONSIDERATIONS

The **Queue** (p. 2222) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 2222).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.515.2 Constructor & Destructor Documentation

6.515.2.1 `template<typename T> decaf::util::StlQueue< T >::StlQueue ()`
[inline]

6.515.2.2 `template<typename T> virtual decaf::util::StlQueue< T >::~StlQueue ()`
[inline, virtual]

6.515.3 Member Function Documentation

6.515.3.1 `template<typename T> T& decaf::util::StlQueue< T >::back ()`
[inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.2 `template<typename T> const T& decaf::util::StlQueue< T >::back () const`
[inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.3 `template<typename T> void decaf::util::StlQueue< T >::clear ()`
[inline]

Empties this queue.

6.515.3.4 `template<typename T> bool decaf::util::StlQueue< T >::empty () const`
[inline]

Checks if this **Queue** (p. 2222) is currently empty.

Returns

boolean indicating queue emptiness

6.515.3.5 `template<typename T> void decaf::util::StlQueue< T >::enqueueFront (`
`const T & t)` [inline]

Places a new Object at the front of the queue.

Parameters

<i>t</i> - Queue (p. 2222) Object Type reference.
--

6.515.3.6 `template<typename T> T& decaf::util::StlQueue< T >::front ()`
[inline]

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

References `decaf::util::StlQueue< T >::getSafeValue()`.

6.515.3.7 `template<typename T> const T& decaf::util::StlQueue< T >::front () const`
`[inline]`

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

References `decaf::util::StlQueue< T >::getSafeValue()`.

6.515.3.8 `template<typename T> T& decaf::util::StlQueue< T >::getSafeValue ()`
`[inline]`

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns

Reference to this Queues safe object

Referenced by `decaf::util::StlQueue< T >::back()`, `decaf::util::StlQueue< T >::front()`, and `decaf::util::StlQueue< T >::pop()`.

6.515.3.9 `template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator ()`
`[inline]`

Gets an **Iterator** (p. 1559) over this **Queue** (p. 2222).

Returns

new iterator pointer that is owned by the caller.

6.515.3.10 `template<typename T> virtual void decaf::util::StlQueue< T >::lock ()`
`[inline, virtual]`

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2640).

References decaf::util::concurrent::Mutex::lock().

6.515.3.11 `template<typename T> virtual void decaf::util::StlQueue< T >::notify ()`
`[inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2641).

References decaf::util::concurrent::Mutex::notify().

6.515.3.12 `template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll ()`
`[inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2642).

References decaf::util::concurrent::Mutex::notifyAll().

6.515.3.13 `template<typename T> T decaf::util::StlQueue< T >::pop ()` `[inline]`

Removes and returns the element that is at the Head of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.14 `template<typename T> void decaf::util::StlQueue< T >::push (const T & t)`
`[inline]`

Places a new Object at the Tail of the queue.

Parameters

<i>t</i>	- Queue (p. 2222) Object Type reference.
----------	---

6.515.3.15 `template<typename T> void decaf::util::StlQueue< T >::reverse (`
`StlQueue< T > & target) const [inline]`

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters

<i>target</i>	- The target queue that will receive the contents of this queue in reverse order.
---------------	---

6.515.3.16 `template<typename T> size_t decaf::util::StlQueue< T >::size () const`
`[inline]`

Gets the Number of elements currently in the **Queue** (p. 2222).

Returns

Queue (p. 2222) Size

6.515.3.17 `template<typename T> virtual std::vector<T> decaf::util::StlQueue< T`
`>::toArray () const [inline, virtual]`

Returns

the all values in this queue as a std::vector.

6.515.3.18 `template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock ()`
`[inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2643).

References decaf::util::concurrent::Mutex::tryLock().

6.515.3.19 `template<typename T> virtual void decaf::util::StlQueue< T >::unlock ()`
`[inline, virtual]`

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2645).

References decaf::util::concurrent::Mutex::unlock().

6.515.3.20 `template<typename T> virtual void decaf::util::StlQueue< T >::wait ()`
`[inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2646).

References decaf::util::concurrent::Mutex::wait().

6.515.3.21 `template<typename T> virtual void decaf::util::StlQueue< T >::wait (long`
`long millisecs) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2647).

References `decaf::util::concurrent::Mutex::wait()`.

6.515.3.22 `template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long millisecs, int nanos) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2648).

References `decaf::util::concurrent::Mutex::wait()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlQueue.h`

6.516 decaf::util::StlSet< E > Class Template Reference

Set (p. 2397) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

```
#include <src/main/decaf/util/StlSet.h>
```

Inheritance diagram for decaf::util::StlSet< E >:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()
Default constructor - does nothing.
- **StlSet** (const **StlSet** &source)
Copy constructor - copies the content of the given set into this one.
- **StlSet** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual ~**StlSet** ()
- **Iterator**< E > * **iterator** ()
Returns
an iterator over a set of elements of type T.
- **Iterator**< E > * **iterator** () const
- virtual bool **equals** (const **Collection**< E > &collection) const
*Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.*

Parameters

collection	- The Collection (p. 851) to be compared to this one.
------------	--

Returns

*true if this **Collection** (p. 851) is equal to the one given.*

- virtual void **copy** (const **Collection**< E > &collection)
*Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).
The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 851)'s clear method.*

Parameters

collection	The collection to mirror.
------------	---------------------------

Exceptions

UnsupportedOperation-Exception	<i>if this is an unmodifiable collection.</i>
IllegalStateException	<i>if the elements cannot be added at this time due to insertion restrictions.</i>

- virtual void **clear** ()

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

*This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.*

*Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

Exceptions

UnsupportedOperation-Exception	<i>if the clear operation is not supported by this collection</i>
--------------------------------	---

- virtual bool **contains** (const E &value) const

Returns true if this collection contains the specified element.

*More formally, returns true if and only if this collection contains at least one element *e* such that (value == NULL ? e == NULL : value == e).*

Parameters

value	<i>The value to check for presence in the collection.</i>
-------	---

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	<i>if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).</i>
----------------------	--

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual bool **isEmpty** () const
- virtual int **size** () const
- virtual bool **add** (const E &value)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added.

***Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this Collection (p. 851).
-------	---

Returns

*true if the element was added to this **Collection** (p. 851).*

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>
IllegalArgumentException	<i>if some property of the element prevents it from being added to this collection</i>
IllegalStateException	<i>if the element cannot be added at this time due to insertion restrictions.</i>

- virtual bool **remove** (const E &value)

*Removes a single instance of the specified element from the collection. More formally, removes an element *e* such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).*

Parameters

value	The reference to the element to remove from this Collection (p. 851).
-------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationException	<i>if this is an unmodifiable collection.</i>
NullPointerException	<i>if the Collection (p. 851) is a container of pointers and does not allow NULL values.</i>

This implementation iterates over the collection looking for the specified element. - If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

6.516.1 Detailed Description

```
template<typename E> class decaf::util::StlSet< E >
```

Set (p. 2397) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

6.516.2 Constructor & Destructor Documentation

6.516.2.1 `template<typename E> decaf::util::StlSet< E >::StlSet () [inline]`

Default constructor - does nothing.

6.516.2.2 `template<typename E> decaf::util::StlSet< E >::StlSet (const StlSet< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

<i>source</i>	The source set.
---------------	-----------------

6.516.2.3 `template<typename E> decaf::util::StlSet< E >::StlSet (const Collection< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

<i>source</i>	The source set.
---------------	-----------------

6.516.2.4 `template<typename E> virtual decaf::util::StlSet< E >::~StlSet () [inline, virtual]`

6.516.3 Member Function Documentation

6.516.3.1 `template<typename E> virtual bool decaf::util::StlSet< E >::add (const E & value) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 851) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor

and assignment operator.

Parameters

<i>value</i>	The reference to the element to add to this Collection (p. 851).
--------------	---

Returns

true if the element was added to this **Collection** (p. 851).

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.
<i>IllegalArgumentException</i>	if some property of the element prevents it from being added to this collection
<i>IllegalStateException</i>	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 853).

6.516.3.2 `template<typename E> virtual void decaf::util::StlSet< E >::clear ()`
`[inline, virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>UnsupportedOperationException</i>	if the clear operation is not supported by this collection
--------------------------------------	--

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 111).

6.516.3.3 `template<typename E> virtual bool decaf::util::StlSet< E >::contains (const`
`E & value) const [inline, virtual]`

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element *e* such that (value == NULL ? e == NULL : value == e).

Parameters

<i>value</i>	The value to check for presence in the collection.
--------------	--

Returns

true if there is at least one of the elements in the collection

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 112).

6.516.3.4 `template<typename E> virtual void decaf::util::StlSet< E >::copy (const Collection< E > & collection) [inline, virtual]`

Renders this **Collection** (p. 851) as a Copy of the given **Collection** (p. 851).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 851)'s clear method.

Parameters

<i>collection</i>	The collection to mirror.
-------------------	---------------------------

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>IllegalStateException</i>	if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 113).

Referenced by `decaf::util::StlSet< Resource * >::copy()`, and `decaf::util::StlSet< Resource * >::StlSet()`.

6.516.3.5 `template<typename E> virtual bool decaf::util::StlSet< E >::equals (const Collection< E > & collection) const [inline, virtual]`

Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.

Parameters

<i>collection</i>	- The Collection (p. 851) to be compared to this one.
-------------------	--

Returns

true if this **Collection** (p. 851) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 114).

Referenced by **decaf::util::StlSet< Resource * >::equals()**.

6.516.3.6 `template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty () const [inline, virtual]`

Returns

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 114).

6.516.3.7 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () [inline, virtual]`

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1557).

6.516.3.8 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () const [inline, virtual]`

Implements **decaf::lang::Iterable< E >** (p. 1558).

6.516.3.9 `template<typename E> virtual bool decaf::util::StlSet< E >::remove (const E & value) [inline, virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection

contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

<i>value</i>	The reference to the element to remove from this Collection (p. 851).
--------------	--

Returns

true if the collection was changed, false otherwise.

Exceptions

<i>UnsupportedOperationException</i>	if this is an unmodifiable collection.
<i>NullPointerException</i>	if the Collection (p. 851) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 116).

```
6.516.3.10  template<typename E> virtual int decaf::util::StlSet< E >::size ( ) const
            [inline, virtual]
```

Returns

The number of elements in this set.

Implements **decaf::util::Collection**< **E** > (p. 864).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**StlSet.h**

6.517 activemq::wireformat::stomp::StompCommandConstants - Class Reference

6.518 `activemq::wireformat::stomp::StompFrame` Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

```
#include <src/main/activemq/wireformat/stomp/StompFrame.h>
```

Public Member Functions

- **StompFrame** ()
Default constructor.
- virtual **~StompFrame** ()
Destruction.
- **StompFrame * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (const **StompFrame** *src)
Copies the contents of the passed Frame to this one.
- void **setCommand** (const std::string &cmd)
Sets the command for this stomp frame.
- const std::string & **getCommand** () const
Accessor for this frame's command field.
- bool **hasProperty** (const std::string &name) const
Checks if the given property is present in the Frame.
- std::string **getProperty** (const std::string &name, const std::string &fallback="") const
Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (const std::string &name)
Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (const std::string &name, const std::string &value)
Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties & getProperties** ()
Gets access to the header properties for this frame.
- const **decaf::util::Properties & getProperties** () const
- const std::vector< unsigned char > & **getBody** () const
Accessor for the body data of this frame.
- std::vector< unsigned char > & **getBody** ()
Non-const version of the body accessor.
- std::size_t **getBodyLength** () const
Return the number of bytes contained in this frames body.
- void **setBody** (const unsigned char *bytes, std::size_t numBytes)
Sets the body data of this frame as a byte sequence.
- void **toStream** (**decaf::io::DataOutputStream** *stream) const
Writes this Frame to an OuputStream in the Stomp Wire Format.
- void **fromStream** (**decaf::io::DataInputStream** *stream)
Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.518.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.518.2 Constructor & Destructor Documentation

6.518.2.1 `activemq::wireformat::stomp::StompFrame::StompFrame ()`

Default constructor.

6.518.2.2 `virtual activemq::wireformat::stomp::StompFrame::~~StompFrame ()` [virtual]

Destruction.

6.518.3 Member Function Documentation

6.518.3.1 `StompFrame* activemq::wireformat::stomp::StompFrame::clone ()` `const`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

6.518.3.2 `void activemq::wireformat::stomp::StompFrame::copy (const` `StompFrame * src)`

Copies the contents of the passed Frame to this one.

Parameters

<i>src</i>	- Frame to copy
------------	-----------------

6.518.3.3 `void activemq::wireformat::stomp::StompFrame::fromStream (` `decaf::io::DataInputStream * stream)`

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters

<i>stream</i>	- The stream to read the Frame from.
---------------	--------------------------------------

Exceptions

<i>IOException</i>	if an error occurs while writing the Frame.
--------------------	---

6.518.3.4 `const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () const [inline]`

Accessor for the body data of this frame.

Returns

char pointer to body data

6.518.3.5 `std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () [inline]`

Non-const version of the body accessor.

6.518.3.6 `std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength () const [inline]`

Return the number of bytes contained in this frames body.

Returns

Body bytes length.

6.518.3.7 `const std::string& activemq::wireformat::stomp::StompFrame::getCommand () const [inline]`

Accessor for this frame's command field.

6.518.3.8 `decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () [inline]`

Gets access to the header properties for this frame.

Returns

the Properties object owned by this Frame

6.518.3.9 **const decaf::util::Properties& activemq::wireformat-
::stomp::StompFrame::getProperties () const**
[inline]

6.518.3.10 **std::string activemq::wireformat::stomp::StompFrame::getProperty (**
const std::string & name, const std::string & fallback = " ") const [inline]

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters

<i>name</i>	- The name of the property to lookup
<i>fallback</i>	- The default value to return if this value isn't set

Returns

string value of the property asked for.

6.518.3.11 **bool activemq::wireformat::stomp::StompFrame::hasProperty (const**
std::string & name) const [inline]

Checks if the given property is present in the Frame.

Parameters

<i>name</i>	- The name of the property to check for.
-------------	--

6.518.3.12 **std::string activemq::wireformat::stomp::StompFrame::removeProperty**
(const std::string & name) [inline]

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters

<i>name</i>	- the Name of the property to get and return.
-------------	---

6.518.3.13 **void activemq::wireformat::stomp::StompFrame::setBody (const**
unsigned char * bytes, std::size_t numBytes)

Sets the body data of this frame as a byte sequence.

Parameters

<i>bytes</i>	The byte buffer to be set in the body.
<i>numBytes</i>	The number of bytes in the buffer.

6.518.3.14 `void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & cmd) [inline]`

Sets the command for this stomp frame.

Parameters

<i>cmd</i>	command The command to be set.
------------	--------------------------------

6.518.3.15 `void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & name, const std::string & value) [inline]`

Sets the property given to the value specified in this Frame's Properties.

Parameters

<i>name</i>	- Name of the property.
<i>value</i>	- Value to set the property to.

6.518.3.16 `void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * stream) const`

Writes this Frame to an OutputStream in the Stomp Wire Format.

Parameters

<i>stream</i>	- The stream to write the Frame to.
---------------	-------------------------------------

Exceptions

<i>IOException</i>	if an error occurs while reading the Frame.
--------------------	---

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompFrame.h`

6.519 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from **StompFrame** (p. 2587)'s.

```
#include <src/main/activemq/wireformat/stomp/StompHelper.h>
```

Public Member Functions

- **StompHelper** ()
- virtual **~StompHelper** ()
- void **convertProperties** (const **Pointer**< **StompFrame** > &frame, const **Pointer**< **Message** > &message)
Converts the Headers in a Stomp Frame into Headers in the given Message - Command.
- void **convertProperties** (const **Pointer**< **Message** > &message, const **Pointer**< **StompFrame** > &frame)
*Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2587).*
- **Pointer**< **ActiveMQDestination** > **convertDestination** (const std::string &destination)
Converts from a Stomp Destination to an ActiveMQDestination.
- std::string **convertDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
Converts from a ActiveMQDestination to a Stomp Destination Name.
- std::string **convertMessageId** (const **Pointer**< **MessageId** > &messageId)
Converts a MessageId instance to a Stomp MessageId String.
- **Pointer**< **MessageId** > **convertMessageId** (const std::string &messageId)
Converts a Stomp MessageId string to a MessageId.
- std::string **convertConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)
Converts a ConsumerId instance to a Stomp ConsumerId String.
- **Pointer**< **ConsumerId** > **convertConsumerId** (const std::string &consumerId)
Converts a Stomp ConsumerId string to a ConsumerId.
- std::string **convertProducerId** (const **Pointer**< **ProducerId** > &producerId)
Converts a ProducerId instance to a Stomp ProducerId String.
- **Pointer**< **ProducerId** > **convertProducerId** (const std::string &producerId)
Converts a Stomp ProducerId string to a ProducerId.
- std::string **convertTransactionId** (const **Pointer**< **TransactionId** > &transactionId)
Converts a TransactionId instance to a Stomp TransactionId String.
- **Pointer**< **TransactionId** > **convertTransactionId** (const std::string &transactionId)
Converts a Stomp TransactionId string to a TransactionId.

6.519.1 Detailed Description

Utility Methods used when marshaling to and from **StompFrame** (p. 2587)'s.

Since

3.0

6.519.2 Constructor & Destructor Documentation

6.519.2.1 **activemq::wireformat::stomp::StompHelper::StompHelper ()**

6.519.2.2 **virtual activemq::wireformat::stomp::StompHelper::~~StompHelper ()**
[virtual]

6.519.3 Member Function Documentation

6.519.3.1 **std::string activemq::wireformat::stomp::StompHelper::convert-ConsumerId (const Pointer< ConsumerId > & consumerId)**

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters

<i>consumerId</i>	- the Consumer instance to convert.
-------------------	-------------------------------------

Returns

a Stomp Consumer Id String.

6.519.3.2 **Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & consumerId)**

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters

<i>consumerId</i>	- the String Consumer Id to convert.
-------------------	--------------------------------------

Returns

Pointer to a new ConsumerId.

6.519.3.3 **Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & destination)**

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters

<i>destination</i>	- The Stomp Destination name string.
--------------------	--------------------------------------

Returns

Pointer to a new ActiveMQDestination.

6.519.3.4 `std::string activemq::wireformat::stomp::StompHelper::convert-Destination (const Pointer< ActiveMQDestination > & destination)`

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters

<i>destination</i>	- The ActiveMQDestination to Convert
--------------------	--------------------------------------

Returns

the Stomp String name that defines the destination.

6.519.3.5 `std::string activemq::wireformat::stomp::StompHelper::convertMessageld (const Pointer< Messageld > & messageld)`

Converts a Messageld instance to a Stomp Messageld String.

Parameters

<i>messageld</i>	- the Messageld instance to convert.
------------------	--------------------------------------

Returns

a Stomp Message Id String.

6.519.3.6 `Pointer<Messageld> activemq::wireformat::stomp::StompHelper::convertMessageld (const std::string & messageld)`

Converts a Stomp Messageld string to a Messageld.

Parameters

<i>messageld</i>	- the String message Id to convert.
------------------	-------------------------------------

Returns

Pointer to a new Messageld.

6.519.3.7 `std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & producerId)`

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters

<i>producerId</i>	- the Producer instance to convert.
-------------------	-------------------------------------

Returns

a Stomp Producer Id String.

6.519.3.8 `Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & producerId)`

Converts a Stomp ProducerId string to a ProducerId.

Parameters

<i>producerId</i>	- the String Producer Id to convert.
-------------------	--------------------------------------

Returns

Pointer to a new ProducerId.

6.519.3.9 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & frame, const Pointer< Message > & message)`

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters

<i>frame</i>	- The frame to extract headers from.
<i>message</i>	- The message to move the Headers to.

6.519.3.10 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & message, const Pointer< StompFrame > & frame)`

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2587).

Parameters

<i>message</i>	- The message to move the Headers to.
<i>frame</i>	- The frame to extract headers from.

6.519.3.11 `std::string activemq::wireformat::stomp::StompHelper::convert-TransactionId (const Pointer< TransactionId > & transactionId)`

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters

<i>transactionId</i>	- the Transaction instance to convert.
----------------------	--

Returns

a Stomp Transaction Id String.

6.519.3.12 `Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & transactionId)`

Converts a Stomp TransactionId string to a TransactionId.

Parameters

<i>transactionId</i>	- the String Transaction Id to convert.
----------------------	---

Returns

Pointer to a new TransactionId.

The documentation for this class was generated from the following file:

6.520 activemq::wireformat::stomp::StompWireFormat Class - Reference

```
#include <src/main/activemq/wireformat/stomp/StompWireFormat.h>
```

Inheritance diagram for `activemq::wireformat::stomp::StompWireFormat`:

Public Member Functions

- **StompWireFormat** ()
- virtual **~StompWireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer** < **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- virtual void **setVersion** (int version AMQCPP_UNUSED)

Set the Version.
- virtual int **getVersion** () const

Get the Version.
- virtual bool **inReceive** () const

Is there a Message being unmarshaled?
- virtual bool **hasNegotiator** () const

*Returns true if this **WireFormat** (p. 2884) has a Negotiator that needs to wrap the Transport that uses it.*
- virtual **Pointer** < **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.520.1.2 virtual **activemq::wireformat::stomp::StompWireFormat::~~StompWireFormat** () [virtual]

6.520.2 Member Function Documentation

6.520.2.1 virtual **Pointer**<**transport::Transport**> **activemq::wireformat::stomp::StompWireFormat::createNegotiator** (const **Pointer**< **transport::Transport** > & *transport*) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns

new instance of a **WireFormatNegotiator** (p. 2904).

Exceptions

<i>Unsupported-OperationException</i>	if the WireFormat (p. 2884) doesn't have a Negotiator.
---------------------------------------	---

Implements **activemq::wireformat::WireFormat** (p. 2886).

6.520.2.2 `virtual int activemq::wireformat::stomp::StompWireFormat::getVersion () const [inline, virtual]`

Get the Version.

Returns

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 2886).

6.520.2.3 `virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator () const [inline, virtual]`

Returns true if this **WireFormat** (p. 2884) has a Negotiator that needs to wrap the - Transport that uses it.

Returns

true if the **WireFormat** (p. 2884) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2886).

6.520.2.4 `virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive () const [inline, virtual]`

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 2887).

6.520.2.5 `virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) [virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

<i>command</i>	The Command to Marshal to the output stream.
<i>transport</i>	The Transport that initiated this marshal call.
<i>out</i>	The output stream to write the command to.

Exceptions

<i>IOException</i>	
--------------------	--

Implements **activemq::wireformat::WireFormat** (p. 2887).

6.520.2.6 virtual void **activemq::wireformat::stomp::StompWireFormat::setVersion** (int version *AMQCPP_UNUSED*) [*inline, virtual*]

Set the Version.

Parameters

<i>the</i>	version of the wire format
------------	----------------------------

Implements **activemq::wireformat::WireFormat** (p. 2887).

6.520.2.7 virtual **Pointer<commands::Command>** **activemq::wireformat::stomp::StompWireFormat::unmarshal** (const **activemq::transport::Transport** * *transport*, **decaf::io::DataInputStream** * *in*) [*virtual*]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

<i>transport</i>	- Pointer to the transport that is making this request.
<i>in</i>	- the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

<i>IOException</i>	
--------------------	--

Implements **activemq::wireformat::WireFormat** (p. 2888).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompWireFormat.h**

6.521 activemq::wireformat::stomp::StompWireFormatFactory - Class Reference

Factory used to create the Stomp Wire Format instance.

```
#include <src/main/activemq/wireformat/stomp/StompWire-  
FormatFactory.h>
```

Inheritance diagram for activemq::wireformat::stomp::StompWireFormatFactory:

Public Member Functions

- **StompWireFormatFactory** ()
- virtual **~StompWireFormatFactory** ()
- virtual **Pointer< WireFormat > createWireFormat** (const **decaf::util::Properties** &properties)

*Creates a new **WireFormat** (p. 2884) Object passing it a set of properties from which it can obtain any optional settings.*

6.521.1 Detailed Description

Factory used to create the Stomp Wire Format instance.

6.521.2 Constructor & Destructor Documentation

6.521.2.1 **activemq::wireformat::stomp::StompWireFormatFactory::StompWireFormatFactory** () [inline]

6.521.2.2 **virtual activemq::wireformat::stomp::StompWireFormatFactory::~~StompWireFormatFactory** () [inline, virtual]

6.521.3 Member Function Documentation

6.521.3.1 **virtual Pointer<WireFormat> activemq::wireformat::stomp::StompWireFormatFactory::createWireFormat** (const **decaf::util::Properties** & *properties*) [virtual]

Creates a new **WireFormat** (p. 2884) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

<i>properties</i>	- the Properties for this WireFormat (p. 2884)
-------------------	---

Implements **activemq::wireformat::WireFormatFactory** (p. 2889).

6.522 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

```
#include <src/main/cms/Stoppable.h>
```

Inheritance diagram for cms::Stoppable:

Public Member Functions

- virtual **~Stoppable** ()
- virtual void **stop** ()=0
Stops this service.

6.522.1 Detailed Description

Interface for a class that implements the stop method.

An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since

1.0

6.522.2 Constructor & Destructor Documentation

6.522.2.1 virtual cms::Stoppable::~**~Stoppable** () [virtual]

6.522.3 Member Function Documentation

6.522.3.1 virtual void cms::Stoppable::stop () [pure virtual]

Stops this service.

Exceptions

CMSException (p. 826)	- if an internal error occurs while stopping the Service.
---------------------------------	---

Implemented in **activemq::core::ActiveMQConnection** (p.212), **activemq::core::ActiveMQSession** (p.352), **activemq::core::ActiveMQConsumer** (p.244), **activemq::cmsutil::PooledSession** (p.2106), and **activemq::cmsutil::CachedConsumer** (p.738).

Referenced by **activemq::cmsutil::PooledSession::stop()**.

6.523 decaf::util::logging::StreamHandler Class Reference

Stream based logging **Handler** (p. 1401).

```
#include <src/main/decaf/util/logging/StreamHandler.h>
```

Inheritance diagram for **decaf::util::logging::StreamHandler**:

Public Member Functions

- **StreamHandler ()**
*Create a **StreamHandler** (p. 2603), with no current output stream.*
- **StreamHandler (decaf::io::OutputStream *stream, Formatter *formatter)**
*Create a **StreamHandler** (p. 2603), with no current output stream.*
- virtual **~StreamHandler ()**
- virtual void **close ()**
Close the current output stream.
- virtual void **flush ()**
*Flush the **Handler** (p. 1401)'s output, clears any buffers.*
- virtual void **publish (const LogRecord &record)**
*Publish the Log Record to this **Handler** (p. 1401).*
- virtual bool **isLoggable (const LogRecord &record) const**
*Check if this **Handler** (p. 1401) would actually log a given **LogRecord** (p. 1719).*

Protected Member Functions

- virtual void **setOutputStream (decaf::io::OutputStream *stream)**
Change the output stream.

- void **close** (bool closeStream)

Closes this handler, but the underlying output stream is only closed if closeStream is true.

6.523.1 Detailed Description

Stream based logging **Handler** (p. 1401).

This is primarily intended as a base class or support class to be used in implementing other logging Handlers.

LogRecords are published to a given **decaf::io::OutputStream** (p. 2066).

Configuration: By default each **StreamHandler** (p. 2603) is initialized using the following **LogManager** (p. 1712) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

* decaf.util.logging.StreamHandler.level specifies the default level for the **Handler** (p. 1401) (defaults to **Level.INFO** (p. 1620)). * decaf.util.logging.StreamHandler.filter specifies the name of a **Filter** (p. 1333) class to use (defaults to no **Filter** (p. 1333)). * decaf.util.logging.StreamHandler.formatter specifies the name of a **Formatter** (p. 1387) class to use (defaults to **decaf.util.logging.SimpleFormatter** (p. 2441)).

Since

1.0

6.523.2 Constructor & Destructor Documentation

6.523.2.1 decaf::util::logging::StreamHandler::StreamHandler ()

Create a **StreamHandler** (p. 2603), with no current output stream.

6.523.2.2 decaf::util::logging::StreamHandler::StreamHandler (decaf::io::OutputStream * stream, Formatter * formatter)

Create a **StreamHandler** (p. 2603), with no current output stream.

6.523.2.3 virtual decaf::util::logging::StreamHandler::~~StreamHandler () [virtual]

6.523.3 Member Function Documentation

6.523.3.1 virtual void decaf::util::logging::StreamHandler::close () [virtual]

Close the current output stream.

The close method will perform a flush and then close the **Handler** (p. 1401). After close has been called this **Handler** (p. 1401) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

Implements **decaf::io::Closeable** (p. 817).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 991).

6.523.3.2 void **decaf::util::logging::StreamHandler::close** (bool *closeStream*)
[protected]

Closes this handler, but the underlying output stream is only closed if closeStream is true.

Parameters

<i>closeStream</i>	whether to close the underlying output stream.
--------------------	--

6.523.3.3 virtual void **decaf::util::logging::StreamHandler::flush** () [virtual]

Flush the **Handler** (p. 1401)'s output, clears any buffers.

Implements **decaf::util::logging::Handler** (p. 1403).

6.523.3.4 virtual bool **decaf::util::logging::StreamHandler::isLoggable** (const **LogRecord** & *record*) const [virtual]

Check if this **Handler** (p. 1401) would actually log a given **LogRecord** (p. 1719).

Parameters

<i>record</i>	LogRecord (p. 1719) to check
---------------	-------------------------------------

Returns

true if the record can be logged with current settings.

Reimplemented from **decaf::util::logging::Handler** (p. 1404).

6.523.3.5 virtual void **decaf::util::logging::StreamHandler::publish** (const **LogRecord** & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 1401).

Parameters

<i>record</i>	The LogRecord (p. 1719) to Publish
---------------	---

Implements **decaf::util::logging::Handler** (p. 1404).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 991).

6.523.3.6 virtual void **decaf::util::logging::StreamHandler::setOutputStream** (
decaf::io::OutputStream * stream) [protected, virtual]

Change the output stream.

If there is a current output stream then the **Formatter** (p. 1387)'s tail string is written and the stream is flushed and closed. Then the output stream is replaced with the new output stream.

Parameters

<i>stream</i>	The new output stream. May not be NULL.
---------------	---

Exceptions

<i>NullPointerException</i>	if the passed stream is NULL.
-----------------------------	-------------------------------

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.524 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 2606).

```
#include <src/main/cms/StreamMessage.h>
```

Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual **~StreamMessage** () throw ()
- virtual bool **readBoolean** () const =0
Reads a Boolean from the Stream message stream.
- virtual void **writeBoolean** (bool value)=0
Writes a boolean to the Stream message stream as a 1-byte value.
- virtual unsigned char **readByte** () const =0
Reads a Byte from the Stream message stream.

- virtual void **writeByte** (unsigned char value)=0
Writes a byte to the Stream message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) const =0
Reads a byte array from the Stream message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0
Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) const =0
Reads a portion of the Stream message stream.
- virtual void **writeBytes** (const unsigned char *value, int offset, int length)=0
Writes a portion of a byte array to the Stream message stream.
- virtual char **readChar** () const =0
Reads a Char from the Stream message stream.
- virtual void **writeChar** (char value)=0
Writes a char to the Stream message stream as a 1-byte value.
- virtual float **readFloat** () const =0
Reads a 32 bit float from the Stream message stream.
- virtual void **writeFloat** (float value)=0
Writes a float to the Stream message stream as a 4 byte value.
- virtual double **readDouble** () const =0
Reads a 64 bit double from the Stream message stream.
- virtual void **writeDouble** (double value)=0
Writes a double to the Stream message stream as a 8 byte value.
- virtual short **readShort** () const =0
Reads a 16 bit signed short from the Stream message stream.
- virtual void **writeShort** (short value)=0
Writes a signed short to the Stream message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const =0
Reads a 16 bit unsigned short from the Stream message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0
Writes a unsigned short to the Stream message stream as a 2 byte value.
- virtual int **readInt** () const =0
Reads a 32 bit signed integer from the Stream message stream.
- virtual void **writeInt** (int value)=0
Writes a signed int to the Stream message stream as a 4 byte value.
- virtual long long **readLong** () const =0
Reads a 64 bit long from the Stream message stream.
- virtual void **writeLong** (long long value)=0
Writes a long long to the Stream message stream as a 8 byte value.
- virtual std::string **readString** () const =0
Reads an ASCII String from the Stream message stream.
- virtual void **writeString** (const std::string &value)=0
Writes an ASCII String to the Stream message stream.

6.524.1 Detailed Description

Interface for a **StreamMessage** (p. 2606).

The stream Messages provides a **Message** (p. 1839) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 2606) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 826). The string-to- primitive conversions may throw a runtime exception if the primitive's `valueOf()` method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X
double								X	X	X
String	X	X	X		X	X	X	X	X	X
byte[]										X

Since

1.3

6.524.2 Constructor & Destructor Documentation

6.524.2.1 `virtual cms::StreamMessage::~StreamMessage () throw ()` [virtual]

6.524.3 Member Function Documentation

6.524.3.1 `virtual bool cms::StreamMessage::readBoolean () const` [pure virtual]

Reads a Boolean from the Stream message stream.

Returns

boolean value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 363).

6.524.3.2 `virtual unsigned char cms::StreamMessage::readByte () const [pure virtual]`

Reads a Byte from the Stream message stream.

Returns

unsigned char value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 363).

6.524.3.3 `virtual int cms::StreamMessage::readBytes (std::vector< unsigned char > &value) const [pure virtual]`

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

<i>value</i>	buffer to place data in
--------------	-------------------------

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of message stream has been reached.
MessageFormat-Exception (p. 1906)	- if this type conversion is invalid.
MessageNot-ReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 364).

6.524.3.4 virtual int cms::StreamMessage::readBytes (unsigned char * *buffer*, int *length*) const [pure virtual]

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 826) is thrown. No bytes will be read from the stream for this exception case.

Parameters

<i>buffer</i>	the buffer into which the data is read
<i>length</i>	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormatException</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNotReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 365).

6.524.3.5 virtual char **cms::StreamMessage::readChar** () const [pure virtual]

Reads a Char from the Stream message stream.

Returns

char value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormatException</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNotReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 365).

6.524.3.6 virtual double cms::StreamMessage::readDouble () const [pure virtual]

Reads a 64 bit double from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of message stream has been reached.
MessageFormatException (p. 1906)	- if this type conversion is invalid.
MessageNotReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 366).

6.524.3.7 virtual float cms::StreamMessage::readFloat () const [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of message stream has been reached.
MessageFormatException (p. 1906)	- if this type conversion is invalid.
MessageNotReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 366).

6.524.3.8 `virtual int cms::StreamMessage::readInt () const` [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns

int value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 367).

6.524.3.9 `virtual long long cms::StreamMessage::readLong () const` [pure virtual]

Reads a 64 bit long from the Stream message stream.

Returns

long long value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 367).

6.524.3.10 virtual short cms::StreamMessage::readShort () const [pure virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns

short value from stream

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of message stream has been reached.
MessageFormatException (p. 1906)	- if this type conversion is invalid.
MessageNotReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 368).

6.524.3.11 virtual std::string cms::StreamMessage::readString () const [pure virtual]

Reads an ASCII String from the Stream message stream.

Returns

String from stream

Exceptions

CMSException (p. 826)	- if the CMS provider fails to read the message due to some internal error.
MessageEOF-Exception (p. 1905)	- if unexpected end of message stream has been reached.
MessageFormatException (p. 1906)	- if this type conversion is invalid.
MessageNotReadableException (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 368).

6.524.3.12 `virtual unsigned short cms::StreamMessage::readUnsignedShort () const`
`[pure virtual]`

Reads a 16 bit unsigned short from the Stream message stream.

Returns

unsigned short value from stream

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to read the message due to some internal error.
<i>MessageEOF-Exception</i> (p. 1905)	- if unexpected end of message stream has been reached.
<i>MessageFormat-Exception</i> (p. 1906)	- if this type conversion is invalid.
<i>MessageNot-ReadableException</i> (p. 1922)	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 369).

6.524.3.13 `virtual void cms::StreamMessage::writeBoolean (bool value)` `[pure virtual]`

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

<i>value</i>	boolean to write to the stream
--------------	--------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 370).

6.524.3.14 virtual void **cms::StreamMessage::writeByte** (unsigned char *value*)
[pure virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters

<i>value</i>	byte to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 370).

6.524.3.15 virtual void **cms::StreamMessage::writeBytes** (const std::vector< unsigned char > & *value*) [pure virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 370).

6.524.3.16 virtual void **cms::StreamMessage::writeBytes** (const unsigned char * *value*, int *offset*, int *length*) [pure virtual]

Writes a portion of a byte array to the Stream message stream.
size as the number of bytes to write.

Parameters

<i>value</i>	bytes to write to the stream
<i>offset</i>	the initial offset within the byte array
<i>length</i>	the number of bytes to use

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 371).

6.524.3.17 `virtual void cms::StreamMessage::writeChar (char value)` [pure virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters

<i>value</i>	char to write to the stream
--------------	-----------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 371).

6.524.3.18 `virtual void cms::StreamMessage::writeDouble (double value)` [pure virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters

<i>value</i>	double to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
--	--

<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.
---	--

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 372).

6.524.3.19 virtual void **cms::StreamMessage::writeFloat** (float *value*) [pure virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters

<i>value</i>	float to write to the stream
--------------	------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 372).

6.524.3.20 virtual void **cms::StreamMessage::writeInt** (int *value*) [pure virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters

<i>value</i>	signed int to write to the stream
--------------	-----------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 372).

6.524.3.21 `virtual void cms::StreamMessage::writeLong (long long value)` [pure virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters

<i>value</i>	signed long long to write to the stream
--------------	---

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 373).

6.524.3.22 `virtual void cms::StreamMessage::writeShort (short value)` [pure virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters

<i>value</i>	signed short to write to the stream
--------------	-------------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 373).

6.524.3.23 `virtual void cms::StreamMessage::writeString (const std::string & value)` [pure virtual]

Writes an ASCII String to the Stream message stream.

Parameters

<i>value</i>	String to write to the stream
--------------	-------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 374).

6.524.3.24 virtual void **cms::StreamMessage::writeUnsignedShort** (unsigned short *value*) [pure virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters

<i>value</i>	unsigned short to write to the stream
--------------	---------------------------------------

Exceptions

<i>CMSException</i> (p. 826)	- if the CMS provider fails to write the message due to some internal error.
<i>MessageNotWriteableException</i> (p. 1923)	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 374).

The documentation for this class was generated from the following file:

6.525 decaf::lang::String Class Reference

The **String** (p. 2620) class represents an immutable sequence of chars.

```
#include <src/main/decaf/lang/String.h>
```

Inheritance diagram for decaf::lang::String:

Public Member Functions

- **String** ()
*Creates a new empty **String** (p. 2620) object.*
- **String** (const **String** &source)

Create a new **String** (p. 2620) object that represents the given STL string.

- **String** (const std::string &source)

Create a new **String** (p. 2620) object that represents the given STL string.

- **String** (const char *array, int size)

Create a new **String** (p. 2620) object that represents the given array of characters.

- **String** (const char *array, int size, int offset, int **length**)

Create a new **String** (p. 2620) object that represents the given array of characters.

- virtual ~**String** ()
- **String** & **operator=** (const **String** &)
- **String** & **operator=** (const std::string &)
- bool **isEmpty** () const
- virtual int **length** () const

Returns

the length of the underlying character sequence.

- virtual char **charAt** (int index) const

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

index	The position to return the char at.
-------	-------------------------------------

Returns

the char at the given position.

Exceptions

IndexOutOfBoundsException	if index is > than length() (p. 804) or negative
---------------------------	---

- virtual **CharSequence** * **subSequence** (int start, int end) const

Returns a new **CharSequence** (p. 803) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters

start	The start index, inclusive.
end	The end index, exclusive.

Returns

a new **CharSequence** (p. 803)

Exceptions

IndexOutOfBoundsException	if start or end > length() (p. 804) or start or end are negative.
---------------------------	--

- virtual std::string **toString** () const

Returns

the string representation of this **CharSequence** (p. 803)

Static Public Member Functions

- static **String valueOf** (bool value)
Returns a **String** (p. 2620) that represents the value of the given boolean value.
- static **String valueOf** (char value)
Returns a **String** (p. 2620) that represents the value of the given char value.
- static **String valueOf** (float value)
Returns a **String** (p. 2620) that represents the value of the given float value.
- static **String valueOf** (double value)
Returns a **String** (p. 2620) that represents the value of the given double value.
- static **String valueOf** (short value)
Returns a **String** (p. 2620) that represents the value of the given short value.
- static **String valueOf** (int value)
Returns a **String** (p. 2620) that represents the value of the given integer value.
- static **String valueOf** (long long value)
Returns a **String** (p. 2620) that represents the value of the given 64bit long value.

6.525.1 Detailed Description

The **String** (p. 2620) class represents an immutable sequence of chars.

Since

1.0

6.525.2 Constructor & Destructor Documentation

6.525.2.1 decaf::lang::String::String ()

Creates a new empty **String** (p. 2620) object.

6.525.2.2 decaf::lang::String::String (const String & source)

Create a new **String** (p. 2620) object that represents the given STL string.

Parameters

source	The string to copy into this new String (p. 2620) object.
---------------	--

6.525.2.3 `decaf::lang::String::String (const std::string & source)`

Create a new **String** (p. 2620) object that represents the given STL string.

Parameters

<i>source</i>	The string to copy into this new String (p. 2620) object.
---------------	--

6.525.2.4 `decaf::lang::String::String (const char * array, int size)`

Create a new **String** (p. 2620) object that represents the given array of characters.

The method takes the size of the array as a parameter to allow for strings that are not N-NULL terminated, the caller can pass `strlen(array)` in the case where the array is properly NULL terminated.

Parameters

<i>array</i>	The character buffer to copy into this new String (p. 2620) object.
<i>size</i>	The size of the string buffer given, in case the string is not NULL terminated.

Exceptions

<i>NullPointerException</i>	if the character array parameter is NULL.
<i>IndexOutOfBoundsException</i>	if the size parameter is negative.

6.525.2.5 `decaf::lang::String::String (const char * array, int size, int offset, int length)`

Create a new **String** (p. 2620) object that represents the given array of characters.

The method takes the size of the array as a parameter to allow for strings that are not N-NULL terminated, the caller can pass `strlen(array)` in the case where the array is properly NULL terminated.

Parameters

<i>array</i>	The character buffer to copy into this new String (p. 2620) object.
<i>size</i>	The size of the string buffer given, in case the string is not NULL terminated.
<i>offset</i>	The position to start copying from in the given buffer.
<i>length</i>	The number of bytes to copy from the given buffer starting from the offset.

Exceptions

<i>NullPointerException</i>	if the character array parameter is NULL.
-----------------------------	---

<i>IndexOutOfBounds-Exception</i>	if the size, offset or length parameter is negative or if the length to copy is greater than the span of size - offset.
-----------------------------------	---

6.525.2.6 virtual **decaf::lang::String::~~String** () [virtual]

6.525.3 Member Function Documentation

6.525.3.1 virtual char **decaf::lang::String::charAt** (int *index*) const [virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

<i>index</i>	The position to return the char at.
--------------	-------------------------------------

Returns

the char at the given position.

Exceptions

<i>IndexOutOfBounds-Exception</i>	if index is > than length() (p. 804) or negative
-----------------------------------	---

Implements **decaf::lang::CharSequence** (p. 804).

6.525.3.2 bool **decaf::lang::String::isEmpty** () const

Returns

true if the length of this **String** (p. 2620) is zero.

6.525.3.3 virtual int **decaf::lang::String::length** () const [virtual]

Returns

the length of the underlying character sequence.

Implements **decaf::lang::CharSequence** (p. 804).

6.525.3.4 **String&** **decaf::lang::String::operator=** (const **String** &)

6.525.3.5 **String&** **decaf::lang::String::operator=** (const std::string &)

6.525.3.6 `virtual CharSequence* decaf::lang::String::subSequence (int start, int end) const` `[virtual]`

Returns a new **CharSequence** (p. 803) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index *end* - 1. The length (in chars) of the returned sequence is *end* - *start*, so if *start* == *end* then an empty sequence is returned.

Parameters

<i>start</i>	The start index, inclusive.
<i>end</i>	The end index, exclusive.

Returns

a new **CharSequence** (p. 803)

Exceptions

<i>IndexOutOfBoundsException</i>	if <i>start</i> or <i>end</i> > length() (p. 804) or <i>start</i> or <i>end</i> are negative.
----------------------------------	--

Implements **decaf::lang::CharSequence** (p. 804).

6.525.3.7 `virtual std::string decaf::lang::String::toString () const` `[virtual]`

Returns

the string representation of this **CharSequence** (p. 803)

Implements **decaf::lang::CharSequence** (p. 805).

6.525.3.8 `static String decaf::lang::String::valueOf (bool value)` `[static]`

Returns a **String** (p. 2620) that represents the value of the given boolean value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

"true" if the boolean is true, "false" otherwise.

6.525.3.9 `static String decaf::lang::String::valueOf (char value)` `[static]`

Returns a **String** (p. 2620) that represents the value of the given char value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

a **String** (p. 2620) that contains the single character value given.

6.525.3.10 static **String** decaf::lang::String::valueOf (float *value*) [static]

Returns a **String** (p. 2620) that represents the value of the given float value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

a **String** (p. 2620) that contains the string representation of the float value given.

6.525.3.11 static **String** decaf::lang::String::valueOf (double *value*) [static]

Returns a **String** (p. 2620) that represents the value of the given double value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

a **String** (p. 2620) that contains the string representation of the double value given.

6.525.3.12 static **String** decaf::lang::String::valueOf (short *value*) [static]

Returns a **String** (p. 2620) that represents the value of the given short value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

a **String** (p. 2620) that contains the string representation of the short value given.

6.525.3.13 static String decaf::lang::String::valueOf (int *value*) [static]

Returns a **String** (p. 2620) that represents the value of the given integer value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

a **String** (p. 2620) that contains the string representation of the integer value given.

6.525.3.14 static String decaf::lang::String::valueOf (long long *value*) [static]

Returns a **String** (p. 2620) that represents the value of the given 64bit long value.

Parameters

<i>value</i>	The value whose string representation is to be returned.
--------------	--

Returns

a **String** (p. 2620) that contains the string representation of the 64 bit long value given.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**String.h**

6.526 decaf::util::StringTokenizer Class Reference

Class that allows for parsing of string based on Tokens.

```
#include <src/main/decaf/util/StringTokenizer.h>
```

Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)

Constructs a string tokenizer for the specified string.

- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () const

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

- virtual bool **hasMoreTokens** () const

Tests if there are more tokens available from this tokenizer's string.

- virtual std::string **nextToken** ()

Returns the next token from this string tokenizer.

- virtual std::string **nextToken** (const std::string &delim)

Returns the next token in this string tokenizer's string.

- virtual unsigned int **toArray** (std::vector< std::string > &array)

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.526.1 Detailed Description

Class that allows for parsing of string based on Tokens.

Since

1.0

6.526.2 Constructor & Destructor Documentation

6.526.2.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & str, const std::string & delim = " \t\n\r\f", bool returnDelims = false)

Constructs a string tokenizer for the specified string.

All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p.2627) may result in an Exception.

Parameters

<i>str</i>	- The string to tokenize
<i>delim</i>	- String containing the delimiters
<i>returnDelims</i>	- boolean indicating if the delimiters are returned as tokens

6.526.2.2 virtual decaf::util::StringTokenizer::~StringTokenizer () [virtual]

6.526.3 Member Function Documentation

6.526.3.1 `virtual int decaf::util::StringTokenizer::countTokens () const`
`[virtual]`

Calculates the number of times that this tokenizer's `nextToken` method can be called before it generates an exception.

The current position is not advanced.

Returns

Count of remaining tokens

6.526.3.2 `virtual bool decaf::util::StringTokenizer::hasMoreTokens () const`
`[virtual]`

Tests if there are more tokens available from this tokenizer's string.

Returns

true if there are more tokens remaining

6.526.3.3 `virtual std::string decaf::util::StringTokenizer::nextToken ()`
`[virtual]`

Returns the next token from this string tokenizer.

Returns

string value of next token

Exceptions

<i>NoSuchElement-Exception</i> (p. 1984)	if there are no more tokens in this string.
--	---

6.526.3.4 `virtual std::string decaf::util::StringTokenizer::nextToken (const std::string & delim)` `[virtual]`

Returns the next token in this string tokenizer's string.

First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 2627) object is changed to be the characters in the string `delim`. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters

<i>delim</i>	The string containing the new set of delimiters.
--------------	--

Returns

next string in the token list

Exceptions

NoSuchElementException (p. 1984)	if there are no more tokens in this string.
--	---

6.526.3.5 virtual void decaf::util::StringTokenizer::reset (const std::string & *str* = " ",
const std::string & *delim* = " ", bool *returnDelims* = false) [virtual]

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing.

* If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. * If set the delim param will reset the string that this Tokenizer is using to tokenize the string. If set to "", no change is made * If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters

<i>str</i>	New String to tokenize or "", defaults to ""
<i>delim</i>	New Delimiter String to use or "", defaults to ""
<i>returnDelims</i>	Should the Tokenizer return delimiters as Tokens, default false

6.526.3.6 virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector<
std::string > & *array*) [virtual]

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters

<i>array</i>	- vector to place token strings in
--------------	------------------------------------

Returns

number of string placed into the vector

- **Pointer< ActiveMQDestination > subscribedDestination**

6.527.1 Constructor & Destructor Documentation

6.527.1.1 **activemq::commands::SubscriptionInfo::SubscriptionInfo ()**

6.527.1.2 **virtual activemq::commands::SubscriptionInfo::~SubscriptionInfo ()**
[virtual]

6.527.2 Member Function Documentation

6.527.2.1 **virtual SubscriptionInfo* activemq::commands::SubscriptionInfo::cloneDataStructure () const**
[virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.527.2.2 **virtual void activemq::commands::SubscriptionInfo::copyDataStructure (const DataStructure * src)** [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1134).

6.527.2.3 `virtual bool activemq::commands::SubscriptionInfo::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 1135).

6.527.2.4 `virtual const std::string& activemq::commands::SubscriptionInfo::get-
ClientId () const [virtual]`

6.527.2.5 `virtual std::string& activemq::commands::SubscriptionInfo::getClientId ()
[virtual]`

6.527.2.6 `virtual unsigned char activemq::commands::SubscriptionInfo::getData-
StructureType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.527.2.7 `virtual const Pointer<ActiveMQDestination>& activemq-
::commands::SubscriptionInfo::getDestination () const
[virtual]`

6.527.2.8 `virtual Pointer<ActiveMQDestination>& activemq-

- virtual `~SubscriptionInfoMarshaller` ()
- virtual `commands::DataStructure * createObject` () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char `getDataStructureType` () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void `tightUnmarshal` (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `decaf::io::DataInputStream *dataIn`, `utils::BooleanStream *bs`)
Tight Un-marhsal to the given stream.
- virtual int `tightMarshal1` (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `utils::BooleanStream *bs`)
Tight Marhsal to the given stream.
- virtual void `tightMarshal2` (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `decaf::io::DataOutputStream *dataOut`, `utils::BooleanStream *bs`)

6.528 activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller Class

Reference

2643

Tight Marshal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

Loose Un-marshal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

Tight Marshal to the given stream.

6.528.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2635).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.528.2 Constructor & Destructor Documentation

6.528.2.1 **activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller** ()
[inline]

6.528.2.2 **virtual activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller** ()
[inline, virtual]

6.528.3 Member Function Documentation

6.528.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::createObject** ()
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.528.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::getDataStructureType** () **const**
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.528.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*)** [virtual]

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1123).

6.528.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)** [virtual]

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1125).

6.528 activemq::wireformat::openwire::marshal::generated::SubscriptionInfo-Marshaller Class

Reference

2645

6.528.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs)`
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

6.528.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs)` [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

6.528.3.7 `virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs)` [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**SubscriptionInfo-Marshaller.h**

6.529 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

```
#include <src/main/decaf/util/concurrent/Synchronizable.h>
```

Inheritance diagram for decaf::util::concurrent::Synchronizable:

Public Member Functions

- virtual **~Synchronizable** ()
- virtual void **lock** ()=0
Locks the object.
- virtual bool **tryLock** ()=0
*Attempts to **Lock** (p. 1682) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** ()=0
Unlocks the object.
- virtual void **wait** ()=0
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)=0
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)=0
Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()=0
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()=0
Signals the waiters on this object that it can now wake up and continue.

6.529.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since

1.0

6.529.2 Constructor & Destructor Documentation

6.529.2.1 virtual **decaf::util::concurrent::Synchronizable::~Synchronizable** ()
[inline, virtual]

6.529.3 Member Function Documentation

6.529.3.1 virtual void **decaf::util::concurrent::Synchronizable::lock** () [pure virtual]

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1042), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1042), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 913), **decaf::util::concurrent::ConcurrentStlMap< Pointer< Messageld >, Pointer< Message >, Messageld::COMPARATOR >** (p. 913), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 913), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 913), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 913), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 913), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 913), **decaf::util::AbstractCollection< E >** (p. 115), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 115), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 115), **decaf::util::AbstractCollection< Resource * >** (p. 115), **decaf::util::**

AbstractCollection< **cms::MessageConsumer** * > (p. 115), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 115), **decaf::util::AbstractCollection**< **URI** > (p. 115), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 115), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 115), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 115), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 115), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 115), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 115), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 115), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 115), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 115), **decaf::io::InputStream** (p. 1467), **decaf::util::StlMap**< **K**, **V**, **COMPARATOR** > (p. 2560), **decaf::util::StlMap**< **cms::Session** *, **SessionResolver** * > (p. 2560), **decaf::util::StlMap**< **std::string**, **WireFormatFactory** * > (p. 2560), **decaf::util::StlMap**< **decaf::lang::Runnable** *, **decaf::util::TimerTask** * > (p. 2560), **decaf::util::StlMap**< **std::string**, **PrimitiveValueNode** > (p. 2560), **decaf::util::StlMap**< **std::string**, **cms::Queue** * > (p. 2560), **decaf::util::StlMap**< **std::string**, **CachedConsumer** * > (p. 2560), **decaf::util::StlMap**< **Pointer**< **commands::ConsumerId** >, **ActiveMQConsumer** *, **commands::ConsumerId::COMPARATOR** > (p. 2560), **decaf::util::StlMap**< **std::string**, **TransportFactory** * > (p. 2560), **decaf::util::StlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerInfo** >, **ConsumerId::COMPARATOR** > (p. 2560), **decaf::util::StlMap**< **int**, **Pointer**< **Command** > > (p. 2560), **decaf::util::StlMap**< **std::string**, **CachedProducer** * > (p. 2560), **decaf::util::StlMap**< **std::string**, **cms::Topic** * > (p. 2560), **decaf::util::StlQueue**< **T** > (p. 2569), **decaf::io::OutputStream** (p. 2069), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2448), **activemq::core::FifoMessageDispatchChannel** (p. 1326), **decaf::util::concurrent::Mutex** (p. 1962), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2651).

6.529.3.2 **virtual void decaf::util::concurrent::Synchronizable::notify ()** [pure virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 1043), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 1043), **decaf::util::concurrent::ConcurrentStlMap**< **K**, **V**, **COMPARATOR** > (p. 914), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **MessageId** >, **Pointer**< **Message** >, **MessageId::COMPARATOR** > (p. 914), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConnectionId** >, **Pointer**< **ConnectionState** >, **ConnectionId::COMPARATOR** > (p. 914), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerState** >, **ConsumerId::COMPARATOR** > (p. 914), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**<

SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 914), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 914), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 914), decaf::util::AbstractCollection< E > (p. 115), decaf::util::AbstractCollection< Pointer< Transport > > (p. 115), decaf::util::AbstractCollection< Pointer< Synchronization > > (p. 115), decaf::util::AbstractCollection< Resource * > (p. 115), decaf::util::AbstractCollection< cms::MessageConsumer * > (p. 115), decaf::util::AbstractCollection< CompositeTask * > (p. 115), decaf::util::AbstractCollection< URI > (p. 115), decaf::util::AbstractCollection< Pointer< MessageDispatch > > (p. 115), decaf::util::AbstractCollection< Pointer< DestinationInfo > > (p. 115), decaf::util::AbstractCollection< PrimitiveValueNode > (p. 115), decaf::util::AbstractCollection< Pointer< Command > > (p. 115), decaf::util::AbstractCollection< Pointer< BackupTransport > > (p. 115), decaf::util::AbstractCollection< cms::MessageProducer * > (p. 115), decaf::util::AbstractCollection< cms::Destination * > (p. 115), decaf::util::AbstractCollection< cms::Session * > (p. 115), decaf::util::AbstractCollection< cms::Connection * > (p. 115), decaf::io::InputStream (p. 1468), decaf::util::StlMap< K, V, COMPARATOR > (p. 2560), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2560), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2560), decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * > (p. 2560), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2560), decaf::util::StlMap< std::string, cms::Queue * > (p. 2560), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2560), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2560), decaf::util::StlMap< std::string, TransportFactory * > (p. 2560), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 2560), decaf::util::StlMap< int, Pointer< Command > > (p. 2560), decaf::util::StlMap< std::string, CachedProducer * > (p. 2560), decaf::util::StlMap< std::string, cms::Topic * > (p. 2560), decaf::util::StlQueue< T > (p. 2570), decaf::io::OutputStream (p. 2069), activemq::core::SimplePriorityMessageDispatchChannel (p. 2448), activemq::core::FifoMessageDispatchChannel (p. 1326), decaf::util::concurrent::Mutex (p. 1962), and decaf::internal::util::concurrent::SynchronizableImpl (p. 2651).

6.529.3.3 virtual void decaf::util::concurrent::Synchronizable::notifyAll() [pure virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1043),

 SynchronizableImpl (p. 2652).

6.529.3.4 virtual bool decaf::util::concurrent::Synchronizable::tryLock() [pure
 virtual]

Attempts to **Lock** (p. 1682) the object, if the lock is already held by another thread than
 this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1047), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1047), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< Messageld >, Pointer< Message >, Messageld::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 919), **decaf::util::AbstractCollection< E >** (p. 119), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 119), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 119), **decaf::util::AbstractCollection< Resource * >** (p. 119), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 119), **decaf::util::AbstractCollection< CompositeTask * >** (p. 119), **decaf::util::AbstractCollection< URI >** (p. 119), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 119), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 119), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 119), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 119), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 119), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 119), **decaf::util::AbstractCollection< cms::Destination * >** (p. 119), **decaf::util::AbstractCollection< cms::Session * >** (p. 119), **decaf::util::AbstractCollection< cms::Connection * >** (p. 119), **decaf::io::InputStream** (p. 1473), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2563), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2563), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2563), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2563), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2563), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2563), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2563), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 2563), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2563), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2563), **decaf::util::StlMap< int, Pointer< Command > >** (p. 2563), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2563), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2563), **decaf::util::StlQueue< T >** (p. 2571), **decaf::io::OutputStream** (p. 2070), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2450), **activemq::core::FifoMessageDispatchChannel** (p. 1328),

6.529.3.5 **virtual void decaf::util::concurrent::Synchronizable::unlock ()** [pure virtual]

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1048), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1048), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< Messageld >, Pointer< Message >, Messageld::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 919), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 919), **decaf::util::AbstractCollection< E >** (p. 120), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 120), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 120), **decaf::util::AbstractCollection< Resource * >** (p. 120), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 120), **decaf::util::AbstractCollection< CompositeTask * >** (p. 120), **decaf::util::AbstractCollection< URI >** (p. 120), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 120), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 120), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 120), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 120), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 120), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 120), **decaf::util::AbstractCollection< cms::Destination * >** (p. 120), **decaf::util::AbstractCollection< cms::Session * >** (p. 120), **decaf::util::AbstractCollection< cms::Connection * >** (p. 120), **decaf::io::InputStream** (p. 1473), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2563), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2563), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2563), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2563), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2563), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2563), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2563), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 2563), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2563), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >**

(p. 2563), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2563), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2563), `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2563), `decaf::util::StlQueue< T >` (p. 2572), `decaf::io::OutputStream` (p. 2071), `activemq::core::SimplePriorityMessageDispatchChannel` (p. 2450), `activemq::core::FifoMessageDispatchChannel` (p. 1328), `decaf::util::concurrent::Mutex` (p. 1963), and `decaf::internal::util::concurrent::SynchronizableImpl` (p. 2652).

6.529.3.6 `virtual void decaf::util::concurrent::Synchronizable::wait ()` [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.

Implemented in `decaf::util::concurrent::CopyOnWriteArrayList< E >` (p. 1048), `decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >` (p. 1048), `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 920), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 920), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 920), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 920), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 920), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 920), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 920), `decaf::util::AbstractCollection< E >` (p. 120), `decaf::util::AbstractCollection< Pointer< Transport > >` (p. 120), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 120), `decaf::util::AbstractCollection< Resource * >` (p. 120), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 120), `decaf::util::AbstractCollection< CompositeTask * >` (p. 120), `decaf::util::AbstractCollection< URI >` (p. 120), `decaf::util::AbstractCollection< Pointer< MessageDispatch > >` (p. 120), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 120), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 120), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 120), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 120), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 120), `decaf::util::AbstractCollection< cms::Destination * >` (p. 120), `decaf::util::AbstractCollection< cms::Session * >` (p. 120), `decaf::util::AbstractCollection< cms::Connection * >` (p. 120), `decaf::io::InputStream` (p. 1473), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2564), `decaf::util::`

6.529.3.7 **virtual void decaf::util::concurrent::Synchronizable::wait (long long millisecs)** [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 1048), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 1048), **decaf::util::concurrent::ConcurrentStlMap**< **K**, **V**, **COMPARATOR** > (p. 920), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **MessageId** >, **Pointer**< **Message** >, **MessageId::COMPARATOR** > (p. 920), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConnectionId** >, **Pointer**< **ConnectionState** >, **ConnectionId::COMPARATOR** > (p. 920), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerState** >, **ConsumerId::COMPARATOR** > (p. 920), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **SessionId** >, **Pointer**< **SessionState** >, **SessionId::COMPARATOR** > (p. 920), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **LocalTransactionId** >, **Pointer**< **TransactionState** >, **LocalTransactionId::COMPARATOR** > (p. 920), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ProducerId** >, **Pointer**<

ProducerState >, **ProducerId::COMPARATOR** > (p. 920), **decaf::util::AbstractCollection**< **E** > (p. 120), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 120), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 120), **decaf::util::AbstractCollection**< **Resource** * > (p. 120), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 120), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 120), **decaf::util::AbstractCollection**< **URI** > (p. 120), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 120), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 120), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 120), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 120), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 120), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 120), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 120), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 120), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 120), **decaf::io::InputStream** (p. 1474), **decaf::util::StlMap**< **K**, **V**, **COMPARATOR** > (p. 2564), **decaf::util::StlMap**< **cms::Session** *, **SessionResolver** * > (p. 2564), **decaf::util::StlMap**< **std::string**, **WireFormatFactory** * > (p. 2564), **decaf::util::StlMap**< **decaf::lang::Runnable** *, **decaf::util::TimerTask** * > (p. 2564), **decaf::util::StlMap**< **std::string**, **PrimitiveValueNode** > (p. 2564), **decaf::util::StlMap**< **std::string**, **cms::Queue** * > (p. 2564), **decaf::util::StlMap**< **std::string**, **CachedConsumer** * > (p. 2564), **decaf::util::StlMap**< **Pointer**< **commands::ConsumerId** >, **ActiveMQConsumer** *, **commands::ConsumerId::COMPARATOR** > (p. 2564), **decaf::util::StlMap**< **std::string**, **TransportFactory** * > (p. 2564), **decaf::util::StlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerInfo** >, **ConsumerId::COMPARATOR** > (p. 2564), **decaf::util::StlMap**< **int**, **Pointer**< **Command** > > (p. 2564), **decaf::util::StlMap**< **std::string**, **CachedProducer** * > (p. 2564), **decaf::util::StlMap**< **std::string**, **cms::Topic** * > (p. 2564), **decaf::util::StlQueue**< **T** > (p. 2572), **decaf::io::OutputStream** (p. 2071), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 2451), **activemq::core::FifoMessageDispatchChannel** (p. 1329), **decaf::util::concurrent::Mutex** (p. 1964), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2653).

6.529.3.8 `virtual void decaf::util::concurrent::Synchronizable::wait (long long millisecs, int nanos) [pure virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or <code>WAIT_INFINITE</code>
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgument-Exception</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorState-Exception</i>	- if the current thread is not the owner of the the Synchronizable (p. 2639) Object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 1049), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 1049), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 920), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 920), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 920), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 920), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 920), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 920), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 920), **decaf::util::AbstractCollection< E >** (p. 121), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 121), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 121), **decaf::util::AbstractCollection< Resource * >** (p. 121), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 121), **decaf::util::AbstractCollection< CompositeTask * >** (p. 121), **decaf::util::AbstractCollection< URI >** (p. 121), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 121), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 121), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 121), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 121), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 121), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 121), **decaf::util::AbstractCollection< cms::Destination * >** (p. 121), **decaf::util::AbstractCollection< cms::Session * >** (p. 121), **decaf::util::AbstractCollection< cms::Connection * >** (p. 121), **decaf::io::InputStream** (p. 1474), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2565), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2565), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2565), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 2565), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2565), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2565), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 2565), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 2565), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 2565), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 2565), **decaf::util::StlMap< int, Pointer< Command > >** (p. 2565), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 2565), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 2565), **decaf::util::StlQueue< T >** (p. 2573), **decaf::io::OutputStream** (p. 2072), **activemq::core::SimplePriorityMessageDispatch-**

6.530 `decaf::internal::util::concurrent::SynchronizableImpl` Class - Reference

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

```
#include <src/main/decaf/internal/util/concurrent/Synchronizable-Impl.h>
```

Inheritance diagram for `decaf::internal::util::concurrent::SynchronizableImpl`:

Public Member Functions

- **SynchronizableImpl** ()
- virtual **~SynchronizableImpl** ()
- virtual void **lock** ()
Locks the object.
- virtual bool **tryLock** ()
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** ()
Unlocks the object.
- virtual void **wait** ()
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()
Signals the waiters on this object that it can now wake up and continue.

6.530.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since

1.0

6.530.2 Constructor & Destructor Documentation

6.530.2.1 **decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ()**

6.530.2.2 **virtual decaf::internal::util::concurrent::SynchronizableImpl::~~SynchronizableImpl ()** [virtual]

6.530.3 Member Function Documentation

6.530.3.1 **virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock ()** [virtual]

Locks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2640).

6.530.3.2 **virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify ()** [virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2641).

6.530 decaf::internal::util::concurrent::SynchronizableImpl Class Reference 2659

6.530.3.3 virtual void **decaf::internal::util::concurrent::SynchronizableImpl::notify-All**() [virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.
<i>RuntimeException</i>	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2642).

6.530.3.4 virtual bool **decaf::internal::util::concurrent::SynchronizableImpl::tryLock**() [virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

<i>RuntimeException</i>	if an error occurs while locking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2643).

6.530.3.5 virtual void **decaf::internal::util::concurrent::SynchronizableImpl::unlock**() [virtual]

Unlocks the object.

Exceptions

<i>RuntimeException</i>	if an error occurs while unlocking the object.
-------------------------	--

Implements **decaf::util::concurrent::Synchronizable** (p. 2645).

6.530.3.6 virtual void **decaf::internal::util::concurrent::SynchronizableImpl::wait**() [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2646).

6.530.3.7 virtual void **decaf::internal::util::concurrent::SynchronizableImpl::wait** (
long long *millisecs*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
------------------	--

Exceptions

<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2647).

6.530.3.8 virtual void **decaf::internal::util::concurrent::SynchronizableImpl::wait** (
long long *millisecs*, int *nanos*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

<i>millisecs</i>	the time in milliseconds to wait, or WAIT_INFINITE
<i>nanos</i>	additional time in nanoseconds with a range of 0-999999

Exceptions

<i>IllegalArgumentException</i>	if an error occurs or the nanos argument is not in the range of [0-999999]
<i>RuntimeException</i>	if an error occurs while waiting on the object.
<i>InterruptedException</i>	if the wait is interrupted before it completes.
<i>IllegalMonitorStateException</i>	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2648).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**SynchronizableImpl.h**

6.531 activemq::core::Synchronization Class Reference

Transacted Object **Synchronization** (p. 2654), used to sync the events of a Transaction with the items in the Transaction.

```
#include <src/main/activemq/core/Synchronization.h>
```

Public Member Functions

- virtual **~Synchronization** ()
- virtual void **beforeEnd** ()=0
- virtual void **afterCommit** ()=0
- virtual void **afterRollback** ()=0

6.531.1 Detailed Description

Transacted Object **Synchronization** (p. 2654), used to sync the events of a Transaction with the items in the Transaction.

6.531.2 Constructor & Destructor Documentation

6.531.2.1 virtual **activemq::core::Synchronization::~~Synchronization** ()
[inline, virtual]

6.531.3 Member Function Documentation

6.531.3.1 virtual void **activemq::core::Synchronization::afterCommit** () [pure virtual]

6.531.3.2 virtual void **activemq::core::Synchronization::afterRollback** () [pure virtual]

6.531.3.3 `virtual void activemq::core::Synchronization::beforeEnd ()` [pure virtual]

The documentation for this class was generated from the following file:

- `src/main/activemq/core/Synchronization.h`

6.532 `decaf::util::concurrent::SynchronousQueue< E >` Class - Template Reference

A **blocking queue** (p. 538) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.

```
#include <src/main/decaf/util/concurrent/Synchronous-Queue.h>
```

Inheritance diagram for `decaf::util::concurrent::SynchronousQueue< E >`:

Data Structures

- class **EmptyIterator**

Public Member Functions

- **SynchronousQueue** ()
- virtual **~SynchronousQueue** ()
- virtual void **put** (const E &value)
Adds the specified element to this queue, waiting if necessary for another thread to receive it.
- virtual bool **offer** (const E &e, long long timeout, const **TimeUnit** &unit)
Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.
- virtual bool **offer** (const E &value)
Inserts the specified element into this queue, if another thread is waiting to receive it.
- virtual E **take** ()
Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.
- virtual bool **poll** (E &result, long long timeout, const **TimeUnit** &unit)
Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.
- virtual bool **poll** (E &result)
Retrieves and removes the head of this queue, if another thread is currently making an element available.

- virtual bool **equals** (const **Collection**< E > &value) const
*Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.*
- virtual **decaf::util::Iterator** < E > * **iterator** ()
- virtual **decaf::util::Iterator** < E > * **iterator** () const
- virtual bool **isEmpty** () const
Returns true if this collection contains no elements.
- virtual int **size** () const
Returns the number of elements in this collection.
- virtual int **remainingCapacity** () const
Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.
- virtual void **clear** ()
*Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.
Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

Exceptions

UnsupportedOperationException	if the clear operation is not supported by this collection
-------------------------------	--

This implementation repeatedly invokes poll until it returns false.

- virtual bool **contains** (const E &value **DECAF_UNUSED**) const
- virtual bool **containsAll** (const **Collection**< E > &collection) const
Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	The Collection (p. 851) to compare to this one.
------------	--

Exceptions

NullPointerException	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
----------------------	---

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

- virtual bool **remove** (const E &value **DECAF_UNUSED**)
- virtual bool **removeAll** (const **Collection**< E > &collection **DECAF_UNUSED**)
- virtual bool **retainAll** (const **Collection**< E > &collection **DECAF_UNUSED**)
- virtual bool **peek** (E &result **DECAF_UNUSED**) const
- virtual std::vector< E > **toArray** () const

*Answers an STL vector containing copies of all elements contained in this **Collection** (p. 851).*

- virtual int **drainTo** (**Collection**< E > &c)

Removes all available elements from this queue and adds them to the given collection.

- virtual int **drainTo** (**Collection**< E > &c, int maxElements)

Removes at most the given number of available elements from this queue and adds them to the given collection.

6.532.1 Detailed Description

```
template<typename E>class decaf::util::concurrent::SynchronousQueue< E >
```

A **blocking queue** (p. 538) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.

A synchronous queue does not have any internal capacity, not even a capacity of one. You cannot `peek` at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and `poll()` (p. 2662) will return `null`. For purposes of other **Collection** (p. 851) methods (for example `contains`), a **SynchronousQueue** (p. 2655) acts as an empty collection. This queue does not permit `null` elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to `true` grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the **Collection** (p. 851) and **Iterator** (p. 1559) interfaces.

Since

1.0

6.532.2 Constructor & Destructor Documentation

6.532.2.1 `template<typename E > decaf::util::concurrent::SynchronousQueue< E >::SynchronousQueue () [inline]`

6.532.2.2 `template<typename E > virtual decaf::util::concurrent::SynchronousQueue< E >::~~SynchronousQueue () [inline, virtual]`

6.532.3 Member Function Documentation

6.532.3.1 `template<typename E > virtual void decaf::util::concurrent-
::SynchronousQueue< E >::clear () [inline,
virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the - **Iterator.remove** (p. 1560) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

<i>Unsupported- OperationException</i>	if the clear operation is not supported by this collection
--	--

This implementation repeatedly invokes poll until it returns false.

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 141).

6.532.3.2 `template<typename E > virtual bool decaf::util::concurrent::Synchronous-
Queue< E >::contains (const E &value DECAF_UNUSED) const [inline,
virtual]`

6.532.3.3 `template<typename E > virtual bool decaf::util::concurrent::Synchronous-
Queue< E >::containsAll (const Collection< E > & collection) const
[inline, virtual]`

Returns true if this collection contains all of the elements in the specified collection.

Parameters

<i>collection</i>	The Collection (p. 851) to compare to this one.
-------------------	--

Exceptions

<i>NullPointerException</i>	if the Collection (p. 851) contains pointers and the Collection (p. 851) does not allow for NULL elements (optional check).
-----------------------------	---

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are

so contained true is returned, otherwise false.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 113).

References decaf::util::Collection< **E** >::isEmpty().

6.532.3.4 `template<typename E> virtual int decaf::util::concurrent::Synchronous-
Queue< E >::drainTo (Collection< E > & c) [inline,
virtual]`

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

<i>c</i>	the collection to transfer elements into
----------	--

Returns

the number of elements transferred

Exceptions

<i>Unsupported-OperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgumentException</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue**< **E** > (p. 541).

References decaf::util::Collection< **E** >::add(), decaf::util::AbstractQueue< **E** >::element(), and decaf::util::concurrent::SynchronousQueue< **E** >::poll().

6.532.3.5 `template<typename E> virtual int decaf::util::concurrent::Synchronous-
Queue< E >::drainTo (Collection< E > & c, int maxElements)
[inline, virtual]`

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`.

6.532 decaf::util::concurrent::SynchronousQueue< E > Class Template Reference

2667

Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

<i>c</i>	the collection to transfer elements into
<i>max-Elements</i>	the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

<i>UnsupportedOperationException</i>	if addition of elements is not supported by the specified collection
<i>IllegalArgumentException</i>	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 542).

References **decaf::util::Collection< E >::add()**, **decaf::util::AbstractQueue< E >::element()**, and **decaf::util::concurrent::SynchronousQueue< E >::poll()**.

6.532.3.6 `template<typename E> virtual bool decaf::util::concurrent::SynchronousQueue< E >::equals (const Collection< E > & collection) const [inline, virtual]`

Answers true if this **Collection** (p. 851) and the one given are the same size and if each element contained in the **Collection** (p. 851) given is equal to an element contained in this collection.

Parameters

<i>collection</i>	- The Collection (p. 851) to be compared to this one.
-------------------	--

Returns

true if this **Collection** (p. 851) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 114).

6.532.3.7 `template<typename E> virtual bool decaf::util::concurrent::SynchronousQueue< E >::isEmpty () const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 2664) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 114).

```
6.532.3.8  template<typename E > virtual decaf::util::Iterator<E>*
           decaf::util::concurrent::SynchronousQueue< E >::iterator ( )
           [inline, virtual]
```

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1557).

```
6.532.3.9  template<typename E > virtual decaf::util::Iterator<E>*
           decaf::util::concurrent::SynchronousQueue< E >::iterator ( ) const
           [inline, virtual]
```

Implements **decaf::lang::Iterable< E >** (p. 1558).

```
6.532.3.10 template<typename E > virtual bool decaf::util::concurrent::Synchronous-
           Queue< E >::offer ( const E & e, long long timeout, const TimeUnit & unit )
           [inline, virtual]
```

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

Returns

true if successful, or false if the specified waiting time elapses before a consumer appears.

Exceptions

<i>InterruptedException</i>	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
<i>NullPointerException</i>	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
<i>IllegalArgumentException</i>	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 543).

6.532.3.11 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & value) [inline, virtual]`

Inserts the specified element into this queue, if another thread is waiting to receive it.

Parameters

<i>value</i>	the element to add to the Queue (p. 2222)
--------------	--

Returns

`true` if the element was added to this queue, else `false`

Exceptions

<i>NullPointerException</i>	if the Queue (p. 2222) implementation does not allow Null values to be inserted into the Queue (p. 2222).
<i>IllegalArgumentException</i>	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2224).

6.532.3.12 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::peek (E &result DECAF_UNUSED) const [inline, virtual]`

6.532.3.13 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E &result, long long timeout, const TimeUnit & unit) [inline, virtual]`

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

Parameters

<i>result</i>	a reference to the value where the head of the Queue (p. 2222) should be copied to.
<i>timeout</i>	the time that the method should block if there is no element available to return.
<i>unit</i>	the Time Units that the timeout value represents.

Returns

`true` if the head of the **Queue** (p. 2222) was copied to the result param or `false` if no value could be returned.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 543).

Referenced by `decaf::util::concurrent::SynchronousQueue< E >::drainTo()`.

6.532.3.14 `template<typename E> virtual bool decaf::util::concurrent::-`
`SynchronousQueue< E >::poll (E & result)` `[inline,`
`virtual]`

Retrieves and removes the head of this queue, if another thread is currently making an element available.

Parameters

<i>result</i>	a reference to the value where the head of the Queue (p. 2222) should be copied to.
---------------	--

Returns

true if the head of the **Queue** (p. 2222) was copied to the result param or false if no value could be returned.

Implements **`decaf::util::Queue< E >`** (p. 2225).

6.532.3.15 `template<typename E> virtual void decaf::util::concurrent::-`
`SynchronousQueue< E >::put (const E & value)` `[inline,`
`virtual]`

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

Parameters

<i>value</i>	the element to add to the Queue (p. 2222).
--------------	---

Exceptions

<i>InterruptedException</i>	Inserts the specified element into this queue, waiting if necessary for space to become available.
<i>NullPointerException</i>	Inserts the specified element into this queue, waiting if necessary for space to become available.
<i>IllegalArgumentException</i>	Inserts the specified element into this queue, waiting if necessary for space to become available.

Implements **`decaf::util::concurrent::BlockingQueue< E >`** (p. 544).

6.532.3.16 `template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::remainingCapacity () const [inline, virtual]`

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 544).

6.532.3.17 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::remove (const E &value DECAF_UNUSED) [inline, virtual]`

6.532.3.18 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::removeAll (const Collection< E > &collection DECAF_UNUSED) [inline, virtual]`

6.532.3.19 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::retainAll (const Collection< E > &collection DECAF_UNUSED) [inline, virtual]`

6.532.3.20 `template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::size () const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than `Integer::MAX_VALUE` elements, returns `Integer::MAX_VALUE`.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 864).

6.532.3.21 `template<typename E > virtual E decaf::util::concurrent::SynchronousQueue< E >::take () [inline, virtual]`

Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.

Returns

the head of this queue

Exceptions

<i>InterruptedException</i>	Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.
-----------------------------	--

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 545).

6.532.3.22 `template<typename E> virtual std::vector<E> decaf::util::concurrent-
::SynchronousQueue< E >::toArray () const [inline,
virtual]`

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 851).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 851)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 119).

The documentation for this class was generated from the following file:

6.533 decaf::lang::System Class Reference

The **System** (p. 2665) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.

```
#include <src/main/decaf/lang/System.h>
```

Public Member Functions

- `virtual ~System ()`

Static Public Member Functions

- `static void arraycopy (const char *src, std::size_t srcPos, char *dest, std::size_t destPos, std::size_t length)`

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const unsigned char *src, std::size_t srcPos, unsigned char *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const short *src, std::size_t srcPos, short *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const int *src, std::size_t srcPos, int *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const long long *src, std::size_t srcPos, long long *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const float *src, std::size_t srcPos, float *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static void **arraycopy** (const double *src, std::size_t srcPos, double *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- template<typename E >
static void **arraycopy** (const E *src, std::size_t srcPos, E *dest, std::size_t destPos, std::size_t length)

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static const **util::Map** < std::string, std::string > & **getenv** ()

Enumerates the system environment and returns a map of env variable names to the string values they hold.

- static std::string **getenv** (const std::string &name)

Reads an environment value from the system and returns it as a string object.

- static void **unsetenv** (const std::string &name)

Clears a set environment value if one is set.

- static void **setenv** (const std::string &name, const std::string &value)

Sets the specified system property to the value given.

- static long long **currentTimeMillis** ()
Returns the current time in milliseconds.
- static long long **nanoTime** ()
Returns the current value of the most precise available system timer, in nanoseconds.
- static int **availableProcessors** ()
Returns the number of processors available for execution of Decaf Threads.
- static **decaf::util::Properties** & **getProperties** ()
Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.
- static std::string **getProperty** (const std::string &key)
*Gets the specified **System** (p. 2665) property if set, otherwise returns an empty string.*
- static std::string **getProperty** (const std::string &key, const std::string &default-Value)
*Gets the specified **System** (p. 2665) property if set, otherwise returns the specified default value.*
- static std::string **setProperty** (const std::string &key, const std::string &value)
*Sets the **System** (p. 2665) Property to the specified value.*
- static std::string **clearProperty** (const std::string &key)
Clear any value associated with the system property specified.

6.533.3.1 static void decaf::lang::System::arraycopy (const char * *src*, std::size_t *srcPos*, char * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

Exceptions

<i>NullPointerException</i>	if src or dest are NULL.

6.533.3.3 `static void decaf::lang::System::arraycopy (const short * src, std::size_t srcPos, short * dest, std::size_t destPos, std::size_t length) [static]`

Copies the number of elements specified by *length* from the source array starting at the given source offset specified by *srcPos* to the dest array starting at the given destination offset given by *destPos*.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from <i>src</i> to <i>dest</i> .

Exceptions

<i>NullPointerException</i>	if <i>src</i> or <i>dest</i> are NULL.
-----------------------------	--

6.533.3.4 `static void decaf::lang::System::arraycopy (const int * src, std::size_t srcPos, int * dest, std::size_t destPos, std::size_t length) [static]`

Copies the number of elements specified by *length* from the source array starting at the given source offset specified by *srcPos* to the dest array starting at the given destination offset given by *destPos*.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from <i>src</i> to <i>dest</i> .

Exceptions

<i>NullPointerException</i>	if <i>src</i> or <i>dest</i> are NULL.
-----------------------------	--

6.533.3.5 static void decaf::lang::System::arraycopy (const long long * *src*, std::size_t *srcPos*, long long * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

Exceptions

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

6.533.3.6 static void decaf::lang::System::arraycopy (const float * *src*, std::size_t *srcPos*, float * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

Exceptions

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

6.533.3.7 static void decaf::lang::System::arraycopy (const double * *src*, std::size_t *srcPos*, double * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

Exceptions

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

```
6.533.3.8  template<typename E > static void decaf::lang::System::arraycopy ( const E
           * src, std::size_t srcPos, E * dest, std::size_t destPos, std::size_t length )
           [inline, static]
```

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

<i>src</i>	The source array to copy from.
<i>srcPos</i>	The position in the array to start copying from.
<i>dest</i>	The destination array to copy to.
<i>destPos</i>	The position in the destination array to start writing at.
<i>length</i>	The number of elements to copy from src to dest.

Exceptions

<i>NullPointerException</i>	if src or dest are NULL.
-----------------------------	--------------------------

```
6.533.3.9  static int decaf::lang::System::availableProcessors ( ) [static]
```

Returns the number of processors available for execution of Decaf Threads.

This value may change during a particular execution of a Decaf based application. - Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

Returns

the number of available processors.

6.533.3.10 `static std::string decaf::lang::System::clearProperty (const std::string & key) [static]`

Clear any value associated with the system property specified.

Parameters

<i>key</i>	The key name of the system property to clear.
------------	---

Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions

<i>IllegalArgument-Exception</i>	if key is an empty string.
----------------------------------	----------------------------

6.533.3.11 `static long long decaf::lang::System::currentTimeMillis () [static]`

Returns the current time in milliseconds.

Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

Returns

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

6.533.3.12 `static const util::Map<std::string, std::string>& decaf::lang::System::getenv () [static]`

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns

A Map of all environment variables.

Exceptions

Exception (p. 1279)	if an error occurs while getting the Environment Map.
----------------------------	---

6.533.3.13 `static std::string decaf::lang::System::getenv (const std::string & name)`
[static]

Reads an environment value from the system and returns it as a string object.

Parameters

<i>name</i>	The environment variable to read.
-------------	-----------------------------------

Returns

a string with the value from the variables or ""

Exceptions

<i>an</i>	Exception (p. 1279) if an error occurs while reading the Env.
-----------	--

6.533.3.14 `static decaf::util::Properties& decaf::lang::System::getProperties ()`
[static]

Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Returns

a reference to the static system Properties object.

6.533.3.15 `static std::string decaf::lang::System::getProperty (const std::string & key)`
[static]

Gets the specified **System** (p. 2665) property if set, otherwise returns an empty string.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters

<i>key</i>	The key name of the desired system property to retrieve.
------------	--

Returns

an empty string if the named property is not set, otherwise returns the value.

Exceptions

<i>IllegalArgument-Exception</i>	if key is an empty string.
----------------------------------	----------------------------

6.533.3.16 static std::string decaf::lang::System::getProperty (const std::string & key, const std::string & defaultValue) [static]

Gets the specified **System** (p.2665) property if set, otherwise returns the specified default value.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters

<i>key</i>	The key name of the desired system property to retrieve.
<i>defaultValue</i>	The default value to return if the key is not set in the System (p.2665) properties.

Returns

the value of the named system property or the defaultValue if the property isn't set..

Exceptions

<i>IllegalArgument-Exception</i>	if key is an empty string.
----------------------------------	----------------------------

6.533.3.17 static long long decaf::lang::System::nanoTime () [static]

Returns the current value of the most precise available system timer, in nanoseconds.

This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

```
long long startTime = System::nanoTime() (p.2674); // ... the code being measured ...
long long estimatedTime = System::nanoTime() (p.2674) - startTime;
```

Returns

The current value of the system timer, in nanoseconds.

6.533.3.18 `static void decaf::lang::System::setenv (const std::string & name, const std::string & value) [static]`

Sets the specified system property to the value given.

Parameters

<i>name</i>	The name of the environment variables to set.
<i>value</i>	The value to assign to name.

Exceptions

<i>an</i>	Exception (p. 1279) if an error occurs when setting the environment variable.
-----------	--

6.533.3.19 `static std::string decaf::lang::System::setProperty (const std::string & key, const std::string & value) [static]`

Sets the **System** (p. 2665) Property to the specified value.

Parameters

<i>key</i>	The key name of the system property to set to the given value.
<i>value</i>	The value to assign to the key.

Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions

<i>IllegalArgument-Exception</i>	if key is an empty string.
----------------------------------	----------------------------

6.533.3.20 `static void decaf::lang::System::unsetenv (const std::string & name) [static]`

Clears a set environment value if one is set.

Parameters

<i>name</i>	The environment variables to clear.
-------------	-------------------------------------

Exceptions

<i>an</i>	Exception (p. 1279) if an error occurs while reading the environment.
-----------	--

6.533.4 Friends And Related Function Documentation

6.533.4.1 friend class decaf::lang::Runtime [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**System.h**

6.534 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

```
#include <src/main/activemq/threads/Task.h>
```

Inheritance diagram for activemq::threads::Task:

Public Member Functions

- virtual **~Task** ()
- virtual bool **iterate** ()=0

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.534.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since

3.0

6.534.2 Constructor & Destructor Documentation

6.534.2.1 virtual activemq::threads::Task::~Task () [inline, virtual]

6.534.3 Member Function Documentation

6.534.3.1 virtual bool `activemq::threads::Task::iterate ()` [pure virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1312), `activemq::core::ActiveMQSessionExecutor` (p. 358), `activemq::threads::CompositeTaskRunner` (p. 895), `activemq::transport::failover::BackupTransportPool` (p. 491), and `activemq::transport::failover::CloseTransportsTask` (p. 819).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/Task.h`

6.535 `activemq::threads::TaskRunner` Class Reference

```
#include <src/main/activemq/threads/TaskRunner.h>
```

Inheritance diagram for `activemq::threads::TaskRunner`:

Public Member Functions

- virtual `~TaskRunner ()`
- virtual void `shutdown (unsigned int timeout)=0`
Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void `shutdown ()=0`
*Shutdown once the task has finished and the **TaskRunner** (p. 2677)'s thread has exited.*
- virtual void `wakeup ()=0`
*Signal the **TaskRunner** (p. 2677) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2676) instance will be run until its iterate method has returned false indicating it is done.*

6.535.1 Constructor & Destructor Documentation

6.535.1.1 virtual `activemq::threads::TaskRunner::~TaskRunner ()` [inline, virtual]

6.535.2 Member Function Documentation

6.535.2.1 `virtual void activemq::threads::TaskRunner::shutdown (unsigned int timeout) [pure virtual]`

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

<i>timeout</i>	- Time in Milliseconds to wait for the task to stop.
----------------	--

Implemented in **activemq::threads::CompositeTaskRunner** (p. 895), and **activemq::threads::DedicatedTaskRunner** (p. 1145).

6.535.2.2 `virtual void activemq::threads::TaskRunner::shutdown () [pure virtual]`

Shutdown once the task has finished and the **TaskRunner** (p. 2677)'s thread has exited.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 896), and **activemq::threads::DedicatedTaskRunner** (p. 1145).

6.535.2.3 `virtual void activemq::threads::TaskRunner::wakeup () [pure virtual]`

Signal the **TaskRunner** (p. 2677) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2676) instance will be run until its iterate method has returned false indicating it is done.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 896), and **activemq::threads::DedicatedTaskRunner** (p. 1145).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/TaskRunner.h`

6.536 decaf::internal::net::tcp::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

```
#include <src/main/decaf/internal/net/tcp/TcpSocket.h>
```

Inheritance diagram for decaf::internal::net::tcp::TcpSocket:

Public Member Functions

• **TcpSocket** ()

Construct a non-connected socket.

• virtual **~TcpSocket** ()

Releases the socket handle but not gracefully shut down the connection.

• SocketHandle **getSocketHandle** ()

Gets the handle for the socket.

• bool **isConnected** () const• bool **isClosed** () const• virtual std::string **getLocalAddress** () const

*Gets the value of the local **Inet** address the **Socket** (p. 2452) is bound to if bound, otherwise return the **InetAddress** (p. 1437) ANY value "0.0.0.0".*

Returns

the local address bound to, or ANY.

• virtual void **create** ()

*Creates the underlying platform **Socket** (p. 2452) data structures which allows for - **Socket** (p. 2452) options to be applied.*

The created socket is in an unconnected state.

Exceptions

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

• virtual void **accept** (SocketImpl *socket)• virtual void **bind** (const std::string &ipaddress, int port)

*Binds this **Socket** (p. 2452) instance to the local ip address and port number given.*

Parameters

ipaddress	<i>The address of local ip to bind to.</i>
port	<i>The port number on the host to bind to.</i>

Exceptions

IOException	<i>if an I/O error occurs while attempting this operation.</i>
-------------	--

• virtual void **connect** (const std::string &hostname, int port, int timeout)

Connects this socket to the given host and port.

Parameters

hostname	<i>The name of the host to connect to, or IP address.</i>
port	<i>The port number on the host to connect to.</i>
timeout	<i>Time in milliseconds to wait for a connection, 0 indicates forever.</i>

Exceptions

IOException	<i>if an I/O error occurs while attempting this operation.</i>
SocketTimeout-Exception (p. 2493)	<i>if the connect call times out due to timeout being set.</i>
IllegalArgument-Exception	<i>if a parameter has an illegal value.</i>

- virtual void **listen** (int backlog)

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

backlog	The maximum length of the connection queue.
---------	---

Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual **decaf::io::InputStream * getInputStream** ()

*Gets the InputStream linked to this **Socket** (p. 2452).*

Returns

*an InputStream pointer owned by the **Socket** (p. 2452) object.*

Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual **decaf::io::OutputStream * getOutputStream** ()

*Gets the OutputStream linked to this **Socket** (p. 2452).*

Returns

*an OutputStream pointer owned by the **Socket** (p. 2452) object.*

Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual int **available** ()

*Gets the number of bytes that can be read from the **Socket** (p. 2452) without blocking.*

Returns

*the number of bytes that can be read from the **Socket** (p. 2452) without blocking.*

Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual void **close** ()

Closes the socket, terminating any blocked reads or writes.

Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual void **shutdownInput** ()

Places the input stream for this socket at "end of stream".

*Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 2486) on the socket, the stream will return EOF.*

Exceptions

IOException	if an I/O error occurs while attempting this operation.
-------------	---

- virtual void **shutdownOutput** ()

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 2486) on the socket, the stream will throw an *IOException*.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

- virtual int **getOption** (int option) const

*Gets the specified **Socket** (p. 2452) option.*

Parameters

option	The Socket (p. 2452) options whose value is to be retrieved.
--------	---

Returns

the value of the given socket option.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

- virtual void **setOption** (int option, int value)

*Sets the specified option on the **Socket** (p. 2452) if supported.*

Parameters

option	The Socket (p. 2452) option to set.
--------	--

value	The value of the socket option to apply to the socket.
-------	--

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

- int **read** (unsigned char *buffer, int size, int offset, int length)

Reads the requested data from the Socket and write it into the passed in buffer.

- void **write** (const unsigned char *buffer, int size, int offset, int length)

Writes the specified data in the passed in buffer to the Socket.

Protected Member Functions

- void **checkResult** (apr_status_t value) const

6.536.1 Detailed Description

Platform-independent implementation of the socket interface.

6.536.2 Constructor & Destructor Documentation

6.536.2.1 decaf::internal::net::tcp::TcpSocket::TcpSocket ()

Construct a non-connected socket.

Exceptions

<i>SocketException</i>	thrown if an error occurs while creating the Socket.
------------------------	--

6.536.2.2 virtual **decaf::internal::net::tcp::TcpSocket::~~TcpSocket** ()
[virtual]

Releases the socket handle but not gracefully shut down the connection.

6.536.3 Member Function Documentation

6.536.3.1 virtual void **decaf::internal::net::tcp::TcpSocket::accept** (SocketImpl *
socket) [virtual]

6.536.3.2 virtual int **decaf::internal::net::tcp::TcpSocket::available** ()
[virtual]

Gets the number of bytes that can be read from the **Socket** (p. 2452) without blocking.

Returns

the number of bytes that can be read from the **Socket** (p. 2452) without blocking.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2481).

6.536.3.3 virtual void **decaf::internal::net::tcp::TcpSocket::bind** (const std::string &
ipaddress, int *port*) [virtual]

Binds this **Socket** (p. 2452) instance to the local ip address and port number given.

Parameters

<i>ipaddress</i>	The address of local ip to bind to.
<i>port</i>	The port number on the host to bind to.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2482).

6.536.3.4 `void decaf::internal::net::tcp::TcpSocket::checkResult (apr_status_t value) const` [protected]

6.536.3.5 `virtual void decaf::internal::net::tcp::TcpSocket::close ()` [virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2482).

6.536.3.6 `virtual void decaf::internal::net::tcp::TcpSocket::connect (const std::string & hostname, int port, int timeout)` [virtual]

Connects this socket to the given host and port.

Parameters

<i>hostname</i>	The name of the host to connect to, or IP address.
<i>port</i>	The port number on the host to connect to.
<i>timeout</i>	Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
SocketTimeout-Exception (p. 2493)	if the connect call times out due to timeout being set.
<i>IllegalArgument-Exception</i>	if a parameter has an illegal value.

Implements **decaf::net::SocketImpl** (p. 2482).

6.536.3.7 `virtual void decaf::internal::net::tcp::TcpSocket::create ()` [virtual]

Creates the underlying platform **Socket** (p. 2452) data structures which allows for **Socket** (p. 2452) options to be applied.

The created socket is in an unconnected state.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2483).

6.536.3.8 virtual **decaf::io::InputStream*** **decaf::internal::net::tcp::TcpSocket::get-InputStream ()** [virtual]

Gets the InputStream linked to this **Socket** (p. 2452).

Returns

an InputStream pointer owned by the **Socket** (p. 2452) object.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2483).

6.536.3.9 virtual std::string **decaf::internal::net::tcp::TcpSocket::getLocalAddress ()** const [virtual]

Gets the value of the local Inet address the **Socket** (p. 2452) is bound to if bound, otherwise return the **InetAddress** (p. 1437) ANY value "0.0.0.0".

Returns

the local address bound to, or ANY.

Implements **decaf::net::SocketImpl** (p. 2484).

6.536.3.10 virtual int **decaf::internal::net::tcp::TcpSocket::getOption (int option)** const [virtual]

Gets the specified **Socket** (p. 2452) option.

Parameters

<i>option</i>	The Socket (p. 2452) options whose value is to be retrieved.
---------------	---

Returns

the value of the given socket option.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2484).

6.536.3.11 **virtual** **decaf::io::OutputStream*** **decaf::internal::net::tcp::TcpSocket::getOutputStream ()** *[virtual]*

Gets the OutputStream linked to this **Socket** (p. 2452).

Returns

an OutputStream pointer owned by the **Socket** (p. 2452) object.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2484).

6.536.3.12 **SocketHandle** **decaf::internal::net::tcp::TcpSocket::getSocketHandle ()** *[inline]*

Gets the handle for the socket.

Returns

SocketHabler for this Socket, can be NULL

6.536.3.13 **bool** **decaf::internal::net::tcp::TcpSocket::isClosed ()** **const** *[inline]*

Returns

true if the close method has been called on this Socket.

6.536.3.14 **bool** **decaf::internal::net::tcp::TcpSocket::isConnected ()** **const** *[inline]*

Returns

true if the socketHandle is not in a disconnected state.

6.536.3.15 **virtual void** **decaf::internal::net::tcp::TcpSocket::listen (int backlog)** *[virtual]*

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

<i>backlog</i>	The maximum length of the connection queue.
----------------	---

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2485).

6.536.3.16 `int decaf::internal::net::tcp::TcpSocket::read (unsigned char * buffer, int size, int offset, int length)`

Reads the requested data from the Socket and write it into the passed in buffer.

Parameters

<i>buffer</i>	The buffer to read into
<i>size</i>	The size of the specified buffer
<i>offset</i>	The offset into the buffer where reading should start filling.
<i>length</i>	The number of bytes past offset to fill with data.

Returns

the actual number of bytes read or -1 if at EOF.

Exceptions

<i>IOException</i>	if an I/O error occurs during the read.
<i>NullPointerException</i>	if buffer is Null.
<i>IndexOutOfBoundsException</i>	if offset + length is greater than buffer size.

6.536.3.17 `virtual void decaf::internal::net::tcp::TcpSocket::setOption (int option, int value)` [virtual]

Sets the specified option on the **Socket** (p. 2452) if supported.

Parameters

<i>option</i>	The Socket (p. 2452) option to set.
<i>value</i>	The value of the socket option to apply to the socket.

Exceptions

<i>IOException</i>	if an I/O error occurs while performing this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2486).

6.536.3.18 virtual void **decaf::internal::net::tcp::TcpSocket::shutdownInput** ()
[virtual]

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 2486) on the socket, the stream will return EOF.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2486).

6.536.3.19 virtual void **decaf::internal::net::tcp::TcpSocket::shutdownOutput** ()
[virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 2486) on the socket, the stream will throw an *IOException*.

Exceptions

<i>IOException</i>	if an I/O error occurs while attempting this operation.
--------------------	---

Implements **decaf::net::SocketImpl** (p. 2486).

6.536.3.20 void **decaf::internal::net::tcp::TcpSocket::write** (const unsigned char *
buffer, int *size*, int *offset*, int *length*)

Writes the specified data in the passed in buffer to the Socket.

Parameters

<i>buffer</i>	The buffer to write to the socket.
<i>size</i>	The size of the specified buffer.
<i>offset</i>	The offset into the buffer where the data to write starts at.
<i>length</i>	The number of bytes past offset to write.

Exceptions

<i>IOException</i>	if an I/O error occurs during the write.
<i>NullPointerException</i>	if buffer is Null.

<i>IndexOutOfBounds-Exception</i>	if offset + length is greater than buffer size.
-----------------------------------	---

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/TcpSocket.h

6.537 decaf::internal::net::tcp::TcpSocketInputStream Class - Reference

Input stream for performing reads on a socket.

```
#include <src/main/decaf/internal/net/tcp/TcpSocketInputStream.h>
```

Inheritance diagram for decaf::internal::net::tcp::TcpSocketInputStream:

Public Member Functions

- **TcpSocketInputStream** (**TcpSocket** *socket)
Create a new InputStream to use for reading from the TCP/IP socket.
- virtual ~**TcpSocketInputStream** ()
- virtual int **available** () const
*Indicates the number of bytes available.
The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.
The default implementation of this method returns zero.*
Returns
the number of bytes available on this input stream.

Exceptions

IOException (p. 1545)	if an I/O error occurs.
------------------------------	-------------------------

- virtual void **close** ()
Close - does nothing.
- virtual long long **skip** (long long num)
Not supported.

Protected Member Functions

- virtual int **doReadByte** ()

- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.537.1 Detailed Description

Input stream for performing reads on a socket.

This class will only work properly for blocking sockets.

Since

1.0

6.537.2 Constructor & Destructor Documentation

6.537.2.1 decaf::internal::net::tcp::TcpSocketInputStream::TcpSocketInputStream (TcpSocket * *socket*)

Create a new InputStream to use for reading from the TCP/IP socket.

Parameters

<i>socket</i>	The parent SocketImpl for this stream.
---------------	--

6.537.2.2 virtual decaf::internal::net::tcp::TcpSocketInputStream::~~TcpSocket- InputStream () [virtual]

6.537.3 Member Function Documentation

6.537.3.1 virtual int decaf::internal::net::tcp::TcpSocketInputStream::available () const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
--	-------------------------

Reimplemented from **decaf::io::InputStream** (p. 1466).

6.537.3.2 `virtual void decaf::internal::net::tcp::TcpSocketInputStream::close ()`
[virtual]

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1464) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs while closing the InputStream (p. 1464).
--	--

Reimplemented from **decaf::io::InputStream** (p. 1466).

6.537.3.3 `virtual int decaf::internal::net::tcp::TcpSocketInputStream::doRead-
ArrayBounded (unsigned char * buffer, int size, int offset, int length)`
[protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1467).

6.537.3.4 `virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadByte ()`
[protected, virtual]

Implements **decaf::io::InputStream** (p. 1467).

6.537.3.5 `virtual long long decaf::internal::net::tcp::TcpSocketInputStream::skip (long long num)`
[virtual]

Not supported.

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1464) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

<i>num</i>	The number of bytes to skip.
------------	------------------------------

Returns

total bytes skipped

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>UnsupportedOperationException</i>	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1472).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocketInputStream.h**

6.538 decaf::internal::net::tcp::TcpSocketOutputStream Class - Reference

Output stream for performing write operations on a socket.

```
#include <src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h>
```

Inheritance diagram for decaf::internal::net::tcp::TcpSocketOutputStream:

Public Member Functions

- **TcpSocketOutputStream** (**TcpSocket** *socket)
Create a new instance of a Socket OutputStream class.
- virtual **~TcpSocketOutputStream** ()
- virtual void **close** ()
*Closes this object and deallocates the appropriate resources.
The object is generally no longer usable after calling close.*

Exceptions

<i>IOException</i> (p. 1545)	if an error occurs while closing.
-------------------------------------	-----------------------------------

The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length)

6.538.1 Detailed Description

Output stream for performing write operations on a socket.

Since

1.0

6.538.2 Constructor & Destructor Documentation

6.538.2.1 **decaf::internal::net::tcp::TcpSocketOutputStream::TcpSocketOutputStream (TcpSocket * socket)**

Create a new instance of a Socket OutputStream class.

Parameters

<i>socket</i>	The socket to use to write out the data.
---------------	--

6.538.2.2 **virtual decaf::internal::net::tcp::TcpSocketOutputStream::~~TcpSocketOutputStream ()** [virtual]

6.538.3 Member Function Documentation

6.538.3.1 **virtual void decaf::internal::net::tcp::TcpSocketOutputStream::close ()** [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i> (p. 1545)	if an error occurs while closing.
--	-----------------------------------

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.538.3.2 virtual void **decaf::internal::net::tcp::TcpSocketOutputStream::doWriteArrayBounded** (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)
[protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2068).

6.538.3.3 virtual void **decaf::internal::net::tcp::TcpSocketOutputStream::doWriteByte** (unsigned char *c*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2069).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h

6.539 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1548).

```
#include <src/main/activemq/transport/tcp/TcpTransport.h>
```

Inheritance diagram for **activemq::transport::tcp::TcpTransport**:

Public Member Functions

- **TcpTransport** (const **Pointer**< **Transport** > &next)
*Creates a new instance of a **TcpTransport** (p. 2693), the transport is left unconnected and is in a unusable state until the connect method is called.*
- virtual ~**TcpTransport** ()
- void **connect** (const **decaf::net::URI** &uri, const **decaf::util::Properties** &properties)
Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.
- virtual void **close** ()
Closes this object and deallocates the appropriate resources.
- virtual bool **isFaultTolerant** () const
*Is this **Transport** (p. 2790) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const
*Is the **Transport** (p. 2790) Connected to its Broker.*
- virtual bool **isClosed** () const
*Has the **Transport** (p. 2790) been shutdown and no longer usable.*

Protected Member Functions

- virtual **decaf::net::Socket** * **createSocket** ()
Create an unconnected Socket instance to be used by the transport to communicate with the broker.
- virtual void **configureSocket** (**decaf::net::Socket** *socket, const **decaf::util::Properties** &properties)
Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

6.539.1 Detailed Description

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1548).

The lower level transport should take care of managing stream reads and writes.

6.539.2 Constructor & Destructor Documentation

6.539.2.1 **activemq::transport::tcp::TcpTransport::TcpTransport** (const **Pointer**< **Transport** > &next)

Creates a new instance of a **TcpTransport** (p. 2693), the transport is left unconnected and is in a unusable state until the connect method is called.

Parameters

<i>next</i>	The next transport in the chain
-------------	---------------------------------

6.539.2.2 **virtual activemq::transport::tcp::TcpTransport::~~TcpTransport** ()
 [virtual]

6.539.3 Member Function Documentation

6.539.3.1 **virtual void activemq::transport::tcp::TcpTransport::close** ()
 [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i>	if an error occurs while closing.
--------------------	-----------------------------------

Reimplemented from **activemq::transport::TransportFilter** (p. 2802).

```
6.539.3.2 virtual void activemq::transport::tcp::TcpTransport::configureSocket (
    decaf::net::Socket * socket, const decaf::util::Properties & properties )
    [protected, virtual]
```

Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.

Parameters

<i>socket</i>	The Socket instance to configure using options from the given - Properties.
---------------	---

Exceptions

<i>NullPointerException</i>	if the Socket instance is null.
<i>IllegalArgumentException</i>	if the socket instance is not handled by the class.
<i>SocketException</i>	if there is an error while setting one of the Socket options.

```
6.539.3.3 void activemq::transport::tcp::TcpTransport::connect ( const
    decaf::net::URI & uri, const decaf::util::Properties & properties )
```

Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.

The Socket is configured using parameters in the properties that are passed to this method.

Parameters

<i>uri</i>	The URI that the Transport (p. 2790) is to connect to once initialized.
<i>properties</i>	The Properties that have been parsed from the URI or from configuration files.

```
6.539.3.4 virtual decaf::net::Socket* activemq::transport::tcp-
    ::TcpTransport::createSocket ( ) [protected,
    virtual]
```

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

Returns

a newly created unconnected Socket instance.

6.540 `activemq::transport::tcp::TcpTransportFactory` Class Reference 2703

Exceptions

<code>IOException</code>	if there is an error while creating the unconnected Socket.
--------------------------	---

Reimplemented in `activemq::transport::tcp::SslTransport` (p. 2526).

6.539.3.5 `virtual bool activemq::transport::tcp::TcpTransport::isClosed () const`
`[inline, virtual]`

Has the **Transport** (p. 2790) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2790)

Reimplemented from `activemq::transport::TransportFilter` (p. 2804).

6.539.3.6 `virtual bool activemq::transport::tcp::TcpTransport::isConnected ()`
`const [inline, virtual]`

Is the **Transport** (p. 2790) Connected to its Broker.

Returns

true if a connection has been made.

Reimplemented from `activemq::transport::TransportFilter` (p. 2804).

6.539.3.7 `virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant ()`
`const [inline, virtual]`

Is this **Transport** (p. 2790) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2790) is fault tolerant.

Reimplemented from `activemq::transport::TransportFilter` (p. 2804).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/tcp/TcpTransport.h`

6.540 `activemq::transport::tcp::TcpTransportFactory` Class - Reference

Factory Responsible for creating the **TcpTransport** (p. 2693).

```
#include <src/main/activemq/transport/tcp/TcpTransport-Factory.h>
```

Inheritance diagram for `activemq::transport::tcp::TcpTransportFactory`:

Public Member Functions

- virtual `~TcpTransportFactory()`
- virtual `Pointer< Transport > create` (const `decaf::net::URI` &location)
*Creates a fully configured **Transport** (p. 2790) instance which could be a chain of filters and transports.*
- virtual `Pointer< Transport > createComposite` (const `decaf::net::URI` &location)
*Creates a slimed down **Transport** (p. 2790) instance which can be used in composite transport instances.*

Protected Member Functions

- virtual `Pointer< Transport > doCreateComposite` (const `decaf::net::URI` &location, const `Pointer< wireformat::WireFormat >` &wireFormat, const `decaf::util::Properties` &properties)

6.540.1 Detailed Description

Factory Responsible for creating the **TcpTransport** (p. 2693).

6.540.2 Constructor & Destructor Documentation

6.540.2.1 `virtual activemq::transport::tcp::TcpTransportFactory::~TcpTransportFactory()` [`inline`, `virtual`]

6.540.3 Member Function Documentation

6.540.3.1 `virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create` (const `decaf::net::URI` & *location*) [`virtual`]

Creates a fully configured **Transport** (p. 2790) instance which could be a chain of filters and transports.

Parameters

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implements **activemq::transport::TransportFactory** (p. 2799).

6.540.3.2 **virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite (const decaf::net::URI & location)**
[virtual]

Creates a slimed down **Transport** (p. 2790) instance which can be used in composite transport instances.

Parameters

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implements **activemq::transport::TransportFactory** (p. 2800).

6.540.3.3 **virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::doCreateComposite (const decaf::net::URI & location, const Pointer< wireformat::WireFormat > & wireFormat, const decaf::util::Properties & properties)** [protected, virtual]

Reimplemented in **activemq::transport::tcp::SslTransportFactory** (p. 2527).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**TcpTransportFactory.h**

6.541 cms::TemporaryQueue Class Reference

Defines a Temporary **Queue** (p. 2221) based **Destination** (p. 1210).

```
#include <src/main/cms/TemporaryQueue.h>
```

Inheritance diagram for cms::TemporaryQueue:

Public Member Functions

- virtual **~TemporaryQueue** () throw ()

- virtual std::string **getQueueName** () const =0
Gets the name of this queue.
- virtual void **destroy** ()=0
*Destroy's the Temporary **Destination** (p. 1210) at the Provider.*

6.541.1 Detailed Description

Defines a Temporary **Queue** (p. 2221) based **Destination** (p. 1210).

A **TemporaryQueue** (p. 2698) is a special type of **Queue** (p. 2221) **Destination** (p. 1210) that can only be consumed from the **Connection** (p. 933) which created it. TemporaryQueues are most commonly used as the reply to address for **Message** (p. 1839)'s that implement the request response pattern.

A **TemporaryQueue** (p. 2698) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 933) that created it.

Since

1.0

6.541.2 Constructor & Destructor Documentation

6.541.2.1 virtual cms::TemporaryQueue::~TemporaryQueue () throw ()
[virtual]

6.541.3 Member Function Documentation

6.541.3.1 virtual void cms::TemporaryQueue::destroy () [pure virtual]

Destroy's the Temporary **Destination** (p. 1210) at the Provider.

Exceptions

CMSException (p. 826)	- if an internal error occurs.
---------------------------------	--------------------------------

Implemented in **activemq::commands::ActiveMQTempQueue** (p. 389).

6.541.3.2 virtual std::string cms::TemporaryQueue::getQueueName () const
[pure virtual]

Gets the name of this queue.

Returns

The queue name.

Exceptions

CMSException (p. 826)	- if an internal error occurs.
---------------------------------	--------------------------------

Implemented in **activemq::commands::ActiveMQTempQueue** (p. 391).

The documentation for this class was generated from the following file:

- src/main/cms/**TemporaryQueue.h**

6.542 cms::TemporaryTopic Class Reference

Defines a Temporary **Topic** (p. 2764) based **Destination** (p. 1210).

```
#include <src/main/cms/TemporaryTopic.h>
```

Inheritance diagram for cms::TemporaryTopic:

Public Member Functions

- virtual **~TemporaryTopic** () throw ()
- virtual std::string **getTopicName** () const =0
Gets the name of this topic.
- virtual void **destroy** ()=0
*Destroy's the Temporary **Destination** (p. 1210) at the Provider.*

6.542.1 Detailed Description

Defines a Temporary **Topic** (p. 2764) based **Destination** (p. 1210).

A **TemporaryTopic** (p. 2700) is a special type of **Topic** (p. 2764) **Destination** (p. 1210) that can only be consumed from the **Connection** (p. 933) which created it. Temporary-Topics are most commonly used as the reply to address for **Message** (p. 1839)'s that implement the request response pattern.

A **TemporaryTopic** (p. 2700) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 933) that created it.

Since

1.0

6.542.2 Constructor & Destructor Documentation

6.542.2.1 `virtual cms::TemporaryTopic::~~TemporaryTopic () throw ()`
`[virtual]`

6.542.3 Member Function Documentation

6.542.3.1 `virtual void cms::TemporaryTopic::destroy () [pure virtual]`

Destroy's the Temporary **Destination** (p. 1210) at the Provider.

Exceptions

<i>CMSException</i> (p. 826)
--

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 398).

6.542.3.2 `virtual std::string cms::TemporaryTopic::getTopicName () const` `[pure virtual]`

Gets the name of this topic.

Returns

The topic name.

Exceptions

<i>CMSException</i> (p. 826)	- if an internal error occurs.
--	--------------------------------

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 400).

The documentation for this class was generated from the following file:

- `src/main/cms/TemporaryTopic.h`

6.543 cms::TextMessage Class Reference

Interface for a text message.

```
#include <src/main/cms/TextMessage.h>
```

Inheritance diagram for `cms::TextMessage`:

Public Member Functions

- virtual **~TextMessage** () throw ()
- virtual std::string **getText** () const =0
Gets the message character buffer.
- virtual void **setText** (const char *msg)=0
Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual void **setText** (const std::string &msg)=0
Sets the message contents.

6.543.1 Detailed Description

Interface for a text message.

A **TextMessage** (p.2701) can contain any Text based pay load such as an XML - Document or other Text based document.

Like all Messages, a **TextMessage** (p.2701) is received in Read-Only mode, any attempt to write to the **Message** (p.1839) will result in a MessageNotWritableException being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since

1.0

6.543.2 Constructor & Destructor Documentation

6.543.2.1 virtual cms::TextMessage::~TextMessage () throw () [virtual]

6.543.3 Member Function Documentation

6.543.3.1 virtual std::string cms::TextMessage::getText () const [pure virtual]

Gets the message character buffer.

Returns

The message character buffer.

Exceptions

CMSException (p. 826)	- if an internal error occurs.
---------------------------------	--------------------------------

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 408).

6.543.3.2 `virtual void cms::TextMessage::setText (const char * msg)` [pure virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters

<i>msg</i>	The message buffer.
------------	---------------------

Exceptions

<i>CMSException</i> (p. 826)	- if an internal error occurs.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode..

Implemented in `activemq::commands::ActiveMQTextMessage` (p. 409).

6.543.3.3 `virtual void cms::TextMessage::setText (const std::string & msg)` [pure virtual]

Sets the message contents.

Parameters

<i>msg</i>	The message buffer.
------------	---------------------

Exceptions

<i>CMSException</i> (p. 826)	- if an internal error occurs.
<i>MessageNot-WriteableException</i> (p. 1923)	- if the message is in read-only mode..

Implemented in `activemq::commands::ActiveMQTextMessage` (p. 409).

The documentation for this class was generated from the following file:

6.544 decaf::lang::Thread Class Reference

A **Thread** (p. 2703) is a concurrent unit of execution.

```
#include <src/main/decaf/lang/Thread.h>
```

Inheritance diagram for decaf::lang::Thread:

Data Structures

- class **UncaughtExceptionHandler**

*Interface for handlers invoked when a **Thread** (p. 2703) abruptly terminates due to an uncaught exception.*

Public Types

- enum **State** { **NEW** = 0, **RUNNABLE** = 1, **BLOCKED** = 2, **WAITING** = 3, **TIME-D_WAITING** = 4, **SLEEPING** = 5, **TERMINATED** = 6 }

*Represents the various states that the **Thread** (p. 2703) can be in during its lifetime.*

Public Member Functions

- **Thread** ()
*Constructs a new **Thread** (p. 2703).*
- **Thread** (**Runnable** *task)
*Constructs a new **Thread** (p. 2703) with the given target **Runnable** (p. 2312) task.*
- **Thread** (const std::string &name)
*Constructs a new **Thread** (p. 2703) with the given name.*
- **Thread** (**Runnable** *task, const std::string &name)
*Constructs a new **Thread** (p. 2703) with the given target **Runnable** (p. 2312) task and name.*
- virtual ~**Thread** ()
- virtual void **start** ()
Creates a system thread and starts it in a joinable mode.
- virtual void **join** ()
*Forces the Current **Thread** (p. 2703) to wait until the thread exits.*
- virtual void **join** (long long millisecs)
*Forces the Current **Thread** (p. 2703) to wait until the thread exits.*
- virtual void **join** (long long millisecs, unsigned int nanos)
*Forces the Current **Thread** (p. 2703) to wait until the thread exits.*
- virtual void **run** ()
Default implementation of the run method - does nothing.
- std::string **getName** () const
*Returns the **Thread** (p. 2703)'s assigned name.*
- void **setName** (const std::string &name)
*Sets the name of the **Thread** (p. 2703) to the new Name given by the argument name*
- int **getPriority** () const

*Gets the currently set priority for this **Thread** (p. 2703).*

- void **setPriority** (int value)

*Sets the current **Thread** (p. 2703)'s priority to the newly specified value.*

- void **setDaemon** (bool value)

*Sets if the given **Thread** (p. 2703) is a Daemon **Thread** (p. 2703) or not.*

- bool **isDaemon** () const

Returns whether this thread is a daemon thread or not, if true this thread cannot be joined.

- const **UncaughtExceptionHandler** * **getUncaughtExceptionHandler** () const

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

- void **setUncaughtExceptionHandler** (**UncaughtExceptionHandler** *handler)

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

- std::string **toString** () const

*Returns a string that describes the **Thread** (p. 2703).*

- bool **isAlive** () const

*Returns true if the **Thread** (p. 2703) is alive, meaning it has been started and has not yet died.*

- **Thread::State** **getState** () const

*Returns the currently set State of this **Thread** (p. 2703).*

Static Public Member Functions

- static void **sleep** (long long millisecs)

Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.

- static void **sleep** (long long millisecs, unsigned int nanos)

Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.

- static void **yield** ()

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

- static long long **getId** ()

*Obtains the **Thread** (p. 2703) Id of the current thread.*

- static **Thread** * **currentThread** ()

Returns a pointer to the currently executing thread object.

Static Public Attributes

- static const int **MIN_PRIORITY** = 1
The minimum priority that a thread can have.
- static const int **NORM_PRIORITY** = 5
The default priority that a thread is given at create time.
- static const int **MAX_PRIORITY** = 10
The maximum priority that a thread can have.

Friends

- class **decaf::util::concurrent::locks::LockSupport**
- class **decaf::lang::Runtime**

6.544.1 Detailed Description

A **Thread** (p. 2703) is a concurrent unit of execution.

It has its own call stack for methods being invoked, their arguments and local variables. Each process has at least one main **Thread** (p. 2703) running when it is started; typically, there are several others for housekeeping. The application might decide to launch additional Threads for specific purposes.

Threads in the same process interact and synchronize by the use of shared objects and monitors associated with these objects.

There are basically two main ways of having a **Thread** (p. 2703) execute application code. One is providing a new class that extends **Thread** (p. 2703) and overriding its **run()** (p. 2710) method. The other is providing a new **Thread** (p. 2703) instance with a **Runnable** (p. 2312) object during its creation. In both cases, the **start()** (p. 2712) method must be called to actually execute the new **Thread** (p. 2703).

Each **Thread** (p. 2703) has an integer priority that basically determines the amount of CPU time the **Thread** (p. 2703) gets. It can be set using the **setPriority(int)** (p. 2711) method. A **Thread** (p. 2703) can also be made a daemon, which makes it run in the background. The latter also affects VM termination behavior: the VM does not terminate automatically as long as there are non-daemon threads running.

See also

decaf.lang.ThreadGroup (p. 2715)

Since

1.0

6.544.2 Member Enumeration Documentation

6.544.2.1 enum `decaf::lang::Thread::State`

Represents the various states that the **Thread** (p. 2703) can be in during its lifetime.

Enumerator:

NEW Before a **Thread** (p. 2703) is started it exists in this State.

RUNNABLE While a **Thread** (p. 2703) is running and is not blocked it is in this State.

BLOCKED A **Thread** (p. 2703) that is waiting to acquire a lock is in this state.

WAITING A **Thread** (p. 2703) that is waiting for another **Thread** (p. 2703) to perform an action is in this state.

TIMED_WAITING A **Thread** (p. 2703) that is waiting for another **Thread** (p. 2703) to perform an action up to a specified time interval is in this state.

SLEEPING A **Thread** (p. 2703) that is blocked in a Sleep call is in this state.

TERMINATED A **Thread** (p. 2703) whose run method has exited is in this state.

6.544.3 Constructor & Destructor Documentation

6.544.3.1 `decaf::lang::Thread::Thread ()`

Constructs a new **Thread** (p. 2703).

This constructor has the same effect as `Thread(NULL, NULL, GIVEN_NAME)`, where `GIVEN_NAME` is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

6.544.3.2 `decaf::lang::Thread::Thread (Runnable * task)`

Constructs a new **Thread** (p. 2703) with the given target **Runnable** (p. 2312) task.

This constructor has the same effect as `Thread(NULL, task, GIVEN_NAME)`, where `GIVEN_NAME` is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

<i>task</i>	the Runnable (p. 2312) that this thread manages, if the task is NULL the Thread (p. 2703)'s run method is used instead.
-------------	---

6.544.3.3 `decaf::lang::Thread::Thread (const std::string & name)`

Constructs a new **Thread** (p. 2703) with the given name.

This constructor has the same effect as `Thread(NULL, NULL, GIVEN_NAME)`, where

GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

<i>name</i>	the name to assign to this Thread (p. 2703).
-------------	---

6.544.3.4 decaf::lang::Thread::Thread (Runnable * task, const std::string & name)

Constructs a new **Thread** (p. 2703) with the given target **Runnable** (p. 2312) task and name.

This constructor has the same effect as Thread(NULL, task, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

<i>task</i>	the Runnable (p. 2312) that this thread manages, if the task is NULL the Thread (p. 2703)'s run method is used instead.
<i>name</i>	the name to assign to this Thread (p. 2703).

6.544.3.5 virtual decaf::lang::Thread::~~Thread () [virtual]

6.544.4 Member Function Documentation

6.544.4.1 static Thread* decaf::lang::Thread::currentThread () [static]

Returns a pointer to the currently executing thread object.

Returns

Pointer (p. 2083) to the **Thread** (p. 2703) object representing the currently running **Thread** (p. 2703).

6.544.4.2 static long long decaf::lang::Thread::getId () [static]

Obtains the **Thread** (p. 2703) Id of the current thread.

Returns

Thread (p. 2703) Id

6.544.4.3 std::string decaf::lang::Thread::getName () const

Returns the **Thread** (p. 2703)'s assigned name.

Returns

the Name of the **Thread** (p. 2703).

6.544.4.4 int decaf::lang::Thread::getPriority () const

Gets the currently set priority for this **Thread** (p. 2703).

Returns

an int value representing the **Thread** (p. 2703)'s current priority.

6.544.4.5 Thread::State decaf::lang::Thread::getState () const

Returns the currently set State of this **Thread** (p. 2703).

Returns

the **Thread** (p. 2703)'s current state.

6.544.4.6 const UncaughtExceptionHandler* decaf::lang::Thread::getUncaughtExceptionHandler () const

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Returns

a pointer to the set **UncaughtExceptionHandler** (p. 2815).

6.544.4.7 bool decaf::lang::Thread::isAlive () const

Returns true if the **Thread** (p. 2703) is alive, meaning it has been started and has not yet died.

Returns

true if the thread is alive.

6.544.4.8 bool decaf::lang::Thread::isDaemon () const

Returns whether this thread is a daemon thread or not, if true this thread cannot be joined.

Returns

true if the thread is a daemon thread.

6.544.4.9 virtual void **decaf::lang::Thread::join** () [virtual]

Forces the Current **Thread** (p. 2703) to wait until the thread exits.

Exceptions

<i>InterruptedException</i>	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.
-----------------------------	--

6.544.4.10 virtual void **decaf::lang::Thread::join** (long long *millisecs*) [virtual]

Forces the Current **Thread** (p. 2703) to wait until the thread exits.

Parameters

<i>millisecs</i>	the time in Milliseconds before the thread resumes
------------------	--

Exceptions

<i>IllegalArgumentException</i>	if the milliseconds parameter is negative.
<i>InterruptedException</i>	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.544.4.11 virtual void **decaf::lang::Thread::join** (long long *millisecs*, unsigned int *nanos*) [virtual]

Forces the Current **Thread** (p. 2703) to wait until the thread exits.

Parameters

<i>millisecs</i>	the time in Milliseconds before the thread resumes
<i>nanos</i>	0-999999 extra nanoseconds to sleep.

Exceptions

<i>IllegalArgumentException</i>	if the nanoseconds parameter is out of range or the milliseconds paramter is negative.
<i>InterruptedException</i>	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.544.4.12 virtual void **decaf::lang::Thread::run** () [virtual]

Default implementation of the run method - does nothing.

Implements **decaf::lang::Runnable** (p. 2312).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 1528).

6.544.4.13 void decaf::lang::Thread::setDaemon (bool *value*)

Sets if the given **Thread** (p. 2703) is a Daemon **Thread** (p. 2703) or not.

Daemon threads cannot be joined and its resource are automatically reclaimed when it terminates.

Parameters

<i>value</i>	Boolean (p. 545) indicating if this thread should be a daemon thread or not.
--------------	---

Exceptions

<i>IllegalThreadStateException</i>	if the thread is already active.
------------------------------------	----------------------------------

6.544.4.14 void decaf::lang::Thread::setName (const std::string & *name*)

Sets the name of the **Thread** (p. 2703) to the new Name given by the argument *name* name the new name of the **Thread** (p. 2703).

6.544.4.15 void decaf::lang::Thread::setPriority (int *value*)

Sets the current **Thread** (p. 2703)'s priority to the newly specified value.

The given value must be within the range **Thread::MIN_PRIORITY** (p. 2713) and **Thread::MAX_PRIORITY** (p. 2713).

Parameters

<i>value</i>	the new priority value to assign to this Thread (p. 2703).
--------------	---

Exceptions

<i>IllegalArgumentException</i>	if the value is out of range.
---------------------------------	-------------------------------

6.544.4.16 void decaf::lang::Thread::setUncaughtExceptionHandler (**UncaughtExceptionHandler** * *handler*)

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Parameters

<i>handler</i>	the <code>UncaughtExceptionHandler</code> to invoke when the Thread (p. 2703) terminates due to an uncaught exception.
----------------	---

6.544.4.17 static void decaf::lang::Thread::sleep (long long *millisecs*) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters

<i>millisecs</i>	time in milliseconds to halt execution.
------------------	---

Exceptions

<i>IllegalArgumentException</i>	if the milliseconds parameter is negative.
<i>InterruptedException</i>	if the Thread (p. 2703) was interrupted while sleeping.

6.544.4.18 static void decaf::lang::Thread::sleep (long long *millisecs*, unsigned int *nanos*) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters

<i>millisecs</i>	time in milliseconds to halt execution.
<i>nanos</i>	0-999999 extra nanoseconds to sleep.

Exceptions

<i>IllegalArgumentException</i>	if the nanoseconds parameter is out of range or the milliseconds parameter is negative.
<i>InterruptedException</i>	if the Thread (p. 2703) was interrupted while sleeping.

6.544.4.19 virtual void decaf::lang::Thread::start () [virtual]

Creates a system thread and starts it in a joinable mode.

Upon creation, the **run()** (p. 2710) method of either this object or the provided **Runnable** (p. 2312) object will be invoked in the context of this thread.

Exceptions

<i>IllegalThreadStateException</i>	if the thread has already been started.
<i>RuntimeException</i>	if the Thread (p. 2703) cannot be created for some reason.

6.544.4.20 `std::string decaf::lang::Thread::toString () const`

Returns a string that describes the **Thread** (p. 2703).

Returns

string describing the **Thread** (p. 2703).

6.544.4.21 `static void decaf::lang::Thread::yield () [static]`

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

6.544.5 Friends And Related Function Documentation

6.544.5.1 `friend class decaf::lang::Runtime [friend]`

6.544.5.2 `friend class decaf::util::concurrent::locks::LockSupport [friend]`

6.544.6 Field Documentation

6.544.6.1 `const int decaf::lang::Thread::MAX_PRIORITY = 10 [static]`

The maximum priority that a thread can have.

6.544.6.2 `const int decaf::lang::Thread::MIN_PRIORITY = 1 [static]`

The minimum priority that a thread can have.

6.544.6.3 `const int decaf::lang::Thread::NORM_PRIORITY = 5 [static]`

The default priority that a thread is given at create time.

The documentation for this class was generated from the following file:

6.545 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p. 2714)

```
#include <src/main/decaf/util/concurrent/ThreadFactory.h>
```

Public Member Functions

- virtual **~ThreadFactory** ()
- virtual **decaf::lang::Thread * newThread** (**decaf::lang::Runnable *r**)=0
Constructs a new Thread.

6.545.1 Detailed Description

public interface **ThreadFactory** (p. 2714)

An object that creates new threads on demand. Using thread factories removes hard-wiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

```
class SimpleThreadFactory : public ThreadFactory (p. 2714) { public: Thread* newThread( Runnable* r ) { return new Thread(r); } }
```

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since

6.545.2 Constructor & Destructor Documentation

6.545.2.1 virtual **decaf::util::concurrent::ThreadFactory::~~ThreadFactory** ()
[inline, virtual]

6.545.3 Member Function Documentation

6.545.3.1 virtual **decaf::lang::Thread* decaf::util::concurrent::ThreadFactory::newThread** (**decaf::lang::Runnable * r**) [pure virtual]

Constructs a new Thread.

Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

Parameters

<i>r</i>	A pointer to a Runnable instance to be executed by new Thread instance returned.
----------	--

Returns

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor:

Data Structures

- class **AbortPolicy**
*Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2724) this class always throws a **RejectedExecutionException** (p. 2263).*
- class **CallerRunsPolicy**
*Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2724) this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.*

Public Member Functions

- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue)
*Creates a new instance of a **ThreadPoolExecutor** (p. 2715).*
- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **RejectedExecutionHandler** *handler)
*Creates a new instance of a **ThreadPoolExecutor** (p. 2715).*
- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **ThreadFactory** *threadFactory)
*Creates a new instance of a **ThreadPoolExecutor** (p. 2715).*
- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, const **TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **ThreadFactory** *threadFactory, **RejectedExecutionHandler** *handler)
*Creates a new instance of a **ThreadPoolExecutor** (p. 2715).*
- virtual ~**ThreadPoolExecutor** ()
- virtual void **execute** (**decaf::lang::Runnable** *task)
Executes the given command at some time in the future.
- virtual void **shutdown** ()
*Performs an orderly shutdown of this **Executor** (p. 1297).*
- virtual **ArrayList** < **decaf::lang::Runnable** * > **shutdownNow** ()
*Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 445) containing the **Runnables** that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about.*

- virtual bool **awaitTermination** (long long timeout, const **decaf::util::concurrent-
::TimeUnit** &unit)

The caller will block until the executor has completed termination meaning all tasks that were scheduled before shutdown have now completed and the executor is ready for deletion.
- virtual bool **isShutdown** () const

Returns whether this executor has been shutdown or not.
- virtual bool **isTerminated** () const

Returns whether all tasks have completed after this executor was shut down.
- virtual int **getPoolSize** () const

*Returns the number of threads that currently exists for this **Executor** (p. 1297).*
- virtual int **getCorePoolSize** () const

*Returns the configured number of core threads for this **Executor** (p. 1297).*
- virtual void **setCorePoolSize** (int poolSize)

Set (p. 2397) the number of threads that this executor treats as its core threads, this value will override the value set in the constructor.
- virtual int **getMaximumPoolSize** () const

*Returns the configured maximum number of threads for this **Executor** (p. 1297).*
- virtual void **setMaximumPoolSize** (int maxSize)

*Sets the maximum number of workers this **Executor** (p. 1297) is allowed to have at any given time above the core pool size.*
- virtual long long **getTaskCount** () const

Returns the current number of pending tasks in the work queue.
- virtual int **getActiveCount** () const

Returns an approximation of the number of threads that are currently running tasks for this executor.
- virtual long long **getCompletedTaskCount** () const

*Returns the approximate number of Tasks that have been completed by this **Executor** (p. 1297), this value never decreases.*
- virtual int **getLargestPoolSize** () const

*Returns the most Threads that have ever been active at one time within this **Executors** (p. 1299) Thread pool.*
- virtual **BlockingQueue** < **decaf::lang::Runnable** * > * **getQueue** ()

*Provides access to the Task **Queue** (p. 2222) used by this **Executor** (p. 1297).*
- virtual bool **isTerminating** () const

Returns true if the executor has begin the process of terminating but has not yet completed the process of shutting down all worker threads.
- virtual void **allowCoreThreadTimeout** (bool value)

When true this setting allows the threads in the core pool to terminate if they sit idle longer than the set keep alive time.
- virtual bool **allowsCoreThreadTimeout** () const

Returns whether this executor has been configured to allow core threads to terminate if they sit idle longer than the configured keep alive time.
- virtual long long **getKeepAliveTime** (const **TimeUnit** &unit) const

Returns the currently set value for the maximum amount of time a worker Thread that is not part of the core threads is allowed to sit idle before it terminates.

- virtual void **setKeepAliveTime** (long long timeout, const **TimeUnit** &unit)
Configures the amount of time a non core Thread will remain alive after it has completed its assigned task.
- virtual void **setThreadFactory** (**ThreadFactory** *factory)
*Sets the **ThreadFactory** (p. 2714) instance used to create new Threads for this - **Executor** (p. 1297).*
- virtual **ThreadFactory** * **getThreadFactory** () const
*Gets the currently configured **ThreadFactory** (p. 2714).*
- virtual **RejectedExecutionHandler** * **getRejectedExecutionHandler** () const
*Gets the currently configured **RejectedExecutionHandler** (p. 2266) for this **Executor** (p. 1297).*
- virtual void **setRejectedExecutionHandler** (**RejectedExecutionHandler** *handler)
*Sets the new **RejectedExecutionHandler** (p. 2266) that this executor should use to process any rejected Runnable tasks.*
- virtual bool **prestartCoreThread** ()
By default a Core thread is only created once the first task is queued, this method forces the creation of core thread that waits in an idle mode for new work to be enqueued.
- virtual int **prestartAllCoreThreads** ()
This method will create and start new core threads running in an idle state waiting for new tasks up to the set core thread limit.
- bool **remove** (decaf::lang::Runnable *task)
Attempts to remove the Runnable from the work queue, if successful then the caller now owns the Runnable and is responsible for deleting it.
- virtual void **purge** ()
*Attempts to remove any **Future** (p. 1390) derived tasks from the pending work queue if they have been canceled.*

Protected Member Functions

- virtual void **beforeExecute** (decaf::lang::Thread *thread, decaf::lang::Runnable *task)
Method called before a task is executed by the given thread.
- virtual void **afterExecute** (decaf::lang::Runnable *task, decaf::lang::Throwable *error)
Called upon completion of execution of a given task.
- virtual void **terminated** ()
*Method invoked when the **Executor** (p. 1297) has terminated, by default this method does nothing.*

Friends

- class **ExecutorKernel**

6.547.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

The Thread Poll has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the `Runnable` interface and one of the worker threads will executing it in its thread context.

6.547.2 Constructor & Destructor Documentation

6.547.2.1 `decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int corePoolSize, int maxPoolSize, long long keepAliveTime, const TimeUnit & unit, BlockingQueue< decaf::lang::Runnable * > * workQueue)`

Creates a new instance of a **ThreadPoolExecutor** (p. 2715).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

<i>corePool-Size</i>	The number of threads to pool regardless of their idle state.
<i>maxPool-Size</i>	The maximum number of threads that will ever exist at one time in the pool.
<i>keepAlive-Time</i>	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
<i>unit</i>	The units that the keepAliveTime is specified in.
<i>workQueue</i>	A BlockingQueue (p. 538) implementation that will be used to hold - Runnable tasks that are awaiting execution within this executor. The Executor (p. 1297) takes ownership of the BlockingQueue (p. 538) instance passed once this method returns.

Exceptions

<i>IllegalArgument-Exception</i>	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
<i>NullPointerException</i>	if the workQueue pointer is NULL.

6.547.2.2 `decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int corePoolSize, int maxPoolSize, long long keepAliveTime, const TimeUnit & unit, BlockingQueue< decaf::lang::Runnable * > * workQueue, RejectedExecutionHandler * handler)`

Creates a new instance of a **ThreadPoolExecutor** (p. 2715).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

<i>corePool-Size</i>	The number of threads to pool regardless of their idle state.
<i>maxPool-Size</i>	The maximum number of threads that will ever exist at one time in the pool.
<i>keepAlive-Time</i>	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
<i>unit</i>	The units that the keepAliveTime is specified in.
<i>workQueue</i>	A BlockingQueue (p. 538) implementation that will be used to hold - Runnable tasks that are awaiting execution within this executor. The Executor (p. 1297) takes ownership of the BlockingQueue (p. 538) instance passed once this method returns.
<i>handler</i>	A RejectedExecutionHandler (p. 2266) implementation that will be used to handle any rejected tasks when they are submitted to this executor. The Executor (p. 1297) takes ownership of the Rejected-ExecutionHandler (p. 2266) instance passed once this method returns.

Exceptions

<i>IllegalArgument-Exception</i>	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
<i>NullPointerException</i>	if the workQueue pointer is NULL.

6.547.2.3 `decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int corePoolSize, int maxPoolSize, long long keepAliveTime, const TimeUnit & unit, BlockingQueue< decaf::lang::Runnable * > * workQueue, ThreadFactory * threadFactory)`

Creates a new instance of a **ThreadPoolExecutor** (p. 2715).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

<i>corePool-Size</i>	The number of threads to pool regardless of their idle state.
----------------------	---

<i>maxPool-Size</i>	The maximum number of threads that will ever exist at one time in the pool.
<i>keepAlive-Time</i>	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
<i>unit</i>	The units that the keepAliveTime is specified in.
<i>workQueue</i>	A BlockingQueue (p. 538) implementation that will be used to hold - Runnable tasks that are awaiting execution within this executor. The Executor (p. 1297) takes ownership of the BlockingQueue (p. 538) instance passed once this method returns.
<i>thread-Factory</i>	A ThreadFactory (p. 2714) implementation that will be used to create worker threads that are used by this executor to run the submitted tasks. The Executor (p. 1297) takes ownership of the ThreadFactory (p. 2714) instance passed once this method returns.

Exceptions

<i>IllegalArgument-Exception</i>	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
<i>NullPointerException</i>	if the workQueue pointer is NULL.

6.547.2.4 `decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int corePoolSize, int maxPoolSize, long long keepAliveTime, const TimeUnit & unit, BlockingQueue< decaf::lang::Runnable * > * workQueue, ThreadFactory * threadFactory, RejectedExecutionHandler * handler)`

Creates a new instance of a **ThreadPoolExecutor** (p. 2715).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

<i>corePool-Size</i>	The number of threads to pool regardless of their idle state.
<i>maxPool-Size</i>	The maximum number of threads that will ever exist at one time in the pool.
<i>keepAlive-Time</i>	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
<i>unit</i>	The units that the keepAliveTime is specified in.
<i>workQueue</i>	A BlockingQueue (p. 538) implementation that will be used to hold - Runnable tasks that are awaiting execution within this executor. The Executor (p. 1297) takes ownership of the BlockingQueue (p. 538) instance passed once this method returns.
<i>thread-Factory</i>	A ThreadFactory (p. 2714) implementation that will be used to create worker threads that are used by this executor to run the submitted tasks. The Executor (p. 1297) takes ownership of the ThreadFactory (p. 2714) instance passed once this method returns.

<i>handler</i>	A RejectedExecutionHandler (p. 2266) implementation that will be used to handle any rejected tasks when they are submitted to this executor. The Executor (p. 1297) takes ownership of the BlockingQueue (p. 538) instance passed once this method returns.
----------------	--

Exceptions

<i>IllegalArgumentException</i>	if the <code>corePoolSize</code> or <code>keepAliveTime</code> are negative or the or if <code>maximumPoolSize</code> is less than or equal to zero, or if <code>corePoolSize</code> is greater than <code>maximumPoolSize</code> .
<i>NullPointerException</i>	if the <code>workQueue</code> pointer is NULL.

6.547.2.5 virtual `decaf::util::concurrent::ThreadPoolExecutor::~~ThreadPool-Executor ()` [virtual]

6.547.3 Member Function Documentation

6.547.3.1 virtual void `decaf::util::concurrent::ThreadPoolExecutor::afterExecute (decaf::lang::Runnable * task, decaf::lang::Throwable * error)`
[protected, virtual]

Called upon completion of execution of a given task.

This method is called from the Thread that executed the given Runnable. If the `Throwable` pointer is not NULL then its value is the Exception that caused the task to terminate.

The base class implementation does nothing, a derived class should call this method on its base class to ensure that all subclasses have a chance to process the `afterExecute` event.

Parameters

<i>task</i>	The Runnable instance that was executed by the calling Thread.
<i>error</i>	The exception that was thrown from the given Runnable.

6.547.3.2 virtual void `decaf::util::concurrent::ThreadPool-Executor::allowCoreThreadTimeout (bool value)`
[virtual]

When true this setting allows the threads in the core pool to terminate if they sit idle longer than the set keep alive time.

Core threads that terminate are replaced as needed by new ones on demand. This settings requires that the set keep alive time be greater than zero and will throw an `IllegalArgumentException` if that is not the case.

Parameters

<i>value</i>	Boolean value indicating if core threads are allowed to time out when idle.
--------------	---

Exceptions

<i>IllegalArgumentException</i>	if the keep alive time is set to zero.
---------------------------------	--

6.547.3.3 virtual bool decaf::util::concurrent::ThreadPoolExecutor::allowsCore-ThreadTimeout () const [virtual]

Returns whether this executor has been configured to allow core threads to terminate if they sit idle longer than the configured keep alive time.

Threads that are not core threads continue to time out using the set keep alive value regardless of whether this option is enabled.

Returns

true if core threads can timeout when idle.

6.547.3.4 virtual bool decaf::util::concurrent::ThreadPoolExecutor::await-Termination (long long timeout, const decaf::util::concurrent::TimeUnit & unit) [virtual]

The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion.

If the timeout period elapses before the executor reaches the terminated state then this method return false to indicate it has not terminated.

Parameters

<i>timeout</i>	The amount of time to wait before abandoning the wait for termination.
<i>unit</i>	The unit of time that the timeout value represents.

Returns

true if the executor terminated or false if the timeout expired.

Exceptions

<i>InterruptedException</i>	if this call is interrupted while awaiting termination.
-----------------------------	---

Implements **decaf::util::concurrent::ExecutorService** (p. 1303).

6.547.3.5 virtual void decaf::util::concurrent::ThreadPoolExecutor::beforeExecute
 (decaf::lang::Thread * *thread*, decaf::lang::Runnable * *task*)
 [protected, virtual]

Method called before a task is executed by the given thread.

The default implementation of this method does nothing, however a subclass can override this method to add some new functionality.

It is recommended that a subclass call this method on its base class to ensure that all base classes have a chance to process this event.

Parameters

<i>thread</i>	The thread that will be executing the given task.
<i>task</i>	The task that will be executed by the given thread.

6.547.3.6 virtual void decaf::util::concurrent::ThreadPoolExecutor::execute (
 decaf::lang::Runnable * *command*) [virtual]

Executes the given command at some time in the future.

The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the **Executor** (p. 1297) implementation.

Parameters

<i>command</i>	the runnable task
----------------	-------------------

Exceptions

RejectedExecution- Exception (p. 2263)	if this task cannot be accepted for execution.
<i>NullPointerException</i>	if command is null

Implements **decaf::util::concurrent::Executor** (p. 1299).

Referenced by decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::Discard-
 OldestPolicy::rejectedExecution().

6.547.3.7 virtual int decaf::util::concurrent::ThreadPoolExecutor::getActiveCount (
) const [virtual]

Returns an approximation of the number of threads that are currently running tasks for this executor.

This value can change rapidly.

Returns

the number of currently active threads.

6.547.3.8 `virtual long long decaf::util::concurrent::ThreadPoolExecutor::getCompletedTaskCount () const`
`[virtual]`

Returns the approximate number of Tasks that have been completed by this **Executor** (p. 1297), this value never decreases.

Returns

the number of completed tasks since creation of the **Executor** (p. 1297).

6.547.3.9 `virtual int decaf::util::concurrent::ThreadPoolExecutor::getCorePoolSize () const` `[virtual]`

Returns the configured number of core threads for this **Executor** (p. 1297).

Returns

the configured number of core Threads.

6.547.3.10 `virtual long long decaf::util::concurrent::ThreadPoolExecutor::getKeepAliveTime (const TimeUnit & unit) const`
`[virtual]`

Returns the currently set value for the maximum amount of time a worker Thread that is not part of the core threads is allowed to sit idle before it terminates.

Parameters

<i>unit</i>	The unit of time to return the results in.
-------------	--

Returns

the configure keep alive time in the requested time units.

6.547.3.11 `virtual int decaf::util::concurrent::ThreadPoolExecutor::getLargestPoolSize () const` `[virtual]`

Returns the most Threads that have ever been active at one time within this **Executors** (p. 1299) Thread pool.

Returns

the largest number of threads ever to coexist in this executor.

6.547.3.12 `virtual int decaf::util::concurrent::ThreadPoolExecutor::getMaximumPoolSize () const [virtual]`

Returns the configured maximum number of threads for this **Executor** (p. 1297).

Returns

the configured maximum number of Threads.

6.547.3.13 `virtual int decaf::util::concurrent::ThreadPoolExecutor::getPoolSize () const [virtual]`

Returns the number of threads that currently exists for this **Executor** (p. 1297).

Returns

the configured number of Threads in the Pool.

6.547.3.14 `virtual BlockingQueue<decaf::lang::Runnable*>* decaf::util::concurrent::ThreadPoolExecutor::getQueue () [virtual]`

Provides access to the Task **Queue** (p. 2222) used by this **Executor** (p. 1297).

This method is meant mainly for debugging and monitoring, care should be taken when using this method. The executor continues to execute tasks from the **Queue** (p. 2222).

Returns

a pointer to the blocking queue that this executor stores future tasks in.

Referenced by decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy::rejectedExecution().

6.547.3.15 `virtual RejectedExecutionHandler* decaf::util::concurrent::ThreadPoolExecutor::getRejectedExecutionHandler () const [virtual]`

Gets the currently configured **RejectedExecutionHandler** (p. 2266) for this **Executor** (p. 1297).

Returns

a pointer to the current **RejectedExecutionHandler** (p. 2266).

6.547.3.16 `virtual long long decaf::util::concurrent::ThreadPoolExecutor::getTaskCount () const [virtual]`

Returns the current number of pending tasks in the work queue.

This is an approximation as the number of pending tasks can quickly changes as tasks complete and new tasks are started.

Returns

number of outstanding tasks, approximate.

6.547.3.17 `virtual ThreadFactory* decaf::util::concurrent::ThreadPoolExecutor::getThreadFactory () const [virtual]`

Gets the currently configured **ThreadFactory** (p. 2714).

It is considered a programming error to delete the pointer returned by this method.

Returns

the currently configured **ThreadFactory** (p. 2714) instance used by this object.

6.547.3.18 `virtual bool decaf::util::concurrent::ThreadPoolExecutor::isShutdown () const [virtual]`

Returns whether this executor has been shutdown or not.

Returns

true if this executor has been shutdown.

Implements **decaf::util::concurrent::ExecutorService** (p. 1304).

Referenced by `decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy::rejectedExecution()`.

6.547.3.19 `virtual bool decaf::util::concurrent::ThreadPoolExecutor::isTerminated () const [virtual]`

Returns whether all tasks have completed after this executor was shut down.

Returns

true if all tasks have completed after a request to shut down was made.

Implements **decaf::util::concurrent::ExecutorService** (p. 1304).

6.547.3.20 `virtual bool decaf::util::concurrent::ThreadPoolExecutor::isTerminating () const [virtual]`

Returns true if the executor has begin the process of terminating but has not yet completed the process of shutting down all worker threads.

If the **Executor** (p. 1297) does not transition from this state to terminated after some time its generally an indication that one of the submitted tasks will not complete and the executor is locked in a terminating state.

Returns

true if all tasks have completed after a request to shut down was made.

6.547.3.21 `virtual int decaf::util::concurrent::ThreadPoolExecutor::prestartAllCoreThreads () [virtual]`

This method will create and start new core threads running in an idle state waiting for new tasks up to the set core thread limit.

When the limit is reached this method returns zero to indicate no more core threads can be created.

Returns

the number of core threads created, or zero if the limit has already been met.

6.547.3.22 `virtual bool decaf::util::concurrent::ThreadPoolExecutor::prestartCoreThread () [virtual]`

By default a Core thread is only created once the first task is queued, this method forces the creation of core thread that waits in an idle mode for new work to be enqueued.

If the limit on core threads has already been reached then this method returns false.

Returns

true if a new core thread was added, false otherwise.

6.547.3.23 `virtual void decaf::util::concurrent::ThreadPoolExecutor::purge () [virtual]`

Attempts to remove any **Future** (p. 1390) derived tasks from the pending work queue if they have been canceled.

This method can be used to more quickly remove and reclaim space as canceled tasks are not run but must await a worker thread to be removed normally. Since there are multiple threads in operation its possible for this method to not remove all canceled tasks from the work queue.

6.547.3.24 **bool** `decaf::util::concurrent::ThreadPoolExecutor::remove (decaf::lang::Runnable * task)`

Attempts to remove the Runnable from the work queue, if successful then the caller now owns the Runnable and is responsible for deleting it.

Parameters

<i>task</i>	The task that is to be removed from the work queue.
-------------	---

Returns

true if the task was removed from the **Queue** (p. 2222).

6.547.3.25 **virtual void** `decaf::util::concurrent::ThreadPoolExecutor::setCorePoolSize (int poolSize)` [virtual]

Set (p. 2397) the number of threads that this executor treats as its core threads, this value will override the value set in the constructor.

If the value given is less than the current value then the core threads will shrink to the new value over time. If the value is larger than the current value then new threads may be started to process currently pending tasks, otherwise they will be started as needed when new tasks arrive.

Parameters

<i>poolSize</i>	The new core pool size for this executor.
-----------------	---

Exceptions

<i>IllegalArgumentException</i>	if the pool size value is less than zero.
---------------------------------	---

6.547.3.26 **virtual void** `decaf::util::concurrent::ThreadPoolExecutor::setKeepAliveTime (long long timeout, const TimeUnit & unit)` [virtual]

Configures the amount of time a non core Thread will remain alive after it has completed its assigned task.

This value can also be applied to core threads if the allowCoreThreadsTimeout option is enabled.

Parameters

<i>timeout</i>	The amount of time an idle worker will live before terminating.
<i>unit</i>	The units that the timeout is given in.

Exceptions

<i>IllegalArgumentException</i>	if allowCoreThreadsTimeout is enabled and the the timeout value given is zero, or the timeout given is negative.
---------------------------------	--

6.547.3.27 virtual void decaf::util::concurrent::ThreadPool-
Executor::setMaximumPoolSize (int *maxSize*)
[virtual]

Sets the maximum number of workers this **Executor** (p. 1297) is allowed to have at any given time above the core pool size.

This new value overrides any set in the constructor and if smaller than the current value worker threads will terminate as they complete their current tasks and become idle.

Parameters

<i>maxSize</i>	The new maximum allowed worker pool size.
----------------	---

Exceptions

<i>IllegalArgumentException</i>	if maxSize is negative or less than core pool size.
---------------------------------	---

6.547.3.28 virtual void decaf::util::concurrent::ThreadPoolExecutor::set-
RejectedExecutionHandler (RejectedExecutionHandler * *handler*)
[virtual]

Sets the new **RejectedExecutionHandler** (p. 2266) that this executor should use to process any rejected Runnable tasks.

This executor takes ownership of the supplied pointer and will desotroy it upon termination, any previous handler is destroyed by this call.

Parameters

<i>handler</i>	The new RejectedExecutionHandler (p. 2266) instance to use.
----------------	--

Exceptions

<i>NullPointerException</i>	if the handler is NULL.
-----------------------------	-------------------------

6.547.3.29 `virtual void decaf::util::concurrent::ThreadPoolExecutor::setThreadFactory (ThreadFactory * factory)`
[virtual]

Sets the **ThreadFactory** (p.2714) instance used to create new Threads for this - **Executor** (p. 1297).

This class takes ownership of the given **ThreadFactory** (p.2714) and will destroy it upon termination or when a new **ThreadFactory** (p.2714) is set using this method.

Parameters

<i>factory</i>	A ThreadFactory (p.2714) instance used by this Executor (p. 1297) to create new Threads.
----------------	--

Exceptions

<i>NullPointerException</i>	if the given factory pointer is NULL.
-----------------------------	---------------------------------------

6.547.3.30 `virtual void decaf::util::concurrent::ThreadPoolExecutor::shutdown ()`
[virtual]

Performs an orderly shutdown of this **Executor** (p. 1297).

Previously queued tasks are allowed to complete but no new tasks are accepted for execution. Calling this method more than once has no affect on this executor.

Implements **decaf::util::concurrent::ExecutorService** (p. 1304).

6.547.3.31 `virtual ArrayList<decaf::lang::Runnable*> decaf::util::concurrent::ThreadPoolExecutor::shutdownNow ()`
[virtual]

Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 445) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about.

There is no guarantee that this method will halt execution of currently executing tasks.

Returns

an **ArrayList** (p. 445) containing all Runnable instance that were still waiting to be executed by this class, call now owns those pointers.

Implements **decaf::util::concurrent::ExecutorService** (p. 1305).

6.547.3.32 virtual void **decaf::util::concurrent::ThreadPoolExecutor::terminated** ()
[protected, virtual]

Method invoked when the **Executor** (p. 1297) has terminated, by default this method does nothing.

When overridden the subclass should call superclass::terminated to ensure that all subclasses have their terminated method invoked.

6.547.4 Friends And Related Function Documentation

6.547.4.1 friend class **ExecutorKernel** [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadPoolExecutor.h**

6.548 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

```
#include <src/main/decaf/lang/Throwable.h>
```

Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** () throw ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () const =0
Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.
- virtual const std::exception * **getCause** () const =0
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (const std::exception *cause)=0
Initializes the contained cause exception with the one given.
- virtual void **setMark** (const char *file, const int lineNumber)=0
Adds a file/line number to the stack trace.
- virtual **Throwable** * **clone** () const =0
Clones this exception.
- virtual std::vector< std::pair < std::string, int > > **getStackTrace** () const =0

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

- virtual void **printStackTrace** () const =0

Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const =0

Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const =0

Gets the stack trace as one contiguous string.

6.548.1 Detailed Description

This class represents an error that has occurred.

All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1279) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 2732) can wrap another **Throwable** (p. 2732) as the cause if the error being thrown. The user can inspect the cause by calling `getCause`, the pointer returned is the property of the **Throwable** (p. 2732) instance and will be deleted when it is deleted or goes out of scope.

Since

6.548.2 Constructor & Destructor Documentation

6.548.2.1 **decaf::lang::Throwable::Throwable** () throw () [inline]

6.548.2.2 **virtual decaf::lang::Throwable::~~Throwable** () throw () [inline, virtual]

6.548.3 Member Function Documentation

6.548.3.1 **virtual Throwable*** **decaf::lang::Throwable::clone** () const [pure virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this **Exception** (p. 1279) object

Implemented in **decaf::net::URISyntaxException** (p. 2859), **decaf::lang::Exception** (p. 1282), **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2032), **decaf::lang::exceptions::InvalidStateException** (p. 1545), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1418), **decaf::lang::exceptions::InterruptedException** (p. 1531), **decaf::security::GeneralSecurityException** (p. 1397), **decaf::security::NoSuchProviderException** (p. 1989), **decaf::security::NoSuchAlgorithmException** (p. 1983), **decaf::security::SignatureException** (p. 2440), **decaf::lang::exceptions::IllegalStateException** (p. 1422), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1425), **decaf::lang::exceptions::NullPointerException** (p. 1991), **decaf::security::InvalidKeyException** (p. 1538), **decaf::lang::exceptions::IllegalArgumentException** (p. 1416), **decaf::util::concurrent::BrokenBarrierException** (p. 558), **decaf::lang::exceptions::RuntimeException** (p. 2317), **decaf::security::KeyException** (p. 1603), **decaf::security::KeyManagementException** (p. 1605), **decaf::util::concurrent::ExecutionException** (p. 1297), **decaf::util::concurrent::TimeoutException** (p. 2739), **decaf::util::NoSuchElementException** (p. 1986), **decaf::lang::exceptions::ClassCastException** (p. 815), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1431), **decaf::lang::exceptions::NumberFormatException** (p. 1997), **decaf::util::concurrent::CancellationException** (p. 750), **decaf::util::concurrent::RejectedExecutionException** (p. 2266), **decaf::net::BindException** (p. 534), **decaf::lang::exceptions::UnsupportedOperationException** (p. 2827), **decaf::net::ConnectException** (p. 933), **decaf::nio::InvalidMarkException** (p. 1541), **decaf::io::UTFDataFormatException** (p. 2877), **decaf::io::UnsupportedEncodingException** (p. 2824), **decaf::net::HttpRetryException** (p. 1411), **decaf::net::MalformedURLException** (p. 1768), **decaf::net::NoRouteToHostException** (p. 1981), **decaf::net::PortUnreachableException** (p. 2109), **decaf::net::ProtocolException** (p. 2213), **decaf::net::SocketTimeoutException** (p. 2495), **decaf::net::UnknownHostException** (p. 2818), **decaf::net::UnknownServiceException** (p. 2821), **decaf::util::zip::ZipException** (p. 2955), **decaf::io::EOFException** (p. 1277), **decaf::io::InterruptedIOException** (p. 1533), **decaf::nio::ReadOnlyBufferException** (p. 2246), **decaf::util::ConcurrentModificationException** (p. 904), **decaf::util::zip::DataFormatException** (p. 1078), **decaf::io::IOException** (p. 1547), **decaf::nio::BufferOverflowException** (p. 611), **decaf::nio::BufferUnderflowException** (p. 614), **decaf::net::SocketException** (p. 2473), **decaf::security::cert::CertificateExpiredException** (p. 760), **decaf::security::cert::CertificateNotYetValidException** (p. 762), **decaf::security::cert::CertificateParsingException** (p. 764), **decaf::security::cert::CertificateEncodingException** (p. 756), **decaf::security::cert::CertificateException** (p. 758), **activemq::exceptions::ActiveMQException** (p. 263), **activemq::exceptions::BrokerException** (p. 564), and **activemq::exceptions::ConnectionFailedException** (p. 959).

```
6.548.3.2 virtual const std::exception* decaf::lang::Throwable::getCause ( ) const
    [pure virtual]
```

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow

for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1283).

6.548.3.3 `virtual std::string decaf::lang::Throwable::getMessage () const [pure virtual]`

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value `cause.getMessage` is then returned.

Returns

string errors message

Implemented in **decaf::lang::Exception** (p. 1284).

6.548.3.4 `virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace () const [pure virtual]`

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1284).

6.548.3.5 `virtual std::string decaf::lang::Throwable::getStackTraceString () const [pure virtual]`

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1284).

6.548.3.6 virtual void **decaf::lang::Throwable::initCause** (const std::exception * *cause*)
[pure virtual]

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

<i>cause</i>	The exception that was the cause of this one.
--------------	---

Implemented in **decaf::lang::Exception** (p. 1284).

6.548.3.7 virtual void **decaf::lang::Throwable::printStackTrace** () const [pure virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 1285).

6.548.3.8 virtual void **decaf::lang::Throwable::printStackTrace** (std::ostream & *stream*) const [pure virtual]

Prints the stack trace to the given output stream.

Parameters

<i>stream</i>	the target output stream.
---------------	---------------------------

Implemented in **decaf::lang::Exception** (p. 1285).

6.548.3.9 virtual void **decaf::lang::Throwable::setMark** (const char * *file*, const int *lineNumber*) [pure virtual]

Adds a file/line number to the stack trace.

Parameters

<i>file</i>	The name of the file calling this method (use __FILE__).
<i>lineNumber</i>	The line number in the calling file (use __LINE__).

Implemented in **decaf::lang::Exception** (p. 1285).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Throwable.h**

6.549 decaf::util::concurrent::TimeoutException Class Reference

```
#include <src/main/decaf/util/concurrent/TimeoutException.h>
```

Inheritance diagram for decaf::util::concurrent::TimeoutException:

Public Member Functions

- **TimeoutException** () throw ()
Default Constructor.
- **TimeoutException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **TimeoutException** (const **TimeoutException** &ex) throw ()
Copy Constructor.
- **TimeoutException** (const std::exception ***cause**) throw ()
Constructor.
- **TimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **TimeoutException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **TimeoutException** * **clone** () const
Clones this exception.
- virtual ~**TimeoutException** () throw ()

6.549.1 Constructor & Destructor Documentation

6.549.1.1 **decaf::util::concurrent::TimeoutException::TimeoutException** () throw () [inline]

Default Constructor.

6.549.1.2 **decaf::util::concurrent::TimeoutException::TimeoutException** (const **decaf::lang::Exception** & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
-----------	--

6.549.1.3 `decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & ex) throw () [inline]`

Copy Constructor.

Parameters

<i>ex</i>	The exception to copy from.
-----------	-----------------------------

6.549.1.4 `decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.549.1.5 `decaf::util::concurrent::TimeoutException::TimeoutException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The string message to report
<i>...</i>	list of primitives that are formatted into the message

6.549.1.6 `decaf::util::concurrent::TimeoutException::TimeoutException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.

<i>msg</i>	The string message to report
...	list of primitives that are formatted into the message

6.549.1.7 `virtual decaf::util::concurrent::TimeoutException::~TimeoutException () throw () [inline, virtual]`

6.549.2 Member Function Documentation

6.549.2.1 `virtual TimeoutException* decaf::util::concurrent-
::TimeoutException::clone () const [inline,
virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new **TimeoutException** (p. 2737) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1282).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TimeoutException.h`

6.550 decaf::util::Timer Class Reference

A facility for threads to schedule tasks for future execution in a background thread.

```
#include <src/main/decaf/util/Timer.h>
```

Public Member Functions

- **Timer** ()
- **Timer** (const std::string &name)
*Create a new **Timer** (p. 2739) whose associated thread is assigned the name given.*
- virtual **~Timer** ()
- void **cancel** ()
Terminates this timer, discarding any currently scheduled tasks.
- int **purge** ()
Removes all canceled tasks from this timer's task queue.
- void **schedule** (**TimerTask** *task, long long delay)
Schedules the specified task for execution after the specified delay.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay)
Schedules the specified task for execution after the specified delay.
- void **schedule** (**TimerTask** *task, const **Date** &time)
Schedules the specified task for execution at the specified time.
- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &time)
Schedules the specified task for execution at the specified time.
- void **schedule** (**TimerTask** *task, long long delay, long long period)
Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.
- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period)
Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.
- void **schedule** (**TimerTask** *task, const **Date** &firstTime, long long period)
Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.
- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period)
Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.
- void **scheduleAtFixedRate** (**TimerTask** *task, long long delay, long long period)
Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.
- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period)
Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.
- void **scheduleAtFixedRate** (**TimerTask** *task, const **Date** &firstTime, long long period)
Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.
- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period)
Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

6.550.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread.

Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 2739) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 2739) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 2739) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the `wait(long)` method.

Since

1.0

6.550.2 Constructor & Destructor Documentation

6.550.2.1 `decaf::util::Timer::Timer ()`

6.550.2.2 `decaf::util::Timer::Timer (const std::string & name)`

Create a new **Timer** (p. 2739) whose associated thread is assigned the name given.

Parameters

<i>name</i>	The name to assign to this Timer (p. 2739)'s Thread.
-------------	---

6.550.2.3 `virtual decaf::util::Timer::~~Timer ()` [virtual]

6.550.3 Member Function Documentation

6.550.3.1 `void decaf::util::Timer::cancel ()`

Terminates this timer, discarding any currently scheduled tasks.

Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the `run` method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.550.3.2 int decaf::util::Timer::purge ()

Removes all canceled tasks from this timer's task queue.

Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p.2739) to destroy the **TimerTask** (p.2751) pointer it was originally given, the caller should ensure that they no longer have any references to TimerTasks that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to $n + c \log n$, where n is the number of tasks in the queue and c is the number of canceled tasks.

This method can be called on a **Timer** (p.2739) object that has no scheduled tasks without error.

Returns

the number of tasks removed from the queue.

6.550.3.3 void decaf::util::Timer::schedule (TimerTask * task, long long delay)

Schedules the specified task for execution after the specified delay.

The **TimerTask** (p.2751) pointer is considered to be owned by the **Timer** (p.2739) class once it has been scheduled, the **Timer** (p.2739) will destroy its **TimerTask** (p.2751)'s once they have been canceled or the **Timer** (p.2739) itself is canceled. A **TimerTask** (p.2751) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p.2739) and the caller should ensure that the **TimerTask** (p.2751) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p.2751) instance are planned.

Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p.2751) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() (p.2672) is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, or timer was canceled.

6.550.3.4 `void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask
> & task, long long delay)`

Schedules the specified task for execution after the specified delay.

Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() (p. 2672) is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, or timer was canceled.

6.550.3.5 `void decaf::util::Timer::schedule (TimerTask * task, const Date & time)`

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 2751) pointer is considered to be owned by the **Timer** (p. 2739) class once it has been scheduled, the **Timer** (p. 2739) will destroy its **TimerTask** (p. 2751)'s once they have been canceled or the **Timer** (p. 2739) itself is canceled. A **TimerTask** (p. 2751) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2739) and the caller should ensure that the **TimerTask** (p. 2751) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2751) instance are planned.

Parameters

<i>task</i>	- task to be scheduled.
<i>time</i>	- time at which task is to be executed.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.6 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & task, const Date & time)

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

Parameters

<i>task</i>	- task to be scheduled.
<i>time</i>	- time at which task is to be executed.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.7 void decaf::util::Timer::schedule (TimerTask * task, long long delay, long long period)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 2751) pointer is considered to be owned by the **Timer** (p. 2739) class once it has been scheduled, the **Timer** (p. 2739) will destroy its **TimerTask** (p. 2751)'s once they have been canceled or the **Timer** (p. 2739) itself is canceled. A **TimerTask** (p. 2751) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2739) and the caller should ensure that the **TimerTask** (p. 2751) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2751) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() (p. 2672) is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.8 `void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & task, long long delay, long long period)`

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() (p. 2672) is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.9 void decaf::util::Timer::schedule (*TimerTask* * *task*, const *Date* & *firstTime*, long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 2751) pointer is considered to be owned by the **Timer** (p. 2739) class once it has been scheduled, the **Timer** (p. 2739) will destroy its **TimerTask** (p. 2751)'s once they have been canceled or the **Timer** (p. 2739) itself is canceled. A **TimerTask** (p. 2751) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2739) and the caller should ensure that the **TimerTask** (p. 2751) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2751) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.10 void decaf::util::Timer::schedule (const decaf::lang::Pointer< *TimerTask* > & *task*, const *Date* & *firstTime*, long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if <code>time.getTime()</code> is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.11 `void decaf::util::Timer::scheduleAtFixedRate (TimerTask * task, long long delay, long long period)`

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 2751) pointer is considered to be owned by the **Timer** (p. 2739) class once it has been scheduled, the **Timer** (p. 2739) will destroy its **TimerTask** (p. 2751)'s once they have been canceled or the **Timer** (p. 2739) itself is canceled. A **TimerTask** (p. 2751) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2739) and the caller should ensure that the **TimerTask** (p. 2751) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2751) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid suc-

cession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a count down timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() (p. 2672) is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.12 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & task, long long delay, long long period)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

<i>task</i>	- task to be scheduled.
<i>delay</i>	- delay in milliseconds before task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if delay is negative, or delay + System.currentTimeMillis() (p. 2672) is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.13 `void decaf::util::Timer::scheduleAtFixedRate (TimerTask * task, const Date & firstTime, long long period)`

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 2751) pointer is considered to be owned by the **Timer** (p. 2739) class once it has been scheduled, the **Timer** (p. 2739) will destroy its **TimerTask** (p. 2751)'s once they have been canceled or the **Timer** (p. 2739) itself is canceled. A **TimerTask** (p. 2751) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2739) and the caller should ensure that the **TimerTask** (p. 2751) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2751) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.14 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & task, const Date & firstTime, long long period)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

<i>task</i>	- task to be scheduled.
<i>firstTime</i>	- First time at which task is to be executed.
<i>period</i>	- time in milliseconds between successive task executions.

Exceptions

<i>NullPointerException</i>	- if the TimerTask (p. 2751) value is Null.
<i>IllegalArgumentException</i>	- if time.getTime() is negative.
<i>IllegalStateException</i>	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.551.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 2739).

Since

1.0

6.551.2 Constructor & Destructor Documentation

6.551.2.1 decaf::util::TimerTask::TimerTask ()

6.551.2.2 virtual **decaf::util::TimerTask::~~TimerTask** () [inline, virtual]

6.551.3 Member Function Documentation

6.551.3.1 bool **decaf::util::TimerTask::cancel** ()

Cancels this timer task.

If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

Returns

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

6.551.3.2 long long **decaf::util::TimerTask::getWhen** () const [protected]

6.551.3.3 bool **decaf::util::TimerTask::isScheduled** () const [protected]

6.551.3.4 long long **decaf::util::TimerTask::scheduledExecutionTime** () const

Returns the scheduled execution time of the most recent actual execution of this task.

(If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

```
void run() (p. 2312) { if( System::currentTimeMillis() (p. 2672) - scheduledExecutionTime() (p. 2752) >= MAX_TARDINESS) return; // Too late; skip this execution. // - Perform the task }
```

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

Returns

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 1141). The return value is undefined if the task has yet to commence its first execution.

6.551.3.5 **void decaf::util::TimerTask::setScheduledTime (long long *time*)**

6.552 decaf::internal::util::TimerTaskHeap Class Reference

A Binary Heap implemented specifically for the Timer class in Decaf Util.

```
#include <src/main/decaf/internal/util/TimerTaskHeap.h>
```

Public Member Functions

- **TimerTaskHeap ()**
- virtual **~TimerTaskHeap ()**
- **Pointer< TimerTask > peek ()**
Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.
- bool **isEmpty ()** const
- std::size_t **size ()** const
- void **insert** (const **Pointer< TimerTask >** &task)
Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.
- void **remove** (std::size_t pos)
Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.
- void **reset ()**
Clear all contents from the heap.
- void **adjustMinimum ()**
Resorts the heap starting at the top.

- `std::size_t deletelfCancelled ()`

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

- `std::size_t find (const Pointer< TimerTask > &task) const`

Searches the heap for the specified TimerTask element and returns its position in the heap.

6.552.1 Detailed Description

A Binary Heap implemented specifically for the Timer class in Decaf Util.

Since

1.0

6.552.2 Constructor & Destructor Documentation

6.552.2.1 `decaf::internal::util::TimerTaskHeap::TimerTaskHeap ()`

6.552.2.2 `virtual decaf::internal::util::TimerTaskHeap::~~TimerTaskHeap ()`
[virtual]

6.552.3 Member Function Documentation

6.552.3.1 `void decaf::internal::util::TimerTaskHeap::adjustMinimum ()`

Resorts the heap starting at the top.

6.552.3.2 `std::size_t decaf::internal::util::TimerTaskHeap::deletelfCancelled ()`

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

Returns

the number of task that were removed from the heap because they were cancelled.

6.552.3.3 `std::size_t decaf::internal::util::TimerTaskHeap::find (const Pointer< TimerTask > & task) const`

Searches the heap for the specified TimerTask element and returns its position in the heap.

Returns the unsigned equivalent of -1 if the element is not found.

Returns

the position in the Heap where the Task is stored, or npos.

6.552.3.4 `void decaf::internal::util::TimerTaskHeap::insert (const Pointer< TimerTask > & task)`

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

Parameters

<i>task</i>	The TimerTask to insert into the heap.
-------------	--

6.552.3.5 `bool decaf::internal::util::TimerTaskHeap::isEmpty () const`

Returns

true if the heap is empty.

6.552.3.6 `Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ()`

Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

Returns

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

6.552.3.7 `void decaf::internal::util::TimerTaskHeap::remove (std::size_t pos)`

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

Parameters

<i>pos</i>	The position at which to remove the TimerTask and begin a resort of the heap.
------------	---

6.552.3.8 `void decaf::internal::util::TimerTaskHeap::reset ()`

Clear all contents from the heap.

6.552.3.9 `std::size_t decaf::internal::util::TimerTaskHeap::size () const`

Returns

the size of the heap.

6.553.1 Detailed Description

A **TimeUnit** (p. 2756) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.

A **TimeUnit** (p. 2756) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 2756) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

Lock (p. 1682) lock = ...; if (lock.tryLock(50, **TimeUnit.MILLISECONDS** (p. 2764))) ...

while this code will timeout in 50 seconds:

Lock (p. 1682) lock = ...; if (lock.tryLock(50, **TimeUnit.SECONDS** (p. 2764))) ...

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 2756).

6.553.2 Constructor & Destructor Documentation

6.553.2.1 **decaf::util::concurrent::TimeUnit::TimeUnit** (int *index*, const std::string & *name*) [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters

<i>index</i>	- Index into the Time Unit set.
<i>name</i>	- Name of the unit type being represented.

6.553.2.2 **virtual decaf::util::concurrent::TimeUnit::~~TimeUnit** () [inline, virtual]

6.553.3 Member Function Documentation

6.553.3.1 **virtual int decaf::util::concurrent::TimeUnit::compareTo** (const **TimeUnit** & *value*) const [virtual]

6.553.3.2 **long long decaf::util::concurrent::TimeUnit::convert** (long long *sourceDuration*, const **TimeUnit** & *sourceUnit*) const

Convert the given time duration in the given unit to this unit.

Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to Long.MIN_VALUE if negative or Long.MAX_VALUE if positive.

For example, to convert 10 minutes to milliseconds, use: **TimeUnit.MILLISECONDS**.-convert(10L, **TimeUnit.MINUTES** (p. 2764))

Parameters

<i>source-Duration</i>	- Duration value to convert.
<i>sourceUnit</i>	- Unit type of the source duration.

Returns

the converted duration in this unit, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

6.553.3.3 `virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & value) const` [virtual]

6.553.3.4 `virtual bool decaf::util::concurrent::TimeUnit::operator< (const TimeUnit & value) const` [virtual]

6.553.3.5 `virtual bool decaf::util::concurrent::TimeUnit::operator== (const TimeUnit & value) const` [virtual]

6.553.3.6 `void decaf::util::concurrent::TimeUnit::sleep (long long timeout) const`

Perform a `Thread.sleep` using this unit.

This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

Parameters

<i>timeout</i>	the minimum time to sleep
----------------	---------------------------

See also

`Thread::sleep`

6.553.3.7 `void decaf::util::concurrent::TimeUnit::timedJoin (decaf::lang::Thread * thread, long long timeout)`

Perform a timed `Thread.join` using this time unit.

This is a convenience method that converts time arguments into the form required by the `Thread.join` method.

Parameters

<i>thread</i>	the thread to wait for
<i>timeout</i>	the maximum time to wait

Exceptions

<i>InterruptedException</i>	if interrupted while waiting.
<i>NullPointerException</i>	if the thread object is null.

See also

Thread::join(long long, long long)

6.553.3.8 void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * *obj*, long long *timeout*) const

Perform a timed `Object.wait` using this time unit.

This is a convenience method that converts timeout arguments into the form required by the `Object.wait` method.

For example, you could implement a blocking `poll` method (see **BlockingQueue.poll** (p. 543)) using:

```
Object poll( long long timeout, const TimeUnit& unit )
    throw( InterruptedException ) {

    while( empty ) {
        unit.timedWait( this, timeout );
        ...
    }
}
```

Parameters

<i>obj</i>	the object to wait on
<i>timeout</i>	the maximum time to wait.

Exceptions

<i>InterruptedException</i>	if interrupted while waiting.
<i>NullPointerException</i>	if the Synchronizable (p. 2639) object is null.

See also

Synchronizable::wait(long long, long long)

6.553.3.9 long long decaf::util::concurrent::TimeUnit::toDays (long long *duration*) const [inline]

Equivalent to `DAYS.convert(duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration.

See also

convert (p. 2758)

6.553.3.10 **long long decaf::util::concurrent::TimeUnit::toHours (long long *duration*)**
const [inline]

Equivalent to `HOURS.convert(duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration.

See also

convert (p. 2758)

6.553.3.11 **long long decaf::util::concurrent::TimeUnit::toMicros (long long *duration*)**
const [inline]

Equivalent to `MICROSECONDS.convert(duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

convert (p. 2758)

6.553.3.12 **long long decaf::util::concurrent::TimeUnit::toMillis (long long *duration*)**
const [inline]

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

convert (p. 2758)

Referenced by `decaf::util::concurrent::LinkedBlockingQueue< E >::offer()`, and `decaf::util::concurrent::LinkedBlockingQueue< E >::poll()`.

6.553.3.13 `long long decaf::util::concurrent::TimeUnit::toMinutes (long long duration) const [inline]`

Equivalent to `MINUTES.convert (duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration.

See also

convert (p. 2758)

6.553.3.14 `long long decaf::util::concurrent::TimeUnit::toNanos (long long duration) const [inline]`

Equivalent to `NANOSECONDS.convert (duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

convert (p. 2758)

6.553.3.15 `long long decaf::util::concurrent::TimeUnit::toSeconds (long long duration
) const [inline]`

Equivalent to `SECONDS.convert(duration, this)`.

Parameters

<i>duration</i>	the duration
-----------------	--------------

Returns

the converted duration.

See also

convert (p. 2758)

6.553.3.16 `virtual std::string decaf::util::concurrent::TimeUnit::toString () const
[virtual]`

Converts the **TimeUnit** (p. 2756) type to the Name of the **TimeUnit** (p. 2756).

Returns

String name of the **TimeUnit** (p. 2756)

6.553.3.17 `static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf (const
std::string & name) [static]`

Returns the **TimeUnit** (p. 2756) constant of this type with the specified name.

The string must match exactly an identifier used to declare an **TimeUnit** (p. 2756) constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters

<i>name</i>	The Name of the TimeUnit (p. 2756) constant to be returned.
-------------	--

Returns

A constant reference to the **TimeUnit** (p. 2756) Constant with the given name.

Exceptions

<i>IllegalArgument-Exception</i>	if this enum type has no constant with the specified name
----------------------------------	---

 TransactionId & other)`

6.556.2.3 virtual **activemq::commands::TransactionId::~TransactionId** ()
[virtual]

6.556.3 Member Function Documentation

6.556.3.1 virtual **TransactionId*** **activemq::commands::TransactionId::cloneData-Structure** () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

Reimplemented in **activemq::commands::XATransactionId** (p. 2938), and **activemq::commands::LocalTransactionId** (p. 1676).

6.556.3.2 virtual int **activemq::commands::TransactionId::compareTo** (const **TransactionId** & *value*) const [virtual]

6.556.3.3 virtual void **activemq::commands::TransactionId::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1134).

Reimplemented in **activemq::commands::XATransactionId** (p. 2939), and **activemq::commands::LocalTransactionId** (p. 1676).

6.556.3.4 virtual bool **activemq::commands::TransactionId::equals** (const **DataStructure** * *value*) const [virtual]

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataSet** (p. 1133)'s are Equal.

Implements **activemq::commands::DataSet** (p. 1135).

Reimplemented in **activemq::commands::XATransactionId** (p. 2939), and **activemq::commands::LocalTransactionId** (p. 1676).

6.556.3.5 `virtual bool activemq::commands::TransactionId::equals (const TransactionId & value) const [virtual]`

6.556.3.6 `virtual unsigned char activemq::commands::TransactionId::getDataSetType () const [virtual]`

Get the **DataSet** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataSet** (p. 1137).

Reimplemented in **activemq::commands::XATransactionId** (p. 2940), and **activemq::commands::LocalTransactionId** (p. 1677).

6.556.3.7 `virtual bool activemq::commands::TransactionId::isLocalTransactionId () const [inline, virtual]`

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1677).

6.556.3.8 `virtual bool activemq::commands::TransactionId::isXATransactionId () const [inline, virtual]`

Reimplemented in **activemq::commands::XATransactionId** (p. 2941).

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

6.557

activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller

Class Reference

2779

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1123).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1680), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2944).

6.557.3.2 **virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)**
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1125).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1680), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2945).

6.557.3.3 **virtual int activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*)**
[virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenWireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1681), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2945).

6.557.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]**

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1681), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2945).

6.557.3.5 **virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]**

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1682), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2946).

Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer** < **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer** < **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer** < **ConnectionId** > &connectionId)
- virtual const **Pointer** < **TransactionId** > & **getTransactionId** () const
- virtual **Pointer** < **TransactionId** > & **getTransactionId** ()

- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)
- virtual unsigned char **getType** () const
- virtual void **setType** (unsigned char type)
- virtual bool **isTransactionInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_TRANSACTIONINFO** = 7

Protected Attributes

- **Pointer**< **ConnectionId** > **connectionId**
- **Pointer**< **TransactionId** > **transactionId**
- unsigned char **type**

6.558.1 Constructor & Destructor Documentation

6.558.1.1 **activemq::commands::TransactionInfo::TransactionInfo** ()

6.558.1.2 **virtual activemq::commands::TransactionInfo::~~TransactionInfo** ()
[virtual]

6.558.2 Member Function Documentation

6.558.2.1 **virtual TransactionInfo* activemq::commands::TransactionInfo::clone-DataStructure** () const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1133).

6.558.2.2 **virtual void activemq::commands::TransactionInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 493).

6.558.2.3 `virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.558.2.4 `virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () const [virtual]`

6.558.2.5 `virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () [virtual]`

6.558.2.6 `virtual unsigned char activemq::commands::TransactionInfo::getDataType () const [virtual]`

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.558.2.7 `virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () const [virtual]`

6.558.2.8 `virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () [virtual]`

6.558.2.9 `virtual unsigned char activemq::commands::TransactionInfo::getType () const [virtual]`

Referenced by **activemq::state::CommandVisitorAdapter::processTransactionInfo()**.

6.558.2.10 `virtual bool activemq::commands::TransactionInfo::isTransactionInfo () const [inline, virtual]`

Returns

an answer of true to the **isTransactionInfo()** (p. 2777) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 497).

6.558.2.11 `virtual void activemq::commands::TransactionInfo::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`

6.558.2.12 `virtual void activemq::commands::TransactionInfo::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`

6.558.2.13 `virtual void activemq::commands::TransactionInfo::setType (unsigned char type) [virtual]`

6.558.2.14 `virtual std::string activemq::commands::TransactionInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.558.2.15 `virtual Pointer< Command > activemq::commands::Transaction-Info::visit (activemq::state::CommandVisitor * visitor) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.559.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::createObject** () const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.559.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::getDataStructureType** () const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

6.559

activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller
Class Reference **2787**
~~Returns~~

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller**
(p. 1122).

6.559.3.3 **virtual void activemq::wireformat::openwire::marshal::generated::-**
TransactionInfoMarshaller::looseMarshal (OpenWireFormat * *format*,
commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*
) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-**
CommandMarshaller (p. 500).

6.559.3.4 **virtual void activemq::wireformat::openwire::marshal::generated::-**
TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*,
commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*)
[virtual]

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-**
CommandMarshaller (p. 501).

6.559.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::-`
TransactionInfoMarshaller::tightMarshal1 (`OpenWireFormat * format`,
`commands::DataStructure * command`, `utils::BooleanStream * bs`)
`[virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 503).

6.559.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::-`
TransactionInfoMarshaller::tightMarshal2 (`OpenWireFormat * format`,
`commands::DataStructure * command`, `decaf::io::DataOutputStream * ds`,
`utils::BooleanStream * bs`) `[virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 504).

6.559.3.7 `virtual void activemq::wireformat::openwire::marshal::generated::-`
TransactionInfoMarshaller::tightUnmarshal (`OpenWireFormat * format`,
`commands::DataStructure * command`, `decaf::io::DataInputStream * dis`,
`utils::BooleanStream * bs`) `[virtual]`

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::Base-CommandMarshaller** (p. 505).

```

Inheritance diagram for `decaf::internal::util::concurrent::Transferer< E >`:

6.563.1 Detailed Description

```
template<typename E>class decaf::internal::util::concurrent::Transferer< E >
```

Shared internal API for dual stacks and queues.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/util/concurrent/Transferer.h`

6.564 decaf::internal::util::concurrent::TransferQueue< E > Class Template Reference

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers.

```
#include <src/main/decaf/internal/util/concurrent/TransferQueue.h>
```

Inheritance diagram for decaf::internal::util::concurrent::TransferQueue< E >:

Public Member Functions

- **TransferQueue** ()
*Node class for **TransferQueue** (p. 2787).*
- virtual ~**TransferQueue** ()
- virtual void **transfer** (E *e, bool timed, long long nanos)
Performs a put.
- virtual E * **transfer** (bool timed, long long nanos)
Performs a take.

6.564.1 Detailed Description

```
template<typename E>class decaf::internal::util::concurrent::TransferQueue< E >
```

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers.

The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

6.564.2 Constructor & Destructor Documentation

```
6.564.2.1 template<typename E > decaf::internal::util::concurrent::TransferQueue< E >::TransferQueue ( ) [inline]
```

Node class for **TransferQueue** (p. 2787).

Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.564 decaf::internal::util::concurrent::TransferQueue< E > Class Template Reference 2795

6.564.2.2 `template<typename E> virtual decaf::internal::util::concurrent-
::TransferQueue< E >::~~TransferQueue () [inline,
virtual]`

6.564.3 Member Function Documentation

6.564.3.1 `template<typename E> virtual void decaf::internal::util::concurrent:-
TransferQueue< E >::transfer (E * e, bool timed, long long nanos)
[inline, virtual]`

Performs a put.

Parameters

<i>e</i>	the item to be handed to a consumer;
<i>timed</i>	if this operation should timeout
<i>nanos</i>	the timeout, in nanoseconds

Exceptions

<i>TimeoutException</i>	if the operation timed out waiting for the consumer to accept the item offered.
<i>InterruptedException</i>	if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 2786).

6.564.3.2 `template<typename E> virtual E* decaf::internal::util::concurrent:-
TransferQueue< E >::transfer (bool timed, long long nanos) [inline,
virtual]`

Performs a take.

Parameters

<i>timed</i>	if this operation should timeout
<i>nanos</i>	the timeout, in nanoseconds

Returns

the item provided or received;

Exceptions

<i>TimeoutException</i>	if the operation timed out waiting for the producer to offer an item.
<i>InterruptedException</i>	if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer**< E > (p. 2786).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**TransferQueue.h**

6.565 decaf::internal::util::concurrent::TransferStack< E > Class Template Reference

6.566 activemq::transport::Transport Class Reference

Interface for a transport layer for command objects.

```
#include <src/main/activemq/transport/Transport.h>
```

Inheritance diagram for activemq::transport::Transport:

Public Member Functions

- virtual **~Transport** ()
- virtual void **start** ()=0

*Starts the **Transport** (p. 2790), the send methods of a **Transport** (p. 2790) will throw an exception if used before the **Transport** (p. 2790) is started.*
- virtual void **stop** ()=0

*Stops the **Transport** (p. 2790).*
- virtual void **oneway** (const **Pointer**< **Command** > &command)=0

Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command)=0

Sends the given command to the broker and then waits for the response.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout)=0

Sends the given command to the broker and then waits for the response.
- virtual **Pointer** < **wireformat::WireFormat** > **getWireFormat** () const =0

Gets the WireFormat instance that is in use by this transport.
- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)=0

Sets the WireFormat instance to use.
- virtual void **setTransportListener** (**TransportListener** *listener)=0

Sets the observer of asynchronous events from this transport.
- virtual **TransportListener** * **getTransportListener** () const =0

Gets the observer of asynchronous events from this transport.
- virtual **Transport** * **narrow** (const std::type_info &typeid)=0

*Narrows down a Chain of Transports to a specific **Transport** (p. 2790) to allow a higher level transport to skip intermediate Transports in certain circumstances.*
- virtual bool **isFaultTolerant** () const =0

*Is this **Transport** (p. 2790) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const =0

*Is the **Transport** (p. 2790) Connected to its Broker.*
- virtual bool **isClosed** () const =0

*Has the **Transport** (p. 2790) been shutdown and no longer usable.*
- virtual bool **isReconnectSupported** () const =0
- virtual bool **isUpdateURIsSupported** () const =0
- virtual std::string **getRemoteAddress** () const =0
- virtual void **reconnect** (const **decaf::net::URI** &uri)=0

reconnect to another location
- virtual void **updateURIs** (bool rebalance, const **decaf::util::List**< **decaf::net::URI** > &uris)=0

*Updates the set of URIs the **Transport** (p. 2790) can connect to.*

6.566.1 Detailed Description

Interface for a transport layer for command objects.

Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 2790) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 2790) layer runs. Transports should be given an instance of a **WireFormat** object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.566.2 Constructor & Destructor Documentation

6.566.2.1 `virtual activemq::transport::Transport::~Transport () [inline, virtual]`

6.566.3 Member Function Documentation

6.566.3.1 `virtual std::string activemq::transport::Transport::getRemoteAddress () const [pure virtual]`

Returns

the remote address for this connection

Implemented in **activemq::transport::IOTransport** (p. 1551), **activemq::transport::mock::MockTransport** (p. 1952), **activemq::transport::failover::FailoverTransport** (p. 1309), and **activemq::transport::TransportFilter** (p. 2803).

6.566.3.2 `virtual TransportListener* activemq::transport::Transport::getTransportListener () const [pure virtual]`

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implemented in **activemq::transport::IOTransport** (p. 1551), **activemq::transport::mock::MockTransport** (p. 1952), **activemq::transport::failover::FailoverTransport** (p. 1309), and **activemq::transport::TransportFilter** (p. 2803).

6.566.3.3 `virtual Pointer<wireformat::WireFormat> activemq::transport::Transport::getWireFormat () const [pure virtual]`

Gets the WireFormat instance that is in use by this transport.

In the case of nested transport this method delegates down to the lowest level transport that actually maintains a `WireFormat` info instance.

Returns

The `WireFormat` the object used to encode / decode commands.

Implemented in `activemq::transport::IOTransport` (p. 1551), `activemq::transport::mock::MockTransport` (p. 1952), `activemq::transport::failover::FailoverTransport` (p. 1310), and `activemq::transport::TransportFilter` (p. 2804).

6.566.3.4 `virtual bool activemq::transport::Transport::isClosed () const [pure virtual]`

Has the **Transport** (p. 2790) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2790)

Implemented in `activemq::transport::IOTransport` (p. 1552), `activemq::transport::mock::MockTransport` (p. 1952), `activemq::transport::TransportFilter` (p. 2804), `activemq::transport::failover::FailoverTransport` (p. 1311), and `activemq::transport::tcp::TcpTransport` (p. 2696).

6.566.3.5 `virtual bool activemq::transport::Transport::isConnected () const [pure virtual]`

Is the **Transport** (p. 2790) Connected to its Broker.

Returns

true if a connection has been made.

Implemented in `activemq::transport::IOTransport` (p. 1552), `activemq::transport::mock::MockTransport` (p. 1953), `activemq::transport::failover::FailoverTransport` (p. 1311), `activemq::transport::TransportFilter` (p. 2804), and `activemq::transport::tcp::TcpTransport` (p. 2696).

6.566.3.6 `virtual bool activemq::transport::Transport::isFaultTolerant () const [pure virtual]`

Is this **Transport** (p. 2790) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2790) is fault tolerant.

Implemented in **activemq::transport::IOTransport** (p. 1552), **activemq::transport::mock::MockTransport** (p. 1953), **activemq::transport::failover::FailoverTransport** (p. 1311), **activemq::transport::TransportFilter** (p. 2804), and **activemq::transport::tcp::TcpTransport** (p. 2696).

6.566.3.7 `virtual bool activemq::transport::Transport::isReconnectSupported ()`
`const [pure virtual]`

Returns

true if reconnect is supported.

Implemented in **activemq::transport::mock::MockTransport** (p. 1954), **activemq::transport::failover::FailoverTransport** (p. 1312), **activemq::transport::IOTransport** (p. 1552), and **activemq::transport::TransportFilter** (p. 2805).

6.566.3.8 `virtual bool activemq::transport::Transport::isUpdateURIsSupported ()`
`const [pure virtual]`

Returns

true if updating uris is supported.

Implemented in **activemq::transport::mock::MockTransport** (p. 1954), **activemq::transport::failover::FailoverTransport** (p. 1312), **activemq::transport::IOTransport** (p. 1552), and **activemq::transport::TransportFilter** (p. 2805).

6.566.3.9 `virtual Transport* activemq::transport::Transport::narrow (const`
`std::type_info & typeId) [pure virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 2790) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

<i>typeId</i>	- The type_info of the Object we are searching for.
---------------	---

Returns

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::IOTransport** (p. 1553), **activemq::transport::mock::MockTransport** (p. 1954), **activemq::transport::failover::FailoverTransport** (p. 1312), and **activemq::transport::TransportFilter** (p. 2805).

6.566.3.10 `virtual void activemq::transport::Transport::oneway (const Pointer< Command> & command) [pure virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

<i>command</i>	The command to be sent.
----------------	-------------------------

Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Implemented in `activemq::transport::mock::MockTransport` (p. 1954), `activemq::transport::IOTransport` (p. 1553), `activemq::transport::failover::FailoverTransport` (p. 1313), `activemq::transport::TransportFilter` (p. 2806), `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2062), `activemq::transport::correlator::ResponseCorrelator` (p. 2305), `activemq::transport::inactivity::InactivityMonitor` (p. 1427), and `activemq::transport::logging::LoggingTransport` (p. 1710).

6.566.3.11 `virtual void activemq::transport::Transport::reconnect (const decaf::net::URI & uri) [pure virtual]`

reconnect to another location

Parameters

<i>uri</i>	The new URI to connect this Transport (p. 2790) to.
------------	--

Exceptions

<i>IOException</i>	on failure or if reconnect is not supported.
--------------------	--

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1313), and `activemq::transport::TransportFilter` (p. 2807).

6.566.3.12 `virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command> & command) [pure virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

Returns

the response from the broker.

Exceptions

<i>IOException</i>	if an exception occurs during the read of the command.
<i>Unsupported-Operation</i>	if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 1955), **activemq::transport::IOTransport** (p. 1553), **activemq::transport::failover::FailoverTransport** (p. 1314), **activemq::transport::TransportFilter** (p. 2807), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2063), **activemq::transport::correlator::ResponseCorrelator** (p. 2306), and **activemq::transport::logging::LoggingTransport** (p. 1711).

```
6.566.3.13 virtual Pointer<Response> activemq::transport::Transport::request (
    const Pointer< Command > & command, unsigned int timeout ) [pure
    virtual]
```

Sends the given command to the broker and then waits for the response.

Parameters

<i>command</i>	The command to be sent.
<i>timeout</i>	The time to wait for this response.

Returns

the response from the broker.

Exceptions

<i>IOException</i>	if an exception occurs during the read of the command.
<i>Unsupported-Operation</i>	if this method is not implemented by this transport.

Implemented in **activemq::transport::IOTransport** (p. 1554), **activemq::transport::mock::MockTransport** (p. 1955), **activemq::transport::failover::FailoverTransport** (p. 1315), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2063), **activemq::transport::TransportFilter** (p. 2807), **activemq::transport::correlator::ResponseCorrelator** (p. 2306), and **activemq::transport::logging::LoggingTransport** (p. 1711).

6.566.3.14 virtual void **activemq::transport::Transport::setTransportListener** (
TransportListener * listener) [pure virtual]

Sets the observer of asynchronous events from this transport.

Parameters

<i>listener</i>	the listener of transport events.
-----------------	-----------------------------------

Implemented in **activemq::transport::IOTransport** (p. 1555), **activemq::transport::mock::MockTransport** (p. 1957), **activemq::transport::failover::FailoverTransport** (p. 1316), and **activemq::transport::TransportFilter** (p. 2808).

6.566.3.15 virtual void **activemq::transport::Transport::setWireFormat** (const
Pointer< wireformat::WireFormat > & wireFormat) [pure virtual]

Sets the WireFormat instance to use.

Parameters

<i>wireFormat</i>	The WireFormat the object used to encode / decode commands.
-------------------	---

Implemented in **activemq::transport::IOTransport** (p. 1555), and **activemq::transport::TransportFilter** (p. 2808).

6.566.3.16 virtual void **activemq::transport::Transport::start** () [pure
virtual]

Starts the **Transport** (p. 2790), the send methods of a **Transport** (p. 2790) will throw an exception if used before the **Transport** (p. 2790) is started.

Exceptions

<i>IOException</i>	if an error occurs while starting the Transport (p. 2790).
--------------------	---

Implemented in **activemq::transport::IOTransport** (p. 1555), **activemq::transport::mock::MockTransport** (p. 1958), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2064), **activemq::transport::TransportFilter** (p. 2808), **activemq::transport::failover::FailoverTransport** (p. 1317), and **activemq::transport::correlator::ResponseCorrelator** (p. 2307).

6.566.3.17 virtual void **activemq::transport::Transport::stop** () [pure
virtual]

Stops the **Transport** (p. 2790).

Exceptions

<i>IOException</i>	if an error occurs while stopping the transport.
--------------------	--

Implemented in **activemq::transport::IOTransport** (p. 1556), **activemq::transport::mock::MockTransport** (p. 1958), **activemq::transport::TransportFilter** (p. 2809), and **activemq::transport::failover::FailoverTransport** (p. 1317).

6.566.3.18 `virtual void activemq::transport::Transport::updateURIs (bool rebalance, const decaf::util::List< decaf::net::URI > & uris) [pure virtual]`

Updates the set of URIs the **Transport** (p. 2790) can connect to.

If the **Transport** (p. 2790) doesn't support updating its URIs then an *IOException* is thrown.

Parameters

<i>rebalance</i>	Indicates if a forced reconnection should be performed as a result of the update.
<i>uris</i>	The new list of URIs that can be used for connection.

Exceptions

<i>IOException</i>	if an error occurs or updates aren't supported.
--------------------	---

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1317), and **activemq::transport::TransportFilter** (p. 2809).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/Transport.h`

6.567 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

```
#include <src/main/activemq/transport/TransportFactory.h>
```

Inheritance diagram for `activemq::transport::TransportFactory`:

Public Member Functions

- `virtual ~TransportFactory ()`
- `virtual Pointer< Transport > create (const decaf::net::URI &location)=0`

*Creates a fully configured **Transport** (p. 2790) instance which could be a chain of filters and transports.*

- virtual **Pointer< Transport > createComposite** (const **decaf::net::URI** &location)=0

*Creates a slimmed down **Transport** (p. 2790) instance which can be used in composite transport instances.*

6.567.1 Detailed Description

Defines the interface for Factories that create Transports or TransportFilters.

The factory should be able to create either a completely configured **Transport** (p. 2790) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimmed down version that is used in composite transports like Failover or Fanout.

Since

3.0

6.567.2 Constructor & Destructor Documentation

6.567.2.1 virtual **activemq::transport::TransportFactory::~TransportFactory** ()
[inline, virtual]

6.567.3 Member Function Documentation

6.567.3.1 virtual **Pointer<Transport> activemq::transport::TransportFactory::create** (const **decaf::net::URI** & *location*) [pure virtual]

Creates a fully configured **Transport** (p. 2790) instance which could be a chain of filters and transports.

Parameters

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1319), **activemq::transport::mock::MockTransportFactory** (p. 1959), and **activemq::transport::tcp::TcpTransportFactory** (p. 2697).

6.567.3.2 `virtual Pointer<Transport> activemq::transport::TransportFactory-
::createComposite (const decaf::net::URI & location) [pure
virtual]`

Creates a slimed down **Transport** (p. 2790) instance which can be used in composite transport instances.

Parameters

<i>location</i>	- URI location to connect to plus any properties to assign.
-----------------	---

Exceptions

<i>ActiveMQException</i>	if an error occurs
--------------------------	--------------------

Implemented in **activemq::transport::mock::MockTransportFactory** (p. 1960), **activemq::transport::failover::FailoverTransportFactory** (p. 1319), and **activemq::transport::tcp::TcpTransportFactory** (p. 2698).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFactory.h**

6.568 activemq::transport::TransportFilter Class Reference

A filter on the transport layer.

```
#include <src/main/activemq/transport/TransportFilter.h>
```

Inheritance diagram for activemq::transport::TransportFilter:

Public Member Functions

- **TransportFilter** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual ~**TransportFilter** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
The transport has resumed after an interruption.
- virtual void **oneway** (const **Pointer**< **Command** > &command)

Sends a one-way command.

- virtual **Pointer< Response > request** (const **Pointer< Command > &command**)

Sends the given command to the broker and then waits for the response.

- virtual **Pointer< Response > request** (const **Pointer< Command > &command**, unsigned int timeout)

Sends the given command to the broker and then waits for the response.

- virtual void **setTransportListener** (**TransportListener *listener**)

Sets the observer of asynchronous events from this transport.

- virtual **TransportListener * getTransportListener** () const

Gets the observer of asynchronous events from this transport.

- virtual **Pointer < wireformat::WireFormat > getWireFormat** () const

Gets the WireFormat instance that is in use by this transport.

- virtual void **setWireFormat** (const **Pointer< wireformat::WireFormat > &wireFormat**)

Sets the WireFormat instance to use.

- virtual void **start** ()

*Starts the **Transport** (p. 2790), the send methods of a **Transport** (p. 2790) will throw an exception if used before the **Transport** (p. 2790) is started.*

- virtual void **stop** ()

*Stops the **Transport** (p. 2790).*

- virtual void **close** ()

Closes this object and deallocates the appropriate resources.

*Has the **Transport** (p. 2790) been shutdown and no longer usable.*

- virtual std::string **getRemoteAddress** () const

- virtual void **reconnect** (const **decaf::net::URI &uri**)

reconnect to another location

- virtual void **updateURIs** (bool rebalance, const **decaf::util::List< decaf::net::URI > &uris**)

*Updates the set of URIs the **Transport** (p. 2790) can connect to.*

Protected Member Functions

- void **fire** (const **decaf::lang::Exception** &ex)
Notify the listener of the thrown Exception.
- void **fire** (const **Pointer**< **Command** > &command)
Notify the listener of the new incoming Command.

Protected Attributes

- **Pointer**< **Transport** > **next**
The transport that this filter wraps around.
- **TransportListener** * **listener**
Listener of this transport.

6.568.1 Detailed Description

A filter on the transport layer.

Transport (p. 2790) filters implement the **Transport** (p. 2790) interface and optionally delegate calls to another **Transport** (p. 2790) object.

Since

1.0

6.568.2 Constructor & Destructor Documentation

6.568.2.1 **activemq::transport::TransportFilter::TransportFilter** (const **Pointer**< **Transport** > & *next*)

Constructor.

Parameters

<i>next</i>	- the next Transport (p. 2790) in the chain
-------------	--

6.568.2.2 **virtual activemq::transport::TransportFilter::~~TransportFilter** ()
[virtual]

6.568.3 Member Function Documentation

6.568.3.1 **virtual void activemq::transport::TransportFilter::close** () [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

<i>IOException</i>	if an error occurs while closing.
--------------------	-----------------------------------

Implements **decaf::io::Closeable** (p. 817).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2062), **activemq::transport::tcp::TcpTransport** (p. 2694), **activemq::transport::correlator::ResponseCorrelator** (p. 2304), and **activemq::transport::inactivity::InactivityMonitor** (p. 1427).

6.568.3.2 `void activemq::transport::TransportFilter::fire (const decaf::lang::Exception & ex)` [protected]

Notify the listener of the thrown Exception.

Parameters

<i>ex</i>	- the exception to send to listeners
-----------	--------------------------------------

6.568.3.3 `void activemq::transport::TransportFilter::fire (const Pointer< Command > & command)` [protected]

Notify the listener of the new incoming Command.

Parameters

<i>command</i>	- the command to send to the listener
----------------	---------------------------------------

6.568.3.4 `virtual std::string activemq::transport::TransportFilter::getRemoteAddress () const` [inline, virtual]

Returns

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2792).

6.568.3.5 `virtual TransportListener* activemq::transport::TransportFilter::getTransportListener () const` [inline, virtual]

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implements **activemq::transport::Transport** (p. 2792).

6.568.3.6 `virtual Pointer<wireformat::WireFormat> activemq::transport-
::TransportFilter::getWireFormat () const [inline,
virtual]`

Gets the WireFormat instance that is in use by this transport.

In the case of nested transport this method delegates down to the lowest level transport that actually maintains a WireFormat info instance.

Returns

The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 2792).

6.568.3.7 `virtual bool activemq::transport::TransportFilter::isClosed () const
[inline, virtual]`

Has the **Transport** (p. 2790) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2790)

Implements **activemq::transport::Transport** (p. 2793).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2696).

6.568.3.8 `virtual bool activemq::transport::TransportFilter::isConnected () const
[inline, virtual]`

Is the **Transport** (p. 2790) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2793).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2696).

6.568.3.9 `virtual bool activemq::transport::TransportFilter::isFaultTolerant () const
[inline, virtual]`

Is this **Transport** (p. 2790) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2790) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2793).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2696).

6.568.3.10 `virtual bool activemq::transport::TransportFilter::isReconnectSupported () const [inline, virtual]`

Returns

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 2794).

6.568.3.11 `virtual bool activemq::transport::TransportFilter::isUpdateURIsSupported () const [inline, virtual]`

Returns

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 2794).

6.568.3.12 `virtual Transport* activemq::transport::TransportFilter::narrow (const std::type_info & typeId) [virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 2790) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

<i>typeId</i>	- The type_info of the Object we are searching for.
---------------	---

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2794).

6.568.3.13 `virtual void activemq::transport::TransportFilter::onCommand (const Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

Parameters

<i>command</i>	- the received command object.
----------------	--------------------------------

Implements **activemq::transport::TransportListener** (p. 2811).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2062), **activemq::transport::correlator::ResponseCorrelator** (p. 2305), **activemq::transport::inactivity::InactivityMonitor** (p. 1427), and **activemq::transport::logging::LoggingTransport** (p. 1710).

6.568.3.14 virtual void **activemq::transport::TransportFilter::oneway** (const **Pointer< Command > & command**) [inline, virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

<i>command</i>	The command to be sent.
----------------	-------------------------

Exceptions

<i>IOException</i>	if an exception occurs during writing of the command.
<i>Unsupported-OperationException</i>	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2795).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2062), **activemq::transport::correlator::ResponseCorrelator** (p. 2305), **activemq::transport::inactivity::InactivityMonitor** (p. 1427), and **activemq::transport::logging::LoggingTransport** (p. 1710).

6.568.3.15 virtual void **activemq::transport::TransportFilter::onException** (const **decaf::lang::Exception & ex**) [virtual]

Event handler for an exception from a command transport.

Parameters

<i>ex</i>	The exception to handle.
-----------	--------------------------

Implements **activemq::transport::TransportListener** (p. 2811).

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1428).

6.568.3.16 `virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & uri) [virtual]`

reconnect to another location

Parameters

<i>uri</i>	The new URI to connect this Transport (p. 2790) to.
------------	--

Exceptions

<i>IOException</i>	on failure or if reconnect is not supported.
--------------------	--

Implements **activemq::transport::Transport** (p. 2795).

6.568.3.17 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command) [inline, virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

<i>command</i>	the command to be sent.
----------------	-------------------------

Returns

the response from the broker.

Exceptions

<i>IOException</i>	if an exception occurs during the read of the command.
<i>UnsupportedOperationException</i>	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2795).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2063), **activemq::transport::correlator::ResponseCorrelator** (p. 2306), and **activemq::transport::logging::LoggingTransport** (p. 1711).

6.568.3.18 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command, unsigned int timeout) [inline, virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

<i>command</i>	The command to be sent.
<i>timeout</i>	The time to wait for this response.

Returns

the response from the broker.

Exceptions

<i>IOException</i>	if an exception occurs during the read of the command.
<i>Unsupported-Operation</i>	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2796).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2063), **activemq::transport::correlator::ResponseCorrelator** (p. 2306), and **activemq::transport::logging::LoggingTransport** (p. 1711).

6.568.3.19 virtual void **activemq::transport::TransportFilter::setTransportListener** (**TransportListener** * *listener*) [inline, virtual]

Sets the observer of asynchronous events from this transport.

Parameters

<i>listener</i>	the listener of transport events.
-----------------	-----------------------------------

Implements **activemq::transport::Transport** (p. 2797).

6.568.3.20 virtual void **activemq::transport::TransportFilter::setWireFormat** (const **Pointer**< **wireformat::WireFormat** > & *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters

<i>wireFormat</i>	The WireFormat the object used to encode / decode commands.
-------------------	---

Implements **activemq::transport::Transport** (p. 2797).

6.568.3.21 virtual void **activemq::transport::TransportFilter::start** () [virtual]

Starts the **Transport** (p. 2790), the send methods of a **Transport** (p. 2790) will throw an exception if used before the **Transport** (p. 2790) is started.

Exceptions

<i>IOException</i>	if an error occurs while starting the Transport (p. 2790).
--------------------	---

Implements **activemq::transport::Transport** (p. 2797).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2064), and **activemq::transport::correlator::ResponseCorrelator** (p. 2307).

6.568.3.22 `virtual void activemq::transport::TransportFilter::stop () [virtual]`

Stops the **Transport** (p. 2790).

Exceptions

<i>IOException</i>	if an error occurs while stopping the transport.
--------------------	--

Implements **activemq::transport::Transport** (p. 2797).

6.568.3.23 `virtual void activemq::transport::TransportFilter::transportInterrupted () [virtual]`

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2812).

6.568.3.24 `virtual void activemq::transport::TransportFilter::transportResumed () [virtual]`

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2812).

6.568.3.25 `virtual void activemq::transport::TransportFilter::updateURIs (bool rebalance, const decaf::util::List< decaf::net::URI > & uris) [inline, virtual]`

Updates the set of URIs the **Transport** (p. 2790) can connect to.

If the **Transport** (p. 2790) doesn't support updating its URIs then an *IOException* is thrown.

Parameters

<i>rebalance</i>	Indicates if a forced reconnection should be performed as a result of the update.
<i>uris</i>	The new list of URIs that can be used for connection.

Exceptions

<code>IOException</code>	if an error occurs or updates aren't supported.
--------------------------	---

Implements `activemq::transport::Transport` (p. 2798).

6.568.4 Field Documentation

6.568.4.1 `TransportListener*` `activemq::transport::TransportFilter::listener`
[protected]

Listener of this transport.

6.568.4.2 `Pointer<Transport>` `activemq::transport::TransportFilter::next`
[protected]

The transport that this filter wraps around.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFilter.h`

6.569 `activemq::transport::TransportListener` Class Reference

A listener of asynchronous exceptions from a command transport object.

```
#include <src/main/activemq/transport/TransportListener.h>
```

Inheritance diagram for `activemq::transport::TransportListener`:

Public Member Functions

- virtual `~TransportListener()`
- virtual void `onCommand` (const `Pointer<Command>` &command)=0
Event handler for the receipt of a command.
- virtual void `onException` (const `decaf::lang::Exception` &ex)=0
Event handler for an exception from a command transport.
- virtual void `transportInterrupted` ()=0
The transport has suffered an interruption from which it hopes to recover.
- virtual void `transportResumed` ()=0
The transport has resumed after an interruption.

6.569.1 Detailed Description

A listener of asynchronous exceptions from a command transport object.

6.569.2 Constructor & Destructor Documentation

6.569.2.1 `virtual activemq::transport::TransportListener::~~TransportListener ()`
`[inline, virtual]`

6.569.3 Member Function Documentation

6.569.3.1 `virtual void activemq::transport::TransportListener::onCommand (const`
`Pointer< Command > & command) [pure virtual]`

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2790) deletes the command upon receipt.

Parameters

<i>command</i>	The received command object.
----------------	------------------------------

Implemented in `activemq::core::ActiveMQConnection` (p. 204), `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2062), `activemq::transport::correlator::ResponseCorrelator` (p. 2305), `activemq::transport::TransportFilter` (p. 2805), `activemq::transport::inactivity::InactivityMonitor` (p. 1427), `activemq::transport::mock::InternalCommandListener` (p. 1528), `activemq::transport::failover::FailoverTransportListener` (p. 1321), and `activemq::transport::logging::LoggingTransport` (p. 1710).

6.569.3.2 `virtual void activemq::transport::TransportListener::onException (const`
`decaf::lang::Exception & ex) [pure virtual]`

Event handler for an exception from a command transport.

Parameters

<i>ex</i>	The exception being propagated to this listener to handle.
-----------	--

Implemented in `activemq::core::ActiveMQConnection` (p. 205), `activemq::transport::failover::BackupTransport` (p. 488), `activemq::transport::TransportFilter` (p. 2806), `activemq::transport::inactivity::InactivityMonitor` (p. 1428), and `activemq::transport::failover::FailoverTransportListener` (p. 1322).

6.569.3.3 `virtual void activemq::transport::TransportListener::transportInterrupted () [pure virtual]`

The transport has suffered an interruption from which it hopes to recover.

Implemented in `activemq::core::ActiveMQConnection` (p. 212), `activemq::transport::TransportFilter` (p. 2809), `activemq::transport::failover::FailoverTransportListener` (p. 1322), and `activemq::transport::DefaultTransportListener` (p. 1179).

6.569.3.4 `virtual void activemq::transport::TransportListener::transportResumed () [pure virtual]`

The transport has resumed after an interruption.

Implemented in `activemq::core::ActiveMQConnection` (p. 213), `activemq::transport::TransportFilter` (p. 2809), `activemq::transport::failover::FailoverTransportListener` (p. 1322), and `activemq::transport::DefaultTransportListener` (p. 1179).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportListener.h`

6.570 `activemq::transport::TransportRegistry` Class Reference

Registry of all **Transport** (p. 2790) Factories that are available to the client at runtime.

```
#include <src/main/activemq/transport/TransportRegistry.h>
```

Public Member Functions

- `virtual ~TransportRegistry ()`
- `TransportFactory * findFactory (const std::string &name) const`
*Gets a Registered **TransportFactory** (p. 2798) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*
- `void registerFactory (const std::string &name, TransportFactory *factory)`
*Registers a new **TransportFactory** (p. 2798) with this Registry.*
- `void unregisterFactory (const std::string &name)`
Unregisters the Factory with the given name and deletes that instance of the Factory.
- `void unregisterAllFactories ()`
Removes all Factories and deletes the instances of the Factory objects.
- `std::vector< std::string > getTransportNames () const`
*Retrieves a list of the names of all the Registered **Transport** (p. 2790)'s in this Registry.*

Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

*Gets the single instance of the **TransportRegistry** (p. 2812).*

6.570.1 Detailed Description

Registry of all **Transport** (p. 2790) Factories that are available to the client at runtime.

New **Transport** (p. 2790)'s must have a factory registered here before a connection attempt is made.

Since

3.0

6.570.2 Constructor & Destructor Documentation

6.570.2.1 **virtual activemq::transport::TransportRegistry::~TransportRegistry** ()
[virtual]

6.570.3 Member Function Documentation

6.570.3.1 **TransportFactory* activemq::transport::TransportRegistry::findFactory**
(const std::string & *name*) const

Gets a Registered **TransportFactory** (p. 2798) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

<i>name</i>	The name of the Factory to find in the Registry.
-------------	--

Returns

the Factory registered under the given name.

Exceptions

<i>NoSuchElementException</i>	if no factory is registered with that name.
-------------------------------	---

6.570.3.2 **static TransportRegistry& activemq::transport::TransportRegistry::getInstance** () [static]

Gets the single instance of the **TransportRegistry** (p. 2812).

Returns

reference to the single instance of this Registry

6.570.3.3 `std::vector<std::string> activemq::transport::TransportRegistry::get-TransportNames () const`

Retrieves a list of the names of all the Registered **Transport** (p. 2790)'s in this Registry.

Returns

stl vector of strings with all the **Transport** (p. 2790) names registered.

6.570.3.4 `void activemq::transport::TransportRegistry::registerFactory (const std::string & name, TransportFactory * factory)`

Registers a new **TransportFactory** (p. 2798) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

<i>name</i>	The name of the new Factory to register.
<i>factory</i>	The new Factory to add to the Registry.

Exceptions

<i>IllegalArgument-Exception</i>	is name is the empty string.
<i>NullPointerException</i>	if the Factory is Null.

6.570.3.5 `void activemq::transport::TransportRegistry::unregisterAllFactories ()`

Removes all Factories and deletes the instances of the Factory objects.

6.570.3.6 `void activemq::transport::TransportRegistry::unregisterFactory (const std::string & name)`

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

<i>name</i>	Name of the Factory to unregister and destroy
-------------	---

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportRegistry.h`

6.571 tree_desc_s Struct Reference

```
#include <src/main/decaf/internal/util/zip/deflate.h>
```

Data Fields

- `ct_data * dyn_tree`
- `int max_code`
- `static_tree_desc * stat_desc`

6.571.1 Field Documentation

6.571.1.1 `ct_data* tree_desc_s::dyn_tree`

6.571.1.2 `int tree_desc_s::max_code`

6.571.1.3 `static_tree_desc* tree_desc_s::stat_desc`

The documentation for this struct was generated from the following file:

- `src/main/decaf/internal/util/zip/deflate.h`

6.572 decaf::lang::Thread::UncaughtExceptionHandler Class - Reference

Interface for handlers invoked when a **Thread** (p.2703) abruptly terminates due to an uncaught exception.

```
#include <src/main/decaf/lang/Thread.h>
```

Public Member Functions

- virtual `~UncaughtExceptionHandler ()`
- virtual void `uncaughtException (const Thread *thread, const Throwable &error)=0 throw ()`

Method invoked when the given thread terminates due to the given uncaught exception.

6.572.1 Detailed Description

Interface for handlers invoked when a **Thread** (p. 2703) abruptly terminates due to an uncaught exception.

6.572.2 Constructor & Destructor Documentation

6.572.2.1 virtual decaf::lang::Thread::UncaughtExceptionHandler-
::~UncaughtExceptionHandler () [inline,
virtual]

6.572.3 Member Function Documentation

6.572.3.1 virtual void decaf::lang::Thread::UncaughtExceptionHandler::uncaught-
Exception (const Thread * *thread*, const Throwable & *error*) throw ()
[pure virtual]

Method invoked when the given thread terminates due to the given uncaught exception.

This method is defined to indicate that it will not throw an exception, throwing and exception from this method will on most systems result in a segmentation fault.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/Thread.h

6.573 decaf::net::UnknownHostException Class Reference

```
#include <src/main/decaf/net/UnknownHostException.h>
```

Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException** () throw ()
Default Constructor.
- **UnknownHostException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownHostException** (const **UnknownHostException** &ex) throw ()
Copy Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownHostException** (const std::exception *cause) throw ()

Constructor.

- **UnknownHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **UnknownHostException** * **clone** () const

Clones this exception.

- virtual ~**UnknownHostException** () throw ()

6.573.1 Constructor & Destructor Documentation

6.573.1.1 **decaf::net::UnknownHostException::UnknownHostException () throw ()**
[inline]

Default Constructor.

6.573.1.2 **decaf::net::UnknownHostException::UnknownHostException (const Exception & ex) throw ()** [inline]

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.573.1.3 **decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & ex) throw ()** [inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.573.1.4 **decaf::net::UnknownHostException::UnknownHostException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()** [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.

<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.573.1.5 `decaf::net::UnknownHostException::UnknownHostException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.573.1.6 `decaf::net::UnknownHostException::UnknownHostException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.573.1.7 `virtual decaf::net::UnknownHostException::~~UnknownHostException () throw () [inline, virtual]`

6.573.2 Member Function Documentation

6.573.2.1 `virtual UnknownHostException* decaf::net::UnknownHostException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new `Exception` instance that is a copy of this `Exception` object.

Reimplemented from **decaf::io::IOException** (p. 1547).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownHostException.h`

6.574 decaf::net::UnknownServiceException Class Reference

```
#include <src/main/decaf/net/UnknownServiceException.h>
```

Inheritance diagram for `decaf::net::UnknownServiceException`:

Public Member Functions

- **UnknownServiceException** () throw ()
Default Constructor.
- **UnknownServiceException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownServiceException** (const **UnknownServiceException** &ex) throw ()
Copy Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownServiceException** (const std::exception *cause) throw ()
Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownServiceException** * clone () const
Clones this exception.
- virtual ~**UnknownServiceException** () throw ()

6.574.1 Constructor & Destructor Documentation

6.574.1.1 decaf::net::UnknownServiceException::UnknownServiceException () throw () [inline]

Default Constructor.

6.574.1.2 decaf::net::UnknownServiceException::UnknownServiceException (
const Exception & ex) throw () `[inline]`

Conversion Constructor from some other Exception.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.574.1.3 decaf::net::UnknownServiceException::UnknownServiceException (
const UnknownServiceException & ex) throw () `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.574.1.4 decaf::net::UnknownServiceException::UnknownServiceException (
const char * file, const int lineNumber, const std::exception * cause, const char *
msg, ...) throw () `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.574.1.5 decaf::net::UnknownServiceException::UnknownServiceException (
const std::exception * cause) throw () `[inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.574.1.6 **decaf::net::UnknownServiceException::UnknownServiceException**
 (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()
 [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.574.1.7 **virtual decaf::net::UnknownServiceException::~~UnknownServiceException** () throw () [inline, virtual]

6.574.2 Member Function Documentation

6.574.2.1 **virtual UnknownServiceException* decaf::net::UnknownServiceException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1547).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**UnknownServiceException.h**

6.575 decaf::io::UnsupportedEncodingException Class Reference

Thrown when the the Character Encoding is not supported.

```
#include <src/main/decaf/io/UnsupportedEncodingException.h>
```

Inheritance diagram for decaf::io::UnsupportedEncodingException:

Public Member Functions

- **UnsupportedEncodingException** () throw ()
Default Constructor.

Copy Constructor.
- **UnsupportedEncodingException** (const **UnsupportedEncodingException** &ex) throw ()
Copy Constructor.
- **UnsupportedEncodingException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnsupportedEncodingException** (const std::exception *cause) throw ()
Constructor.
- **UnsupportedEncodingException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **UnsupportedEncodingException** * clone () const
Clones this exception.
- virtual ~**UnsupportedEncodingException** () throw ()

6.575.1 Detailed Description

Thrown when the the Character Encoding is not supported.

Since

1.0

6.575.2 Constructor & Destructor Documentation

6.575.2.1 **decaf::io::UnsupportedEncodingException::UnsupportedEncodingException** () throw () `[inline]`

Default Constructor.

6.575.2.2 **decaf::io::UnsupportedEncodingException::UnsupportedEncodingException** (const lang::Exception & ex) throw () `[inline]`

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.575.2.3 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const UnsupportedEncodingException & *ex*) throw ()
[inline]

Copy Constructor.

Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.575.2.4 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () *[inline]*

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.575.2.5 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const std::exception * *cause*) throw ()
[inline]

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.575.2.6 **decaf::io::UnsupportedEncodingException::UnsupportedEncodingException** (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()
[inline]

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.575.2.7 **virtual decaf::io::UnsupportedEncodingException::~~UnsupportedEncodingException** () throw () [inline, virtual]

6.575.3 Member Function Documentation

6.575.3.1 **virtual UnsupportedOperationException* decaf::io::UnsupportedEncodingException::clone** () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1547).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**UnsupportedEncodingException.h**

Clones this exception.
- virtual ~**UnsupportedOperationException** () throw ()

6.576.1 Constructor & Destructor Documentation

6.576.1.1 **decaf::lang::exceptions::UnsupportedOperationException**
Exception::UnsupportedOperationException () throw ()
 [inline]

Default Constructor.

6.576.1.2 **decaf::lang::exceptions::UnsupportedOperationException::-**
UnsupportedOperationException (const Exception & ex) throw ()
 [inline]

Conversion Constructor from some other **Exception** (p. 1279).

Parameters

ex	An exception that should become this type of Exception (p. 1279)
-----------	---

6.576.1.3 **decaf::lang::exceptions::UnsupportedOperationException**
Exception::UnsupportedOperationException (const
UnsupportedOperationException & ex) throw () [inline]

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception (p. 1279)
-----------	---

6.576.1.4 **decaf::lang::exceptions::UnsupportedOperationException::-**
UnsupportedOperationException (*const char * file*, *const int lineNumber*,
*const std::exception * cause*, *const char * msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.576.1.5 **decaf::lang::exceptions::UnsupportedOperationException::-**
UnsupportedOperationException (*const std::exception * cause*) throw ()
[inline]

Constructor.

Parameters

<i>cause</i>	Pointer (p. 2083) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	---

6.576.1.6 **decaf::lang::exceptions::UnsupportedOperationException::-**
UnsupportedOperationException (*const char * file*, *const int lineNumber*,
*const char * msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.576.1.7 `virtual decaf::lang::exceptions::UnsupportedOperationException-
::~UnsupportedOperationException () throw () [inline,
virtual]`

6.576.2 Member Function Documentation

6.576.2.1 `virtual UnsupportedOperationException* decaf::lang::exceptions-
::UnsupportedOperationException::clone () const [inline,
virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1279) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1282).

Reimplemented in **decaf::nio::ReadOnlyBufferException** (p. 2246).

The documentation for this class was generated from the following file:

6.578.1 Detailed Description

This class represents an instance of a **URI** (p. 2828) as defined by RFC 2396.

6.578.2 Constructor & Destructor Documentation

6.578.2.1 decaf::net::URI::URI ()

Default Constructor, same as calling a Constructor with all fields empty.

6.578.2.2 `decaf::net::URI::URI (const URI & uri)`

Constructs a **URI** (p. 2828) as a copy of another **URI** (p. 2828).

Parameters

<i>uri</i>	- uri to copy
------------	---------------

Exceptions

URISyntax-Exception (p. 2856)	if the URI (p. 2828) passed is malformed.
---	--

6.578.2.3 `decaf::net::URI::URI (const std::string & uri)`

Constructs a **URI** (p. 2828) from the given string.

Parameters

<i>uri</i>	- string uri to parse.
------------	------------------------

Exceptions

URISyntax-Exception (p. 2856)	if the URI (p. 2828) passed is malformed.
---	--

6.578.2.4 `decaf::net::URI::URI (const std::string & scheme, const std::string & ssp, const std::string & fragment)`

Constructs a **URI** (p. 2828) from the given components.

Parameters

<i>scheme</i>	- the uri scheme
<i>ssp</i>	- Scheme specific part
<i>fragment</i>	- Fragment

Exceptions

URISyntax-Exception (p. 2856)	if the URI (p. 2828) passed is malformed.
---	--

6.578.2.5 `decaf::net::URI::URI (const std::string & scheme, const std::string & userInfo,
const std::string & host, int port, const std::string & path, const std::string & query,
const std::string & fragment)`

Constructs a **URI** (p. 2828) from the given components.

Parameters

<i>scheme</i>	- Scheme name
<i>userInfo</i>	- User name and authorization information
<i>host</i>	- Host name
<i>port</i>	- Port number
<i>path</i>	- Path
<i>query</i>	- Query
<i>fragment</i>	- Fragment

Exceptions

URISyntax-Exception (p. 2856)	if the URI (p. 2828) passed is malformed.
---	--

6.578.2.6 `decaf::net::URI::URI (const std::string & scheme, const std::string & host, const
std::string & path, const std::string & fragment)`

Constructs a **URI** (p. 2828) from the given components.

Parameters

<i>scheme</i>	- Scheme name
<i>host</i>	- Host name
<i>path</i>	- Path
<i>fragment</i>	- Fragment

Exceptions

URISyntax-Exception (p. 2856)	if the URI (p. 2828) passed is malformed.
---	--

6.578.2.7 `decaf::net::URI::URI (const std::string & scheme, const std::string & authority,
const std::string & path, const std::string & query, const std::string & fragment)`

Constructs a **URI** (p. 2828) from the given components.

Parameters

<i>scheme</i>	- Scheme name
<i>authority</i>	- Authority
<i>path</i>	- Path
<i>query</i>	- Query
<i>fragment</i>	- Fragment

Exceptions

URISyntaxException (p. 2856)	if the URI (p. 2828) passed is malformed.
--	--

6.578.2.8 `virtual decaf::net::URI::~~URI () [inline, virtual]`

6.578.3 Member Function Documentation

6.578.3.1 `virtual int decaf::net::URI::compareTo (const URI & value) const [virtual]`

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

<i>value</i>	- the value to compare to this one.
--------------	-------------------------------------

Returns

zero if equal minus one if less than and one if greater than.

6.578.3.2 `static URI decaf::net::URI::create (const std::string uri) [static]`

Creates a **URI** (p. 2828) by parsing the given string.

This convenience factory method works as if by invoking the `URI(string)` constructor; any **URISyntaxException** (p. 2856) thrown by the constructor is caught and wrapped in a new `IllegalArgumentException` object, which is then thrown.

Parameters

<i>uri</i>	- URI (p. 2828) string to parse
------------	--

Exceptions

<i>IllegalArgument-Exception</i>	
----------------------------------	--

6.578.3.3 virtual bool **decaf::net::URI::equals** (const **URI** & *value*) const [virtual]

Returns

true if this value is considered equal to the passed value.

6.578.3.4 std::string **decaf::net::URI::getAuthority** () const

Returns

the decoded authority component of this **URI** (p. 2828).

6.578.3.5 std::string **decaf::net::URI::getFragment** () const

Returns

the decoded fragment component of this **URI** (p. 2828).

6.578.3.6 std::string **decaf::net::URI::getHost** () const

Returns

the host component of this **URI** (p. 2828).

6.578.3.7 std::string **decaf::net::URI::getPath** () const

Returns

the path component of this **URI** (p. 2828).

6.578.3.8 int **decaf::net::URI::getPort** () const

Returns

the port component of this **URI** (p. 2828).

6.578.3.9 std::string **decaf::net::URI::getQuery** () const

Returns

the query component of this **URI** (p. 2828).

6.578.3.10 `std::string decaf::net::URI::getRawAuthority () const`

Returns the raw authority component of this **URI** (p. 2828).

The authority component of a **URI** (p. 2828), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns

the raw authority component of the **URI** (p. 2828)

6.578.3.11 `std::string decaf::net::URI::getRawFragment () const`

Returns the raw fragment component of this **URI** (p. 2828).

The fragment component of a **URI** (p. 2828), if defined, only contains legal **URI** (p. 2828) characters.

Returns

the raw fragment component of this **URI** (p. 2828)

6.578.3.12 `std::string decaf::net::URI::getRawPath () const`

Returns the raw path component of this **URI** (p. 2828).

The path component of a **URI** (p. 2828), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns

the raw path component of this **URI** (p. 2828)

6.578.3.13 `std::string decaf::net::URI::getRawQuery () const`

Returns the raw query component of this **URI** (p. 2828).

The query component of a **URI** (p. 2828), if defined, only contains legal **URI** (p. 2828) characters.

Returns

the raw query component of the **URI** (p. 2828).

6.578.3.14 `std::string decaf::net::URI::getRawSchemeSpecificPart () const`

Returns the raw scheme-specific part of this **URI** (p. 2828).

The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 2828) only contains legal **URI** (p. 2828) characters.

Returns

the raw scheme special part of the uri

6.578.3.15 `std::string decaf::net::URI::getRawUserInfo () const`

Returns the raw user-information component of this **URI** (p. 2828).

The user-information component of a **URI** (p. 2828), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns

the raw user-information component of the **URI** (p. 2828)

6.578.3.16 `std::string decaf::net::URI::getScheme () const`**Returns**

the scheme component of this **URI** (p. 2828)

6.578.3.17 `std::string decaf::net::URI::getSchemeSpecificPart () const`

Returns the decoded scheme-specific part of this **URI** (p. 2828).

The string returned by this method is equal to that returned by the `getRawSchemeSpecificPart` method except that all sequences of escaped octets are decoded.

Returns

the raw scheme specific part of the uri.

6.578.3.18 `std::string decaf::net::URI::getUserInfo () const`**Returns**

the user info component of this **URI** (p. 2828)

6.578.3.19 `bool decaf::net::URI::isAbsolute () const`

Tells whether or not this **URI** (p. 2828) is absolute.

A **URI** (p. 2828) is absolute if, and only if, it has a scheme component.

Returns

true if, and only if, this **URI** (p. 2828) is absolute

6.578.3.20 `bool decaf::net::URI::isOpaque () const`

Tells whether or not this **URI** (p. 2828) is opaque.

A **URI** (p. 2828) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 2828) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns

true if, and only if, this **URI** (p. 2828) is opaque

6.578.3.21 `URI decaf::net::URI::normalize () const`

Normalizes this **URI** (p. 2828)'s path.

If this **URI** (p. 2828) is opaque, or if its path is already in normal form, then this **URI** (p. 2828) is returned. Otherwise a new **URI** (p. 2828) is constructed that is identical to this **URI** (p. 2828) except that its path is computed by normalizing this **URI** (p. 2828)'s path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed.
2. If a ".." segment is preceded by a non-".." segment then both of these segments are removed. This step is repeated until it is no longer applicable.
3. If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 2828) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 2828) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more "." segments if there were insufficient non-".." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

Returns

A **URI** (p. 2828) equivalent to this **URI** (p. 2828), but whose path is in normal form

6.578.3.22 virtual bool decaf::net::URI::operator< (const **URI** & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

6.578.3.23 virtual bool decaf::net::URI::operator== (const **URI** & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

6.578.3.24 **URI** decaf::net::URI::parseServerAuthority () const

Attempts to parse this **URI** (p.2828)'s authority component, if defined, into user-information, host, and port components.

If this **URI** (p.2828)'s authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p.2828) has no authority component, this method simply returns this **URI** (p.2828).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns

A **URI** (p.2828) whose authority field has been parsed as a server-based authority

Exceptions

URISyntax-Exception (p.2856)	- If the authority component of this URI (p.2828) is defined but cannot be parsed as a server-based authority.
--	---

6.578.3.25 URI decaf::net::URI::relativize (const URI & uri) const

Relativizes the given **URI** (p. 2828) against this **URI** (p. 2828).

The relativization of the given **URI** (p. 2828) against this **URI** (p. 2828) is computed as follows:

1. If either this **URI** (p. 2828) or the given **URI** (p. 2828) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 2828) is not a prefix of the path of the given **URI** (p. 2828), then the given **URI** (p. 2828) is returned.
2. Otherwise a new relative hierarchical **URI** (p. 2828) is constructed with query and fragment components taken from the given **URI** (p. 2828) and with a path component computed by removing this **URI** (p. 2828)'s path from the beginning of the given **URI** (p. 2828)'s path.

Parameters

<i>uri</i>	- The URI (p. 2828) to be relativized against this URI (p. 2828)
------------	--

Returns

The resulting **URI** (p. 2828)

6.578.3.26 URI decaf::net::URI::resolve (const std::string & str) const

Constructs a new **URI** (p. 2828) by parsing the given string and then resolving it against this **URI** (p. 2828).

This convenience method works as if invoking it were equivalent to evaluating the expression `resolve(URI::create(str))`.

Parameters

<i>str</i>	- The string to be parsed into a URI (p. 2828)
------------	---

Returns

The resulting **URI** (p. 2828)

Exceptions

<i>IllegalArgument-Exception</i>	- If the given string violates RFC 2396
----------------------------------	---

6.578.3.27 URI decaf::net::URI::resolve (const URI & uri) const

Resolves the given **URI** (p. 2828) against this **URI** (p. 2828).

If the given **URI** (p. 2828) is already absolute, or if this **URI** (p. 2828) is opaque, then a copy of the given **URI** (p. 2828) is returned.

If the given **URI** (p. 2828)'s fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 2828) with the given fragment but with all other components equal to those of this **URI** (p. 2828) is returned. This allows a **URI** (p. 2828) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 2828).

Otherwise this method constructs a new hierarchical **URI** (p. 2828) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 2828) is constructed with this **URI** (p. 2828)'s scheme and the given **URI** (p. 2828)'s query and fragment components. 2. If the given **URI** (p. 2828) has an authority component then the new **URI** (p. 2828)'s authority and path are taken from the given **URI** (p. 2828). 3. Otherwise the new **URI** (p. 2828)'s authority component is copied from this **URI** (p. 2828), and its path is computed as follows:

1. If the given **URI** (p. 2828)'s path is absolute then the new **URI** (p. 2828)'s path is taken from the given **URI** (p. 2828). 2. Otherwise the given **URI** (p. 2828)'s path is relative, and so the new **URI** (p. 2828)'s path is computed by resolving the path of the given **URI** (p. 2828) against the path of this **URI** (p. 2828). This is done by concatenating all but the last segment of this **URI** (p. 2828)'s path, if any, with the given **URI** (p. 2828)'s path and then normalizing the result as if by invoking the `normalize` method.

The result of this method is absolute if, and only if, either this **URI** (p. 2828) is absolute or the given **URI** (p. 2828) is absolute.

Parameters

<i>uri</i>	- The URI (p. 2828) to be resolved against this URI (p. 2828)
------------	---

Returns

The resulting **URI** (p. 2828)

6.578.3.28 std::string decaf::net::URI::toString () const

Returns the content of this **URI** (p. 2828) as a string.

If this **URI** (p. 2828) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 2828) was created by normalization, resolution, or relativization, and so a string is constructed from this **URI** (p. 2828)'s components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns

the string form of this **URI** (p. 2828)

6.578.3.29 URL decaf::net::URI::toURL () const

Constructs a **URL** (p. 2868) from this **URI** (p. 2828).

This convenience method works as if invoking it were equivalent to evaluating the expression `new URL (p. 2868)(this.toString())` after first checking that this **URI** (p. 2828) is absolute.

Returns

A **URL** (p. 2868) constructed from this **URI** (p. 2828)

Exceptions

<i>IllegalArgument-Exception</i>	- If this URL (p. 2868) is not absolute
<i>MalformedURL-Exception</i> (p. 1766)	- If a protocol handler for the URL (p. 2868) could not be found, or if some other error occurred while constructing the URL (p. 2868)

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URI.h`

6.579 decaf::internal::net::URIEncoderDecoder Class Reference

Static Public Member Functions

- static void **validate** (const std::string &s, const std::string &legal)
Validate a string by checking if it contains any characters other than:
- static void **validateSimple** (const std::string &s, const std::string &legal)
Validate a string by checking if it contains any characters other than:
- static std::string **quoteIllegal** (const std::string &s, const std::string &legal)
All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ".
- static std::string **encodeOthers** (const std::string &s)
Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

- static std::string **decode** (const std::string &s)

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

6.579.1 Constructor & Destructor Documentation

6.579.1.1 **decaf::internal::net::URLEncoderDecoder::URLEncoderDecoder** ()

6.579.1.2 **virtual decaf::internal::net::URLEncoderDecoder::~~URLEncoderDecoder** () [inline, virtual]

6.579.2 Member Function Documentation

6.579.2.1 **static std::string decaf::internal::net::URLEncoderDecoder::decode** (const std::string & s) [static]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

" and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C \$%"

Parameters

s	- The encoded string.
---	-----------------------

Returns

The decoded version.

6.579.2.2 **static std::string decaf::internal::net::URLEncoderDecoder::encodeOthers** (const std::string & s) [static]

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

They are converted into their hexadecimal value prepended by ".

For example: Euro currency symbol -> "%E2%82%AC".

Parameters

s	- the string to be converted
---	------------------------------

Returns

the converted string

6.579.2.3 `static std::string decaf::internal::net::URLEncoderDecoder::quotelllegal (const std::string & s, const std::string & legal) [static]`

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by "%".

For example: '#' -> "%23"

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters

<i>s</i>	- the string to be converted
<i>legal</i>	- the characters allowed to be preserved in the string s

Returns

converted string

6.579.2.4 `static void decaf::internal::net::URLEncoderDecoder::validate (const std::string & s, const std::string & legal) [static]`

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter
4. characters that are not ISO Control or are not ISO Space characters)

Parameters

<i>s</i>	- the string to be validated
<i>legal</i>	- the characters allowed in the string s

Exceptions

<i>URISyntaxException</i>	if the uri string is not well formed.
---------------------------	---------------------------------------

6.579.2.5 `static void decaf::internal::net::URLEncoderDecoder::validateSimple (const std::string & s, const std::string & legal) [static]`

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter

Parameters

<i>s</i>	- the string to be validated
<i>legal</i>	- the characters allowed in the string s

Exceptions

<code>URISyntaxException</code>	if the uri string is not well formed.
---------------------------------	---------------------------------------

The documentation for this class was generated from the following file:

6.580 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

```
#include <src/main/decaf/internal/net/URIHelper.h>
```

Public Member Functions

- **URIHelper** (const std::string &unreserved, const std::string &punct, const std::string &reserved, const std::string &someLegal, const std::string &allLegal)
*Setup the **URIHelper** (p. 2844) with values assigned to the various fields that are used in the validation process.*
- **URIHelper** ()
Sets up the filter strings with sane defaults.
- virtual ~**URIHelper** ()
- **URIType parseURI** (const std::string &uri, bool forceServer)
Parse the passed in URI.
- void **validateScheme** (const std::string &uri, const std::string &scheme, int index)
Validate the schema portin of the URI.
- void **validateSsp** (const std::string &uri, const std::string &ssp, std::size_t index)
Validate that the URI Ssp Segment contains no invalid encodings.
- void **validateAuthority** (const std::string &uri, const std::string &authority, std::size_t index)
Validate that the URI Authority Segment contains no invalid encodings.
- void **validatePath** (const std::string &uri, const std::string &path, std::size_t index)
Validate that the URI Path Segment contains no invalid encodings.
- void **validateQuery** (const std::string &uri, const std::string &query, std::size_t index)
Validate that the URI Query Segment contains no invalid encodings.
- void **validateFragment** (const std::string &uri, const std::string &fragment, std::size_t index)
Validate that the URI fragment contains no invalid encodings.
- **URIType parseAuthority** (bool forceServer, const std::string &authority)

determine the host, port and user-info if the authority parses successfully to a server based authority

- void **validateUserinfo** (const std::string &uri, const std::string &userinfo, std::size_t index)

Check the supplied user info for validity.

- bool **isValidHost** (bool forceServer, const std::string &host)

distinguish between IPv4, IPv6, domain name and validate it based on its type

- bool **isValidDomainName** (const std::string &host)

Validates the string past to determine if it is a well formed domain name.

- bool **isValidIPv4Address** (const std::string &host)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XX-X.XXX were X is any number 0-9.

- bool **isValidIPv6Address** (const std::string &ipAddress)

Determines if the given address is valid according to the IPv6 spec.

- bool **isValidIPv4Word** (const std::string &word)

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

- bool **isValidHexChar** (char c)

Determines if the given char is a valid Hex char.

6.580.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.580.2 Constructor & Destructor Documentation

- 6.580.2.1 **decaf::internal::net::URIHelper::URIHelper** (const std::string & *unreserved*, const std::string & *punct*, const std::string & *reserved*, const std::string & *someLegal*, const std::string & *allLegal*)

Setup the **URIHelper** (p. 2844) with values assigned to the various fields that are used in the validation process.

The defaults are overridden by these values.

Parameters

<i>unreserved</i>	- characters not reserved for use.
<i>punct</i>	- allowable punctuation symbols.
<i>reserved</i>	- characters not allowed for general use in the URI.
<i>someLegal</i>	- characters that are legal in certain cases.
<i>allLegal</i>	- characters that are always legal.

6.580.2.2 decaf::internal::net::URIHelper::URIHelper ()

Sets up the filter strings with sane defaults.

6.580.2.3 virtual decaf::internal::net::URIHelper::~~URIHelper () [inline, virtual]

6.580.3 Member Function Documentation

6.580.3.1 bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & *host*)

Validates the string past to determine if it is a well formed domain name.

Parameters

<i>host</i>	- domain name to validate.
-------------	----------------------------

Returns

true if host is well formed.

6.580.3.2 bool decaf::internal::net::URIHelper::isValidHexChar (char *c*)

Determines if the given char is a valid Hex char.

Valid chars are A-F (upper or lower case) and 0-9.

Parameters

<i>c</i>	- char to inspect
----------	-------------------

Returns

true if *c* is a valid hex char.

6.580.3.3 bool decaf::internal::net::URIHelper::isValidHost (bool *forceServer*, const std::string & *host*)

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters

<i>forceServer</i>	- true if the forceServer mode should be active.
<i>host</i>	- Host string to validate.

Returns

true if the host value if a valid domain name.

Exceptions

<i>URISyntaxException</i>	if the host is invalid and forceServer is true.
---------------------------	---

6.580.3.4 bool decaf::internal::net::URIHelper::isValidIPv4Word (const std::string & word)

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters

<i>word</i>	- string value to check.
-------------	--------------------------

Returns

true if the word is a valid IPv4 word.

6.580.3.5 bool decaf::internal::net::URIHelper::isValidIPv6Address (const std::string & ipAddress)

Determines if the given address is valid according to the IPv6 spec.

Parameters

<i>ipAddress</i>	- string ip address value to validate.
------------------	--

Returns

true if the address string is valid.

6.580.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & host)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.-XXX were X is any number 0-9.

and XXX is not greater than 255.

Parameters

<i>host</i>	- IPv4 address string to parse.
-------------	---------------------------------

Returns

true if host is a well formed IPv4 address.

**6.580.3.7 URIType decaf::internal::net::URIHelper::parseAuthority (bool
forceServer, const std::string & authority)**

determine the host, port and user-info if the authority parses successfully to a server based authority

behavior in error cases: if forceServer is true, throw URISyntaxException with the proper diagnostic messages. if forceServer is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the forceServer parameter e.g. mal-formed ipv6 address

Parameters

<i>forceServer</i>	
<i>authority</i>	

Returns

a **URIType** (p. 2860) instance containing the parsed data.

Exceptions

<i>URISyntaxException</i>	
---------------------------	--

**6.580.3.8 URIType decaf::internal::net::URIHelper::parseURI (const std::string & uri,
bool forceServer)**

Parse the passed in URI.

Parameters

<i>uri</i>	- the URI to Parse
<i>forceServer</i>	- if true invalid URI data throws an Exception

Returns

a **URIType** (p. 2860) instance containing the parsed data.

Exceptions

<i>URISyntaxException</i>	if forceServer is true and the URI is invalid.
---------------------------	--

6.580.3.9 void decaf::internal::net::URIHelper::validateAuthority (const std::string & *uri*, const std::string & *authority*, std::size_t *index*)

Validate that the URI Authority Segment contains no invalid encodings.

Parameters

<i>uri</i>	- the full uri.
<i>authority</i>	- the Authority to check.
<i>index</i>	- position in the uri where Authority starts.

Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

6.580.3.10 void decaf::internal::net::URIHelper::validateFragment (const std::string & *uri*, const std::string & *fragment*, std::size_t *index*)

Validate that the URI fragment contains no invalid encodings.

Parameters

<i>uri</i>	- the full uri.
<i>fragment</i>	- the fragment to check.
<i>index</i>	- position in the uri where fragment starts.

Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

6.580.3.11 void decaf::internal::net::URIHelper::validatePath (const std::string & *uri*, const std::string & *path*, std::size_t *index*)

Validate that the URI Path Segment contains no invalid encodings.

Parameters

<i>uri</i>	- the full uri.
<i>path</i>	- the path to check.
<i>index</i>	- position in the uri where path starts.

Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

6.580.3.12 void decaf::internal::net::URIHelper::validateQuery (const std::string & *uri*,
const std::string & *query*, std::size_t *index*)

Validate that the URI Query Segment contains no invalid encodings.

Parameters

<i>uri</i>	- the full uri.
<i>query</i>	- the query to check.
<i>index</i>	- position in the uri where fragment starts.

Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

6.580.3.13 void decaf::internal::net::URIHelper::validateScheme (const std::string & *uri*,
const std::string & *scheme*, int *index*)

Validate the schema portin of the URI.

Parameters

<i>uri</i>	- the URI to check.
<i>scheme</i>	- the schema section of the URI.
<i>index</i>	- index in uri where schema starts.

Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

6.580.3.14 void decaf::internal::net::URIHelper::validateSsp (const std::string & *uri*,
const std::string & *ssp*, std::size_t *index*)

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters

<i>uri</i>	- the full uri.
<i>ssp</i>	- the SSP to check.
<i>index</i>	- position in the uri where Ssp starts.

Exceptions

<i>URISyntaxException</i>	if the fragment has errors.
---------------------------	-----------------------------

6.580.3.15 `void decaf::internal::net::URIHelper::validateUserinfo (const std::string & uri, const std::string & userinfo, std::size_t index)`

Check the supplied user info for validity.

Parameters

<i>uri</i>	- the uri to parse.
<i>userinfo</i>	- supplied user info
<i>index</i>	- index into the URI string where the data is located.

Returns

true if valid

Exceptions

<i>URISyntaxException</i> if an error occurs
--

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIHelper.h`

6.581 activemq::transport::failover::URIPool Class Reference

```
#include <src/main/activemq/transport/failover/URIPool.h>
```

Public Member Functions

- **URIPool ()**
Create an Empty URI Pool.
- **URIPool (const decaf::util::List< URI > &uris)**
Creates a new URI Pool using the given list as the initial Free List.
- **~URIPool ()**
- **URI getURI ()**
Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.
- **void addURI (const URI &uri)**
Adds a URI to the free list, callers that have previously taken one using the getURI method should always return the URI when they close the resource that was connected to that URI.
- **void addURIs (const LinkedList< URI > &uris)**
Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

- void **removeURI** (const **URI** &uri)
Remove a given URI from the Free List.
- bool **isRandomize** () const
Is the URI that is given randomly picked from the pool or is each one taken in sequence.
- void **setRandomize** (bool value)
Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

6.581.1 Constructor & Destructor Documentation

6.581.1.1 activemq::transport::failover::URIPool::URIPool ()

Create an Empty URI Pool.

6.581.1.2 activemq::transport::failover::URIPool::URIPool (const decaf::util::List< URI > &uris)

Creates a new URI Pool using the given list as the initial Free List.

Parameters

<i>uris</i>	- List of URI to place in the Pool.
-------------	-------------------------------------

6.581.1.3 activemq::transport::failover::URIPool::~~URIPool ()

6.581.2 Member Function Documentation

6.581.2.1 void activemq::transport::failover::URIPool::addURI (const URI &uri)

Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

Parameters

<i>uri</i>	- a URI previously taken from the pool.
------------	---

6.581.2.2 void activemq::transport::failover::URIPool::addURIs (const LinkedList< URI > &uris)

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters

<i>uris</i>	- List of URIs to add into the Pool.
-------------	--------------------------------------

6.581.2.3 URI `activemq::transport::failover::URIPool::getURI ()`

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a `NoSuchElementException`.

Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns

the next free URI in the Pool.

Exceptions

<i>NoSuchElementException</i>	if there are none free currently.
-------------------------------	-----------------------------------

**6.581.2.4 `bool activemq::transport::failover::URIPool::isRandomize () const`
[inline]**

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns

true if URI gets are random.

6.581.2.5 `void activemq::transport::failover::URIPool::removeURI (const URI & uri)`

Remove a given URI from the Free List.

Parameters

<i>uri</i>	- the URI to find and remove from the free list
------------	---

**6.581.2.6 `void activemq::transport::failover::URIPool::setRandomize (bool value)`
[inline]**

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters

<i>value</i>	- true indicates URI gets are random.
--------------	---------------------------------------

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**URIPool.h**

6.582 activemq::util::URISupport Class Reference

```
#include <src/main/activemq/util/URISupport.h>
```

Static Public Member Functions

- static void **parseURL** (const std::string &**URI**, **decaf::util::Properties** &properties)
Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.
- static **CompositeData** **parseComposite** (const **URI** &uri)
*Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the **CompositeData** (p. 890)'s internal list.*
- static **decaf::util::Properties** **parseQuery** (std::string query)
Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.
- static void **parseQuery** (std::string query, **decaf::util::Properties** *properties)
Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.
- static std::string **createQueryString** (const **Properties** &options)
Given a properties object create a string that can be appended to a URI as a valid Query string.

6.582.1 Member Function Documentation

6.582.1.1 static std::string **activemq::util::URISupport::createQueryString** (const **Properties** & *options*) `[static]`

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters

<i>options</i>	Properties object containing key / value query values.
----------------	--

Returns

a valid URI query string.

Exceptions

<i>URISyntaxException</i>	if the string in the Properties object can't be encoded into a valid URI Query string.
---------------------------	--

6.582.1.2 static CompositeData activemq::util::URISupport::parseComposite (const URI & uri) [static]

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the **CompositeData** (p. 890)'s internal list.

Parameters

<i>uri</i>	- The Composite URI to parse.
------------	-------------------------------

Returns

a new **CompositeData** (p. 890) object with the parsed data

Exceptions

<i>URISyntaxException</i>	if the URI is not well formed.
---------------------------	--------------------------------

6.582.1.3 static decaf::util::Properties activemq::util::URISupport::parseQuery (std::string query) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

<i>query</i>	The query string to parse and extract the encoded properties.
--------------	---

Returns

Properties object with the parsed output.

Exceptions

<i>IllegalArgumentException</i>	if the Query string is not well formed.
---------------------------------	---

6.582.1.4 static void **activemq::util::URISupport::parseQuery** (std::string *query*,
decaf::util::Properties * *properties*) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

<i>query</i>	- the query string to parse.
<i>properties</i>	- object pointer to get the parsed output.

Exceptions

<i>IllegalArgumentException</i>	if the Query string is not well formed.
---------------------------------	---

6.582.1.5 static void **activemq::util::URISupport::parseURL** (const std::string & *URI*,
decaf::util::Properties & *properties*) [static]

Parses the properties out of the provided Broker URI and sets them in the passed - Properties Object.

Parameters

<i>URI</i>	a Broker URI to parse
<i>properties</i>	a Properties object to set the parsed values in

Exceptions

<i>IllegalArgumentException</i>	if the passed URI is invalid
---------------------------------	------------------------------

6.583 decaf::net::URISyntaxException Class Reference

```
#include <src/main/decaf/net/URISyntaxException.h>
```

Inheritance diagram for decaf::net::URISyntaxException:

Public Member Functions

- **URISyntaxException** () throw ()
Default Constructor.
- **URISyntaxException** (const **Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **URISyntaxException** (const **URISyntaxException** &ex) throw ()
Copy Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const std::exception *cause) throw ()
Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const char *msg **DECAF_UNUSED**) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason, int index) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **URISyntaxException** * **clone** () const
Clones this exception.
- virtual ~**URISyntaxException** () throw ()
- std::string **getInput** () const
- std::string **getReason** () const
- int **getIndex** () const

6.583.1 Constructor & Destructor Documentation

6.583.1.1 **decaf::net::URISyntaxException::URISyntaxException ()** throw ()
[inline]

Default Constructor.

6.583.1.2 **decaf::net::URISyntaxException::URISyntaxException (const Exception & ex)** throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception
----	--

6.583.1.3 `decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & ex) throw () [inline]`

Copy Constructor.

Parameters

<i>ex</i>	An exception that should become this type of Exception
-----------	--

6.583.1.4 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.583.1.5 `decaf::net::URISyntaxException::URISyntaxException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.583.1.6 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const char *msg DECAF_UNUSED) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.

<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.583.1.7 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const std::string & input, const std::string & reason) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.
Sets the input string that caused the error and the reason for the error.

Parameters

<i>file</i>	The file name where exception occurs.
<i>lineNumber</i>	The line number where the exception occurred.
<i>input</i>	The URL (p. 2868) that caused the exception.
<i>reason</i>	The reason for the failure.

6.583.1.8 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const std::string & input, const std::string & reason, int index) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.
Sets the input string that caused the error and the reason for the error.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>input</i>	The input URI (p. 2828) that caused the exception
<i>reason</i>	The reason for the failure.
<i>index</i>	The index in the URI (p. 2828) string where the error occurred.

6.583.1.9 `virtual decaf::net::URISyntaxException::~~URISyntaxException () throw () [inline, virtual]`

6.583.2 Member Function Documentation

6.583.2.1 `virtual URISyntaxException* decaf::net::URISyntaxException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p. 1282).

6.583.2.2 `int decaf::net::URISyntaxException::getIndex () const` `[inline]`

Returns

the index in the input string where the error occurred or -1

6.583.2.3 `std::string decaf::net::URISyntaxException::getInput () const`
`[inline]`

Returns

the Input string that cause this exception or ""

6.583.2.4 `std::string decaf::net::URISyntaxException::getReason () const`
`[inline]`

Returns

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URISyntaxException.h`

6.584 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

```
#include <src/main/decaf/internal/net/URIType.h>
```

Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual **~URIType** ()
- std::string **getSource** () const
*Gets the source URI string that was parsed to obtain this **URIType** (p. 2860) instance and the resulting data.,*
- void **setSource** (const std::string &source)

*Sets the source URI string that was parsed to obtain this **URIType** (p. 2860) instance and the resulting data.,*

- std::string **getScheme** () const
Gets the Scheme of the URI, e.g.
- void **setScheme** (const std::string &scheme)
Sets the Scheme of the URI, e.g.
- std::string **getSchemeSpecificPart** () const
Gets the Scheme Specific Part of the URI.
- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)
Sets the Scheme Specific Part of the URI.
- std::string **getAuthority** () const
Gets the Authority of the URI.
- void **setAuthority** (const std::string &authority)
Sets the Authority of the URI.
- std::string **getUserInfo** () const
Gets the user info part of the URI, e.g.
- void **setUserInfo** (const std::string &userinfo)
Sets the user info part of the URI, e.g.
- std::string **getHost** () const
Gets the Host name part of the URI.
- void **setHost** (const std::string &host)
Sets the Host name part of the URI.
- int **getPort** () const
Gets the port part of the URI.
- void **setPort** (int port)
Sets the port part of the URI.
- std::string **getPath** () const
Gets the Path part of the URI.
- void **setPath** (const std::string &path)
Sets the Path part of the URI.
- std::string **getQuery** () const
Gets the Query part of the URI.
- void **setQuery** (const std::string &query)
Sets the Query part of the URI.
- std::string **getFragment** () const
Gets the Fragment part of the URI.
- void **setFragment** (const std::string &fragment)
Sets the Fragment part of the URI.
- bool **isOpaque** () const
Gets if the URI is Opaque.
- void **setOpaque** (bool opaque)
Sets if the URI is Opaque.
- bool **isAbsolute** () const

Gets if the URI is Absolute.

- void **setAbsolute** (bool absolute)

Sets if the URI is Absolute.

- bool **isServerAuthority** () const

Gets if the URI is a Server Authority.

- void **setServerAuthority** (bool serverAuthority)

Sets if the URI is a Server Authority.

- bool **isValid** () const

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

- void **setValid** (bool valid)

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.584.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.584.2 Constructor & Destructor Documentation

6.584.2.1 **decaf::internal::net::URIType::URIType** (const std::string & source)
[inline]

6.584.2.2 **decaf::internal::net::URIType::URIType** () [inline]

6.584.2.3 **virtual decaf::internal::net::URIType::~~URIType** () [inline, virtual]

6.584.3 Member Function Documentation

6.584.3.1 **std::string decaf::internal::net::URIType::getAuthority** () const
[inline]

Gets the Authority of the URI.

Returns

Authority part string.

6.584.3.2 **std::string decaf::internal::net::URIType::getFragment** () const
[inline]

Gets the Fragment part of the URI.

Returns

Fragment part string.

6.584.3.3 `std::string decaf::internal::net::URIType::getHost () const` `[inline]`

Gets the Host name part of the URI.

Returns

Host name part string.

6.584.3.4 `std::string decaf::internal::net::URIType::getPath () const` `[inline]`

Gets the Path part of the URI.

Returns

Path part string.

6.584.3.5 `int decaf::internal::net::URIType::getPort () const` `[inline]`

Gets the port part of the URI.

Returns

port part string, -1 if not set.

6.584.3.6 `std::string decaf::internal::net::URIType::getQuery () const` `[inline]`

Gets the Query part of the URI.

Returns

Query part string.

**6.584.3.7 `std::string decaf::internal::net::URIType::getScheme () const`
`[inline]`**

Gets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Returns

scheme part string.

6.584.3.8 `std::string decaf::internal::net::URIType::getSchemeSpecificPart () const` `[inline]`

Gets the Scheme Specific Part of the URI.

Returns

scheme specific part string.

6.584.3.9 `std::string decaf::internal::net::URIType::getSource () const` `[inline]`

Gets the source URI string that was parsed to obtain this **URIType** (p. 2860) instance and the resulting data,.

Returns

the source URI string

6.584.3.10 `std::string decaf::internal::net::URIType::getUserInfo () const` `[inline]`

Gets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Returns

user info part string.

6.584.3.11 `bool decaf::internal::net::URIType::isAbsolute () const` `[inline]`

Gets if the URI is Absolute.

Returns

true if Absolute.

6.584.3.12 `bool decaf::internal::net::URIType::isOpaque () const` `[inline]`

Gets if the URI is Opaque.

Returns

true if opaque.

6.584.3.13 **bool decaf::internal::net::URIType::isServerAuthority () const**
[inline]

Gets if the URI is a Server Authority.

Returns

true if Server Authority.

6.584.3.14 **bool decaf::internal::net::URIType::isValid () const** [inline]

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns

true if the **URIType** (p. 2860) contains valid data.

6.584.3.15 **void decaf::internal::net::URIType::setAbsolute (bool *absolute*)**
[inline]

Sets if the URI is Absolute.

Parameters

<i>absolute</i>	- true if Absolute.
-----------------	---------------------

6.584.3.16 **void decaf::internal::net::URIType::setAuthority (const std::string & *authority*)** [inline]

Sets the Authority of the URI.

Parameters

<i>authority</i>	Authority part string.
------------------	------------------------

6.584.3.17 **void decaf::internal::net::URIType::setFragment (const std::string & *fragment*)** [inline]

Sets the Fragment part of the URI.

Parameters

<i>fragment</i>	- Fragment part string.
-----------------	-------------------------

6.584.3.18 void decaf::internal::net::URIType::setHost (const std::string & *host*)
[inline]

Sets the Host name part of the URI.

Parameters

<i>host</i>	- Host name part string.
-------------	--------------------------

6.584.3.19 void decaf::internal::net::URIType::setOpaque (bool *opaque*)
[inline]

Sets if the URI is Opaque.

Parameters

<i>opaque</i>	true if opaque.
---------------	-----------------

6.584.3.20 void decaf::internal::net::URIType::setPath (const std::string & *path*)
[inline]

Sets the Path part of the URI.

Parameters

<i>path</i>	- Path part string.
-------------	---------------------

6.584.3.21 void decaf::internal::net::URIType::setPort (int *port*) [inline]

Sets the port part of the URI.

Parameters

<i>port</i>	- port part string, -1 if not set.
-------------	------------------------------------

6.584.3.22 void decaf::internal::net::URIType::setQuery (const std::string & *query*)
[inline]

Sets the Query part of the URI.

Parameters

<i>query</i>	- Query part string.
--------------	----------------------

6.584.3.23 `void decaf::internal::net::URIType::setScheme (const std::string & scheme) [inline]`

Sets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Parameters

<i>scheme</i>	- scheme part string.
---------------	-----------------------

6.584.3.24 `void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & schemeSpecificPart) [inline]`

Sets the Scheme Specific Part of the URI.

Parameters

<i>scheme-SpecificPart</i>	- scheme specific part string.
----------------------------	--------------------------------

6.584.3.25 `void decaf::internal::net::URIType::setServerAuthority (bool serverAuthority) [inline]`

Sets if the URI is a Server Authority.

Parameters

<i>server-Authority</i>	- true if Server Authority.
-------------------------	-----------------------------

6.584.3.26 `void decaf::internal::net::URIType::setSource (const std::string & source) [inline]`

Sets the source URI string that was parsed to obtain this **URIType** (p. 2860) instance and the resulting data,.

Parameters

<i>source</i>	- the source URI string
---------------	-------------------------

6.584.3.27 `void decaf::internal::net::URIType::setUserInfo (const std::string & userinfo) [inline]`

Sets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Parameters

<i>userinfo</i>	- user info part string.
-----------------	--------------------------

6.584.3.28 void **decaf::internal::net::URIType::setValid** (bool *valid*) [inline]

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters

<i>valid</i>	- true if the URIType (p. 2860) contains valid data.
--------------	---

The documentation for this class was generated from the following file:

6.585 decaf::net::URL Class Reference

Class **URL** (p. 2868) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

```
#include <src/main/decaf/net/URL.h>
```

Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

6.585.1 Detailed Description

Class **URL** (p. 2868) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

<http://www.ksc.nasa.gov/facts/internet/url-primer.html>

In general, a **URL** (p. 2868) can be broken into several parts. The previous example of a **URL** (p. 2868) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named `www.ksc.nasa.gov`. The information on that host machine is named `/facts/internet/url-primer.html`. The exact meaning of

this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 2868) is called the path component.

A **URL** (p. 2868) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

```
http://www.ksc.nasa.gov:80/facts/internet/url-primer.html
```

The syntax of **URL** (p. 2868) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 2828)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports `scope_ids`. The syntax and usage of `scope_ids` is described here.

A **URL** (p. 2868) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

```
http://www.apache.org/cms/index.html#chapter1
```

This fragment is not technically part of the **URL** (p. 2868). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag `chapter1` attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 2868). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 2868):

```
http://www.apache.org/cms/index.html
```

contained within it the relative **URL** (p. 2868):

```
FAQ.html
```

it would be a shorthand for:

```
http://www.apache.org/cms/FAQ.html
```

The relative **URL** (p. 2868) need not specify all the components of a **URL** (p. 2868). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 2868). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 2868) class does not itself encode or decode any **URL** (p. 2868) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 2868), and also to decode any escaped fields, that are returned from **URL** (p. 2868). Furthermore, because **URL** (p. 2868) has no knowledge of **URL** (p. 2868) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 2868). For example, the two URLs:

```
http://foo.com/hello world/ and http://foo.com/hello%20world
```

would be considered not equal to each other.

Note, the **URI** (p. 2828) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 2828), and to convert between these two classes using `toURI()` and `URI.toURL()` (p. 2840).

The **URLEncoder** (p. 2871) and **URLDecoder** (p. 2870) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

6.585.2 Constructor & Destructor Documentation

6.585.2.1 `decaf::net::URL::URL ()`

6.585.2.2 `decaf::net::URL::URL (const std::string & url)`

6.585.2.3 `virtual decaf::net::URL::~~URL ()` `[inline, virtual]`

The documentation for this class was generated from the following file:

```
#include <src/main/decaf/net/URLDecoder.h>
```

Public Member Functions

- `virtual ~URLDecoder ()`

Static Public Member Functions

- `static std::string decode (const std::string &value)`

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.

6.586.1 Constructor & Destructor Documentation

6.586.1.1 `virtual decaf::net::URLDecoder::~~URLDecoder ()` `[inline, virtual]`

6.586.2 Member Function Documentation

6.586.2.1 `static std::string decaf::net::URLDecoder::decode (const std::string & value)`
`[static]`

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type.

'+' will be converted to space, '%' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C \$%"

Parameters

<i>value</i>	- string The encoded string.
--------------	------------------------------

Returns

The decoded version as a string.

The documentation for this class was generated from the following file:

6.587 decaf::net::URLEncoder Class Reference

```
#include <src/main/decaf/net/URLEncoder.h>
```

Public Member Functions

- `virtual ~URLEncoder ()`

Static Public Member Functions

- `static std::string encode (const std::string &value)`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

6.587.1 Constructor & Destructor Documentation

6.587.1.1 `virtual decaf::net::URLEncoder::~URLEncoder ()` `[inline, virtual]`

6.587.2 Member Function Documentation

6.587.2.1 `static std::string decaf::net::URLEncoder::encode (const std::string & value)`
`[static]`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexadecimal value prepended by '%'.
 For example: '#' -> '%23'

For example: '#' -> '%23'

In addition, spaces are substituted by '+'

Parameters

<code>value</code>	- the string to be converted
--------------------	------------------------------

Returns

the converted string

6.588 activemq::util::Usage Class Reference

```
#include <src/main/activemq/util/Usage.h>
```

Inheritance diagram for `activemq::util::Usage`:

Public Member Functions

- virtual `~Usage ()`
- virtual void `waitForSpace ()=0`
*Waits forever for more space to be returned to this **Usage** (p. 2872) Manager.*
- virtual void `waitForSpace (unsigned int timeout)=0`
*Waits for more space to be returned to this **Usage** (p. 2872) Manager, times out when the given time span in milliseconds elapses.*
- virtual void `enqueueUsage (unsigned long long value)=0`
Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void `increaseUsage (unsigned long long value)=0`
Increases the usage by the value amount.
- virtual void `decreaseUsage (unsigned long long value)=0`
Decreases the usage by the value amount.
- virtual bool `isFull () const =0`
*Returns true if this **Usage** (p. 2872) instance is full, i.e.*

6.588.1 Constructor & Destructor Documentation

6.588.1.1 `virtual activemq::util::Usage::~~Usage () [inline, virtual]`

6.588.2 Member Function Documentation

6.588.2.1 `virtual void activemq::util::Usage::decreaseUsage (unsigned long long value) [pure virtual]`

Decreases the usage by the value amount.

Parameters

<i>value</i>	Amount of space to return to the pool
--------------	---------------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 1819).

6.588.2.2 `virtual void activemq::util::Usage::enqueueUsage (unsigned long long value) [pure virtual]`

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters

<i>value</i>	Amount of usage in bytes to add.
--------------	----------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 1819).

6.588.2.3 `virtual void activemq::util::Usage::increaseUsage (unsigned long long value) [pure virtual]`

Increases the usage by the value amount.

Parameters

<i>value</i>	Amount of usage to add.
--------------	-------------------------

Implemented in **activemq::util::MemoryUsage** (p. 1820).

6.588.2.4 `virtual bool activemq::util::Usage::isFull () const [pure virtual]`

Returns true if this **Usage** (p. 2872) instance is full, i.e.

Usage (p. 2872) $\geq 100\%$

Returns

true if **Usage** (p. 2872) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 1820).

6.588.2.5 `virtual void activemq::util::Usage::waitForSpace () [pure virtual]`

Waits forever for more space to be returned to this **Usage** (p. 2872) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 1821).

6.588.2.6 `virtual void activemq::util::Usage::waitForSpace (unsigned int timeout) [pure virtual]`

Waits for more space to be returned to this **Usage** (p. 2872) Manager, times out when the given time span in milliseconds elapses.

Parameters

<i>timeout</i>	The time to wait for more space.
----------------	----------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 1821).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**Usage.h**

6.589 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

```
#include <src/main/decaf/io/UTFDataFormatException.h>
```

Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** () throw ()
Default Constructor.
- **UTFDataFormatException** (const **lang::Exception** &ex) throw ()
Copy Constructor.
- **UTFDataFormatException** (const **UTFDataFormatException** &ex) throw ()
Copy Constructor.

- **UTFDataFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UTFDataFormatException** (const std::exception *cause) throw ()
Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **UTFDataFormatException * clone** () const
Clones this exception.
- virtual **~UTFDataFormatException** () throw ()

6.589.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since

1.0

6.589.2 Constructor & Destructor Documentation

6.589.2.1 **decaf::io::UTFDataFormatException::UTFDataFormatException ()**
 throw () [inline]

Default Constructor.

6.589.2.2 **decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & ex)** throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy
----	-----------------------

6.589.2.3 **decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & ex)** throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type
----	--

6.589.2.4 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.589.2.5 `decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.589.2.6 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.589.2.7 `virtual decaf::io::UTFDataFormatException::~~UTFDataFormatException () throw () [inline, virtual]`

6.589.3 Member Function Documentation

```
6.589.3.1 virtual UTFDataFormatException* decaf::io::UTF-
DataFormatException::clone ( ) const [inline,
virtual]
```

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1547).

The documentation for this class was generated from the following file:

- src/main/decaf/io/UTFDataFormatException.h

6.590 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 2877)).

```
#include <src/main/decaf/util/UUID.h>
```

Inheritance diagram for decaf::util::UUID:

Public Member Functions

*Static factory to retrieve a type 3 (name based) **UUID** (p. 2877) based on the specified byte array.*
- static **UUID fromString** (const std::string &name)
*Creates a **UUID** (p. 2877) from the string standard representation as described in the **toString()** (p. 2883) method.*

6.590.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 2877)).

A **UUID** (p. 2877) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 2877) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 2877) is as follows: The most significant long consists of the following unsigned fields:

```
0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000-
F000 version 0x00000000000000FF time_hi
```

The least significant long consists of the following unsigned fields:

```
0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFF-
FF node
```

The variant field contains a value which identifies the layout of the **UUID** (p. 2877). The bit layout described above is valid only for a **UUID** (p. 2877) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 2877). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.590.2 Constructor & Destructor Documentation

6.590.2.1 `decaf::util::UUID::UUID (long long mostSigBits, long long leastSigBits)`

Constructs a new **UUID** (p. 2877) using the specified data.

mostSigBits is used for the most significant 64 bits of the **UUID** (p. 2877) and *leastSigBits* becomes the least significant 64 bits of the **UUID** (p. 2877).

Parameters

<i>mostSigBits</i>	
<i>leastSigBits</i>	

6.590.2.2 `virtual decaf::util::UUID::~~UUID ()` [virtual]

6.590.3 Member Function Documentation

6.590.3.1 `virtual int decaf::util::UUID::clockSequence ()` [virtual]

The clock sequence value associated with this **UUID** (p. 2877).

The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 2877). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 2877).

The *clockSequence* value is only meaningful in a time-based **UUID** (p. 2877), which has version type 1. If this **UUID** (p. 2877) is not a time-based **UUID** (p. 2877) then this method throws `UnsupportedOperationException`.

Returns

the *clockSequence* associated with a V1 **UUID** (p. 2877)

Exceptions

<i>Unsupported- OperationException</i>	if this UUID (p. 2877) version does not support this operation.
--	--

6.590.3.2 `virtual int decaf::util::UUID::compareTo (const UUID & value) const`
[virtual]

Compare the given **UUID** (p. 2877) to this one.

Parameters

<i>value</i>	- the UUID (p. 2877) to compare to
--------------	---

6.590.3.3 `virtual bool decaf::util::UUID::equals (const UUID & value) const`
[virtual]

Compares this **UUID** (p. 2877) to the one given, returns true if they are equal.

Parameters

<i>value</i>	The UUID (p. 2877) to compare to.
--------------	--

Returns

true if UUIDs are the same.

6.590.3.4 `static UUID decaf::util::UUID::fromString (const std::string & name)`
[static]

Creates a **UUID** (p. 2877) from the string standard representation as described in the **toString()** (p. 2883) method.

Parameters

<i>name</i>	A string to be used to construct a UUID (p. 2877).
-------------	---

Returns

type 3 **UUID** (p. 2877)

Exceptions

<i>IllegalArgumentException</i>	if the UUID (p. 2877) string given is invalid.
---------------------------------	---

6.590.3.5 `virtual long long decaf::util::UUID::getLeastSignificantBits () const`
[virtual]

Returns

the most significant 64 bits of this **UUID** (p. 2877)'s 128 bit value.

6.590.3.6 `virtual long long decaf::util::UUID::getMostSignificantBits () const`
`[virtual]`

Returns

the most significant 64 bits of this **UUID** (p. 2877)'s 128 bit value.

6.590.3.7 `static UUID decaf::util::UUID::nameUUIDFromBytes (const std::vector<`
`char > & name) [static]`

Static factory to retrieve a type 3 (name based) **UUID** (p. 2877) based on the specified byte array.

Parameters

<i>name</i>	A byte array to be used to construct a UUID (p. 2877).
-------------	---

Returns

type 3 **UUID** (p. 2877)

6.590.3.8 `static UUID decaf::util::UUID::nameUUIDFromBytes (const char * name,`
`std::size_t size) [static]`

Static factory to retrieve a type 3 (name based) **UUID** (p. 2877) based on the specified byte array.

Parameters

<i>name</i>	A byte array to be used to construct a UUID (p. 2877).
<i>size</i>	The size of the byte array, or number of bytes to use.

Returns

type 3 **UUID** (p. 2877)

6.590.3.9 `virtual long long decaf::util::UUID::node () [virtual]`

The node value associated with this **UUID** (p. 2877).

The 48 bit node value is constructed from the node field of this **UUID** (p. 2877). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 2877) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 2877), which has version type 1. If this **UUID** (p. 2877) is not a time-based **UUID** (p. 2877) then this method throws `UnsupportedOperationException`.

Returns

the node value of this **UUID** (p. 2877)

Exceptions

<i>Unsupported- OperationException</i>	if this UUID (p. 2877) version does not support this operation.
--	--

6.590.3.10 `virtual bool decaf::util::UUID::operator< (const UUID & value) const`
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

6.590.3.11 `virtual bool decaf::util::UUID::operator== (const UUID & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters

<i>value</i>	- the value to be compared to this one.
--------------	---

Returns

true if this object is equal to the one passed.

6.590.3.12 `static UUID decaf::util::UUID::randomUUID ()` [static]

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 2877).

The **UUID** (p. 2877) is generated using a cryptographically strong pseudo random number generator.

Returns

type 4 **UUID** (p. 2877)

6.590.3.13 virtual long long decaf::util::UUID::timestamp () [virtual]

The timestamp value associated with this **UUID** (p. 2877).

The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p. 2877). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 2877), which has version type 1. If this **UUID** (p. 2877) is not a time-based **UUID** (p. 2877) then this method throws UnsupportedOperationException.

Returns

the timestamp associated with a V1 **UUID** (p. 2877)

Exceptions

<i>Unsupported-OperationException</i>	if this UUID (p. 2877) version does not support this operation.
---------------------------------------	--

6.590.3.14 virtual std::string decaf::util::UUID::toString () const [virtual]

Returns a String object representing this **UUID** (p. 2877).

UUID (p. 2877)'s are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

Returns

formatted string for this **UUID** (p. 2877)

6.590.3.15 virtual int decaf::util::UUID::variant () [virtual]

The variant number associated with this **UUID** (p. 2877).

The variant number describes the layout of the **UUID** (p. 2877). The variant number has the following meaning:

* 0 Reserved for NCS backward compatibility * 2 The Leach-Salz variant (used by this class) * 6 Reserved, Microsoft Corporation backward compatibility * 7 Reserved for future definition

Returns

the variant associated with a V1 **UUID** (p. 2877)

Exceptions

<i>Unsupported- OperationException</i>	if this UUID (p. 2877) version does not support this operation.
--	--

6.590.3.16 virtual int decaf::util::UUID::version () [virtual]

The version number associated with this **UUID** (p. 2877).

The version number describes how this **UUID** (p. 2877) was generated. The version number has the following meaning:

* 1 Time-based **UUID** (p. 2877) * 2 DCE security **UUID** (p. 2877) * 3 Name-based **UUID** (p. 2877) * 4 Randomly generated **UUID** (p. 2877)

Returns

the version associated with a V1 **UUID** (p. 2877)

Exceptions

<i>Unsupported- OperationException</i>	if this UUID (p. 2877) version does not support this operation.
--	--

6.591 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

```
#include <src/main/activemq/wireformat/WireFormat.h>
```

Inheritance diagram for activemq::wireformat::WireFormat:

Public Member Functions

- virtual ~**WireFormat** ()

- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer** < **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version)=0

Set the Version.

- virtual int **getVersion** () const =0

Get the Version.

- virtual bool **hasNegotiator** () const =0

*Returns true if this **WireFormat** (p.2884) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual bool **inReceive** () const =0

Indicates if the WireFormat object is in the process of receiving a message.

- virtual **Pointer** < **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)=0

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.591.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

Version

Revision:

1.1

6.591.2 Constructor & Destructor Documentation

- 6.591.2.1 virtual **activemq::wireformat::WireFormat::~WireFormat** ()
[inline, virtual]

6.591.3 Member Function Documentation

6.591.3.1 virtual **Pointer**<**transport::Transport**> **activemq::wireformat::WireFormat::createNegotiator** (const **Pointer**< **transport::Transport** > & *transport*) [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters

<i>transport</i>	The Transport to Wrap the Negotiator around.
------------------	--

Returns

new instance of a **WireFormatNegotiator** (p. 2904) as a **Pointer**<**Transport**> (p. 2083).

Exceptions

<i>UnsupportedOperationException</i>	if the WireFormat (p. 2884) doesn't have a Negotiator.
--------------------------------------	---

Implemented in **activemq::wireformat::stomp::StompWireFormat** (p. 2598), and **activemq::wireformat::openwire::OpenWireFormat** (p. 2049).

6.591.3.2 virtual int **activemq::wireformat::WireFormat::getVersion** () const [pure virtual]

Get the Version.

Returns

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2051), and **activemq::wireformat::stomp::StompWireFormat** (p. 2599).

6.591.3.3 virtual bool **activemq::wireformat::WireFormat::hasNegotiator** () const [pure virtual]

Returns true if this **WireFormat** (p. 2884) has a Negotiator that needs to wrap the - Transport that uses it.

Returns

true if the **WireFormat** (p. 2884) provides a Negotiator.

Implemented in **activemq::wireformat::stomp::StompWireFormat** (p. 2599), and **activemq::wireformat::openwire::OpenWireFormat** (p. 2051).

6.591.3.4 `virtual bool activemq::wireformat::WireFormat::inReceive () const`
`[pure virtual]`

Indicates if the WireFormat object is in the process of receiving a message.

This is useful for monitoring inactivity and the **WireFormat** (p. 2884) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 2884) instance to determine if its busy or not and not mark the connection as inactive if so.

Returns

true if the **WireFormat** (p. 2884) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2051), and **activemq::wireformat::stomp::StompWireFormat** (p. 2599).

6.591.3.5 `virtual void activemq::wireformat::WireFormat::marshal (`
`const Pointer< commands::Command > & command, const`
`activemq::transport::Transport * transport, decaf::io::DataOutputStream`
`* out) [pure virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

<i>command</i>	The Command to Marshal
<i>transport</i>	The Transport that called this method.
<i>out</i>	The output stream to write the command to.

Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2053), and **activemq::wireformat::stomp::StompWireFormat** (p. 2599).

6.591.3.6 `virtual void activemq::wireformat::WireFormat::setVersion (int version)`
`[pure virtual]`

Set the Version.

Parameters

<i>version</i>	the version of the wire format
----------------	--------------------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2056), and **activemq::wireformat::stomp::StompWireFormat** (p. 2600).

6.591.3.7 virtual **Pointer**<**commands::Command**> **activemq::wireformat::WireFormat::unmarshal** (const **activemq::transport::Transport** * *transport*, **decaf::io::DataInputStream** * *in*) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

<i>transport</i>	Pointer to the transport that is making this request.
<i>in</i>	The input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

<i>IOException</i>	if an I/O error occurs.
--------------------	-------------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2058), and **activemq::wireformat::stomp::StompWireFormat** (p. 2600).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormat.h**

6.592 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p. 2888) is the interface that all **WireFormatFactory** (p. 2888) classes must extend.

```
#include <src/main/activemq/wireformat/WireFormatFactory.h>
```

Inheritance diagram for **activemq::wireformat::WireFormatFactory**:

Public Member Functions

- virtual **~WireFormatFactory** ()
- virtual **Pointer**< **WireFormat** > **createWireFormat** (const **decaf::util::Properties** &properties)=0
*Creates a new **WireFormat** (p. 2884) Object passing it a set of properties from which it can obtain any optional settings.*

6.592.1 Detailed Description

The **WireFormatFactory** (p. 2888) is the interface that all **WireFormatFactory** (p. 2888) classes must extend.

The Factory creates a **WireFormat** (p. 2884) Object based on the properties that are set in the passed `Properties` object.

6.592.2 Constructor & Destructor Documentation

6.592.2.1 `virtual activemq::wireformat::WireFormatFactory::~WireFormatFactory () [inline, virtual]`

6.592.3 Member Function Documentation

6.592.3.1 `virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat (const decaf::util::Properties & properties) [pure virtual]`

Creates a new **WireFormat** (p. 2884) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

<i>properties</i>	The Properties for this WireFormat (p. 2884).
-------------------	--

Returns

Pointer to a new instance of a **WireFormat** (p. 2884) object.

Exceptions

<i>IllegalStateException</i>	if the factory has not been initialized.
------------------------------	--

Implemented in `activemq::wireformat::openwire::OpenWireFormatFactory` (p. 2060), and `activemq::wireformat::stomp::StompWireFormatFactory` (p. 2601).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormatFactory.h`

6.593 activemq::commands::WireFormatInfo Class Reference

```
#include <src/main/activemq/commands/WireFormatInfo.h>
```

Inheritance diagram for `activemq::commands::WireFormatInfo`:

Public Member Functions

- **WireFormatInfo** ()
- virtual **~WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.*
- virtual **DataStructure** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.*
- virtual bool **isMarshalAware** () const
Determine if the class implementing this interface is really wanting to be told about marshaling.
- virtual **decaf::lang::Pointer** < **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- int **getVersion** () const
Get the current Wireformat Version.
- void **setVersion** (int version)
Set the current Wireformat Version.
- long long **getMaxInactivityDuration** () const
Returns the currently configured Max Inactivity duration.
- void **setMaxInactivityDuration** (long long maxInactivityDuration)
Sets the Max inactivity duration value.
- long long **getMaxInactivityDurationInitalDelay** () const
Returns the currently configured Max Inactivity Intial Delay duration.
- void **setMaxInactivityDurationInitalDelay** (long long maxInactivityDuration-InitalDelay)
Sets the Max inactivity initial delay duration value.
- bool **isStackTraceEnabled** () const
Checks if the stackTraceEnabled flag is on.
- void **setStackTraceEnabled** (bool stackTraceEnabled)
Sets if the stackTraceEnabled flag is on.
- bool **isTcpNoDelayEnabled** () const
Checks if the tcpNoDelayEnabled flag is on.
- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

- Sets if the tcpNoDelayEnabled flag is on.*

 - bool **isCacheEnabled** () const

Checks if the cacheEnabled flag is on.

 - void **setCacheEnabled** (bool cacheEnabled)

Sets if the cacheEnabled flag is on.

 - int **getCacheSize** () const

Gets the Cache Size setting.

 - void **setCacheSize** (int value)

Sets the Cache Size setting.

 - bool **isTightEncodingEnabled** () const

Checks if the tightEncodingEnabled flag is on.

 - void **setTightEncodingEnabled** (bool tightEncodingEnabled)

Sets if the tightEncodingEnabled flag is on.

 - bool **isSizePrefixDisabled** () const

Checks if the sizePrefixDisabled flag is on.

 - void **setSizePrefixDisabled** (bool sizePrefixDisabled)

Sets if the sizePrefixDisabled flag is on.

 - const std::vector< unsigned char > & **getMagic** () const

Get the Magic field.

 - void **setMagic** (const std::vector< unsigned char > &magic)

Sets the value of the magic field.

 - const std::vector< unsigned char > & **getMarshaledProperties** () const

Get the marshalledProperties field.

 - void **setMarshaledProperties** (const std::vector< unsigned char > &marshalledProperties)

Sets the value of the marshalledProperties field.

 - virtual const **util::PrimitiveMap** & **getProperties** () const

*Gets the Properties for this **Command** (p. 866).*

 - virtual **util::PrimitiveMap** & **getProperties** ()

*Gets the Properties for this **Command** (p. 866).*

 - virtual void **setProperties** (const **util::PrimitiveMap** &map)

*Sets the Properties for this **Command** (p. 866).*

 - bool **isValid** () const

*Determines if we think this is a Valid **WireFormatInfo** (p. 2889) command.*

 - virtual bool **isWireFormatInfo** () const
 - virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)
 - virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED)

Static Public Attributes

- static const unsigned char **ID_WIREFORMATINFO** = 1

6.593.1 Constructor & Destructor Documentation

6.593.1.1 `activemq::commands::WireFormatInfo::WireFormatInfo ()`

6.593.1.2 `virtual activemq::commands::WireFormatInfo::~~WireFormatInfo ()`
[virtual]

6.593.2 Member Function Documentation

6.593.2.1 `virtual void activemq::commands::WireFormatInfo::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED)` [virtual]

Reimplemented from `activemq::commands::BaseDataStructure` (p. 529).

6.593.2.2 `virtual void activemq::commands::WireFormatInfo::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED)` [virtual]

Reimplemented from `activemq::commands::BaseDataStructure` (p. 530).

6.593.2.3 `virtual DataStructure* activemq::commands::WireFormatInfo::clone-DataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1133).

6.593.2.4 `virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure *src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 493).

6.593.2.5 `virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure *value) const` [virtual]

Compares the `DataStructure` (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 494).

6.593.2.6 `int activemq::commands::WireFormatInfo::getCacheSize () const`

Gets the Cache Size setting.

Returns

currently set cache size.

6.593.2.7 `virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType () const` [virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1137).

6.593.2.8 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic () const` [inline]

Get the Magic field.

Returns

const reference to a `std::vector<char>`

6.593.2.9 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshaledProperties () const` [inline]

Get the marshaledProperties field.

Returns

const reference to a `std::vector<char>`

6.593.2.10 `long long activemq::commands::WireFormatInfo::getMaxInactivity-Duration () const`

Returns the currently configured Max Inactivity duration.

Returns

the set inactivity duration value.

6.593.2.11 `long long activemq::commands::WireFormatInfo::getMaxInactivity-DurationInitialDelay () const`

Returns the currently configured Max Inactivity Initial Delay duration.

Returns

the set inactivity duration initial delay value.

6.593.2.12 `virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () const [inline, virtual]`

Gets the Properties for this **Command** (p. 866).

Returns

the Properties object for this **Command** (p. 866).

6.593.2.13 `virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () [inline, virtual]`

Gets the Properties for this **Command** (p. 866).

Returns

the Properties object for this **Command** (p. 866).

6.593.2.14 `int activemq::commands::WireFormatInfo::getVersion () const [inline]`

Get the current Wireformat Version.

Returns

int that identifies the version

6.593.2.15 **bool activemq::commands::WireFormatInfo::isCacheEnabled () const**

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.593.2.16 **virtual bool activemq::commands::WireFormatInfo::isMarshalAware ()
const [inline, virtual]**

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 530).

6.593.2.17 **bool activemq::commands::WireFormatInfo::isSizePrefixDisabled ()
const**

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.593.2.18 **bool activemq::commands::WireFormatInfo::isStackTraceEnabled ()
const**

Checks if the stackTraceEnabled flag is on.

Returns

true if the flag is on.

6.593.2.19 **bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled ()
const**

Checks if the tcpNoDelayEnabled flag is on.

Returns

true if the flag is on.

6.593.2.20 `bool activemq::commands::WireFormatInfo::isTightEncodingEnabled () const`

Checks if the tightEncodingEnabled flag is on.

Returns

true if the flag is on.

6.593.2.21 `bool activemq::commands::WireFormatInfo::isValid () const`

Determines if we think this is a Valid **WireFormatInfo** (p. 2889) command.

Returns

true if its valid.

6.593.2.22 `virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo () const [inline, virtual]`

Returns

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 497).

6.593.2.23 `void activemq::commands::WireFormatInfo::setCacheEnabled (bool cacheEnabled)`

Sets if the cacheEnabled flag is on.

Parameters

<i>cache-Enabled</i>	- true to turn flag is on
----------------------	---------------------------

6.593.2.24 `void activemq::commands::WireFormatInfo::setCacheSize (int value)`

Sets the Cache Size setting.

Parameters

<i>value</i>	- value to set to the cache size.
--------------	-----------------------------------

6.593.2.25 `void activemq::commands::WireFormatInfo::setMagic (const
std::vector< unsigned char > & magic) [inline]`

Sets the value of the magic field.

Parameters

<i>magic</i>	- const std::vector<char>
--------------	---------------------------

6.593.2.26 `void activemq::commands::WireFormatInfo::setMarshaledProperties (const
std::vector< unsigned char > & marshalledProperties) [inline]`

Sets the value of the marshalledProperties field.

Parameters

<i>marshalled- Properties</i>	The Byte Array vector that contains the marshaled form of the Message (p. 1821) properties, this is the data sent over the wire.
-----------------------------------	---

6.593.2.27 `void activemq::commands::WireFormatInfo::setMaxInactivityDuration (long long
maxInactivityDuration)`

Sets the Max inactivity duration value.

Parameters

<i>max- Inactivity- Duration</i>	- max time a client can be inactive.
--	--------------------------------------

6.593.2.28 `void activemq::commands::WireFormatInfo::setMaxInactivity-
DurationInitalDelay (long long maxInactivityDurationInitalDelay
)`

Sets the Max inactivity initial delay duration value.

Parameters

<i>max- Inactivity- Duration- InitalDelay</i>	- time before the inactivity delay is checked.
---	--

6.593.2.29 `virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & map) [inline, virtual]`

Sets the Properties for this **Command** (p. 866).

Parameters

<i>map</i>	- PrimitiveMap to copy
------------	------------------------

6.593.2.30 `void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool sizePrefixDisabled)`

Sets if the sizePrefixDisabled flag is on.

Parameters

<i>sizePrefix-Disabled</i>	- true to turn flag is on
----------------------------	---------------------------

6.593.2.31 `void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool stackTraceEnabled)`

Sets if the stackTraceEnabled flag is on.

Parameters

<i>stackTrace-Enabled</i>	- ture to turn flag is on
---------------------------	---------------------------

6.593.2.32 `void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool tcpNoDelayEnabled)`

Sets if the tcpNoDelayEnabled flag is on.

Parameters

<i>tcpNoDelay-Enabled</i>	- ture to turn flag is on
---------------------------	---------------------------

6.593.2.33 `void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool tightEncodingEnabled)`

Sets if the tightEncodingEnabled flag is on.

Parameters

<i>tight- Encoding- Enabled</i>	- true to turn flag is on
---	---------------------------

6.593.2.34 `void activemq::commands::WireFormatInfo::setVersion (int version)`
`[inline]`

Set the current Wireformat Version.

Parameters

<i>version</i>	- int that identifies the version
----------------	-----------------------------------

6.593.2.35 `virtual std::string activemq::commands::WireFormatInfo::toString ()`
`const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 498).

6.593.2.36 `virtual decaf::lang::Pointer<commands::Command>`
`activemq::commands::WireFormatInfo::visit (activemq::state::-`
`CommandVisitor * visitor) throw (exceptions::ActiveMQException)`
`[virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2298) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 871).

6.593.3 Field Documentation

6.593.3.1 `const unsigned char activemq::commands::WireFormatInfo::ID_WIREFOR-`
`MATINFO = 1 [static]`

The documentation for this class was generated from the following file:

6.594

activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller
Class Reference 2907

• [src/main/activemq/commands/WireFormatInfo.h](#)

6.594 activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2900).

```
#include <src/main/activemq/wireformat/openwire/marshal/generated/-  
WireFormatInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller`:

Public Member Functions

- **WireFormatInfoMarshaller** ()
- virtual **~WireFormatInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () const
Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)
Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)
Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)
Tight Marhsal to the given stream.

6.594.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2900).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.594.2 Constructor & Destructor Documentation

6.594.2.1 **activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::WireFormatInfoMarshaller ()**
[inline]

6.594.2.2 **virtual activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller ()** [inline, virtual]

6.594.3 Member Function Documentation

6.594.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::createObject ()** const
[virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.594.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::getDataStructureType ()** const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.594

activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller
Class Reference 2909

6.594.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds) [virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1123).

6.594.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis) [virtual]`

Loose Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1125).

6.594.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) [virtual]`

Tight Marhsal to the given stream.

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1127).

6.594.3.6 `virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1129).

6.594.3.7 `virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis, utils::BooleanStream * bs) [virtual]`

Tight Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1131).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**WireFormatInfo-Marshaller.h**

6.595 activemq::wireformat::WireFormatNegotiator Class Reference

Defines a **WireFormatNegotiator** (p. 2904) which allows a **WireFormat** (p. 2884) to.

```
#include <src/main/activemq/wireformat/WireFormatNegotiator.h>
```

Inheritance diagram for activemq::wireformat::WireFormatNegotiator:

Public Member Functions

- **WireFormatNegotiator** (const **Pointer**< **transport::Transport** > &next)
*Creates a new instance of a **WireFormat** (p. 2884) Negotiator wrapping the Transport passed.*
- virtual ~**WireFormatNegotiator** ()

6.595.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 2904) which allows a **WireFormat** (p. 2884) to.

6.595.2 Constructor & Destructor Documentation

6.595.2.1 **activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator** (const **Pointer**< **transport::Transport** > &next) [inline]

Creates a new instance of a **WireFormat** (p. 2884) Negotiator wrapping the Transport passed.

Parameters

<i>next</i>	The next Transport in the chain
-------------	---------------------------------

6.595.2.2 virtual **activemq::wireformat::WireFormatNegotiator::~~WireFormatNegotiator** () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatNegotiator.h**

6.596 **activemq::wireformat::WireFormatRegistry** Class Reference

Registry of all **WireFormat** (p. 2884) Factories that are available to the client at runtime.

```
#include <src/main/activemq/wireformat/WireFormatRegistry.h>
```

Public Member Functions

- virtual **~WireFormatRegistry** ()
- **WireFormatFactory** * **findFactory** (const std::string &name) const
*Gets a Registered **WireFormatFactory** (p. 2888) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*
- void **registerFactory** (const std::string &name, **WireFormatFactory** *factory)
*Registers a new **WireFormatFactory** (p. 2888) with this Registry.*
- void **unregisterFactory** (const std::string &name)
Unregisters the Factory with the given name and deletes that instance of the Factory.
- void **unregisterAllFactories** ()
Removes all Factories and deletes the instances of the Factory objects.
- std::vector< std::string > **getWireFormatNames** () const
*Retrieves a list of the names of all the Registered **WireFormat** (p. 2884)'s in this - Registry.*

Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()
*Gets the single instance of the **WireFormatRegistry** (p. 2905).*

6.596.1 Detailed Description

Registry of all **WireFormat** (p. 2884) Factories that are available to the client at runtime.

New **WireFormat** (p. 2884)'s must have a factory registered here before a connection attempt is made.

Since

3.0

6.596.2 Constructor & Destructor Documentation

6.596.2.1 virtual **activemq::wireformat::WireFormatRegistry::~~WireFormatRegistry**() [virtual]

6.596.3 Member Function Documentation

6.596.3.1 **WireFormatFactory*** **activemq::wireformat::WireFormatRegistry::findFactory**(const std::string & *name*) const

Gets a Registered **WireFormatFactory** (p. 2888) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

<i>name</i>	The name of the Factory to find in the Registry.
-------------	--

Returns

the Factory registered under the given name.

Exceptions

<i>NoSuchElementException</i>	if no factory is registered with that name.
-------------------------------	---

6.596.3.2 static **WireFormatRegistry&** **activemq::wireformat::WireFormatRegistry::getInstance**() [static]

Gets the single instance of the **WireFormatRegistry** (p. 2905).

Returns

reference to the single instance of this Registry

6.596.3.3 **std::vector<std::string>** **activemq::wireformat::WireFormatRegistry::getWireFormatNames**() const

Retrieves a list of the names of all the Registered **WireFormat** (p. 2884)'s in this - Registry.

Returns

stl vector of strings with all the **WireFormat** (p. 2884) names registered.

6.596.3.4 `void activemq::wireformat::WireFormatRegistry::registerFactory (const std::string & name, WireFormatFactory * factory)`

Registers a new **WireFormatFactory** (p. 2888) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

<i>name</i>	The name of the new Factory to register.
<i>factory</i>	The new Factory to add to the Registry.

Exceptions

<i>IllegalArgument-Exception</i>	is name is the empty string.
<i>NullPointerException</i>	if the Factory is Null.

6.596.3.5 `void activemq::wireformat::WireFormatRegistry::unregisterAllFactories ()`

Removes all Factories and deletes the instances of the Factory objects.

6.596.3.6 `void activemq::wireformat::WireFormatRegistry::unregisterFactory (const std::string & name)`

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

<i>name</i>	Name of the Factory to unregister and destroy
-------------	---

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormatRegistry.h`

6.597 activemq::transport::inactivity::WriteChecker Class Reference

Runnable class used by the {.

```
#include <src/main/activemq/transport/inactivity/Write-Checker.h>
```

Inheritance diagram for `activemq::transport::inactivity::WriteChecker`:

Public Member Functions

- **WriteChecker** (**InactivityMonitor** *parent)
- virtual ~**WriteChecker** ()
- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.597.1 Detailed Description

Runnable class used by the {}.

See also

InactivityMonitor (p. 1425)} to make periodic writes to the underlying **transport** (p. 71) if no other write activity is going on in order to more quickly detect failures of the connection to the broker.

Since

3.1.0

6.597.2 Constructor & Destructor Documentation

6.597.2.1 `activemq::transport::inactivity::WriteChecker::WriteChecker (InactivityMonitor *parent)`

6.597.2.2 `virtual activemq::transport::inactivity::WriteChecker::~~WriteChecker ()`
[virtual]

6.597.3 Member Function Documentation

6.597.3.1 `virtual void activemq::transport::inactivity::WriteChecker::run ()`
[virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2312).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/inactivity/**WriteChecker.h**

6.598 decaf::io::Writer Class Reference

```
#include <src/main/decaf/io/Writer.h>
```

Inheritance diagram for decaf::io::Writer:

Public Member Functions

- **Writer** ()
- virtual **~Writer** ()
- virtual void **write** (char v)
Writes an single byte char value.
- virtual void **write** (const std::vector< char > &buffer)
Writes an array of Chars.
- virtual void **write** (const char *buffer, int size)
Writes a byte array to the output stream.
- virtual void **write** (const char *buffer, int size, int offset, int length)
Writes a byte array to the output stream.
- virtual void **write** (const std::string &str)
Writes a string.
- virtual void **write** (const std::string &str, int offset, int length)
Writes a string.
- virtual **decaf::lang::Appendable** & **append** (char value)
Appends the specified character to this Appendable.
- virtual **decaf::lang::Appendable** & **append** (const **decaf::lang::CharSequence** *csq)
Appends the specified character sequence to this Appendable.
- virtual **decaf::lang::Appendable** & **append** (const **decaf::lang::CharSequence** *csq, int start, int end)
Appends a subsequence of the specified character sequence to this Appendable.

Protected Member Functions

- virtual void **doWriteArrayBounded** (const char *buffer, int size, int offset, int length)=0
Override this method to customize the functionality of the method write(char buffer, int size, int offset, int length).*
- virtual void **doWriteChar** (char v)
- virtual void **doWriteVector** (const std::vector< char > &buffer)
- virtual void **doWriteArray** (const char *buffer, int size)
- virtual void **doWriteString** (const std::string &str)
- virtual void **doWriteStringBounded** (const std::string &str, int offset, int length)
- virtual **decaf::lang::Appendable** & **doAppendChar** (char value)
- virtual **decaf::lang::Appendable** & **doAppendCharSequence** (const **decaf::lang::CharSequence** *csq)
- virtual **decaf::lang::Appendable** & **doAppendCharSequenceStartEnd** (const **decaf::lang::CharSequence** *csq, int start, int end)

6.598.1 Constructor & Destructor Documentation

6.598.1.1 `decaf::io::Writer::Writer ()`

6.598.1.2 `virtual decaf::io::Writer::~~Writer ()` [virtual]

6.598.2 Member Function Documentation

6.598.2.1 `virtual decaf::lang::Appendable& decaf::io::Writer::append (char value)`
[virtual]

Appends the specified character to this Appendable.

Parameters

<i>value</i>	The character to append.
--------------	--------------------------

Returns

a Reference to this Appendable

Exceptions

<i>Exception</i>	if an error occurs.
------------------	---------------------

Implements **decaf::lang::Appendable** (p. 443).

6.598.2.2 `virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * csq)` [virtual]

Appends the specified character sequence to this Appendable.

Parameters

<i>csq</i>	The character sequence from which a subsequence will be appended. If <i>csq</i> is NULL, then characters will be appended as if <i>csq</i> contained the string "null".
------------	---

Returns

a Reference to this Appendable.

Exceptions

<i>Exception</i>	if an error occurs.
------------------	---------------------

Implements **decaf::lang::Appendable** (p. 443).

6.598.2.3 **virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * *csq*, int *start*, int *end*)** [virtual]

Appends a subsequence of the specified character sequence to this Appendable.

Parameters

<i>csq</i>	- The character sequence from which a subsequence will be appended. If <i>csq</i> is NULL, then characters will be appended as if <i>csq</i> contained the string "null".
<i>start</i>	The index of the first character in the subsequence.
<i>end</i>	The index of the character following the last character in the subsequence.

Returns

a Reference to this Appendable

Exceptions

<i>Exception</i>	if an error occurs.
<i>IndexOutOfBoundsException</i>	<i>start</i> is greater than <i>end</i> , or <i>end</i> is greater than <i>csq.length()</i>

Implements **decaf::lang::Appendable** (p. 443).

6.598.2.4 **virtual decaf::lang::Appendable& decaf::io::Writer::doAppendChar (char *value*)** [protected, virtual]

6.598.2.5 **virtual decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequence (const decaf::lang::CharSequence * *csq*)** [protected, virtual]

6.598.2.6 **virtual decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequenceStartEnd (const decaf::lang::CharSequence * *csq*, int *start*, int *end*)** [protected, virtual]

6.598.2.7 **virtual void decaf::io::Writer::doWriteArray (const char * *buffer*, int *size*)** [protected, virtual]

6.598.2.8 **virtual void decaf::io::Writer::doWriteArrayBounded (const char * *buffer*, int *size*, int *offset*, int *length*)** [protected, pure virtual]

Override this method to customize the functionality of the method `write(char* buffer, int size, int offset, int length)`.

All subclasses must override this method to provide the basic **Writer** (p. 2908) functionality.

Implemented in **decaf::io::OutputStreamWriter** (p. 2075).

6.598.2.9 virtual void **decaf::io::Writer::doWriteChar** (char *v*) [protected, virtual]

6.598.2.10 virtual void **decaf::io::Writer::doWriteString** (const std::string & *str*) [protected, virtual]

6.598.2.11 virtual void **decaf::io::Writer::doWriteStringBounded** (const std::string & *str*, int *offset*, int *length*) [protected, virtual]

6.598.2.12 virtual void **decaf::io::Writer::doWriteVector** (const std::vector< char > & *buffer*) [protected, virtual]

6.598.2.13 virtual void **decaf::io::Writer::write** (char *v*) [virtual]

Writes an single byte char value.

Parameters

<i>v</i>	The value to be written.
----------	--------------------------

Exceptions

<i>IOException</i> (p. 1545)	thrown if an error occurs.
--	----------------------------

6.598.2.14 virtual void **decaf::io::Writer::write** (const std::vector< char > & *buffer*) [virtual]

Writes an array of Chars.

Parameters

<i>buffer</i>	The array to be written.
---------------	--------------------------

Exceptions

<i>IOException</i> (p. 1545)	thrown if an error occurs.
--	----------------------------

6.598.2.15 virtual void **decaf::io::Writer::write** (const char * *buffer*, int *size*) [virtual]

Writes a byte array to the output stream.

Parameters

<i>buffer</i>	The byte array to write (cannot be NULL).
<i>size</i>	The size in bytes of the buffer passed.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.

6.598.2.16 virtual void **decaf::io::Writer::write** (const char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Writes a byte array to the output stream.

Parameters

<i>buffer</i>	The byte array to write (cannot be NULL).
<i>size</i>	The size in bytes of the buffer passed.
<i>offset</i>	The position in the array to start writing from.
<i>length</i>	The number of bytes in the array to write.

Exceptions

<i>IOException</i> (p. 1545)	if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if offset + length > size of the buffer.

6.598.2.17 virtual void **decaf::io::Writer::write** (const std::string & *str*) [virtual]

Writes a string.

Parameters

<i>str</i>	The string to be written.
------------	---------------------------

Exceptions

<i>IOException</i> (p. 1545)	thrown if an error occurs.
--	----------------------------

6.598.2.18 virtual void decaf::io::Writer::write (const std::string & *str*, int *offset*, int *length*) [virtual]

Writes a string.

Parameters

<i>str</i>	The string to be written.
<i>offset</i>	The position in the array to start writing from.
<i>length</i>	The number of bytes in the array to write.

Exceptions

<i>IOException</i> (p. 1545)	thrown if an error occurs.
<i>IndexOutOfBounds-Exception</i>	if offset+length is greater than the string length.

6.601 cms::XAConnection Class Reference

The **XAConnection** (p. 2917) interface defines an extended **Connection** (p. 933) type that is used to create **XASession** (p. 2935) objects.

```
#include <src/main/cms/XAConnection.h>
```

Inheritance diagram for cms::XAConnection:

Public Member Functions

- `virtual ~XAConnection () throw ()`
- `virtual XASession * createXASession ()=0`
Creates an XASession (p. 2935) object.

6.601.1 Detailed Description

The **XAConnection** (p. 2917) interface defines an extended **Connection** (p. 933) type that is used to create **XASession** (p. 2935) objects.

This is an optional interface and CMS providers are allowed to omit an implementation and instead throw an exception from an **XAConnectionFactory** (p. 2918) stub to indicate that XA is not supported.

Since

2.3

6.601.2 Constructor & Destructor Documentation

6.601.2.1 virtual cms::XAConnection::~XAConnection () throw () [virtual]

6.601.3 Member Function Documentation

6.601.3.1 virtual XASession* cms::XAConnection::createXASession () [pure virtual]

Creates an **XASession** (p. 2935) object.

Returns

a newly created **XASession** (p. 2935) instance, caller owns the pointer.

Exceptions

CMSException (p. 826)	If the XAConnection (p. 2917) object fails to create the XASession (p. 2935) instance due to an internal error.
---------------------------------	---

Implemented in **activemq::core::ActiveMQXAConnection** (p. 433).

The documentation for this class was generated from the following file:

- src/main/cms/**XAConnectionFactory.h**

6.602 cms::XAConnectionFactory Class Reference

The **XAConnectionFactory** (p. 2918) interface is specialized interface that defines an **ConnectionFactory** (p. 955) that creates **Connection** (p. 933) instance that will participate in XA Transactions.

```
#include <src/main/cms/XAConnectionFactory.h>
```

Inheritance diagram for cms::XAConnectionFactory:

Public Member Functions

- virtual **XAConnection * createXAConnection** ()=0
*Creates an **XAConnection** (p. 2917) with the default user name and password.*
- virtual **XAConnection * createXAConnection** (const std::string &userName, const std::string &password)=0
Creates an XA connection with the specified user name and password.

Static Public Member Functions

- static **XAConnectionFactory * createCMSXAConnectionFactory** (const std::string &brokerURI)
*Static method that is used to create a provider specific XA **Connection** (p. 933) factory.*

6.602.1 Detailed Description

The **XAConnectionFactory** (p. 2918) interface is specialized interface that defines an **ConnectionFactory** (p. 955) that creates **Connection** (p. 933) instance that will participate in XA Transactions.

Some application provide support for grouping XA capable resource use into a distributed transaction (optional). To include CMS API transactions in a XA transaction, an application requires a XA aware library. A CMS provider exposes its XA support using an **XAConnectionFactory** (p. 2918) object, which an application uses to create **XAConnection** (p. 2917) objects.

The **XAConnectionFactory** (p. 2918) interface is optional. CMS providers are not required to support this interface. This interface is for use by CMS providers to support transactional environments. Client programs are strongly encouraged to use the transactional support available in their environment, rather than use these XA interfaces directly.

Since

2.3

6.602.2 Constructor & Destructor Documentation

- 6.602.2.1 virtual **cms::XAConnectionFactory::~XAConnectionFactory** ()
 [virtual]

6.602.3 Member Function Documentation

6.602.3.1 static **XAConnectionFactory*** cms::XAConnectionFactory-
::createCMSXAConnectionFactory (const std::string & brokerURI)
[static]

Static method that is used to create a provider specific XA **Connection** (p. 933) factory.

The provider implements this method in their library and returns an instance of a **XA-ConnectionFactory** (p. 2918) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

The XA interfaces are optional in CMS however if a provider chooses to omit them it should still override this method and throw an **UnsupportedOperationException** (p. 2827) to indicate that it doesn't provide this functionality.

Parameters

<i>brokerURI</i>	The remote address to use to connect to the Provider.
------------------	---

Returns

A pointer to a provider specific implementation of the **XAConnectionFactory** (p. 2918) interface, the caller is responsible for deleting this resource.

Exceptions

CMSException (p. 826)	if an internal error occurs while creating the XAConnectionFactory (p. 2918).
Unsupported-OperationException (p. 2827)	if the provider does not support the XA API.

6.602.3.2 virtual **XAConnection*** cms::XAConnectionFactory::createXA-
Connection () [pure virtual]

Creates an **XAConnection** (p. 2917) with the default user name and password.

The connection is created in stopped mode just as the standard **Connection** (p. 933) object is created from the **ConnectionFactory** (p. 955). No messages will be delivered until the **Connection.start** (p. 2534) method is explicitly called.

Returns

a new **XAConnectionFactory** (p. 2918) instance, the caller owns the returned pointer.

Exceptions

CMSException (p. 826)	if an internal error occurs while creating the Connection (p. 933).
---------------------------------	--

<i>CMSSecurity-Exception</i> (p. 835)	if the client authentication fails because the user name or password are invalid.
---	---

Implemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 435).

6.602.3.3 **virtual XAConnection* cms::XAConnectionFactory::createXA-Connection (const std::string & *userName*, const std::string & *password*)**
[pure virtual]

Creates an XA connection with the specified user name and password.

The connection is created in stopped mode just as the standard **ConnectionFactory** (p. 955) creates a new **Connection** (p. 933). No messages will be delivered until the **Connection.start** (p. 2534) method is explicitly called.

Returns

a new **XAConnectionFactory** (p. 2918) instance, the caller owns the returned pointer.

Exceptions

<i>CMSException</i> (p. 826)	if an internal error occurs while creating the Connection (p. 933).
<i>CMSSecurity-Exception</i> (p. 835)	if the client authentication fails because the user name or password are invalid.

Implemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 436).

The documentation for this class was generated from the following file:

- src/main/cms/**XAConnectionFactory.h**

6.603 cms::XAException Class Reference

The **XAException** (p. 2921) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.

Requests the Resource Manager to rollback a specified transaction branch.

- virtual bool **setTransactionTimeout** (int seconds)=0
*Sets the transaction timeout value for this **XAResource** (p. 2926).*
- virtual void **start** (const **Xid** *xid, int flags)=0
Starts work for a specified transaction branch.

Static Public Attributes

- static const int **TMENDRSCAN**
Flag to end a recovery scan.
- static const int **TMFAIL**
Flag to indicate that the caller is dissociation from a transaction branch and that it should be marked rollback only.
- static const int **TMJOIN**
Flag to indicate that the caller is joining an existing transaction branch.
- static const int **TMNOFLAGS**
Flag that indicates that no flags options are selected.
- static const int **TMONEPHASE**
Flag that indicates the caller is using one-phase commit optimization.
- static const int **TMRESUME**
Flag that indicates the caller is resuming association with a suspended transaction branch.
- static const int **TMSTARTRSCAN**
Flag that indicates the start of a recovery scan.
- static const int **TMSUCCESS**
Flag that indicates the caller is dissociating from a transaction branch.
- static const int **TMSUSPEND**
Flag that indicates that the caller is suspending (not terminating) its association with a transaction branch.
- static const int **XA_RDONLY**
Flag that indicates that transaction work has been read only and has been committed normally.
- static const int **XA_OK**
Flag that indicates that transaction work has been Prepared normally.

6.604.1 Detailed Description

The **XAResource** (p. 2926) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).

The XA interface defines the contract between a Resource Manager and a Transaction Manager in a distributed transaction processing (DTP) environment. A CMS provider implements this interface to support the association between a global transaction and a message broker connection.

The **XAResource** (p.2926) is exposed to CMS client so that they can proxy calls from the Transaction Manager API of their choosing to the CMS provider. The CMS provider should behave and a standard XA Resource Manager its up to the client however to transmit the Transaction Manager's calls to the CMS provider through this interface.

Since

2.3

6.604.2 Constructor & Destructor Documentation

6.604.2.1 `virtual cms::XAResource::~XAResource () [virtual]`

6.604.3 Member Function Documentation

6.604.3.1 `virtual void cms::XAResource::commit (const Xid * xid, bool onePhase) [pure virtual]`

Commits a global transaction.

Parameters

<i>xid</i>	the XID which identifies the global transaction.
<i>onePhase</i>	true if the resource manager should use a one-phase commit protocol to commit the transaction.

Exceptions

XAException (p. 2921)	if an error occurred.
---------------------------------	-----------------------

Possible errors are identified by the errorcode in the **XAException** (p.2921) and include: XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, XA_HEURMIX, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. In addition, one of the XA_RB* errors can occur if the transaction was not committed and onePhase was set to true. On completion of this method, the Resource Manager has rolled back the transaction and released resources held by the transaction.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 426).

6.604.3.2 `virtual void cms::XAResource::end (const Xid * xid, int flags) [pure virtual]`

Ends the work done for a transaction branch.

The Resource Manager disconnects the XA resource from the transaction branch and allows the transaction to complete.

Parameters

<i>xid</i>	the XID which identifies the global transaction. Should have previously been used as the parameter to a start. method.
<i>flags</i>	a flags integer - one of: XAResource::TMSUCCESS (p. 2934), - XAResource::TMFAIL (p. 2933), or XAResource::TMSUSPEND (p. 2934).

TMSUCCESS means that this section of work completed successfully.

TMFAIL means that this section of work failed. The Resource Manager can mark the transaction for rollback only.

TMSUSPEND means that this section of work is suspended and not yet complete. The associated transaction context is also suspended and must be restarted with a call to **start(Xid, int)** (p. ??) with the TMRESUME flag.

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 426).

6.604.3.3 `virtual void cms::XAResource::forget (const Xid * xid) [pure virtual]`

Informs the Resource Manager that it can forget about a specified transaction branch.

Parameters

<i>xid</i>	the XID which identifies the global transaction.
------------	--

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 427).

6.604.3.4 `virtual int cms::XAResource::getTransactionTimeout () const [pure virtual]`

Gets the transaction timeout value for this **XAResource** (p. 2926).

The default timeout value is the default timeout value set for the Resource Manager.

Returns

the transaction timeout value for this **XAResource** (p. 2926) in seconds.

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 427).

6.604.3.5 `virtual bool cms::XAResource::isSameRM (const XAResource *
theXAResource) [pure virtual]`

Returns true if the ResourceManager for this **XAResource** (p. 2926) is the same as the Resource Manager for a supplied **XAResource** (p. 2926).

Parameters

<i>theXA-Resource</i>	an XAResource (p. 2926) object
-----------------------	---------------------------------------

Returns

true if the Resource Manager for this **XAResource** (p. 2926) is the same as the Resource Manager for *theXAResource*.

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 428).

6.604.3.6 `virtual int cms::XAResource::prepare (const Xid * xid) [pure
virtual]`

Requests the Resource manager to prepare to commit a specified transaction.

Parameters

<i>xid</i>	the XID which identifies the global transaction.
------------	--

Returns

an integer: XA_RDONLY or XA_OK. XA_OK implies that the transaction work has been prepared normally, XA_RDONLY implies that the transaction branch is read only and has been committed. If there is a failure which requires a rollback, an **XAException** (p. 2921) is raised.

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVALID, or XAER_PROTO.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 429).

6.604.3.7 `virtual int cms::XAResource::recover (int flag, Xid ** recovered)` [pure virtual]

Get a list of prepared transaction branches.

Typically used by a transaction manager during recovery to find transaction branches that are in prepared or heuristically completed states.

Parameters

<i>flag</i>	an integer. Must be one of: XAResource::TMSTARTRSCAN (p. 2934), XAResource::TMENDRSCAN (p. 2933), XAResource::TMNOFLAGS (p. 2934).
-------------	---

Returns

an array of zero or more XIDs identifying the transaction branches in the prepared or heuristically completed states.

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_INVALID, and XAER_PROTO.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 429).

6.604.3.8 `virtual void cms::XAResource::rollback (const Xid * xid)` [pure virtual]

Requests the Resource Manager to rollback a specified transaction branch.

Parameters

<i>xid</i>	the XID which identifies the transaction branch.
------------	--

Exceptions

<i>XAException</i> (p. 2921)	if an error occurs.
--	---------------------

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 430).

6.604.3.9 **virtual bool cms::XAResource::setTransactionTimeout (int *seconds*)**
[pure virtual]

Sets the transaction timeout value for this **XAResource** (p. 2926).

If the value is set to 0, the default timeout value for the Resource Manager is used.

Parameters

<i>seconds</i>	the new Timeout value in seconds.
----------------	-----------------------------------

Returns

true if the transaction timeout value has been updated, false otherwise.

Exceptions

<i>XAException</i> (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, or XAER_INVALID.
--	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 431).

6.604.3.10 **virtual void cms::XAResource::start (const Xid * *xid*, int *flags*)** [pure virtual]

Starts work for a specified transaction branch.

Parameters

<i>xid</i>	the XID which identifies the transaction branch.
<i>flags</i>	an integer. Must be one of XAResource::TMNOFLAGS (p. 2934), XAResource::TMJOIN (p. 2933), or XAResource::TMRESUME (p. 2934).

TMJOIN implies that the start applies to joining a transaction previously passed to the Resource Manager.

TMRESUME implies that the start applies to a suspended transaction that should be restarted.

If TMNOFLAGS is specified, then if the transaction has been previously seen by the Resource Manager, an **XAException** (p. 2921) is raised with the code XAER_DUPID.

Exceptions

XAException (p. 2921)	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVALID, or XAER_PROTO.
---------------------------------	--

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 431).

6.604.4 Field Documentation

6.604.4.1 **const int cms::XAResource::TMENDRSCAN** [static]

Flag to end a recovery scan.

6.604.4.2 **const int cms::XAResource::TMFAIL** [static]

Flag to indicate that the caller is dissociation from a transaction branch and that it should be marked rollback only.

6.604.4.3 **const int cms::XAResource::TMJOIN** [static]

Flag to indicate that the caller is joining an existing transaction branch.

6.604.4.4 **const int cms::XAResource::TMNOFLAGS** [static]

Flag that indicates that no flags options are selected.
(ie a null flag)

6.604.4.5 **const int cms::XAResource::TMONEPHASE** [static]

Flag that indicates the caller is using one-phase commit optimization.

6.604.4.6 **const int cms::XAResource::TMRESUME** [static]

Flag that indicates the caller is resuming association with a suspended transaction branch.

6.604.4.7 `const int cms::XAResource::TMSTARTRSCAN` `[static]`

Flag that indicates the start of a recovery scan.

6.604.4.8 `const int cms::XAResource::TMSUCCESS` `[static]`

Flag that indicates the caller is dissociating from a transaction branch.

6.604.4.9 `const int cms::XAResource::TMSUSPEND` `[static]`

Flag that indicates that the caller is suspending (not terminating) its association with a transaction branch.

6.604.4.10 `const int cms::XAResource::XA_OK` `[static]`

Flag that indicates that transaction work has been Prepared normally.

6.604.4.11 `const int cms::XAResource::XA_RDONLY` `[static]`

Flag that indicates that transaction work has been read only and has been committed normally.

The documentation for this class was generated from the following file:

6.605 cms::XASession Class Reference

The **XASession** (p.2935) interface extends the capability of **Session** (p.2361) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).

```
#include <src/main/cms/XASession.h>
```

Inheritance diagram for cms::XASession:

Public Member Functions

- virtual `~XASession ()` throw `()`
- virtual `XAResource * getXAResource ()` const =0

*Returns the XA resource associated with this **Session** (p. 2361) to the caller.*

6.605.1 Detailed Description

The **XASession** (p.2935) interface extends the capability of **Session** (p.2361) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).

This support takes the form of a **cms::XAResource** (p.2926) object. The functionality of this object closely resembles that defined by the standard X/Open XA Resource interface.

An application controls the transactional assignment of an **XASession** (p.2935) by obtaining its **XAResource** (p.2926). It uses the **XAResource** (p.2926) to assign the session to a transaction, prepare and commit work on the transaction, and so on.

An **XAResource** (p.2926) provides some fairly sophisticated facilities for interleaving work on multiple transactions, recovering a list of transactions in progress, and so on. A XA aware CMS provider must fully implement this functionality.

The **XASession** (p.2935) instance will behave much like a normal **cms::Session** (p.2361) however some methods will not operate as normal, any call to **Session::commit** (p.2366), or **Session::rollback** (p.2376) will result in a **CMSException** (p.826) being thrown. Also when not inside an XA transaction the **MessageConsumer** (p.1877) will operate as if it were in the AutoAcknowledge mode.

The **XASession** (p.2935) interface is optional. CMS providers are not required to support this interface. This interface is for use by CMS providers to support transactional environments. Client programs are strongly encouraged to use the transactional support available in their environment, rather than use these XA interfaces directly.

Since

2.3

6.605.2 Constructor & Destructor Documentation

6.605.2.1 `virtual cms::XASession::~~XASession () throw () [virtual]`

6.605.3 Member Function Documentation

6.605.3.1 `virtual XAResource* cms::XASession::getXAResource () const [pure virtual]`

Returns the XA resource associated with this **Session** (p.2361) to the caller.

The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns

an XAResource instance to the caller, the caller does not own this pointer and should not delete it.

Implemented in **activemq::core::ActiveMQXASession** (p.438).

The documentation for this class was generated from the following file:

- `src/main/cms/XASession.h`

6.606 activemq::commands::XATransactionId Class Reference

6.606.2.4 `virtual activemq::commands::XATransactionId::~~XATransactionId ()`
`[virtual]`

6.606.3 Member Function Documentation

6.606.3.1 `virtual Xid* activemq::commands::XATransactionId::clone () const`
`[virtual]`

Creates a Copy of this Xid instance that contains the same id values.

Returns

a new Xid instance that is equal to this one when compared.

Implements **cms::Xid** (p. 2948).

6.606.3.2 `virtual XATransactionId* activemq::commands::XATransactionId::cloneDataStructure () const`
`[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::TransactionId** (p. 2768).

6.606.3.3 `virtual int activemq::commands::XATransactionId::compareTo (const XATransactionId & value) const` `[virtual]`

6.606.3.4 `virtual void activemq::commands::XATransactionId::copyDataStructure (const DataStructure * src)` `[virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::TransactionId** (p. 2768).

6.606.3.5 `virtual bool activemq::commands::XATransactionId::equals (const DataStructure * value) const` `[virtual]`

Compares the **DataStructure** (p. 1133) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 1133)'s are Equal.

Reimplemented from **activemq::commands::TransactionId** (p. 2768).

6.606.3.6 `virtual bool activemq::commands::XATransactionId::equals (const Xid * other) const` [virtual]

6.606.3.7 `virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & value) const` [virtual]

6.606.3.8 `virtual int activemq::commands::XATransactionId::getBranchQualifier (unsigned char * buffer, int size) const` [virtual]

Gets the transaction branch qualifier component of the XID.

The value of this Xid's branch qualifier is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the branch qualifier then no copy is performed and the method returns -1.

Parameters

<i>buffer</i>	The location in memory to copy the qualifier bytes to.
<i>size</i>	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

<i>XAException</i>	if the size parameter is less than zero or buffer is NULL.
--------------------	--

Implements **cms::Xid** (p. 2948).

6.606.3.9 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () const` [virtual]

6.606.3.10 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ()` [virtual]

6.606.3.11 `virtual unsigned char activemq::commands::XA-
TransactionId::getDataStructureType () const`
[virtual]

Get the **DataStructure** (p. 1133) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::TransactionId** (p. 2769).

6.606.3.12 `virtual int activemq::commands::XATransactionId::getFormatId () const`
[virtual]

Gets the format identifier component of the XID.

Returns

an integer containing the format identifier. 0 means the OSI CCR format.

Implements **cms::Xid** (p. 2949).

6.606.3.13 `virtual int activemq::commands::XATransactionId::get-
GlobalTransactionId (unsigned char * buffer, int size) const`
[virtual]

Gets the global transaction id component of the XID.

The value of this Xid's transaction id is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the transaction id then no copy is performed and the method returns -1.

Parameters

<i>buffer</i>	The location in memory to copy the transaction id bytes to.
<i>size</i>	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

<i>XAException</i>	if the size parameter is less than zero or buffer is NULL.
--------------------	--

Implements **cms::Xid** (p. 2949).

- 6.606.3.14 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId () const` [virtual]
 - 6.606.3.15 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId ()` [virtual]
 - 6.606.3.16 `virtual bool activemq::commands::XATransactionId::isXATransactionId () const` [inline, virtual]
- Reimplemented from **activemq::commands::TransactionId** (p. 2769).
- 6.606.3.17 `virtual bool activemq::commands::XATransactionId::operator< (const XATransactionId & value) const` [virtual]
 - 6.606.3.18 `XATransactionId& activemq::commands::XATransactionId::operator= (const XATransactionId & other)`
 - 6.606.3.19 `virtual bool activemq::commands::XATransactionId::operator== (const XATransactionId & value) const` [virtual]
 - 6.606.3.20 `virtual void activemq::commands::XATransactionId::setBranchQualifier (const std::vector< unsigned char > & branchQualifier)` [virtual]
 - 6.606.3.21 `virtual void activemq::commands::XATransactionId::setFormatId (int formatId)` [virtual]
 - 6.606.3.22 `virtual void activemq::commands::XATransactionId::setGlobalTransactionId (const std::vector< unsigned char > & globalTransactionId)` [virtual]
 - 6.606.3.23 `virtual std::string activemq::commands::XATransactionId::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1133) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 2770).

6.606.4 Field Documentation

- 6.606.4.1 `std::vector<unsigned char> activemq::commands::XATransactionId::branchQualifier` [protected]

6.607.3 Member Function Documentation

6.607.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire-::marshal::generated::XATransactionIdMarshaller::createObject** ()
const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1120).

6.607.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::generated-::XATransactionIdMarshaller::getDataStructureType** () const
[virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1122).

6.607.3.3 `virtual void activemq::wireformat::openwire::marshal::generated::XA-TransactionIdMarshaller::looseMarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataOutputStream * ds) [virtual]`

Tight Marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- DataOutputStream to marshal to

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller` (p. 2771).

6.607.3.4 `virtual void activemq::wireformat::openwire::marshal::generated::XA-TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis) [virtual]`

Loose Un-marshal to the given stream.

Parameters

<i>format</i>	- The OpenWireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from `activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller` (p. 2772).

6.607.3.5 `virtual int activemq::wireformat::openwire::marshal::generated::XA-TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) [virtual]`

Tight Marshal to the given stream.

6.607 activemq::wireformat::openwire::marshal::generated::XATransactionId-Marshaller Class

Reference

2953

Parameters

<i>format</i>	The OpenwireFormat properties
<i>command</i>	The object to Marshal
<i>bs</i>	The boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2772).

6.607.3.6 virtual void **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightMarshal2** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataOutputStream** * *ds*, **utils::BooleanStream** * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Marshal
<i>ds</i>	- the DataOutputStream to Marshal to
<i>bs</i>	- boolean stream to marshal to.

Exceptions

<i>IOException</i>	if an error occurs.
--------------------	---------------------

Reimplemented from **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2773).

6.607.3.7 virtual void **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightUnmarshal** (**OpenWireFormat** * *format*, **commands::DataStructure** * *command*, **decaf::io::DataInputStream** * *dis*, **utils::BooleanStream** * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

<i>format</i>	- The OpenwireFormat properties
<i>command</i>	- the object to Un-Marshal
<i>dis</i>	- the DataInputStream to Un-Marshal from
<i>bs</i>	- boolean stream to unmarshal from.

Exceptions

<i>IOException</i> if an error occurs.

6.608 cms::Xid Class Reference

An interface which provides a mapping for the X/Open XID transaction identifier structure.

```
#include <src/main/cms/Xid.h>
```

Inheritance diagram for cms::Xid:

Public Member Functions

- **Xid** ()
- virtual **~Xid** ()
- virtual **Xid * clone** () const =0
*Creates a Copy of this **Xid** (p. 2946) instance that contains the same id values.*
- virtual bool **equals** (const **Xid** *other) const =0
*Compares this **Xid** (p. 2946) to another and returns true if they are the same.*
- virtual int **getBranchQualifier** (unsigned char *buffer, int size) const =0
Gets the transaction branch qualifier component of the XID.
- virtual int **getFormatId** () const =0
Gets the format identifier component of the XID.
- virtual int **getGlobalTransactionId** (unsigned char *buffer, int size) const =0
Gets the global transaction id component of the XID.

Static Public Attributes

- static const int **MAXGTRIDSIZE**
The maximum number of bytes which will be copied into the array passed to `getGlobaltransactionId()`.
- static const int **MAXBQUALSIZE**
The maximum number of bytes which will be copied into the array that is passed to `getBranchQualifier()` (p. 2948).

6.608.1 Detailed Description

An interface which provides a mapping for the X/Open XID transaction identifier structure.

The **Xid** (p. 2946) interface is used by the Transaction Manager and the Resource managers. It is not typically used by application programs directly but the application developer must define a mechanism to map the calls and structures used by the Transaction Manager API in use into the format used by the CMS XA interfaces.

6.608.2 Constructor & Destructor Documentation

6.608.2.1 `cms::Xid::Xid ()`

6.608.2.2 `virtual cms::Xid::~Xid () [virtual]`

6.608.3 Member Function Documentation

6.608.3.1 `virtual Xid* cms::Xid::clone () const [pure virtual]`

Creates a Copy of this **Xid** (p. 2946) instance that contains the same id values.

Returns

a new **Xid** (p. 2946) instance that is equal to this one when compared.

Implemented in **activemq::commands::XATransactionId** (p. 2938).

6.608.3.2 `virtual bool cms::Xid::equals (const Xid * other) const [pure virtual]`

Compares this **Xid** (p. 2946) to another and returns true if they are the same.

Returns

true if both **Xid** (p. 2946)'s represent that same id value.

6.608.3.3 `virtual int cms::Xid::getBranchQualifier (unsigned char * buffer, int size) const [pure virtual]`

Gets the transaction branch qualifier component of the XID.

The value of this **Xid** (p. 2946)'s branch qualifier is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the branch qualifier then no copy is performed and the method returns -1.

Parameters

<i>buffer</i>	The location in memory to copy the qualifier bytes to.
<i>size</i>	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

<i>XAException</i> (p. 2921)	if the size parameter is less than zero or buffer is NULL.
--	--

Implemented in **activemq::commands::XATransactionId** (p. 2939).

6.608.3.4 `virtual int cms::Xid::getFormatId () const` [pure virtual]

Gets the format identifier component of the XID.

Returns

an integer containing the format identifier. 0 means the OSI CCR format.

Implemented in **activemq::commands::XATransactionId** (p. 2940).

6.608.3.5 `virtual int cms::Xid::getGlobalTransactionId (unsigned char * buffer, int size) const` [pure virtual]

Gets the global transaction id component of the XID.

The value of this **Xid** (p. 2946)'s transaction id is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the transaction id then no copy is performed and the method returns -1.

Parameters

<i>buffer</i>	The location in memory to copy the transaction id bytes to.
<i>size</i>	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

<i>XAException</i> (p. 2921)	if the size parameter is less than zero or buffer is NULL.
--	--

Implemented in **activemq::commands::XATransactionId** (p. 2940).

6.608.4 Field Documentation

6.608.4.1 const int cms::Xid::MAXBQUALSIZE [static]

The maximum number of bytes which will be copied into the array that is passed to **getBranchQualifier()** (p. 2948).

6.608.4.2 const int cms::Xid::MAXGTRIDSIZE [static]

The maximum number of bytes which will be copied into the array passed to **getGlobaltransactionId()**.

6.609 decaf::util::logging::XMLFormatter Class Reference

Format a **LogRecord** (p. 1719) into a standard XML format.

```
#include <src/main/decaf/util/logging/XMLFormatter.h>
```

Inheritance diagram for decaf::util::logging::XMLFormatter:

Public Member Functions

- **XMLFormatter** ()
- virtual **~XMLFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const
*Converts a **LogRecord** (p. 1719) into an XML string.*
- virtual std::string **getHead** (const **Handler** *handler)
Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.
- virtual std::string **getTail** (const **Handler** *handler)
Returns the tail string for a set of log records formatted as XML strings.

6.609.1 Detailed Description

Format a **LogRecord** (p. 1719) into a standard XML format.

TODO - Currently only outputs UTF-8 The **XMLFormatter** (p. 2950) can be used with arbitrary character encodings, but it is recommended that it normally be used with UTF-8. The character encoding can be set on the output **Handler** (p. 1401).

6.609.3.1 **virtual std::string decaf::util::logging::XMLFormatter::format (const LogRecord & record) const** [virtual]

Converts a **LogRecord** (p. 1719) into an XML string.

Parameters

<i>record</i>	The log record to be formatted.
---------------	---------------------------------

Returns

the log record formatted as an XML string.

Implements **decaf::util::logging::Formatter** (p. 1388).

6.609.3.2 **virtual std::string decaf::util::logging::XMLFormatter::getHead (const Handler * handler)** [virtual]

Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.

Parameters

<i>handler</i>	The output handler, may be NULL.
----------------	----------------------------------

Returns

the header string for log records formatted as XML strings.

6.609.3.3 `virtual std::string decaf::util::logging::XMLFormatter::getTail (const Handler * handler) [virtual]`

Returns the tail string for a set of log records formatted as XML strings.

Parameters

<i>handler</i>	The output handler, may be NULL.
----------------	----------------------------------

Returns

the tail string for log records formatted as XML strings.

The documentation for this class was generated from the following file:

6.611 decaf::util::zip::ZipException Class Reference

```
#include <src/main/decaf/util/zip/ZipException.h>
```

Inheritance diagram for `decaf::util::zip::ZipException`:

Public Member Functions

- **`ZipException () throw ()`**
Default Constructor.

- **ZipException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **ZipException** (const ZipException &ex) throw ()
Copy Constructor.
- **ZipException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ZipException** (const std::exception *cause) throw ()
Constructor.
- **ZipException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **ZipException** * clone () const
Clones this exception.
- virtual ~**ZipException** () throw ()

6.611.1 Constructor & Destructor Documentation

6.611.1.1 decaf::util::zip::ZipException::ZipException () throw ()

Default Constructor.

6.611.1.2 decaf::util::zip::ZipException::ZipException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy
-----------	-----------------------

6.611.1.3 decaf::util::zip::ZipException::ZipException (const ZipException & ex) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type
-----------	--

6.611.1.4 **decaf::util::zip::ZipException::ZipException** (*const char * file*, *const int lineNumber*, *const std::exception * cause*, *const char * msg*, ...) *throw ()*
 [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.611.1.5 **decaf::util::zip::ZipException::ZipException** (*const std::exception * cause*)
 throw () [inline]

Constructor.

Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.611.1.6 **decaf::util::zip::ZipException::ZipException** (*const char * file*, *const int lineNumber*, *const char * msg*, ...) *throw ()* [inline]

Constructor.

Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

6.611.1.7 **virtual decaf::util::zip::ZipException::~ZipException** () *throw ()*
 [virtual]

6.611.2 Member Function Documentation

6.611.2.1 `virtual ZipException* decaf::util::zip::ZipException::clone () const`
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1547).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/zip/ZipException.h`

Chapter 7

File Documentation

7.1 src/main/activemq/cmsutil/CachedConsumer.h File Reference

```
#include <cms/MessageConsumer.h> #include <activemq/util/-  
Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedConsumer**
A cached message consumer contained within a pooled session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.2 src/main/activemq/cmsutil/CachedProducer.h File Reference

```
#include <cms/MessageProducer.h> #include <activemq/util/-  
Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedProducer**
A cached message producer contained within a pooled session.

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.3 src/main/activemq/cmsutil/CmsAccessor.h File Reference

```
#include <cms/ConnectionFactory.h> #include <activemq/cmsutil/-  
ResourceLifecycleManager.h>      #include <activemq/util/-  
Config.h>
```

Data Structures

- class **activemq::cmsutil::CmsAccessor**

*Base class for **activemq.cmsutil.CmsTemplate** (p. 836) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 955) to operate on.*

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.4 src/main/activemq/cmsutil/CmsDestinationAccessor.h File - Reference

```
#include <activemq/util/Config.h> #include <activemq/cmsutil/-  
CmsAccessor.h> #include <activemq/cmsutil/DynamicDestination-  
Resolver.h>
```

Data Structures

- class **activemq::cmsutil::CmsDestinationAccessor**

*Extends the **CmsAccessor** (p. 819) to add support for resolving destination names.*

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.5 src/main/activemq/cmsutil/CmsTemplate.h File Reference

```
#include <activemq/util/Config.h> #include <activemq/cmsutil/-
CmsDestinationAccessor.h> #include <activemq/cmsutil/-
SessionCallback.h> #include <activemq/cmsutil/Producer-
Callback.h> #include <activemq/cmsutil/SessionPool.h>
#include <cms/ConnectionFactory.h> #include <cms/Delivery-
Mode.h> #include <string>
```

Data Structures

- class **activemq::cmsutil::CmsTemplate**
***CmsTemplate** (p. 836) simplifies performing synchronous CMS operations.*
- class **activemq::cmsutil::CmsTemplate::ProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::SendExecutor**
- class **activemq::cmsutil::CmsTemplate::ReceiveExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveReceiveExecutor**

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.6 src/main/activemq/cmsutil/DestinationResolver.h File Reference

```
#include <cms/Session.h> #include <activemq/util/Config.-
h>
```

Data Structures

- class **activemq::cmsutil::DestinationResolver**
*Resolves a CMS destination name to a *Destination*.*

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.7 src/main/activemq/cmsutil/DynamicDestinationResolver.h File Reference

```
#include <activemq/cmsutil/DestinationResolver.h> #include  
<cms/Session.h> #include <decaf/util/StlMap.h> #include  
<activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::DynamicDestinationResolver**

Resolves a CMS destination name to a `Destination`.

- class **activemq::cmsutil::DynamicDestinationResolver::SessionResolver**

Manages maps of names to topics and queues for a single session.

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.8 src/main/activemq/cmsutil/MessageCreator.h File Reference

```
#include <cms/Session.h> #include <cms/Message.h> #include  
<activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::MessageCreator**

Creates the user-defined message to be sent by the `CmsTemplate` (p. 836).

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

Defines

- #define **AMQ_CATCH_RETHROW**(type)
Macro for catching and re-throwing an exception of a given type.
- #define **AMQ_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)
Macro for catching an exception of one type and then re-throwing as another type.
- #define **AMQ_CATCHALL_THROW**(type)
A catch-all that throws a known exception.
- #define **AMQ_CATCHALL_NOTHROW**()
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- #define **AMQ_CATCH_NOTHROW**(type)
Macro for catching and re-throwing an exception of a given type.

7.110.1 Define Documentation

7.110.1.1 `#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters

<i>sourceType</i>	the type of the exception to be caught.
<i>targetType</i>	the type of the exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.110.1.2 `#define AMQ_CATCH_NOTHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters

<i>type</i>	The type of the exception to throw (e.g. <code>ActiveMQException</code>).
-------------	--

7.110.1.3 `#define AMQ_CATCH_RETHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw; \
}
```

Macro for catching and re-throwing an exception of a given type.

7.111 src/main/decaf/lang/exceptions/ExceptionDefines.h File Reference 3017

Parameters

<i>type</i>	The type of the exception to throw (e.g. <code>ActiveMQException</code>).
-------------	--

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.110.1.4 #define AMQ_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
    activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.110.1.5 #define AMQ_CATCHALL_THROW(type)

Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters

<i>type</i>	the type of exception to be thrown.
-------------	-------------------------------------

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.111 src/main/decaf/lang/exceptions/ExceptionDefines.h File - Reference

Defines

- #define **DECAF_CATCH_RETHROW**(type)

Macro for catching and rethrowing an exception of a given type.

- **#define DECAF_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)

Macro for catching an exception of one type and then rethrowing as another type.

- **#define DECAF_CATCHALL_THROW**(type)

A catch-all that throws a known exception.

- **#define DECAF_CATCHALL_NOTHROW**()

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

- **#define DECAF_CATCH_NOTHROW**(type)

Macro for catching and rethrowing an exception of a given type.

7.111.1 Define Documentation

7.111.1.1 **#define DECAF_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)

Value:

```
catch( sourceType& ex ){ \
    targetType target( &ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters

<i>sourceType</i>	the type of the exception to be caught.
<i>targetType</i>	the type of the exception to be thrown.

Referenced by `decaf::util::PriorityQueue< E >::add()`.

7.111.1.2 **#define DECAF_CATCH_NOTHROW**(type)

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters

<i>type</i>	The type of the exception to throw (e.g. Exception).
-------------	---

7.111.1.3 **#define DECAF_CATCH_RETHROW(type)****Value:**

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw; \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters

<i>type</i>	The type of the exception to throw (e.g. Exception).
-------------	---

Referenced by `decaf::util::PriorityQueue< E >::add()`, and `decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue()`.

7.111.1.4 **#define DECAF_CATCHALL_NOTHROW()****Value:**

```
catch( ... ){ \
    lang::Exception ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

Referenced by `decaf::util::ArrayList< E >::~~ArrayList()`.

7.111.1.5 **#define DECAF_CATCHALL_THROW(type)****Value:**

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters

<i>type</i>	the type of exception to be thrown.
-------------	-------------------------------------

Referenced by `decaf::util::PriorityQueue< E >::add()`, and `decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue()`.

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidClientIdException**
This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.278 src/main/cms/InvalidDestinationException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidDestinationException**
This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.279 src/main/cms/InvalidSelectorException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidSelectorException**

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.280 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h> #include <cms/Message.h> #include  
<cms/CMSException.h> #include <cms/MessageFormatException.h>  
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::MapMessage**

*A **MapMessage** (p. 1779) object is used to send a set of name-value pairs.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.281 src/main/cms/MessageConsumer.h File Reference

7.282 src/main/cms/MessageEnumeration.h File Reference

```
#include <cms/Config.h> #include <cms/Message.h> #include  
<cms/CMSException.h>
```

Data Structures

- class **cms::MessageEnumeration**

Defines an object that enumerates a collection of Messages.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.283 src/main/cms/MessageEOFException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2606) or **BytesMessage** (p. 718) is being read.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.284 src/main/cms/MessageFormatException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageFormatException**

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.285 src/main/cms/MessageListener.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageListener**

*A **MessageListener** (p. 1916) object is used to receive asynchronously delivered messages.*

Namespaces

<cms/CMSException.h> #include <cms/InvalidDestination-
Exception.h> #include <cms/MessageFormatException.h> ×
#include <cms/UnsupportedOperationException.h> #include
<cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

*A client uses a **MessageProducer** (p. 1924) object to send messages to a **Destination** (p. 1210).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.289 src/main/cms/ObjectMessage.h File Reference

```
#include <cms/Config.h> #include <cms/Message.h>
```

Data Structures

- class **cms::ObjectMessage**

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.290 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>      #include <cms/Destination.h> ×  
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**

An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.291 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/util/-  
Iterator.h>      #include <decaf/util/AbstractCollection.h>  
#include <decaf/lang/Exception.h> #include <decaf/lang/exceptions/-  
IndexOutOfBoundsException.h> #include <decaf/util/NoSuch-  
ElementException.h>
```

Data Structures

- class **decaf::util::Queue**< **E** >

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**

7.292 src/main/cms/QueueBrowser.h File Reference

```
#include <string> #include <cms/Config.h> #include <cms/-  
Closeable.h> #include <cms/Queue.h> #include <cms/Message.-  
h> #include <cms/CMSException.h> #include <cms/Message-  
Enumeration.h>
```

Data Structures

- class **cms::QueueBrowser**

*This class implements in interface for browsing the messages in a **Queue** (p. 2221) without removing them.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.293 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>          #include <cms/Closeable.h> ×

Exception.h>
```

Data Structures

- class **cms::TextMessage**

Interface for a text message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.300 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>      #include <cms/Destination.h> ×  
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**

An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.301 src/main/cms/TransactionInProgressException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::TransactionInProgressException**

This exception is thrown when an operation is invalid because a transaction is in progress.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.302 src/main/cms/TransactionRolledBackException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::TransactionRolledBackException**

*This exception must be thrown when a call to **Session.commit** (p. 2366) results in a rollback of the current transaction.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.303 src/main/cms/UnsupportedOperationException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::UnsupportedOperationException**

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.304 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::UnsupportedOperationException**

Namespaces

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.305 src/main/cms/XAConnection.h File Reference

```
#include <cms/Config.h>    #include <cms/CMSException.h> ×  
#include <cms/Connection.h> #include <cms/XASession.h>
```

Data Structures

- class **cms::XAConnection**
*The **XAConnection** (p. 2917) interface defines an extended **Connection** (p. 933) type that is used to create **XASession** (p. 2935) objects.*

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.306 src/main/cms/XAConnectionFactory.h File Reference

```
#include <cms/Config.h>    #include <cms/XAConnection.h> ×  
#include <cms/XAException.h>
```

Data Structures

- class **cms::XAConnectionFactory**
*The **XAConnectionFactory** (p. 2918) interface is specialized interface that defines an **ConnectionFactory** (p. 955) that creates **Connection** (p. 933) instance that will participate in XA Transactions.*

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.307 src/main/cms/XAException.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::XAException**

*The **XAException** (p. 2921) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.308 src/main/cms/XAResource.h File Reference

```
#include <cms/Config.h> #include <cms/Xid.h> #include  
<cms/XAException.h>
```

Data Structures

- class **cms::XAResource**

*The **XAResource** (p. 2926) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.309 src/main/cms/XASession.h File Reference

```
#include <cms/Config.h> #include <cms/Session.h> #include  
<cms/XAResource.h>
```

Data Structures

- class **cms::XASession**

*The **XASession** (p. 2935) interface extends the capability of **Session** (p. 2361) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.310 src/main/cms/Xid.h File Reference

```
#include <cms/Config.h> #include <cms/CMSException.h>
```

Data Structures

- class **cms::Xid**

An interface which provides a mapping for the X/Open XID transaction identifier structure.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.311 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h> #include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**

Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.312 src/main/decaf/internal/DecafRuntime.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/lang/-  
Runtime.h>      #include <decaf/util/concurrent/Mutex.h> ×  
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::DecafRuntime**
Handles APR initialization and termination.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.313 src/main/decaf/internal/io/StandardErrorOutputStream.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Output-  
Stream.h>
```

Data Structures

- class **decaf::internal::io::StandardErrorOutputStream**
Wrapper Around the Standard error Output facility on the current platform.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::io**

7.374 src/main/decaf/io/BlockingByteArrayInputStream.h File - Reference

```
#include <decaf/io/InputStream.h> #include <vector>
```

Data Structures

- class **decaf::io::BlockingByteArrayInputStream**

This is a blocking version of a byte buffer stream.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.375 src/main/decaf/io/BufferedInputStream.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Filter-  
InputStream.h> #include <decaf/lang/exceptions/Illegal-  
ArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedInputStream**

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.376 src/main/decaf/io/BufferedOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h> #include <decaf/lang/exceptions/-  
IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedOutputStream**

Wrapper around another output stream that buffers output before writing to the target output stream.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.377 src/main/decaf/io/ByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h> #include <decaf/util/concurrent/-  
Mutex.h> #include <vector>
```

Data Structures

- class **decaf::io::ByteArrayInputStream**

*A **ByteArrayInputStream** (p. 679) contains an internal buffer that contains bytes that may be read from the stream.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.378 src/main/decaf/io/ByteArrayOutputStream.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Output-  
Stream.h> #include <decaf/lang/exceptions/IllegalArgumentException-  
Exception.h> #include <utility>
```

Data Structures

- class **decaf::io::ByteArrayOutputStream**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.379 src/main/decaf/io/DataInput.h File Reference

```
#include <decaf/util/Config.h> #include <vector> #include
<string> #include <decaf/io/IOException.h> #include <decaf/io/-
EOFException.h> #include <decaf/io/UTFDataFormatException.-
h> #include <decaf/lang/exceptions/NullPointerException.-
h> #include <decaf/lang/exceptions/IndexOutOfBoundsException.-
h>
```

Data Structures

- class **decaf::io::DataInput**

*The **DataInput** (p. 1086) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.380 src/main/decaf/io/DataInputStream.h File Reference

```
#include <decaf/io/FilterInputStream.h> #include <decaf/io/-
IOException.h> #include <decaf/io/EOFException.h> #include
<decaf/io/UTFDataFormatException.h> #include <decaf/lang/exceptions/-
NullPointerException.h> #include <decaf/lang/exceptions/-
IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::DataInputStream**

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.381 src/main/decaf/io/DataOutput.h File Reference

```
#include <decaf/util/Config.h> #include <vector> #include  
<string> #include <decaf/io/IOException.h> #include <decaf/io/-  
EOFException.h> #include <decaf/lang/exceptions/Null-  
PointerException.h> #include <decaf/lang/exceptions/-  
IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::DataOutput**

*The **DataOutput** (p. 1103) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.382 src/main/decaf/io/DataOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h> #include <decaf/io/-  
IOException.h> #include <decaf/io/UTFDataFormatException.-  
h> #include <string>
```

Data Structures

- class **decaf::io::DataOutputStream**

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.383 src/main/decaf/io/EOFException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::EOFException**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.384 src/main/decaf/io/FileDescriptor.h File Reference

```
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::io::FileDescriptor**

This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.385 src/main/decaf/io/FilterInputStream.h File Reference

```
#include <decaf/io/InputStream.h> #include <decaf/io/IO-  
Exception.h> #include <decaf/lang/exceptions/NullPointer-  
Exception.h> #include <decaf/lang/exceptions/IndexOutOf-  
BoundsException.h>
```

Data Structures

- class **decaf::io::FilterInputStream**

A **FilterInputStream** (p. 1334) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.386 src/main/decaf/io/FilterOutputStream.h File Reference

```

Data Structures

- class **decaf::io::InputStream**

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.389 src/main/decaf/io/InputStreamReader.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Reader.h>
```

Data Structures

- class **decaf::io::InputStreamReader**

An *InputStreamReader* (p. 1475) is a bridge from byte streams to character streams.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

Mutex.h> #include <decaf/util/Config.h> #include <decaf/lang/exceptions/-  
NullPointerException.h> #include <decaf/lang/exceptions/-  
IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::OutputStream**

Base interface for any class that wants to represent an output stream of bytes.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.393 src/main/decaf/io/OutputStreamWriter.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Writer.-  
h>
```

Data Structures

- class **decaf::io::OutputStreamWriter**

A class for turning a character stream into a byte stream.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.394 src/main/decaf/io/PushbackInputStream.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Input-  
Stream.h> #include <decaf/io/FilterInputStream.h>
```

Data Structures

- class **decaf::io::PushbackInputStream**

*A **PushbackInputStream** (p. 2214) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.445 src/main/decaf/net/ProtocolException.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/io/IO-  
Exception.h>
```

Data Structures

- class **decaf::net::ProtocolException**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.446 src/main/decaf/net/ServerSocket.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/net/Inet-  
Address.h> #include <decaf/net/SocketImpl.h> #include  
<decaf/net/SocketImplFactory.h> #include <decaf/lang/exceptions/-  
NullPointerException.h> #include <decaf/lang/exceptions/-  
IllegalArgumentException.h> #include <decaf/net/Unknown-  
HostException.h> #include <decaf/net/SocketTimeoutException.-  
h> #include <decaf/io/IOException.h> #include <string>
```

Data Structures

- class **decaf::net::ServerSocket**
This class implements server sockets.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.447 src/main/decaf/net/ServerSocketFactory.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/net/Inet-  
Address.h>
```

Data Structures

- class **decaf::net::ServerSocketFactory**

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.448 src/main/decaf/net/Socket.h File Reference

```
#include <decaf/net/InetAddress.h> #include <decaf/net/-  
SocketImplFactory.h> #include <decaf/net/SocketException.-  
h> #include <decaf/io/InputStream.h> #include <decaf/io/-  
OutputStream.h> #include <decaf/io/Closeable.h> #include  
<decaf/util/Config.h> #include <decaf/lang/exceptions/-  
NullPointerException.h> #include <decaf/lang/exceptions/-  
IllegalArgumentException.h> #include <decaf/net/Unknown-  
HostException.h> #include <decaf/net/SocketTimeoutException.-  
h> #include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::net::Socket**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.449 src/main/decaf/net/SocketAddress.h File Reference

```
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::net::SocketAddress**

*Base class for protocol specific **Socket** (p. 2452) addresses.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.450 src/main/decaf/net/SocketError.h File Reference

```
#include <string> #include <decaf/util/Config.h>
```

Data Structures

- class **decaf::net::SocketError**

Static utility class to simplify handling of error codes for socket operations.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.451 src/main/decaf/net/SocketException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::net::SocketException**

Exception for errors when manipulating sockets.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.452 src/main/decaf/net/SocketFactory.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/io/IO-  
Exception.h>    #include <decaf/net/UnknownHostException.-  
h>
```

Data Structures

- class **decaf::net::SocketFactory**

*The **SocketFactory** (p. 2473) is used to create **Socket** (p. 2452) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.453 src/main/decaf/net/SocketImpl.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/io/IO-  
Exception.h>    #include <decaf/io/InputStream.h>    #include  
<decaf/io/OutputStream.h> #include <decaf/io/FileDescriptor.-  
h> #include <decaf/net/SocketException.h> #include <decaf/net/-  
SocketTimeoutException.h>    #include <decaf/net/Socket-  
Options.h> #include <string>
```

Data Structures

- class **decaf::net::SocketImpl**

*Acts as a base class for all physical **Socket** (p. 2452) implementations.*

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.454 src/main/decaf/net/SocketImplFactory.h File Reference

```
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::net::SocketImplFactory**
Factory class interface for a Factory that creates SocketImpl objects.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.455 src/main/decaf/net/SocketOptions.h File Reference

```
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::net::SocketOptions**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.456 src/main/decaf/net/SocketTimeoutException.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/io/Interrupted-  
IOException.h>
```

Data Structures

- class **decaf::net::SocketTimeoutException**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.457 src/main/decaf/net/ssl/SSLContext.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/net/ssl/SSLContextSpi.h>
```

Data Structures

- class **decaf::net::ssl::SSLContext**
*Represents an implementation of the Secure **Socket** (p. 2452) Layer for streaming based sockets.*

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.458 src/main/decaf/net/ssl/SSLContextSpi.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/security/SecureRandom.h>
```

Data Structures

- class **decaf::net::ssl::SSLContextSpi**
*Defines the interface that should be provided by an **SSLContext** (p. 2495) provider.*

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.459 src/main/decaf/net/ssl/SSLParameters.h File Reference

```
#include <decaf/util/Config.h> #include <string> #include  
<vector>
```

Data Structures

- class **decaf::net::ssl::SSLParameters**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.460 src/main/decaf/net/ssl/SSLServerSocket.h File Reference

```
#include <decaf/util/Config.h> #include <decaf/net/-  
ServerSocket.h>
```

Data Structures

- class **decaf::net::ssl::SSLServerSocket**
Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.461 src/main/decaf/net/ssl/SSLServerSocketFactory.h File Reference

```
#include <decaf/util/Config.h>          #include <decaf/net/-  
ServerSocketFactory.h> #include <vector> #include <string> x
```

Data Structures

- class **decaf::net::ssl::SSLServerSocketFactory**
Factory class interface that provides methods to create SSL Server Sockets.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.462 src/main/decaf/net/ssl/SSLSocket.h File Reference

```
#include <decaf/util/Config.h>          #include <decaf/net/-  
Socket.h> #include <decaf/net/ssl/SSLParameters.h>
```

Data Structures

- class **decaf::net::ssl::SSLSocket**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.463 src/main/decaf/net/ssl/SSLSocketFactory.h File Reference

```
#include <decaf/util/Config.h>          #include <decaf/net/-  
SocketFactory.h> #include <vector> #include <string>
```

Data Structures

- class **decaf::net::ssl::SSLSocketFactory**

*Factory class interface for a **SocketFactory** (p. 2473) that can create **SSLSocket** (p. 2513) objects.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**
- namespace **decaf::net::ssl**

7.464 src/main/decaf/net/UnknownHostException.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/io/IO-
Exception.h>
```

Data Structures

- class **decaf::net::UnknownHostException**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.465 src/main/decaf/net/UnknownServiceException.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/io/IO-
Exception.h>
```

Data Structures

- class **decaf::net::UnknownServiceException**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.466 src/main/decaf/net/URI.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/lang/-  
Comparable.h>      #include <decaf/lang/exceptions/Illegal-  
ArgumentException.h> #include <decaf/net/URISyntaxException.-  
h> #include <decaf/net/MalformedURLException.h> #include  
<decaf/net/URL.h> #include <decaf/internal/net/URIType.-  
h> #include <string>
```

Data Structures

- class **decaf::net::URI**
*This class represents an instance of a **URI** (p. 2828) as defined by RFC 2396.*

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.467 src/main/decaf/net/URISyntaxException.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/lang/-  
Exception.h>
```

Data Structures

- class **decaf::net::URISyntaxException**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::net**

7.468 src/main/decaf/net/URL.h File Reference

```
#include <decaf/util/Config.h> #include <string>
```

Data Structures

- class **decaf::net::URL**

*Class **URL** (p. 2868) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.469 src/main/decaf/net/URLDecoder.h File Reference

```
#include <decaf/util/Config.h> #include <string>
```

Data Structures

- class **decaf::net::URLDecoder**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.470 src/main/decaf/net/URLEncoder.h File Reference

```
#include <decaf/util/Config.h> #include <string>
```

Data Structures

- class **decaf::net::URLEncoder**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::net**

7.471 src/main/decaf/nio/Buffer.h File Reference

```
#include <decaf/lang/exceptions/IllegalArgumentException.-  
h> #include <decaf/nio/InvalidMarkException.h>
```

Data Structures

- class **decaf::nio::Buffer**

A container for data of a specific primitive type.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::nio**

7.472 src/main/decaf/nio/BufferOverflowException.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/lang/-

```

Data Structures

- class **decaf::nio::BufferOverflowException**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::nio**

7.473 src/main/decaf/nio/BufferUnderflowException.h File Reference

```
#include <decaf/util/Config.h>      #include <decaf/lang/-  
Exception.h>
```

Data Structures

- class **decaf::nio::BufferUnderflowException**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::nio**

7.474 src/main/decaf/nio/ByteBuffer.h File Reference

```
#include <decaf/nio/Buffer.h>      #include <decaf/lang/-  
Comparable.h> #include <decaf/lang/exceptions/NullPointerException.h> #include <decaf/lang/exceptions/IndexOutOfBoundsException.h> #include <decaf/nio/BufferUnderflowException.h> #include <decaf/nio/BufferOverflowException.h> #include <decaf/nio/ReadOnlyBufferException.h>
```

Data Structures

- class **decaf::nio::ByteBuffer**
This class defines six categories of operations upon byte buffers:

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::nio**

7.475 src/main/decaf/nio/CharBuffer.h File Reference

```
#include <decaf/nio/Buffer.h>      #include <decaf/lang/-  
Comparable.h> #include <decaf/lang/exceptions/NullPointerException.h> #include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

```
BoundsException.h>    #include <decaf/nio/BufferUnderflow-  
Exception.h> #include <decaf/nio/BufferOverflowException.-  
h> #include <decaf/nio/ReadOnlyBufferException.h> #include  
<decaf/lang/CharSequence.h> #include <decaf/lang/Appendable.-  
h>
```

Data Structures

- class **decaf::nio::CharBuffer**

This class defines four categories of operations upon character buffers:

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::nio**

7.476 src/main/decaf/nio/DoubleBuffer.h File Reference

```
#include <decaf/nio/Buffer.h>    #include <decaf/lang/-  
Comparable.h> #include <decaf/lang/exceptions/NullPointer-  
Exception.h> #include <decaf/lang/exceptions/IndexOutOf-  
BoundsException.h> #include <decaf/nio/BufferUnderflow-  
Exception.h> #include <decaf/nio/BufferOverflowException.-  
h> #include <decaf/nio/ReadOnlyBufferException.h>
```

Data Structures

- class **decaf::nio::DoubleBuffer**

This class defines four categories of operations upon double buffers:

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::nio**

7.477 src/main/decaf/nio/FloatBuffer.h File Reference

```
#include <decaf/nio/Buffer.h>          #include <decaf/lang/-  
Comparable.h> #include <decaf/lang/exceptions/NullPointer-  
Exception.h> #include <decaf/lang/exceptions/IndexOutOf-  
BoundsException.h> #include <decaf/nio/BufferUnderflow-  
Exception.h> #include <decaf/nio/BufferOverflowException.-  
h> #include <decaf/nio/ReadOnlyBufferException.h>
```

Data Structures

- class **decaf::nio::FloatBuffer**

This class defines four categories of operations upon float buffers:

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::nio**

7.478 src/main/decaf/nio/IntBuffer.h File Reference

```
#include <decaf/nio/Buffer.h>          #include <decaf/lang/-

Defines

- #define **WAIT_INFINITE** 0xFFFFFFFF
The synchronized macro defines a mechanism for synchronizing a section of code.
- #define **synchronized(W)**

7.523.1 Define Documentation

7.523.1.1 #define synchronized(W)

Value:

```
if(false){} \
else \
for( decaf::util::concurrent::Lock lock_W(W); \
    lock_W.isLocked(); lock_W.unlock() )
```

7.523.1.2 #define WAIT_INFINITE 0xFFFFFFFF

The synchronized macro defines a mechanism for synchronizing a section of code.

The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compilers restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

```
somefunction() { synchronized(X) (p. 3231) { // Do something that needs synchronizing.
} }
```

7.524 src/main/decaf/util/concurrent/ConcurrentMap.h File - Reference

#include <decaf/lang/exceptions/InterruptedException.-
h>      #include <decaf/lang/exceptions/IllegalMonitorState-
Exception.h>
```

Data Structures

- class **decaf::util::concurrent::locks::Condition**

Condition (p. 921) factors out the **Mutex** (p. 1960) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1684) implementations.
