6.665.3.1 `virtual RedeliveryPolicy* activemq::core::RedeliveryPolicy::clone ()`
`const` [pure virtual]

Create a copy of this Policy and return it.

Returns

pointer to a new **RedeliveryPolicy** (p. 2972) that is a copy of this one.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1570).

6.665.3.2 `virtual void activemq::core::RedeliveryPolicy::configure (const decaf::util::Properties & properties)` [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix `cms.RedeliveryPolicy.XXX` where `XXX` is the name of a property with a public setter method. For instance `cms.RedeliveryPolicy.useExponentialBackOff` will be used to set the value of the use exponential back off toggle.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters

properties The Properties object used to configure this object.

Exceptions

NumberFormatException if a property that is numeric cannot be converted

IllegalArgumentException if a property can't be converted to the correct type.

6.665.3.3 `virtual double activemq::core::RedeliveryPolicy::getBackOffMultiplier () const` [pure virtual]

Returns

The value of the Back-Off Multiplier for Message Redelivery.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1571).

6.665.3.4 `virtual short activemq::core::RedeliveryPolicy::getCollisionAvoidancePercent () const` [pure virtual]

Returns

the currently set Collision Avoidance percentage.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1571).

6.665.3.5 `virtual long long activemq::core::RedeliveryPolicy::getInitialRedeliveryDelay () const` [pure virtual]

Gets the initial time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed initially.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1571).

6.665.3.6 `virtual int activemq::core::RedeliveryPolicy::getMaximumRedeliveries () const` [pure virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns

maximum allowed redeliveries for a message.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1571).

6.665.3.7 `virtual long long activemq::core::RedeliveryPolicy::getRedeliveryDelay (long long previousDelay)` [pure virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters

previousDelay The last delay that was used between message redeliveries.

Returns

the new delay to use before attempting another redelivery.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1572).

6.665.3.8 `virtual bool activemq::core::RedeliveryPolicy::isUseCollisionAvoidance () const` [pure virtual]

Returns

whether or not collision avoidance is enabled for this Policy.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1572).

6.665.3.9 `virtual bool activemq::core::RedeliveryPolicy::isUseExponentialBackOff () const` [pure virtual]

Returns

whether or not the exponential back off option is enabled.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1572).

6.665.3.10 `virtual void activemq::core::RedeliveryPolicy::setBackOffMultiplier (double value)` [pure virtual]

Sets the Back-Off Multiplier for Message Redelivery.

Parameters

value The new value for the back-off multiplier.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1572).

6.665.3.11 `virtual void activemq::core::RedeliveryPolicy::setCollisionAvoidancePercent (short value)` [pure virtual]

Parameters

value The collision avoidance percentage setting.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1572).

6.665.3.12 `virtual void activemq::core::RedeliveryPolicy::setInitialRedeliveryDelay (long long value)` [pure virtual]

Sets the initial time that redelivery will be delayed.

Parameters

value Time in Milliseconds to wait before starting redelivery.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1573).

6.665.3.13 `virtual void activemq::core::RedeliveryPolicy::setMaximumRedeliveries
(int maximumRedeliveries)` [pure virtual]

Sets the Maximum allowable redeliveries for a Message.

Parameters

maximumRedeliveries The maximum number of times that a message will be redelivered.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1573).

6.665.3.14 `virtual void activemq::core::RedeliveryPolicy::setUseCollisionAvoidance
(bool value)` [pure virtual]

Parameters

value Enable or Disable collision avoidance for this Policy.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1573).

6.665.3.15 `virtual void activemq::core::RedeliveryPolicy::setUseExponentialBackOff
(bool value)` [pure virtual]

Parameters

value Enable or Disable the exponential back off multiplier option.

Implemented in `activemq::core::policies::DefaultRedeliveryPolicy` (p. 1573).

6.665.4 Field Documentation

6.665.4.1 `const long long activemq::core::RedeliveryPolicy::NO_MAXIMUM_
REDELIVERIES` [static]

The documentation for this class was generated from the following file:

6.666 decaf::util::concurrent::locks::ReentrantLock Class Reference

A reentrant mutual exclusion **Lock** (p. 2229) with extended capabilities.

```
#include <src/main/decaf/util/concurrent/locks/ReentrantLock.h>
```

Inheritance diagram for `decaf::util::concurrent::locks::ReentrantLock`:

Public Member Functions

- **ReentrantLock** ()
- virtual **~ReentrantLock** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock.
- virtual void **lockInterruptibly** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock unless the current thread is interrupted.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock only if it is not held by another thread at the time of invocation.
- virtual bool **tryLock** (long long time, const **TimeUnit** &unit) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Attempts to release this lock.
- virtual **Condition** * **newCondition** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException)
*Returns a **Condition** (p. 1156) instance for use with this **Lock** (p. 2229) instance.*
- int **getHoldCount** () const
Queries the number of holds on this lock by the current thread.
- bool **isHeldByCurrentThread** () const
Queries if this lock is held by the current thread.
- bool **isLocked** () const
Queries if this lock is held by any thread.
- bool **isFair** () const
Returns true if this lock has fairness set true.
- std::string **toString** () const
Returns a string identifying this lock, as well as its lock state.

6.666.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 2229) with extended capabilities. A **ReentrantLock** (p. 2977) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking lock will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods **isHeldByCurrentThread**() (p. 2980), and **getHoldCount**() (p. 2979).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, locks favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair locks accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain locks and guarantee lack of starvation. Note however, that fairness of locks does not guarantee fairness of thread scheduling. Thus, one of many threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the lock. Also note that the untimed tryLock method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

```
class X { private:  
    ReentrantLock (p. 2977) lock; // ...  
public:  
    void m() { lock.lock(); // block until condition holds  
    try { // ... method body } finally { lock.unlock() } } }
```

In addition to implementing the **Lock** (p. 2229) interface, this class defines methods isLocked and getLockQueueLength, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

Since

1.0

6.666.2 Constructor & Destructor Documentation

6.666.2.1 decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ()

6.666.2.2 virtual decaf::util::concurrent::locks::ReentrantLock::~~ReentrantLock () [virtual]

6.666.3 Member Function Documentation

6.666.3.1 int decaf::util::concurrent::locks::ReentrantLock::getHoldCount ()
const

Queries the number of holds on this lock by the current thread.

A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of code should not be entered with the lock already held then we can assert that fact:

```
class X { private:  
    ReentrantLock (p. 2977) lock; // ...  
public:  
    void m() { assert( lock.getHoldCount() == 0 ); lock.lock(); try { // ... method body } catch(...)  
    { lock.unlock(); } } }
```

Returns

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.666.3.2 bool decaf::util::concurrent::locks::ReentrantLock::isFair () const

Returns true if this lock has fairness set true.

Returns

true if this lock has fairness set true

6.666.3.3 bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread () const

Queries if this lock is held by the current thread.

This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

```
class X { private: ReentrantLock (p. 2977) lock = new ReentrantLock() (p. 2979); // ...
public: void m() { assert( lock.isHeldByCurrentThread() ); // ... method body } }
```

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

```
class X { private: ReentrantLock (p. 2977) lock = new ReentrantLock() (p. 2979); // ...
public: void m() { assert !lock.isHeldByCurrentThread() (p. 2980); lock.lock(); try { // ...
method body } finally { lock.unlock(); } } }
```

Returns

true if current thread holds this lock and false otherwise

6.666.3.4 bool decaf::util::concurrent::locks::ReentrantLock::isLocked () const

Queries if this lock is held by any thread.

This method is designed for use in monitoring of the system state, not for synchronization control.

Returns

true if any thread holds this lock and false otherwise

6.666.3.5 virtual void decaf::util::concurrent::locks::ReentrantLock::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Acquires the lock.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 2231).

6.666.3.6 virtual void de-
caf::util::concurrent::locks::ReentrantLock::lockInterruptibly
 () throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::InterruptedException) [virtual]

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implements **decaf::util::concurrent::locks::Lock** (p. 2231).

6.666.3.7 virtual Condition* de-
caf::util::concurrent::locks::ReentrantLock::newCondition
 () throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Returns a **Condition** (p. 1156) instance for use with this **Lock** (p. 2229) instance.

The returned **Condition** (p. 1156) instance supports the same usages as do the **Mutex** (p. 2604) Class' methods (wait, notify, and notifyAll).

* If this lock is not held when any of the **Condition** (p. 1156) waiting or signalling methods are called, then an `IllegalMonitorStateException` is thrown. * When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called. * If a thread is interrupted while waiting then the wait will terminate, an `InterruptedException` will be thrown, and the thread's interrupted status will be cleared. * Waiting threads are signaled in FIFO order. * The ordering of lock reacquisition for threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair locks favors those threads that have been waiting the longest.

Exceptions

RuntimeException if an error occurs while creating the **Condition** (p. 1156).

UnsupportedOperationException if this **Lock** (p. 2229) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 2232).

6.666.3.8 **std::string decaf::util::concurrent::locks::ReentrantLock::toString ()**
const

Returns a string identifying this lock, as well as its lock state.

The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

Returns

a string identifying this lock, as well as its lock state

6.666.3.9 **virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock**
(long long *time*, const TimeUnit & *unit*)
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::InterruptedException) [virtual]

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 2983) method. If you want a timed tryLock that does permit barging on a fair lock then combine the timed and un-timed forms together:

```
if (lock.tryLock() || lock.tryLock(timeout, unit) ) { ... }
```

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread;
or * The specified waiting time elapses

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

Parameters

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 2233).

6.666.3.10 **virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock ()**
throw (decaf::lang::exceptions::RuntimeException) [virtual]

Acquires the lock only if it is not held by another thread at the time of invocation.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 2983) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting for this lock, then use **tryLock(0, TimeUnit.SECONDS)** (p. 3568) which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

Returns

true if the lock was acquired and false otherwise

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 2234).

6.666.3.11 **virtual void decaf::util::concurrent::locks::ReentrantLock::unlock**
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Attempts to release this lock.

If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then **IllegalMonitorStateException** is thrown.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 2234).

Constructor.
- **RejectedExecutionException** (const char *file, const int lineNumber, const char *msg,...)
 throw ()

Constructor - Initializes the file name and line number where this message occurred.

- **RejectedExecutionException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **RejectedExecutionException** * clone () const

Clones this exception.

- virtual ~**RejectedExecutionException** () throw ()

6.667.1 Constructor & Destructor Documentation

6.667.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException () throw () [inline]

Default Constructor.

6.667.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.667.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const RejectedExecutionException & ex) throw () [inline]

Copy Constructor.

Parameters

ex - The Exception to copy in this new instance.

References decaf::lang::Exception::Exception().

6.667.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const std::exception * cause) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.667.1.5 `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException`
 (`const char * file`, `const int lineNumber`, `const char * msg`, ...)
 throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file - The file name where exception occurs
lineNumber - The line number where the exception occurred.
msg - The message to report
 ... - list of primitives that are formatted into the message

6.667.1.6 `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException`
 (`const char * file`, `const int lineNumber`, `const std::exception * cause`, `const char * msg`, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file - The file name where exception occurs
lineNumber - The line number where the exception occurred.
cause - The exception that was the cause for this one to be thrown.
msg - The message to report
 ... - list of primitives that are formatted into the message

6.667.1.7 `virtual`
`decaf::util::concurrent::RejectedExecutionException::~~RejectedExecutionException`
 () throw () [inline, virtual]

6.667.2 Member Function Documentation

6.667.2.1 `virtual RejectedExecutionException* decaf::util::concurrent::RejectedExecutionException::clone` () `const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance this exception type with a copy the current state.

Reimplemented from `decaf::lang::Exception` (p. 1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/RejectedExecutionException.h`

6.668 decaf::util::concurrent::RejectedExecutionHandler Class Reference

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p.??).

6.668.1 Detailed Description

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p.??).

Since

1.0

6.668.2 Constructor & Destructor Documentation

- 6.668.2.1** virtual
decaf::util::concurrent::RejectedExecutionHandler::~~RejectedExecutionHandler
() [inline, virtual]

6.668.3 Member Function Documentation

- 6.668.3.1** virtual void de-
caf::util::concurrent::RejectedExecutionHandler::rejectedExecution
(Runnable * r, ThreadPoolExecutor * *executer*) throw (RejectedExecutionException) [pure virtual]

Method that may be invoked by a **ThreadPoolExecutor** (p.??) when **execute** (p.??) cannot accept a task.

This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p.1749).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p.2984), which will be propagated to the caller of **execute** (p.??).

Parameters

- r* The pointer to the runnable task requested to be executed.
executer The pointer to the executor attempting to execute this task.

Exceptions

RejectedExecutionException (p.2984) if there is no remedy.

6.669.1 Constructor & Destructor Documentation

6.669.1.1 `activemq::commands::RemoveInfo::RemoveInfo ()`

6.669.1.2 `virtual activemq::commands::RemoveInfo::~~RemoveInfo () [virtual]`

6.669.2 Member Function Documentation

6.669.2.1 `virtual RemoveInfo* activemq::commands::RemoveInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.669.2.2 `virtual void activemq::commands::RemoveInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.669.2.3 `virtual bool activemq::commands::RemoveInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.669.2.4 `virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSetructure** (p. 1553) type copy.

Implements **activemq::commands::DataSetructure** (p. 1557).

6.669.2.5 `virtual long long activemq::commands::RemoveInfo::getLastDeliveredSequenceId () const [virtual]`

6.669.2.6 `virtual const Pointer<DataSetructure>& activemq::commands::RemoveInfo::getObjectId () const [virtual]`

6.669.2.7 `virtual Pointer<DataSetructure>& activemq::commands::RemoveInfo::getObjectId () [virtual]`

6.669.2.8 `virtual bool activemq::commands::RemoveInfo::isRemoveInfo () const [inline, virtual]`

Returns

an answer of true to the **isRemoveInfo()** (p. 2990) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 699).

6.669.2.9 `virtual void activemq::commands::RemoveInfo::setLastDeliveredSequenceId (long long lastDeliveredSequenceId) [virtual]`

6.669.2.10 `virtual void activemq::commands::RemoveInfo::setObjectId (const Pointer< DataSetructure > & objectId) [virtual]`

6.669.2.11 `virtual std::string activemq::commands::RemoveInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSetructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

6.669.2.12 `virtual Pointer<Command> activemq::commands::RemoveInfo::visit
 (activemq::state::CommandVisitor * visitor) throw (
 exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1112).

6.669.3 Field Documentation

6.669.3.1 `const unsigned char activemq::commands::RemoveInfo::ID _ -
 REMOVEINFO = 12 [static]`

6.669.3.2 `long long activemq::commands::RemoveInfo::lastDeliveredSequenceId
 [protected]`

6.669.3.3 `Pointer<DataStructure> activemq::commands::RemoveInfo::objectId
 [protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/RemoveInfo.h`

6.670 activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2991).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/RemoveInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller`:

Public Member Functions

- **RemoveInfoMarshaller** ()
- virtual **~RemoveInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.670.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2991). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.670.2 Constructor & Destructor Documentation

6.670.2.1 **activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::RemoveInfoMarshaller**
() [inline]

6.670.2.2 **virtual**
activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::~~RemoveInfoMarshaller
() [inline, virtual]

6.670.3 Member Function Documentation

6.670.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.670.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::getDataSetType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.670.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 736).

6.670.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 737).

6.670.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

6.670.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

6.670.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/RemoveInfoMarshaller.h`

6.671 activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2995).

6.671.2.2 **virtual**
activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::~~RemoveInfoMarshaller
() [inline, virtual]

6.671.3 Member Function Documentation

6.671.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.671.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.671.3.3 virtual void activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 729).

6.671.3.4 virtual void activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 730).

6.671.3.5 virtual int activemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

```
6.671.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

```
6.671.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

6.672.3 Member Function Documentation

6.672.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.672.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.672.3.3 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.672.3.4 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.672.3.5 virtual int activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.672.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.672.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

6.673.3 Member Function Documentation

6.673.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.673.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.673.3.3 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.673.3.4 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

6.673.3.5 virtual int activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

```
6.673.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

```
6.673.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.674.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p.3007). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.674.2 Constructor & Destructor Documentation

6.674.2.1 activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::RemoveInfoMarshaller () [inline]

6.674.2.2 virtual
activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::~~RemoveInfoMarshaller () [inline, virtual]

6.674.3 Member Function Documentation

6.674.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.674.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.674.3.3 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

6.674.3.4 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

6.674.3.5 virtual int activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```
6.674.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.674.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

The documentation for this class was generated from the following file:

6.675.2.2 virtual
activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::~~RemoveInfoMarshaller () [inline, virtual]

6.675.3 Member Function Documentation

6.675.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.675.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.675.3.3 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 709).

6.675.3.4 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 710).

6.675.3.5 virtual int activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```
6.675.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.675.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

- virtual void **setClientId** (const std::string &clientId)

- virtual bool **isRemoveSubscriptionInfo** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REMOVESUBSCRIPTIONINFO** = 9

Protected Attributes

- **Pointer< ConnectionId > connectionId**
- std::string **subscriptionName**
- std::string **clientId**

6.676.1 Constructor & Destructor Documentation

6.676.1.1 **activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo** ()

6.676.1.2 **virtual**
activemq::commands::RemoveSubscriptionInfo::~~RemoveSubscriptionInfo
() [virtual]

6.676.2 Member Function Documentation

6.676.2.1 **virtual RemoveSubscriptionInfo* ac-**
tivemq::commands::RemoveSubscriptionInfo::cloneDataStructure ()
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.676.2.2 **virtual void ac-**
tivemq::commands::RemoveSubscriptionInfo::copyDataStructure (const
DataStructure * src) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.676.2.3 `virtual bool activemq::commands::RemoveSubscriptionInfo::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.676.2.4 `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () const [virtual]`

6.676.2.5 `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () [virtual]`

6.676.2.6 `virtual const Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () const [virtual]`

6.676.2.7 `virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () [virtual]`

6.676.2.8 `virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.676.2.9** `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName () const [virtual]`
- 6.676.2.10** `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName () [virtual]`
- 6.676.2.11** `virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo () const [inline, virtual]`

Returns

an answer of true to the `isRemoveSubscriptionInfo()` (p. 3018) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 699).

- 6.676.2.12** `virtual void activemq::commands::RemoveSubscriptionInfo::setClientId (const std::string & clientId) [virtual]`
- 6.676.2.13** `virtual void activemq::commands::RemoveSubscriptionInfo::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`
- 6.676.2.14** `virtual void activemq::commands::RemoveSubscriptionInfo::setSubscriptionName (const std::string & subscriptionName) [virtual]`
- 6.676.2.15** `virtual std::string activemq::commands::RemoveSubscriptionInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

- 6.676.2.16** `virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

6.677

activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller

Class Reference

3023

Implements **activemq::commands::Command** (p. 1112).

6.677.3.1 virtual **commands::DataStructure*** **activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.677

activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller

Class Reference

3025

```
6.677.3.2 virtual unsigned char ac-
          tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::getDataSt
          ( ) const [virtual]
```

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

```
6.677.3.3 virtual void ac-
          tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseMars
          ( OpenWireFormat * wireFormat, commands::DataStructure *
            dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
            decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 716).

```
6.677.3.4 virtual void ac-
          tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseUnm
          ( OpenWireFormat * wireFormat, commands::DataStructure *
            dataStructure, decaf::io::DataInputStream * dataIn ) throw (
            decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 717).

6.677.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

6.677.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

6.677.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 720).

The documentation for this class was generated from the following file:

6.678.2 Constructor & Destructor Documentation

6.678.2.1 **activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::RemoveSubscriptionInfoMarshaller** () [inline]

6.678.2.2 **virtual**
activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::~~RemoveSubscriptionInfoMarshaller () [inline, virtual]

6.678.3 Member Function Documentation

6.678.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.678.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

6.678

activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller

Class Reference

3029

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.678.3.3 virtual void **activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - **BinaryWriter** that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 702).

6.678.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 703).

6.678.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.678.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.678.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightUnm
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

6.679

activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller

Class Reference

3031

bs - `BooleanStream` stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/RemoveSubscriptionInfoMarshaller.h`

6.679 **activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller** Class Reference

6.679.2.2 virtual
activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::~~RemoveSubscriptionInfoMarshaller () [inline, virtual]

6.679.3 Member Function Documentation

6.679.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements activemq::wireformat::openwire::marshal::DataStreamMarshaller (p. 1505).

6.679.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements activemq::wireformat::openwire::marshal::DataStreamMarshaller (p. 1511).

6.679

activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller

Class Reference

3033

```
6.679.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseMars
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

```
6.679.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseUnm
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

```
6.679.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

```
6.679.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

```
6.679.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightUnma
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

The documentation for this class was generated from the following file:

6.680.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.680.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.680

activemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller

Class Reference

3037

```
6.680.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::looseMars
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

```
6.680.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::looseUnm
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

```
6.680.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

```
6.680.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

```
6.680.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::RemoveSubscriptionInfoMarshaller::tightUnma
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.682

activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller

Class Reference

3045

```
6.682.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseMars
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

```
6.682.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseUnm
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

```
6.682.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```
6.682.3.6  virtual void ac-
            tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMars
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataOutputStream * dataOut,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.682.3.7  virtual void ac-
            tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightUnma
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataInputStream * dataIn,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/RemoveSubscriptionInfoMarshaller.h`

6.683 activemq::commands::ReplayCommand Class Reference

```
#include <src/main/activemq/commands/ReplayCommand.h>
```

Inheritance diagram for **activemq::commands::ReplayCommand**:

Public Member Functions

- **ReplayCommand** ()
- virtual **~ReplayCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaller share.
- virtual **ReplayCommand * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual int **getFirstNakNumber** () const
- virtual void **setFirstNakNumber** (int firstNakNumber)
- virtual int **getLastNakNumber** () const
- virtual void **setLastNakNumber** (int lastNakNumber)
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REPLAYCOMMAND** = 65

Protected Attributes

- int **firstNakNumber**
- int **lastNakNumber**

6.683.1 Constructor & Destructor Documentation

6.683.1.1 `activemq::commands::ReplayCommand::ReplayCommand ()`

6.683.1.2 `virtual activemq::commands::ReplayCommand::~~ReplayCommand ()`
[virtual]

6.683.2 Member Function Documentation

6.683.2.1 `virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.683.2.2 `virtual void activemq::commands::ReplayCommand::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.683.2.3 `virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.683.2.4 `virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

6.683.2.5 `virtual int activemq::commands::ReplayCommand::getFirstNakNumber () const [virtual]`

6.683.2.6 `virtual int activemq::commands::ReplayCommand::getLastNakNumber () const [virtual]`

6.683.2.7 `virtual void activemq::commands::ReplayCommand::setFirstNakNumber (int firstNakNumber) [virtual]`

6.683.2.8 `virtual void activemq::commands::ReplayCommand::setLastNakNumber (int lastNakNumber) [virtual]`

6.683.2.9 `virtual std::string activemq::commands::ReplayCommand::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

6.683.2.10 `virtual Pointer<Command> activemq::commands::ReplayCommand::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1112).

6.683.3 Field Documentation

6.683.3.1 `int activemq::commands::ReplayCommand::firstNakNumber` [protected]

6.683.3.2 `const unsigned char activemq::commands::ReplayCommand::ID` - `REPLAYCOMMAND = 65` [static]

6.683.3.3 `int activemq::commands::ReplayCommand::lastNakNumber` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ReplayCommand.h`

6.684 `activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller` Class Reference

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 3046).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ReplayCommandMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller`:

Public Member Functions

- **ReplayCommandMarshaller** ()
- virtual `~ReplayCommandMarshaller` ()
- virtual `commands::DataStructure * createObject ()` const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `decaf::io::DataInputStream *dataIn`, `utils::BooleanStream *bs`) throw (`decaf::io::IOException`)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `utils::BooleanStream *bs`) throw (`decaf::io::IOException`)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (`OpenWireFormat *wireFormat`, `commands::DataStructure *dataStructure`, `decaf::io::DataOutputStream *dataOut`, `utils::BooleanStream *bs`) throw (`decaf::io::IOException`)
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.684.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 3046). NOTE! This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.684.2 Constructor & Destructor Documentation

6.684.2.1 activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::ReplayCommandMarshaller () [inline]

6.684.2.2 virtual activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::~~ReplayCommandMarshaller () [inline, virtual]

6.684.3 Member Function Documentation

6.684.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.684.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.684.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.684.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

6.684.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 711).

```
6.684.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 712).

```
6.684.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

6.685.3 Member Function Documentation

6.685.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.685.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.685.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.685.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

6.685.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 718).

```
6.685.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

```
6.685.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.686.3 Member Function Documentation

6.686.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.686.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.686.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.686.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

6.686.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 738).

```
6.686.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 739).

```
6.686.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

Public Member Functions

- **ReplayCommandMarshaller** ()
- virtual **~ReplayCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshall an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.687.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p.3058). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.687.2 Constructor & Destructor Documentation

6.687.2.1 activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::ReplayCommandMarshaller () [inline]

6.687.2.2 virtual
activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::~~ReplayCommandMarshaller () [inline, virtual]

6.687.3 Member Function Documentation

6.687.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.687.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.687.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.687.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.687.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 704).

```
6.687.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 706).

```
6.687.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ReplayCommandMarshaller.h`

6.688 activemq::wireformat::openwire::marshal::v6::ReplayCommandMa Class Reference

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 3062).

6.688.3 Member Function Documentation

6.688.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.688.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.688.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.688.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

6.688.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 731).

```
6.688.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 732).

```
6.688.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

6.689.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

6.689.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```
6.689.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.689.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

6.694.2.3 `virtual
activemq::cmsutil::ResourceLifecycleManager::~~ResourceLifecycleManager () [virtual]`

Destructor - calls destroy

6.694.3 Member Function Documentation

6.694.3.1 `void activemq::cmsutil::ResourceLifecycleManager::addConnection (cms::Connection * connection) throw (cms::CMSException)`

Adds a connection so that its life will be managed by this object.

Parameters

connection the object to be managed

6.694.3.2 `void activemq::cmsutil::ResourceLifecycleManager::addDestination (cms::Destination * dest) throw (cms::CMSException)`

Adds a destination so that its life will be managed by this object.

Parameters

dest the object to be managed

6.694.3.3 `void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer (cms::MessageConsumer * consumer) throw (cms::CMSException)`

Adds a message consumer so that its life will be managed by this object.

Parameters

consumer the object to be managed

6.694.3.4 `void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer (cms::MessageProducer * producer) throw (cms::CMSException)`

Adds a message producer so that its life will be managed by this object.

Parameters

producer the object to be managed

6.694.3.5 `void activemq::cmsutil::ResourceLifecycleManager::addSession (cms::Session * session) throw (cms::CMSException)`

Adds a session so that its life will be managed by this object.

Parameters

session the object to be managed

6.694.3.6 `void activemq::cmsutil::ResourceLifecycleManager::destroy () throw (cms::CMSException)`

Closes and destroys the contained CMS resources.

Exceptions

cms::CMSException (p. 1074) thrown if an error occurs.

6.694.3.7 `ResourceLifecycleManager& activemq::cmsutil::ResourceLifecycleManager::operator= (const ResourceLifecycleManager &) [inline, protected]`

6.694.3.8 `void activemq::cmsutil::ResourceLifecycleManager::releaseAll ()`

Releases all of the contained resources so that this object will no longer control their lifetimes.

The documentation for this class was generated from the following file:

```

Inheritance diagram for `activemq::commands::Response`:

Public Member Functions

- `Response ()`
- `virtual ~Response ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual Response * cloneDataStructure () const`
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- `virtual void copyDataStructure (const DataStructure *src)`

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*

- virtual int **getCorrelationId** () const

- virtual void **setCorrelationId** (int correlationId)

- virtual bool **isResponse** () const

- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_RESPONSE** = 30

Protected Attributes

- int correlationId

6.695.1 Constructor & Destructor Documentation

6.695.1.1 activemq::commands::Response::Response ()

6.695.1.2 virtual activemq::commands::Response::~~Response () [virtual]

6.695.2 Member Function Documentation

6.695.2.1 virtual Response* activemq::commands::Response::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1424), **activemq::commands::DataResponse** (p. 1478), **activemq::commands::ExceptionResponse** (p. 1721), and **activemq::commands::IntegerResponse** (p. 1957).

6.695.2.2 `virtual void activemq::commands::Response::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1424), `activemq::commands::DataResponse` (p. 1478), `activemq::commands::ExceptionResponse` (p. 1721), and `activemq::commands::IntegerResponse` (p. 1957).

6.695.2.3 `virtual bool activemq::commands::Response::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1424), `activemq::commands::DataResponse` (p. 1478), `activemq::commands::ExceptionResponse` (p. 1721), and `activemq::commands::IntegerResponse` (p. 1957).

6.695.2.4 `virtual int activemq::commands::Response::getCorrelationId () const [virtual]`

6.695.2.5 `virtual unsigned char activemq::commands::Response::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaller share.

Returns

new `DataStructure` (p. 1553) type copy.

Implements `activemq::commands::DataStructure` (p. 1557).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1425), `activemq::commands::DataResponse` (p. 1479), `activemq::commands::ExceptionResponse` (p. 1721), and `activemq::commands::IntegerResponse` (p. 1958).

6.695.2.6 `virtual bool activemq::commands::Response::isResponse () const`
`[inline, virtual]`

Returns

an answer of true to the `isResponse()` (p. 3078) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 699).

6.695.2.7 `virtual void activemq::commands::Response::setCorrelationId (int`
`correlationId) [virtual]`

6.695.2.8 `virtual std::string activemq::commands::Response::toString () const`
`[virtual]`

Returns a string containing the information for this `DataSet` (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

Reimplemented in `activemq::commands::DataArrayResponse`
 (p. 1425), `activemq::commands::DataResponse` (p. 1479), `ac-`
`tivemq::commands::ExceptionResponse` (p. 1722), and `ac-`
`tivemq::commands::IntegerResponse` (p. 1958).

6.695.2.9 `virtual Pointer<Command> activemq::commands::Response::visit`
`(activemq::state::CommandVisitor * visitor) throw (`
`exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a `Response` (p. 3076) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 1112).

6.695.3 Field Documentation

6.695.3.1 `int activemq::commands::Response::correlationId` `[protected]`

6.695.3.2 `const unsigned char activemq::commands::Response::ID_RESPONSE =`
`30 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/Response.h`

6.696 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

```
#include <src/main/activemq/transport/mock/ResponseBuilder.h>
```

Inheritance diagram for `activemq::transport::mock::ResponseBuilder`:

Public Member Functions

- virtual `~ResponseBuilder()`
- virtual `Pointer< Response > buildResponse (const Pointer< Command > &command)=0`
Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.
- virtual void `buildIncomingCommands (const Pointer< Command > &command, decaf::util::StlQueue< Pointer< Command > > &queue)=0`
*When called the **ResponseBuilder** (p. 3079) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

6.696.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.696.2 Constructor & Destructor Documentation

6.696.2.1 virtual `activemq::transport::mock::ResponseBuilder::~ResponseBuilder ()` [inline, virtual]

6.696.3 Member Function Documentation

6.696.3.1 virtual void `activemq::transport::mock::ResponseBuilder::buildIncomingCommands (const Pointer< Command > & command, decaf::util::StlQueue< Pointer< Command > > & queue)` [pure virtual]

When called the **ResponseBuilder** (p. 3079) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

- command* - The Command being sent to the Broker.
- queue* - Queue of Command sent back from the broker.

Implemented in `activemq::wireformat::openwire::OpenWireResponseBuilder` (p. 2718).

6.696.3.2 `virtual Pointer<Response> activemq::transport::mock::ResponseBuilder::buildResponse (const Pointer< Command > & command)` [pure virtual]

Given a `Command`, check if it requires a response and return the appropriate `Response` that the Broker would send for this `Command`.

Parameters

command - The command to build a response for

Returns

A `Response` object pointer, or `NULL` if no response.

Implemented in `activemq::wireformat::openwire::OpenWireResponseBuilder` (p. 2718).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/ResponseBuilder.h`

6.697 `activemq::transport::correlator::ResponseCorrelator` Class Reference

This type of transport filter is responsible for correlating asynchronous responses with requests.

`#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>`

Inheritance diagram for `activemq::transport::correlator::ResponseCorrelator`:

Public Member Functions

- **`ResponseCorrelator (const Pointer< Transport > &next)`**
Constructor.
- `virtual ~ResponseCorrelator ()`
- `virtual void oneway (const Pointer< Command > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)`
Sends a one-way command.
- `virtual Pointer< Response > request (const Pointer< Command > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)`
Sends the given request to the server and waits for the response.
- `virtual Pointer< Response > request (const Pointer< Command > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)`
Sends the given request to the server and waits for the response.
- `virtual void onCommand (const Pointer< Command > &command)`

This is called in the context of the nested transport's reading thread.

- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.
- virtual void **onTransportException** (Transport *source, const decaf::lang::Exception &ex)
Event handler for an exception from a command transport.

6.697.1 Detailed Description

This type of transport filter is responsible for correlating asynchronous responses with requests. Non-response messages are simply sent directly to the CommandListener. It owns the transport that it

6.697.2 Constructor & Destructor Documentation

6.697.2.1 activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator (const Pointer< Transport > & next)

Constructor.

Parameters

next the next transport in the chain

6.697.2.2 virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator () [virtual]

6.697.3 Member Function Documentation

6.697.3.1 virtual void activemq::transport::correlator::ResponseCorrelator::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 3638).

6.697.3.2 virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

command the received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3640).

6.697.3.3 virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3640).

6.697.3.4 virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException (Transport * *source*, const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

source The source of the exception

ex The exception.

6.697.3.5 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

Parameters

command The request to send.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3642).

```
6.697.3.6 virtual Pointer<Response> ac-
    tivemq::transport::correlator::ResponseCorrelator::request
    ( const Pointer< Command > & command, un-
      signed int timeout ) throw ( decaf::io::IOException,
      decaf::lang::exceptions::UnsupportedOperationException ) [virtual]
```

Sends the given request to the server and waits for the response.

Parameters

command The request to send.

timeout The time to wait for a response.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3641).

```
6.697.3.7 virtual void activemq::transport::correlator::ResponseCorrelator::start (
    ) throw ( decaf::io::IOException ) [virtual]
```

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

IOException if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 3642).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**ResponseCorrelator.h**

6.698 activemq::wireformat::openwire::marshal::v4::ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3085).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ResponseMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v4::ResponseMarshaller:

Public Member Functions

- **ResponseMarshaller** ()
- virtual **~ResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.698.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3085). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.698.2 Constructor & Destructor Documentation

6.698.2.1 `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::ResponseMarshaller () [inline]`

6.698.2.2 `virtual
activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::~~ResponseMarshaller () [inline, virtual]`

6.698.3 Member Function Documentation

6.698.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1435), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1497), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1740), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1972).

6.698.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1435), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1497), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1740), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1972).

6.698.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1435), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1497), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1740), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1972).

```
6.698.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1436), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1498), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1741), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1973).

```
6.698.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1436), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1498), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1741), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1973).

6.698.3.6 virtual void `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal2`
 (`OpenWireFormat * wireFormat`, `commands::DataStructure`
 * `dataStructure`, `decaf::io::DataOutputStream * dataOut`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1437), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1499), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1742), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1974).

6.698.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1437), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1499), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1742), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1974).

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 736).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1427), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1489), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1728), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1964).

6.699.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1428), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1490), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1729), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1965).

6.699.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1428), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1490), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1729), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1965).

```

6.699.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1429), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1491), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1730), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1966).

```

6.699.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 740).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1429), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1491), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller`

(p. 1730), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1966).

The documentation for this class was generated from the following file:

Un-marshall an object instance from the data input stream.
- `virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`

Write a object instance to data output stream.

6.700.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3093). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.700.2 Constructor & Destructor Documentation

6.700.2.1 `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::ResponseMarshaller`
() [inline]

6.700.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::~~ResponseMarshaller`
() [inline, virtual]

6.700.3 Member Function Documentation

6.700.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::createObject`
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1443), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1481), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1736), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1980).

6.700.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::getDataStructureType`
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1443), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1481), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller`

(p. 1736), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1980).

6.700.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1443), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1481), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1736), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1980).

6.700.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1444), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1482), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1737), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1981).

```

6.700.3.5  virtual int ac-
            tivemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, utils::BooleanStream * bs ) throw (
            decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1444), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1482), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1737), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1981).

```

6.700.3.6  virtual void ac-
            tivemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightMarshal2
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataOutputStream * dataOut,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1445), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller`

(p. 1483), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1738), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1982).

6.700.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 727).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1445), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1483), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1738), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1982).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/ResponseMarshaller.h`

6.701 `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` Class Reference

Marshaling code for Open Wire Format for `ResponseMarshaller` (p. 3098).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/ResponseMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller`:

Public Member Functions

- `ResponseMarshaller ()`
- `virtual ~ResponseMarshaller ()`
- `virtual commands::DataStructure * createObject () const`

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.701.2.2 `virtual
activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::~~ResponseMarshaller () [inline, virtual]`

6.701.3 Member Function Documentation

6.701.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1431), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1493), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1732), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1968).

6.701.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1431), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1493), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1732), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1968).

6.701.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1431), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1493), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1732), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1968).

```
6.701.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1432), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1494), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1733), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1969).

```
6.701.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1432), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1494), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1733), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1969).

6.701.3.6 virtual void `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal2`
 (`OpenWireFormat * wireFormat`, `commands::DataStructure`
 * `dataStructure`, `decaf::io::DataOutputStream * dataOut`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1433), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1495), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1734), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1970).

```
6.701.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1433), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1495), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1734), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1970).

The documentation for this class was generated from the following file:

6.702.3 Member Function Documentation

6.702.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1439), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1501), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1744), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1976).

6.702.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1439), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1501), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1744), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1976).

6.702.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 716).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1439), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1501), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1744), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1976).

6.702.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1440), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1502), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1745), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1977).

6.702.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1440), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1502), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1745), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1977).

```

6.702.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1441), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1503), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1746), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1978).

```

6.702.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 720).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1441), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1503), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller`

(p. 1746), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1978).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/ResponseMarshaller.h`

6.703 `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` Class Reference

Marshaling code for Open Wire Format for `ResponseMarshaller` (p. 3107).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/ResponseMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller`:

Public Member Functions

- `ResponseMarshaller ()`

Write a object instance to data output stream.
- `virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`
Un-marshall an object instance from the data input stream.
- `virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`

Write a object instance to data output stream.

6.703.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 3107). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.703.2 Constructor & Destructor Documentation

6.703.2.1 `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::ResponseMarshaller () [inline]`

6.703.2.2 `virtual activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::~~ResponseMarshaller () [inline, virtual]`

6.703.3 Member Function Documentation

6.703.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1447), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1485), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1724), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1960).

6.703.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1447), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1485), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller`

(p. 1724), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1960).

6.703.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1447), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1485), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1724), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1960).

6.703.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1448), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1486), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1725), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1961).

```

6.703.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v6::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1448), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1486), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1725), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1961).

```

6.703.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1449), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller`

(p. 1487), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1726), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1962).

6.703.3.7 `virtual void activemq::wireformat::openwire::marshal::v6::ResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 733).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::DataArrayResponseMarshaller` (p. 1449), `activemq::wireformat::openwire::marshal::v6::DataResponseMarshaller` (p. 1487), `activemq::wireformat::openwire::marshal::v6::ExceptionResponseMarshaller` (p. 1726), and `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller` (p. 1962).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/ResponseMarshaller.h`

6.704 decaf::lang::Runnable Class Reference

Interface for a runnable object - defines a task that can be run by a thread.

```
#include <src/main/decaf/lang/Runnable.h>
```

Inheritance diagram for `decaf::lang::Runnable`:

Public Member Functions

- `virtual ~Runnable ()`
- `virtual void run ()=0`

Run method - called by the *Thread* (p. 3520) class in the context of the thread.

6.704.1 Detailed Description

Interface for a runnable object - defines a task that can be run by a thread.

6.704.2 Constructor & Destructor Documentation

6.704.2.1 virtual decaf::lang::Runnable::~~Runnable () [inline, virtual]

6.704.3 Member Function Documentation

6.704.3.1 virtual void decaf::lang::Runnable::run () [pure virtual]

Run method - called by the **Thread** (p. 3520) class in the context of the thread.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 1134), **activemq::threads::DedicatedTaskRunner** (p. 1565), **activemq::transport::inactivity::ReadChecker** (p. 2960), **activemq::transport::inactivity::WriteChecker** (p. 3755), **activemq::transport::IOTransport** (p. 2010), **activemq::transport::mock::InternalCommandListener** (p. 1987), **decaf::lang::Thread** (p. 3527), and **decaf::util::concurrent::PooledThread** (p. 2778).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Runnable.h**

6.705 decaf::lang::Runtime Class Reference

```
#include <src/main/decaf/lang/Runtime.h>
```

Inheritance diagram for decaf::lang::Runtime:

Public Member Functions

- virtual ~**Runtime** ()

Static Public Member Functions

- static **Runtime** * **getRuntime** ()
*Gets the single instance of the Decaf **Runtime** (p. 3112) for this Process.*
- static void **initializeRuntime** (int argc, char **argv)
Initialize the Decaf Library passing it the args that were passed to the application at startup.
- static void **initializeRuntime** ()
Initialize the Decaf Library.
- static void **shutdownRuntime** ()

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

6.705.1 Constructor & Destructor Documentation

6.705.1.1 `virtual decaf::lang::Runtime::~~Runtime () [inline, virtual]`

6.705.2 Member Function Documentation

6.705.2.1 `static Runtime* decaf::lang::Runtime::getRuntime () [static]`

Gets the single instance of the Decaf **Runtime** (p. 3112) for this Process.

Returns

pointer to the single Decaf **Runtime** (p. 3112) instance that exists for this process

6.705.2.2 `static void decaf::lang::Runtime::initializeRuntime (int argc, char ** argv) [static]`

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters

argc - The number of args passed

argv - Array of char* values passed to the Process on start.

Exceptions

runtime_error if the library is already initialized or an error occurs during initialization.

6.705.2.3 `static void decaf::lang::Runtime::initializeRuntime () [static]`

Initialize the Decaf Library.

Exceptions

runtime_error if the library is already initialized or an error occurs during initialization.

6.705.2.4 `static void decaf::lang::Runtime::shutdownRuntime () [static]`

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions

runtime_error if the library has not already been initialized or an error occurs during shutdown.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Runtime.h`

6.706 decaf::lang::exceptions::RuntimeException Class Reference

#include <src/main/decaf/lang/exceptions/RuntimeException.h>

Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** () throw ()
Default Constructor.
- **RuntimeException** (const **Exception** &ex) throw ()
Conversion Constructor from some other ActiveMQException.
- **RuntimeException** (const **RuntimeException** &ex) throw ()
Copy Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **RuntimeException** (const std::exception *cause) throw ()
Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **RuntimeException** * **clone** () const
Clones this exception.
- virtual ~**RuntimeException** () throw ()

6.706.1 Constructor & Destructor Documentation

6.706.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException () throw () [inline]

Default Constructor.

6.706.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other ActiveMQException.

Parameters

ex The **Exception** (p.1712) whose data is to be copied into this one.

6.706.1.3 `decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.706.1.4 `decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.706.1.5 `decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.706.1.6 `decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.706.1.7 virtual decaf::lang::exceptions::RuntimeException::~~RuntimeException () throw () [inline, virtual]

6.706.2 Member Function Documentation

6.706.2.1 virtual RuntimeException* decaf::lang::exceptions::RuntimeException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p.1712) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p.1715).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**RuntimeException.h**

6.707 decaf::security::SecureRandom Class Reference

```
#include <src/main/decaf/security/SecureRandom.h>
```

Inheritance diagram for decaf::security::SecureRandom:

Public Member Functions

- **SecureRandom** ()
Creates a new instance of a secure random number generator that implements the default random number algorithm.
- **SecureRandom** (const std::vector< unsigned char > &seed)
Creates a new instance of a secure random number generator that implements the default random number algorithm.
- **SecureRandom** (const unsigned char *seed, int size)
Creates a new instance of a secure random number generator that implements the default random number algorithm.
- virtual ~**SecureRandom** ()
- virtual void **nextBytes** (std::vector< unsigned char > &buf)
Modifies the byte array by a random sequence of bytes generated by this random number generator.
Parameters
buf non-null array to contain the new random bytes

See also

next (p. 2954)

- virtual void **nextBytes** (unsigned char *buf, int size)

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf non-null array to contain the new random bytes

See also

next (p. 2954)

Exceptions

NullPointerException if *buff* is *NULL*

IllegalArgumentException if *size* is negative

- virtual void **setSeed** (unsigned long long seed)

Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.

Parameters

seed the seed that alters the state of the random number generator

See also

next (p. 2954)

Random() (p. 2954)

Random(long)

- virtual void **setSeed** (const std::vector< unsigned char > &seed)

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

- virtual void **setSeed** (const unsigned char *seed, int size)

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Protected Member Functions

- virtual int **next** (int bits)

*Answers a pseudo-random uniformly distributed **int** value of the number of bits specified by the argument **bits** as described by Donald E.*

Knuth in The Art of Computer Programming, Volume 2: Seminumerical Algorithms, section 3.2.1.

Returns

int a pseudo-random generated int number

Parameters

bits number of bits of the returned value

See also

nextBytes (p. 2955)

nextDouble (p. 2956)

nextFloat (p. 2956)

nextInt(int) (p. 2957)

nextGaussian (p. 2956)

nextLong (p. 2957)

6.707.1 Detailed Description

Since

1.0

6.707.2 Constructor & Destructor Documentation

6.707.2.1 decaf::security::SecureRandom::SecureRandom ()

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 3116) instance that is created with this constructor is unseeded and can be seeded by calling the `setSeed` method. Calls to `nextBytes` on an unseeded **SecureRandom** (p. 3116) result in the object seeding itself.

6.707.2.2 decaf::security::SecureRandom::SecureRandom (const std::vector< unsigned char > & seed)

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 3116) instance created by this constructor is seeded using the passed byte array.

Parameters

seed The seed bytes to use to seed this secure random number generator.

6.707.2.3 decaf::security::SecureRandom::SecureRandom (const unsigned char * seed, int size)

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 3116) instance created by this constructor is seeded using the passed byte array.

Parameters

seed The seed bytes to use to seed this secure random number generator.

size The number of bytes in the seed buffer.

Exceptions

NullPointerException if the seed buffer is NULL.

IllegalArgumentException if the size value is negative.

6.707.2.4 `virtual decaf::security::SecureRandom::~~SecureRandom ()` [virtual]

6.707.3 Member Function Documentation

6.707.3.1 `virtual int decaf::security::SecureRandom::next (int bits)` [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

int a pseudo-random generated int number

Parameters

bits number of bits of the returned value

See also

`nextBytes` (p. 2955)
`nextDouble` (p. 2956)
`nextFloat` (p. 2956)
`nextInt()` (p. 2956)
`nextInt(int)` (p. 2957)
`nextGaussian` (p. 2956)
`nextLong` (p. 2957)

Reimplemented from `decaf::util::Random` (p. 2954).

6.707.3.2 `virtual void decaf::security::SecureRandom::nextBytes (unsigned char * buf, int size)` [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf non-null array to contain the new random bytes

See also

`next` (p. 2954)

Exceptions

NullPointerException if *buf* is NULL
IllegalArgumentException if *size* is negative

Reimplemented from `decaf::util::Random` (p. 2955).

6.707.3.3 `virtual void decaf::security::SecureRandom::nextBytes (std::vector< unsigned char > & buf)` [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf non-null array to contain the new random bytes

See also

`next` (p. 2954)

Reimplemented from `decaf::util::Random` (p. 2955).

6.707.3.4 virtual void decaf::security::SecureRandom::setSeed (const std::vector< unsigned char > & *seed*) [virtual]

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters

seed A vector of bytes that is used update the seed of the RNG.

6.707.3.5 virtual void decaf::security::SecureRandom::setSeed (const unsigned char * *seed*, int *size*) [virtual]

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters

seed The seed bytes to use to seed this secure random number generator.

size The number of bytes in the seed buffer.

Exceptions

NullPointerException if the seed buffer is NULL.

IllegalArgumentException if the size value is negative.

6.707.3.6 virtual void decaf::security::SecureRandom::setSeed (unsigned long long *seed*) [virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

seed the seed that alters the state of the random number generator

See also

`next` (p. 2954)

`Random()` (p. 2954)

`Random(long)`

Reimplemented from `decaf::util::Random` (p. 2957).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/SecureRandom.h`

6.708 decaf::internal::security::SecureRandomImpl Class Reference

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

```
#include <src/main/decaf/internal/security/unix/SecureRandomImpl.h>
```

Inheritance diagram for decaf::internal::security::SecureRandomImpl:

Public Member Functions

- **SecureRandomImpl** ()
- virtual **~SecureRandomImpl** ()
- virtual void **providerSetSeed** (const unsigned char *seed, int size)

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.
- virtual void **providerNextBytes** (unsigned char *bytes, int numBytes)

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.
- virtual unsigned char * **providerGenerateSeed** (int numBytes)

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.
- **SecureRandomImpl** ()
- virtual **~SecureRandomImpl** ()
- virtual void **providerSetSeed** (const unsigned char *seed, int size)

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.
- virtual void **providerNextBytes** (unsigned char *bytes, int numBytes)

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.
- virtual unsigned char * **providerGenerateSeed** (int numBytes)

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

6.708.1 Detailed Description

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources. Secure Random Number Generator for Windows based platforms that attempts to obtain secure bytes with high entropy from known sources.

If the platform does not have a source of secure bytes then the platform random number generator is used if one exists otherwise the Decaf RNG is used as a last resort.

6.708.3 Member Function Documentation

6.708.3.1 virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int *numBytes*) [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

numBytes The number of bytes that should be generated for the new seed array.

Implements decaf::security::SecureRandomSpi (p. 3125).

6.708.3.2 virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int *numBytes*) [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

numBytes The number of bytes that should be generated for the new seed array.

Implements decaf::security::SecureRandomSpi (p. 3125).

6.708.3.3 `virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes (unsigned char * bytes, int numBytes) [virtual]`

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

bytes The array that will be filled with random bytes equal to size.

numBytes The number of bytes to generate and write into the bytes array.

Implements `decaf::security::SecureRandomSpi` (p. 3125).

6.708.3.4 `virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes (unsigned char * bytes, int numBytes) [virtual]`

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

bytes The array that will be filled with random bytes equal to size.

numBytes The number of bytes to generate and write into the bytes array.

Implements `decaf::security::SecureRandomSpi` (p. 3125).

6.708.3.5 `virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed (const unsigned char * seed, int size) [virtual]`

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

seed The array of bytes used to update the generators seed.

size The size of the passed byte array.

Implements `decaf::security::SecureRandomSpi` (p. 3126).

6.708.3.6 `virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed (const unsigned char * seed, int size) [virtual]`

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

seed The array of bytes used to update the generators seed.

size The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 3126).

The documentation for this class was generated from the following files:

6.709.3.1 `virtual unsigned char* decaf::security::SecureRandomSpi::providerGenerateSeed (int numBytes)` [pure virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

numBytes The number of bytes that should be generated for the new seed array.

Implemented in `decaf::internal::security::SecureRandomImpl` (p. 3123), and `decaf::internal::security::SecureRandomImpl` (p. 3123).

6.709.3.2 `virtual void decaf::security::SecureRandomSpi::providerNextBytes (unsigned char * bytes, int numBytes)` [pure virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

bytes The array that will be filled with random bytes equal to size.

numBytes The number of bytes to generate and write into the bytes array.

Implemented in `decaf::internal::security::SecureRandomImpl` (p. 3123), and `decaf::internal::security::SecureRandomImpl` (p. 3123).

6.709.3.3 `virtual void decaf::security::SecureRandomSpi::providerSetSeed (const unsigned char * seed, int size)` [pure virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

seed The array of bytes used to update the generators seed.

size The size of the passed byte array.

Implemented in `decaf::internal::security::SecureRandomImpl` (p. 3124), and `decaf::internal::security::SecureRandomImpl` (p. 3124).

Acquires a permit from this semaphore, blocking until one is available.
- bool **tryAcquire** () throw (decaf::lang::exceptions::RuntimeException)
Acquires a permit from this semaphore, only if one is available at the time of invocation.
- bool **tryAcquire** (long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)
Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.
- void **release** () throw (decaf::lang::exceptions::RuntimeException)
Releases a permit, returning it to the semaphore.
- void **acquire** (int permits) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.
- void **acquireUninterruptibly** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, blocking until all are available.

- **bool tryAcquire** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.
- **bool tryAcquire** (int permits, long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.
- **void release** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Releases the given number of permits, returning them to the semaphore.
- **int availablePermits** () const
Returns the current number of permits available in this semaphore.
- **int drainPermits** () throw (decaf::lang::exceptions::RuntimeException)
Acquires and returns all permits that are immediately available.
- **bool isFair** () const
- **std::string toString** () const
Returns a string identifying this semaphore, as well as its state.

6.710.1 Detailed Description

A counting semaphore. Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 3129) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 3132) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 3126) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

```
class Pool { private:
static const int MAX_AVAILABLE = 100; Semaphore (p. 3126) available;
std::vector<std::string> items; std::vector<bool> used;
Mutex (p. 2604) lock;
public:
Pool() : available( MAX_AVAILABLE, true ) { used.resize( MAX_AVAILABLE ); items.resize(
MAX_AVAILABLE ); }
std::string getItem() throws InterruptedException { available.acquire(); return getNextAvailableItem(); }
void putItem( std::string x ) { if( markAsUnused(x) ) { available.release(); } }
std::string getNextAvailableItem() {
```

```
synchronized( &lock ) (p. 4287) { for( int i = 0; i < MAX_AVAILABLE; ++i ) { if( !used[i] )
{ used[i] = true; return items[i]; } }
```

```
return std::string(); // not reached }
```

```
bool markAsUnused( const std::string& item ) { synchronized( &lock ) (p. 4287) { for( int i =
0; i < MAX_AVAILABLE; ++i ) { if( item == items[i] ) { if( used[i] ) { used[i] = false; return
true; } else return false; } } } return false; } };
```

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back to the pool and a permit is returned to the semaphore, allowing another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 3129) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this way, the binary semaphore has the property (unlike many **Lock** (p. 2228) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 3129) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific internal points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinite postponement when these methods are used without fairness set true.

Since

1.0

6.710.2 Constructor & Destructor Documentation

6.710.2.1 decaf::util::concurrent::Semaphore::Semaphore (int *permits*)

Creates a **Semaphore** (p. 3126) with the given number of permits and nonfair fairness setting.

Parameters

permits the initial number of permits available. This value may be negative, in which case

releases must occur before any acquires will be granted.

6.710.2.2 `decaf::util::concurrent::Semaphore::Semaphore (int permits, bool fair)`

Creates a **Semaphore** (p. 3126) with the given number of permits and the given fairness setting.

Parameters

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

fair true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

6.710.2.3 `virtual decaf::util::concurrent::Semaphore::~~Semaphore () [virtual]`

6.710.3 Member Function Documentation

6.710.3.1 `void decaf::util::concurrent::Semaphore::acquire () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)`

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes the **release()** (p. 3132) method for this semaphore and the current thread is next to be assigned a permit; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

Exceptions

InterruptedException - if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.2 `void decaf::util::concurrent::Semaphore::acquire (int permits) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)`

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 3132).

Parameters

permits the number of permits to acquire.

Exceptions

InterruptedException if the current thread is interrupted.

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.3 void decaf::util::concurrent::Semaphore::acquireUninterruptibly () throw (decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, blocking until one is available.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes the **release()** (p. 3132) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

Exceptions

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.4 void decaf::util::concurrent::Semaphore::acquireUninterruptibly (int *permits*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, blocking until all are available.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

Parameters

permits the number of permits to acquire.

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.5 int decaf::util::concurrent::Semaphore::availablePermits () const

Returns the current number of permits available in this semaphore.

This method is typically used for debugging and testing purposes.

Returns

the number of permits available in this semaphore

6.710.3.6 int decaf::util::concurrent::Semaphore::drainPermits () throw (decaf::lang::exceptions::RuntimeException)

Acquires and returns all permits that are immediately available.

Returns

the number of permits acquired

Exceptions

RuntimeException if an unexpected error occurs while draining the **Semaphore** (p. 3126).

6.710.3.7 bool decaf::util::concurrent::Semaphore::isFair () const

Returns

true if this semaphore has fairness set true

6.710.3.8 void decaf::util::concurrent::Semaphore::release () throw (decaf::lang::exceptions::RuntimeException)

Releases a permit, returning it to the semaphore.

Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 3129). Correct usage of a semaphore is established by programming convention in the application.

Exceptions

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 3126).

6.710.3.9 void decaf::util::concurrent::Semaphore::release (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Releases the given number of permits, returning them to the semaphore.

Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes; otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

Parameters

permits the number of permits to release

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 3126).

6.710.3.10 std::string decaf::util::concurrent::Semaphore::toString () const

Returns a string identifying this semaphore, as well as its state.

The state, in brackets, includes the String "Permits =" followed by the number of permits.

Returns

a string identifying this semaphore, as well as its state

6.710.3.11 `bool decaf::util::concurrent::Semaphore::tryAcquire (int
permits, long long timeout, const TimeUnit & unit)
throw (decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::RuntimeException)`

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread; or * The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 3132).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 3132).

Parameters

permits the number of permits to acquire

timeout the maximum amount of time to wait to acquire the permits.

unit the units that the timeout param represents.

Returns

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.12 `bool decaf::util::concurrent::Semaphore::tryAcquire
(long long timeout, const TimeUnit & unit)
throw (decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::RuntimeException)`

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * Some other thread invokes the **release()** (p. 3132) method for this semaphore and the current thread is next to be assigned a permit; or
- * Some other thread interrupts the current thread; or
- * The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting to acquire a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

timeout the maximum time to wait for a permit

unit the time unit of the timeout argument

Returns

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

Exceptions

InterruptedException if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.13 bool decaf::util::concurrent::Semaphore::tryAcquire () throw (decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, only if one is available at the time of invocation.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 3134) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use **tryAcquire(0, TimeUnit.SECONDS)** (p. 3568) which is almost equivalent (it also detects interruption).

Returns

true if a permit was acquired and false otherwise

Exceptions

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.710.3.14 `bool decaf::util::concurrent::Semaphore::tryAcquire (int permits
) throw (decaf::lang::exceptions::IllegalArgumentException,
 decaf::lang::exceptions::RuntimeException)`

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to tryAcquire will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(permits, 0, **TimeUnit.SECONDS** (p. 3568)) which is almost equivalent (it also detects interruption).

Parameters

permits the number of permits to acquire

Returns

true if the permits were acquired and false otherwise.

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 3126).

6.712 decaf::net::ServerSocket Class Reference

This class implements server sockets.

`#include <src/main/decaf/net/ServerSocket.h>`

Inheritance diagram for `decaf::net::ServerSocket`:

Public Member Functions

- **ServerSocket** ()
Creates a non-bound server socket.
- **ServerSocket** (int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
*Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- **ServerSocket** (int port, int backlog) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
*Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- **ServerSocket** (int port, int backlog, const **InetAddress** *address) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
*Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- virtual ~**ServerSocket** ()
*Releases socket handle if **close()** (p. 3142) hasn't been called.*
- virtual void **bind** (const std::string &host, int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.
- virtual void **bind** (const std::string &host, int port, int backlog) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.
- virtual **Socket** * **accept** () throw (decaf::io::IOException)
*Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 3136), the caller blocks until a connection is made.*
- virtual void **close** () throw (decaf::io::IOException)
Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.
- virtual bool **isClosed** () const
- virtual bool **isBound** () const
- virtual int **getReceiveBufferSize** () const throw (SocketException)
*Gets the receive buffer size for this socket, **SO_RCVBUF**.*
- virtual void **setReceiveBufferSize** (int size) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)
*Sets the receive buffer size for this socket, **SO_RCVBUF**.*
- virtual bool **getReuseAddress** () const throw (SocketException)
*Gets the reuse address flag, **SO_REUSEADDR**.*

- virtual void **setReuseAddress** (bool reuse) throw (SocketException)
Sets the reuse address flag, SO_REUSEADDR.
- virtual int **getSoTimeout** () const throw (SocketException)
Gets the timeout for socket operations, SO_TIMEOUT.
- virtual void **setSoTimeout** (int timeout) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)
Sets the timeout for socket operations, SO_TIMEOUT.
- virtual int **getLocalPort** () const
*Gets the port number on the Local machine that this **ServerSocket** (p. 3136) is bound to.*
- virtual std::string **toString** () const

Static Public Member Functions

- static void **setSocketImplFactory** (SocketImplFactory *factory) throw (decaf::io::IOException, decaf::net::SocketException)
*Sets the instance of a **SocketImplFactory** (p. 3314) that the **ServerSocket** (p. 3136) class should use when new instances of this class are created.*

Protected Member Functions

- **ServerSocket** (SocketImpl *impl)
*Creates a **ServerSocket** (p. 3136) wrapping the provided **SocketImpl** (p. 3306) instance, this **Socket** (p. 3281) is considered unconnected.*
- virtual void **implAccept** (Socket *socket) throw (decaf::io::IOException)
*Virtual method that allows a **ServerSocket** (p. 3136) subclass to override the accept call and provide its own **SocketImpl** (p. 3306) for the socket.*
- virtual int **getDefaultBacklog** ()
Allows a subclass to override what is considered the default backlog.

- void **ensureCreated** () const throw (decaf::io::IOException)
- void **setupSocketImpl** (int port, int backlog, const InetAddress *ifAddress)

6.712.1 Detailed Description

This class implements server sockets. A server socket waits for requests to come in over the network.

The actual work of the server socket is performed by an instance of the **SocketImpl** (p. 3306) class. An application can change the socket factory that creates the socket implementation to configure itself to create sockets of a particular type.

Since

1.0

6.712.2 Constructor & Destructor Documentation

6.712.2.1 `decaf::net::ServerSocket::ServerSocket ()`

Creates a non-bound server socket.

6.712.2.2 `decaf::net::ServerSocket::ServerSocket (int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)`

Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 3314) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3306) is created.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

Exceptions

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.712.2.3 `decaf::net::ServerSocket::ServerSocket (int port, int backlog) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)`

Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at *backlog*, connections that arrive after the backlog has been reached are refused. If *backlog* is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3314) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3306) is created.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

Exceptions

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.712.2.4 decaf::net::ServerSocket::ServerSocket (int *port*, int *backlog*, const InetAddress * *address*) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)

Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the *ifAddress* is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at *backlog*, connections that arrive after the backlog has been reached are refused. If *backlog* is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3314) is registered then the *createSocketImpl* method on the factory will be called otherwise a default **SocketImpl** (p. 3306) is created.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

ifAddress The IP Address to bind to on the local machine.

Exceptions

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.712.2.5 virtual decaf::net::ServerSocket::~~ServerSocket () [virtual]

Releases socket handle if *close()* (p. 3142) hasn't been called.

6.712.2.6 decaf::net::ServerSocket::ServerSocket (SocketImpl * *impl*) [protected]

Creates a **ServerSocket** (p. 3136) wrapping the provided **SocketImpl** (p. 3306) instance, this **Socket** (p. 3281) is considered unconnected.

The **ServerSocket** (p. 3136) class takes ownership of this **SocketImpl** (p. 3306) pointer and will delete it when the **Socket** (p. 3281) class is destroyed.

Parameters

impl The **SocketImpl** (p. 3306) instance to wrap.

Exceptions

NullPointerException if the passed **SocketImpl** (p. 3306) is Null.

6.712.3 Member Function Documentation

6.712.3.1 virtual Socket* decaf::net::ServerSocket::accept () throw (decaf::io::IOException) [virtual]

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 3136), the caller blocks until a connection is made.

If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 3319) if the operation times out.

Returns

a new **Socket** (p. 3281) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions

IOException if an I/O error occurs while binding the socket.

SocketException (p. 3298) if an error occurs while blocking on the accept call.

SocketTimeoutException (p. 3319) if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2666).

6.712.3.2 virtual void decaf::net::ServerSocket::bind (const std::string & host, int port, int backlog) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException) [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

If the backlog is greater than zero it will be used instead of the default value, otherwise the default value is used and no error is generated.

Parameters

host The IP address or host name.

port The TCP port between 1..65535.

backlog The size of listen backlog.

Exceptions

IOException if an I/O error occurs while binding the socket.

IllegalArgumentException if the parameters are not valid.

6.712.3.3 virtual void decaf::net::ServerSocket::bind (const std::string & host, int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException) [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

Parameters

host The IP address or host name.

port The TCP port between 1..65535.

Exceptions

IOException if an I/O error occurs while binding the socket.

IllegalArgumentException if the parameters are not valid.

6.712.3.4 void decaf::net::ServerSocket::checkClosed () const throw (decaf::io::IOException) [protected]

6.712.3.5 virtual void decaf::net::ServerSocket::close () throw (decaf::io::IOException) [virtual]

Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.

Exceptions

IOException if an I/O error occurs while performing this operation.

6.712.3.6 void decaf::net::ServerSocket::ensureCreated () const throw (decaf::io::IOException) [protected]

6.712.3.7 virtual int decaf::net::ServerSocket::getDefaultBacklog () [protected, virtual]

Allows a subclass to override what is considered the default backlog.

Returns

the default backlog for connections.

6.712.3.8 virtual int decaf::net::ServerSocket::getLocalPort () const [virtual]

Gets the port number on the Local machine that this **ServerSocket** (p. 3136) is bound to.

Returns

the port number of this machine that is bound, if not bound returns -1.

6.712.3.9 virtual int decaf::net::ServerSocket::getReceiveBufferSize () const throw (SocketException) [virtual]

Gets the receive buffer size for this socket, SO_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

Returns

the receive buffer size in bytes.

Exceptions

SocketException (p. 3298) if the operation fails.

6.712.3.10 `virtual bool decaf::net::ServerSocket::getReuseAddress () const
 throw (SocketException) [virtual]`

Gets the reuse address flag, SO_REUSEADDR.

Returns

True if the address can be reused.

Exceptions

SocketException (p. 3298) if the operation fails.

6.712.3.11 `virtual int decaf::net::ServerSocket::getSoTimeout () const throw (
 SocketException) [virtual]`

Gets the timeout for socket operations, SO_TIMEOUT.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 3298) Thrown if unable to retrieve the information.

6.712.3.12 `virtual void decaf::net::ServerSocket::implAccept (Socket * socket)
 throw (decaf::io::IOException) [protected, virtual]`

Virtual method that allows a **ServerSocket** (p. 3136) subclass to override the accept call and provide its own **SocketImpl** (p. 3306) for the socket.

Parameters

socket The socket object whose **SocketImpl** (p. 3306) should be used for the accept call.

Exceptions

IOException if an I/O error occurs while performing this operation.

6.712.3.13 `virtual bool decaf::net::ServerSocket::isBound () const [virtual]`

Returns

true of the server socket is bound.

6.712.3.14 `virtual bool decaf::net::ServerSocket::isClosed () const [virtual]`

Returns

true if the close method has been called on the **ServerSocket** (p. 3136).

6.712.3.15 `virtual void decaf::net::ServerSocket::setReceiveBufferSize (int size) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters

size Number of bytes to set the receive buffer to.

Exceptions

SocketException (p. 3298) if the operation fails.

IllegalArgumentException if the value is zero or negative.

6.712.3.16 `virtual void decaf::net::ServerSocket::setReuseAddress (bool reuse) throw (SocketException) [virtual]`

Sets the reuse address flag, SO_REUSEADDR.

Parameters

reuse If true, sets the flag.

Exceptions

SocketException (p. 3298) if the operation fails.

6.712.3.17 `static void decaf::net::ServerSocket::setSocketImplFactory (SocketImplFactory * factory) throw (decaf::io::IOException, decaf::net::SocketException) [static]`

Sets the instance of a **SocketImplFactory** (p. 3314) that the **ServerSocket** (p. 3136) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

Parameters

factory The instance of a **SocketImplFactory** (p. 3314) to use when new **SocketImpl** (p. 3306) objects are created.

Exceptions

IOException if an I/O error occurs while performing this operation.

SocketException (p. 3298) if this method has already been called with a valid factory.

6.712.3.18 `virtual void decaf::net::ServerSocket::setSoTimeout (int timeout) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the timeout for socket operations, `SO_TIMEOUT`.

A value of zero indicates that timeout is infinite for operations on this socket.

Parameters

timeout The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 3298) Thrown if unable to set the information.

IllegalArgumentException if the timeout value is negative.

6.712.3.19 `void decaf::net::ServerSocket::setupSocketImpl (int port, int backlog, const InetAddress * ifAddress) [protected]`

6.712.3.20 `virtual std::string decaf::net::ServerSocket::toString () const [virtual]`

Returns

a string representing this `ServerSocket` (p. 3136).

6.713.1 Detailed Description

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

Since

1.0

6.713.2 Constructor & Destructor Documentation

6.713.2.1 decaf::net::ServerSocketFactory::ServerSocketFactory () [protected]

6.713.2.2 virtual decaf::net::ServerSocketFactory::~~ServerSocketFactory () [virtual]

6.713.3 Member Function Documentation

6.713.3.1 virtual **ServerSocket*** decaf::net::ServerSocketFactory::createServerSocket () [virtual]

Create a new **ServerSocket** (p. 3136) that is unbound.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Reimplemented in decaf::internal::net::DefaultServerSocketFactory (p. 1575), decaf::internal::net::ssl::DefaultSSLServerSocketFactory (p. 1584), and decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory (p. 2671).

6.713.3.2 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*) [pure virtual]

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1576), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1585), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2671).

6.713.3.3 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*, int *backlog*, const InetAddress * *address*) [pure virtual]

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3136) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3136) will listen on all interfaces.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The number of pending connect request the **ServerSocket** (p. 3136) can queue.

address The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1576), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1585), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2672).

6.713.3.4 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*, int *backlog*) [pure virtual]

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3136) will use the specified connection backlog setting.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The number of pending connect request the **ServerSocket** (p. 3136) can queue.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Implemented in **decaf::internal::net::DefaultServerSocketFactory** (p. 1576), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 1585), and **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 2672).

6.713.3.5 static ServerSocketFactory* decaf::net::ServerSocketFactory::getDefault () [static]

Returns the Default **ServerSocket** (p. 3136) factory, the pointer is owned by the Decaf runtime and should not be deleted by the caller.

Only one default **ServerSocketFactory** (p. 3145) exists for the lifetime of the Application.

Returns

the default **ServerSocketFactory** (p. 3145) for this application.

Reimplemented in **decaf::net::ssl::SSLServerSocketFactory** (p. 3336).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ServerSocketFactory.h**

6.714 cms::Session Class Reference

A **Session** (p. 3148) object is a single-threaded context for producing and consuming messages.

```
#include <src/main/cms/Session.h>
```

Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** {
AUTO_ACKNOWLEDGE, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_**
ACKNOWLEDGE, **SESSION_TRANSACTIONED**,
INDIVIDUAL_ACKNOWLEDGE }

Public Member Functions

- virtual `~Session ()`
- virtual void `close ()=0 throw (CMSEException)`
Closes this session as well as any active child consumers or producers.
- virtual void `commit ()=0 throw (CMSEException)`
Commits all messages done in this transaction and releases any locks currently held.
- virtual void `rollback ()=0 throw (CMSEException)`
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void `recover ()=0 throw (CMSEException)`
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual `MessageConsumer * createConsumer (const Destination *destination)=0 throw (CMSEException)`
*Creates a **MessageConsumer** (p. 2423) for the specified destination.*
- virtual `MessageConsumer * createConsumer (const Destination *destination, const std::string &selector)=0 throw (CMSEException)`
*Creates a **MessageConsumer** (p. 2423) for the specified destination, using a message selector.*
- virtual `MessageConsumer * createConsumer (const Destination *destination, const std::string &selector, bool noLocal)=0 throw (CMSEException)`
*Creates a **MessageConsumer** (p. 2423) for the specified destination, using a message selector.*
- virtual `MessageConsumer * createDurableConsumer (const Topic *destination, const std::string &name, const std::string &selector, bool noLocal=false)=0 throw (CMSEException)`
*Creates a durable subscriber to the specified topic, using a **Message** (p. 2375) selector.*
- virtual `MessageProducer * createProducer (const Destination *destination)=0 throw (CMSEException)`
*Creates a **MessageProducer** (p. 2550) to send messages to the specified destination.*
- virtual `QueueBrowser * createBrowser (const cms::Queue *queue)=0 throw (CMSEException)`
*Creates a new **QueueBrowser** (p. 2951) to peek at Messages on the given **Queue** (p. 2947).*
- virtual `QueueBrowser * createBrowser (const cms::Queue *queue, const std::string &selector)=0 throw (CMSEException)`
*Creates a new **QueueBrowser** (p. 2951) to peek at Messages on the given **Queue** (p. 2947).*
- virtual `Queue * createQueue (const std::string &queueName)=0 throw (CMSEException)`
*Creates a queue identity given a **Queue** (p. 2947) name.*
- virtual `Topic * createTopic (const std::string &topicName)=0 throw (CMSEException)`
*Creates a topic identity given a **Queue** (p. 2947) name.*

- virtual **TemporaryQueue** * **createTemporaryQueue** ()=0 throw (CMSEException)
*Creates a **TemporaryQueue** (p. 3516) object.*
- virtual **TemporaryTopic** * **createTemporaryTopic** ()=0 throw (CMSEException)
*Creates a **TemporaryTopic** (p. 3517) object.*
- virtual **Message** * **createMessage** ()=0 throw (CMSEException)
*Creates a new **Message** (p. 2375).*
- virtual **BytesMessage** * **createBytesMessage** ()=0 throw (CMSEException)
*Creates a **BytesMessage** (p. 979).*
- virtual **BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytes-Size)=0 throw (CMSEException)
*Creates a **BytesMessage** (p. 979) and sets the payload to the passed value.*
- virtual **StreamMessage** * **createStreamMessage** ()=0 throw (CMSEException)
*Creates a new **StreamMessage** (p. 3415).*
- virtual **TextMessage** * **createTextMessage** ()=0 throw (CMSEException)
*Creates a new **TextMessage** (p. 3519).*
- virtual **TextMessage** * **createTextMessage** (const std::string &text)=0 throw (CMSEException)
*Creates a new **TextMessage** (p. 3519) and set the text to the value given.*
- virtual **MapMessage** * **createMapMessage** ()=0 throw (CMSEException)
*Creates a new **MapMessage** (p. 2318).*
- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0 throw (CMSEException)
Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const =0 throw (CMSEException)
*Gets if the Sessions is a Transacted **Session** (p. 3148).*
- virtual void **unsubscribe** (const std::string &name)=0 throw (CMSEException)
Unsubscribes a durable subscription that has been created by a client.

6.714.1 Detailed Description

A **Session** (p.3148) object is a single-threaded context for producing and consuming messages. A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.
- It is a factory for **TemporaryTopics** and **TemporaryQueues**.

- It provides a way to create **Queue** (p. 2947) or **Topic** (p. 3568) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 2423) until a message arrives. The thread may then use one or more of the Session's MessageProducers.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's `close` method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 3148) method that can be called concurrently.
- Invoking any other **Session** (p. 3148) method on a closed session must throw an **IllegalStateException** (p. 1868). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 3148) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 3148) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 3148). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 2550) this implies that all messages sent by the producer are not sent to the Provider unit the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 2423) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 2375) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 2375).

Since

1.0

6.714.2 Member Enumeration Documentation

6.714.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully

returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 2375) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.714.3 Constructor & Destructor Documentation

6.714.3.1 `virtual cms::Session::~~Session () [inline, virtual]`

6.714.4 Member Function Documentation

6.714.4.1 `virtual void cms::Session::close () throw (CMSEException) [pure virtual]`

Closes this session as well as any active child consumers or producers.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implements **cms::Closeable** (p. 1065).

Implemented in **activemq::cmsutil::PooledSession** (p. 2768).

6.714.4.2 `virtual void cms::Session::commit () throw (CMSEException) [pure virtual]`

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

IllegalStateException (p. 1868) - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2768).

Referenced by **activemq::cmsutil::PooledSession::commit()**.

6.714.4.3 `virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * queue) throw (CMSEException) [pure virtual]`

Creates a new **QueueBrowser** (p. 2951) to peek at Messages on the given **Queue** (p. 2947).

Parameters

queue the **Queue** (p. 2947) to browse

Returns

New **QueueBrowser** (p. 2951) that is owned by the caller.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2768).

6.714.4.4 `virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue
* queue, const std::string & selector) throw (CMSEException) [pure
virtual]`

Creates a new **QueueBrowser** (p. 2951) to peek at Messages on the given **Queue** (p. 2947).

Parameters

queue the **Queue** (p. 2947) to browse

selector the **Message** (p. 2375) selector to filter which messages are browsed.

Returns

New **QueueBrowser** (p. 2951) that is owned by the caller.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2768).

6.714.4.5 `virtual BytesMessage* cms::Session::createBytesMessage () throw (CMSEException) [pure virtual]`

Creates a **BytesMessage** (p. 979).

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2769).

6.714.4.6 `virtual BytesMessage* cms::Session::createBytesMessage (const
unsigned char * bytes, int bytesSize) throw (CMSEException) [pure
virtual]`

Creates a **BytesMessage** (p. 979) and sets the payload to the passed value.

Parameters

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2769).

6.714.4.7 virtual `MessageConsumer* cms::Session::createConsumer (const Destination * destination) throw (CMSEException)` [pure virtual]

Creates a **MessageConsumer** (p. 2423) for the specified destination.

Parameters

destination the **Destination** (p. 1610) that this consumer receiving messages for.

Returns

pointer to a new **MessageConsumer** (p. 2423) that is owned by the caller (caller deletes)

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2770).

6.714.4.8 virtual `MessageConsumer* cms::Session::createConsumer (const Destination * destination, const std::string & selector) throw (CMSEException)` [pure virtual]

Creates a **MessageConsumer** (p. 2423) for the specified destination, using a message selector.

Parameters

destination the **Destination** (p. 1610) that this consumer receiving messages for.

selector the **Message** (p. 2375) Selector to use

Returns

pointer to a new **MessageConsumer** (p. 2423) that is owned by the caller (caller deletes)

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if an invalid destination is specified.

InvalidSelectorException (p. 1999) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2771).

6.714.4.9 `virtual MessageConsumer* cms::Session::createConsumer (const Destination * destination, const std::string & selector, bool noLocal) throw (CMSException) [pure virtual]`

Creates a **MessageConsumer** (p. 2423) for the specified destination, using a message selector.

Parameters

destination the **Destination** (p. 1610) that this consumer receiving messages for.

selector the **Message** (p. 2375) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new **MessageConsumer** (p. 2423) that is owned by the caller (caller deletes)

Exceptions

CMSException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if an invalid destination is specified.

InvalidSelectorException (p. 1999) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2771).

6.714.4.10 `virtual MessageConsumer* cms::Session::createDurableConsumer (const Topic * destination, const std::string & name, const std::string & selector, bool noLocal = false) throw (CMSException) [pure virtual]`

Creates a durable subscriber to the specified topic, using a **Message** (p. 2375) selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination the topic to subscribe to

name The name used to identify the subscription

selector the **Message** (p. 2375) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable **MessageConsumer** (p. 2423) that is owned by the caller (caller deletes)

Exceptions

CMSException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if an invalid destination is specified.

InvalidSelectorException (p. 1999) - if the message selector is invalid.

Implemented in `activemq::cmsutil::PooledSession` (p. 2772).

6.714.4.11 `virtual MapMessage* cms::Session::createMapMessage () throw (CMSEException) [pure virtual]`

Creates a new `MapMessage` (p. 2318).

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in `activemq::cmsutil::PooledSession` (p. 2772).

6.714.4.12 `virtual Message* cms::Session::createMessage () throw (CMSEException) [pure virtual]`

Creates a new `Message` (p. 2375).

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in `activemq::cmsutil::PooledSession` (p. 2772).

6.714.4.13 `virtual MessageProducer* cms::Session::createProducer (const Destination * destination) throw (CMSEException) [pure virtual]`

Creates a `MessageProducer` (p. 2550) to send messages to the specified destination.

Parameters

destination the `Destination` (p. 1610) to send on

Returns

New `MessageProducer` (p. 2550) that is owned by the caller.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

InvalidDestinationException (p. 1993) - if an invalid destination is specified.

Implemented in `activemq::cmsutil::PooledSession` (p. 2773).

6.714.4.14 `virtual Queue* cms::Session::createQueue (const std::string & queueName) throw (CMSEException) [pure virtual]`

Creates a queue identity given a `Queue` (p. 2947) name.

Parameters

queueName the name of the new **Queue** (p. 2947)

Returns

new **Queue** (p. 2947) pointer that is owned by the caller.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2773).

6.714.4.15 `virtual StreamMessage* cms::Session::createStreamMessage () throw (CMSEException) [pure virtual]`

Creates a new **StreamMessage** (p. 3415).

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2773).

6.714.4.16 `virtual TemporaryQueue* cms::Session::createTemporaryQueue () throw (CMSEException) [pure virtual]`

Creates a **TemporaryQueue** (p. 3516) object.

Returns

new **TemporaryQueue** (p. 3516) pointer that is owned by the caller.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2774).

6.714.4.17 `virtual TemporaryTopic* cms::Session::createTemporaryTopic () throw (CMSEException) [pure virtual]`

Creates a **TemporaryTopic** (p. 3517) object.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2774).

6.714.4.18 `virtual TextMessage* cms::Session::createTextMessage (const std::string & text) throw (CMSEException) [pure virtual]`

Creates a new **TextMessage** (p. 3519) and set the text to the value given.

Parameters

text the initial text for the message

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2774).

6.714.4.19 `virtual TextMessage* cms::Session::createTextMessage () throw (CMSEException) [pure virtual]`

Creates a new **TextMessage** (p. 3519).

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2774).

6.714.4.20 `virtual Topic* cms::Session::createTopic (const std::string & topicName) throw (CMSEException) [pure virtual]`

Creates a topic identity given a **Queue** (p. 2947) name.

Parameters

topicName the name of the new **Topic** (p. 3568)

Returns

new **Topic** (p. 3568) pointer that is owned by the caller.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2775).

6.714.4.21 `virtual AcknowledgeMode cms::Session::getAcknowledgeMode () const throw (CMSEException) [pure virtual]`

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2775).

6.714.4.22 `virtual bool cms::Session::isTransacted () const throw (CMSEException) [pure virtual]`

Gets if the Sessions is a Transacted **Session** (p. 3148).

Returns

transacted true - false.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2776).

6.714.4.23 `virtual void cms::Session::recover () throw (CMSEException) [pure virtual]`

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException (p. 1868) - if the method is called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2776).

6.714.4.24 `virtual void cms::Session::rollback () throw (CMSEException) [pure virtual]`

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

IllegalStateException (p. 1868) - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2776).

6.714.4.25 `virtual void cms::Session::unsubscribe (const std::string & name)
throw (CMSEException) [pure virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 2423) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name The name used to identify this subscription

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2777).

The documentation for this class was generated from the following file:

- `src/main/cms/Session.h`

6.715 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

```
#include <src/main/activemq/cmsutil/SessionCallback.h>
```

Inheritance diagram for `activemq::cmsutil::SessionCallback`:

Public Member Functions

- `virtual ~SessionCallback ()`
- `virtual void doInCms (cms::Session *session)=0 throw (cms::CMSEException)`

Execute any number of operations against the supplied CMS session.

6.715.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

6.715.2 Constructor & Destructor Documentation

6.715.2.1 `virtual activemq::cmsutil::SessionCallback::~SessionCallback ()`
`[inline, virtual]`

6.715.3 Member Function Documentation

6.715.3.1 `virtual void activemq::cmsutil::SessionCallback::doInCms (cms::Session * session) throw (cms::CMSException)` `[pure virtual]`

Execute any number of operations against the supplied CMS session.

Parameters

session the CMS Session

Exceptions

cms::CMSException (p. 1074) if thrown by CMS API methods

Implemented in `activemq::cmsutil::CmsTemplate::ProducerExecutor` (p. 2868), and `activemq::cmsutil::CmsTemplate::ReceiveExecutor` (p. 2971).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/SessionCallback.h`

6.716 activemq::commands::SessionId Class Reference

```
#include <src/main/activemq/commands/SessionId.h>
```

Inheritance diagram for `activemq::commands::SessionId`:

Public Types

- `typedef decaf::lang::PointerComparator< SessionId > COMPARATOR`

Public Member Functions

- `SessionId ()`
- `SessionId (const SessionId &other)`
- `SessionId (const ConnectionId *connectionId, long long sessionId)`
- `SessionId (const ProducerId *producerId)`
- `SessionId (const ConsumerId *consumerId)`
- `virtual ~SessionId ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual SessionId * cloneDataStructure () const`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*

- const **Pointer**< **ConnectionId** > & **getParentId** () const
- virtual const std::string & **getConnectionId** () const
- virtual std::string & **getConnectionId** ()
- virtual void **setConnectionId** (const std::string &connectionId)
- virtual long long **getValue** () const
- virtual void **setValue** (long long value)
- virtual int **compareTo** (const **SessionId** &value) const
- virtual bool **equals** (const **SessionId** &value) const
- virtual bool **operator==** (const **SessionId** &value) const
- virtual bool **operator<** (const **SessionId** &value) const
- **SessionId** & **operator=** (const **SessionId** &other)

Static Public Attributes

- static const unsigned char **ID_SESSIONID** = 121

Protected Attributes

- std::string **connectionId**
- long long **value**

6.716.1 Member Typedef Documentation

6.716.1.1 `typedef decaf::lang::PointerComparator<SessionId>
activemq::commands::SessionId::COMPARATOR`

6.716.2 Constructor & Destructor Documentation

6.716.2.1 `activemq::commands::SessionId::SessionId ()`

6.716.2.2 `activemq::commands::SessionId::SessionId (const SessionId & other)`

6.716.2.3 `activemq::commands::SessionId::SessionId (const ConnectionId *
connectionId, long long sessionId)`

6.716.2.4 `activemq::commands::SessionId::SessionId (const ProducerId *
producerId)`

6.716.2.5 `activemq::commands::SessionId::SessionId (const ConsumerId *
consumerId)`

6.716.2.6 `virtual activemq::commands::SessionId::~~SessionId () [virtual]`

6.716.3 Member Function Documentation

6.716.3.1 `virtual SessionId* activemq::commands::SessionId::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.716.3.2 `virtual int activemq::commands::SessionId::compareTo (const SessionId
& value) const [virtual]`

6.716.3.3 `virtual void activemq::commands::SessionId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.716.3.4 `virtual bool activemq::commands::SessionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.716.3.5 virtual bool activemq::commands::SessionId::equals (const SessionId & *value*) const [virtual]

6.716.3.6 virtual std::string& activemq::commands::SessionId::getConnectionId () [virtual]

6.716.3.7 virtual const std::string& activemq::commands::SessionId::getConnectionId () const [virtual]

6.716.3.8 virtual unsigned char activemq::commands::SessionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

6.716.3.9 const Pointer<ConnectionId>& activemq::commands::SessionId::getParentId () const

6.716.3.10 virtual long long activemq::commands::SessionId::getValue () const [virtual]

6.716.3.11 virtual bool activemq::commands::SessionId::operator< (const SessionId & *value*) const [virtual]

6.716.3.12 SessionId& activemq::commands::SessionId::operator= (const SessionId & *other*)

6.716.3.13 virtual bool activemq::commands::SessionId::operator== (const SessionId & *value*) const [virtual]

6.716.3.14 virtual void activemq::commands::SessionId::setConnectionId (const std::string & *connectionId*) [virtual]

6.716.3.15 virtual void activemq::commands::SessionId::setValue (long long *value*) [virtual]

6.716.3.16 virtual std::string activemq::commands::SessionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.716.4 Field Documentation

6.716.4.1 `std::string activemq::commands::SessionId::connectionId` [protected]

6.716.4.2 `const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.716.4.3 `long long activemq::commands::SessionId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/SessionId.h`

6.717 activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3165).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/SessionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller`:

Public Member Functions

- **SessionIdMarshaller** ()
- virtual **~SessionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.717.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3165). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.717.2 Constructor & Destructor Documentation

6.717.2.1 `activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::SessionIdMarshaller ()` [inline]

6.717.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::~~SessionIdMarshaller ()` [inline, virtual]

6.717.3 Member Function Documentation

6.717.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::createObject () const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.717.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::getDataStructureType () const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.717.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.717.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.717.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.717.3.6 virtual void `activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal2`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
* `dataStructure`, `decaf::io::DataOutputStream * dataOut`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.717.3.7 virtual void `activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightUnmarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
* `dataStructure`, `decaf::io::DataInputStream * dataIn`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/SessionIdMarshaller.h`

6.718 activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3169).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/SessionIdMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller**:

Public Member Functions

- **SessionIdMarshaller** ()
- virtual **~SessionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.718.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 3169). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.718.2 Constructor & Destructor Documentation

6.718.2.1 activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::SessionIdMarshaller () [inline]

6.718.2.2 virtual
activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::~~SessionIdMarshaller () [inline, virtual]

6.718.3 Member Function Documentation

6.718.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.718.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.718.3.3 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.718.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.718.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.718.3.6 virtual void **activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.718.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.719.2.1 `activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::SessionIdMarshaller () [inline]`

6.719.2.2 `virtual
activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::~~SessionIdMarshaller () [inline, virtual]`

6.719.3 Member Function Documentation

6.719.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.719.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::getDataStructureType
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.719.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

```
6.719.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

```
6.719.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.719.3.6 virtual void activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.719.3.7 virtual void activemq::wireformat::openwire::marshal::v6::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

() [inline, virtual]`

6.720.3 Member Function Documentation

6.720.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.720.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::getDataStructureType
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.720.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.720.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.720.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.720.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.720.3.7 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightUnmarshal
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::~~SessionIdMarshaller
() [inline, virtual]`

6.721.3 Member Function Documentation

6.721.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.721.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::getDataStructureType
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.721.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.721.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.721.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.721.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.721.3.7 virtual void `activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightUnmarshal`
(`OpenWireFormat` * *wireFormat*, `commands::DataStructure`
* *dataStructure*, `decaf::io::DataInputStream` * *dataIn*,
`utils::BooleanStream` * *bs*) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::~~SessionIdMarshaller () [inline, virtual]`

6.722.3 Member Function Documentation

6.722.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.722.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.722.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.722.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.722.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.722.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.722.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/SessionIdMarshaller.h

6.723 activemq::commands::SessionInfo Class Reference

```
#include <src/main/activemq/commands/SessionInfo.h>
```

Inheritance diagram for **activemq::commands::SessionInfo**:

Public Member Functions

- **SessionInfo** ()
- virtual **~SessionInfo** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **SessionInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- unsigned int **getAckMode** () const
- void **setAckMode** (unsigned int mode)
- **Pointer< RemoveInfo > createRemoveCommand** () const
- virtual const **Pointer< SessionId > & getSessionId** () const
- virtual **Pointer< SessionId > & getSessionId** ()
- virtual void **setSessionId** (const **Pointer< SessionId > &sessionId**)
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SESSIONINFO** = 4

Protected Attributes

- **Pointer< SessionId > sessionId**

6.723.1 Constructor & Destructor Documentation

6.723.1.1 activemq::commands::SessionInfo::SessionInfo ()

6.723.1.2 virtual activemq::commands::SessionInfo::~~SessionInfo () [virtual]

6.723.2 Member Function Documentation

6.723.2.1 virtual SessionInfo* activemq::commands::SessionInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.723.2.2 `virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.723.2.3 `Pointer<RemoveInfo> activemq::commands::SessionInfo::createRemoveCommand () const`

6.723.2.4 `virtual bool activemq::commands::SessionInfo::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.723.2.5 `unsigned int activemq::commands::SessionInfo::getAckMode () const [inline]`

6.723.2.6 `virtual unsigned char activemq::commands::SessionInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.723.2.7** `virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () const`
[virtual]
- 6.723.2.8** `virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ()`
[virtual]
- 6.723.2.9** `void activemq::commands::SessionInfo::setAckMode (unsigned int mode)` [inline]
- 6.723.2.10** `virtual void activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & sessionId)` [virtual]
- 6.723.2.11** `virtual std::string activemq::commands::SessionInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

- 6.723.2.12** `virtual Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.1112).

6.723.3 Field Documentation

- 6.723.3.1** `const unsigned char activemq::commands::SessionInfo::ID_SESSIONINFO = 4` [static]
- 6.723.3.2** `Pointer<SessionId> activemq::commands::SessionInfo::sessionId`
[protected]

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.724.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 3192). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.724.2 Constructor & Destructor Documentation

6.724.2.1 `activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::SessionInfoMarshaller () [inline]`

6.724.2.2 `virtual activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::~~SessionInfoMarshaller () [inline, virtual]`

6.724.3 Member Function Documentation

6.724.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.724.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.724.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.724.3.4 virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 730).

6.724.3.5 virtual int activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 731).

6.724.3.6 virtual void activemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 732).

```
6.724.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

6.725.2.1 `activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::SessionInfoMarshaller () [inline]`

6.725.2.2 `virtual activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::~~SessionInfoMarshaller () [inline, virtual]`

6.725.3 Member Function Documentation

6.725.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.725.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.725.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

```

6.725.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

```

6.725.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```

6.725.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 726).

```
6.725.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

6.726.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p.3199). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.726.2 Constructor & Destructor Documentation

6.726.2.1 `activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::SessionInfoMarshaller () [inline]`

6.726.2.2 `virtual activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::~~SessionInfoMarshaller () [inline, virtual]`

6.726.3 Member Function Documentation

6.726.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.726.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.726.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

```

6.726.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

```

6.726.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

```

6.726.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

```
6.726.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.727.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p.3203). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.727.2 Constructor & Destructor Documentation

6.727.2.1 `activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::SessionInfoMarshaller () [inline]`

6.727.2.2 `virtual activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::~~SessionInfoMarshaller () [inline, virtual]`

6.727.3 Member Function Documentation

6.727.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.727.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.727.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.727.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 703).

6.727.3.5 virtual int activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 704).

6.727.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 706).

```
6.727.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

The documentation for this class was generated from the following file:

6.728.2.1 `activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::SessionInfoMarshaller () [inline]`

6.728.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::~~SessionInfoMarshaller () [inline, virtual]`

6.728.3 Member Function Documentation

6.728.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.728.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.728.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.728.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 737).

6.728.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 738).

6.728.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 739).

```
6.728.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

6.729.3 Member Function Documentation

6.729.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.729.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.729.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.729.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

6.729.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

6.729.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 712).

```
6.729.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/SessionInfoMarshaller.h

6.730 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

```
#include <src/main/activemq/cmsutil/SessionPool.h>
```

Public Member Functions

- **SessionPool** (**cms::Connection** *connection, **cms::Session::AcknowledgeMode** acknowledgeMode, **ResourceLifecycleManager** *resourceLifecycleManager)
Constructs a session pool.

- virtual `~SessionPool ()`
Destroys the pooled session objects, but not the underlying session resources.
- virtual `PooledSession * takeSession () throw (cms::CMSEException)`
Takes a session from the pool, creating one if necessary.
- virtual void `returnSession (PooledSession *session)`
Returns a session to the pool.
- `ResourceLifecycleManager * getResourceLifecycleManager ()`

Protected Member Functions

- `SessionPool (const SessionPool &)`
- `SessionPool & operator= (const SessionPool &)`

6.730.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode. Internal session resources are managed through a provided `ResourceLifecycleManager` (p. 3074), not by this pool. This class is thread-safe.

6.730.2 Constructor & Destructor Documentation

6.730.2.1 `activemq::cmsutil::SessionPool::SessionPool (const SessionPool &)`
[inline, protected]

6.730.2.2 `activemq::cmsutil::SessionPool::SessionPool (cms::Connection * connection, cms::Session::AcknowledgeMode ackMode, ResourceLifecycleManager * resourceLifecycleManager)`

Constructs a session pool.

Parameters

connection the connection to be used for creating all sessions.

ackMode the acknowledge mode to be used for all sessions

resourceLifecycleManager the object responsible for managing the lifecycle of any allocated `cms::Session` (p. 3148) resources.

6.730.2.3 `virtual activemq::cmsutil::SessionPool::~SessionPool ()` [virtual]

Destroys the pooled session objects, but not the underlying session resources.

That is the job of the `ResourceLifecycleManager` (p. 3074).

6.730.3 Member Function Documentation

6.730.3.1 `ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager ()` [inline]

6.730.3.2 `SessionPool& activemq::cmsutil::SessionPool::operator= (const SessionPool &)` [inline, protected]

6.730.3.3 `virtual void activemq::cmsutil::SessionPool::returnSession (PooledSession * session)` [virtual]

Returns a session to the pool.

Parameters

session the session to be returned.

6.730.3.4 `virtual PooledSession* activemq::cmsutil::SessionPool::takeSession ()`
`throw (cms::CMSEException)` [virtual]

Takes a session from the pool, creating one if necessary.

Returns

the pooled session object

Exceptions

cms::CMSEException (p. 1074) if an error occurred

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/SessionPool.h`

6.732 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

```
#include <src/main/decaf/util/Set.h>
```

Inheritance diagram for decaf::util::Set< E >:

Public Member Functions

- virtual `~Set()`

6.732.1 Detailed Description

```
template<typename E> class decaf::util::Set< E >
```

A collection that contains no duplicate elements. More formally, sets contain no pair of elements `e1` and `e2` such that `e1 == e2`, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since

1.0

6.732.2 Constructor & Destructor Documentation

Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a **String** (p. 3427) into a **Short** (p. 3220).*
- static short **reverseBytes** (short value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.
- static short **parseShort** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed short in the radix specified by the second argument.
- static short **parseShort** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal short.
- static **Short valueOf** (short value)
*Returns a **Short** (p. 3220) instance representing the specified short value.*
- static **Short valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Short** (p. 3220) object holding the value given by the specified std::string.*
- static **Short valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Short** (p. 3220) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 16
Size of this objects primitive type in bits.
- static const short **MAX_VALUE** = (short)0x7FFF
Max Value for this Object's primitive type.
- static const short **MIN_VALUE** = (short)0x8000
Max Value for this Object's primitive type.

6.733.1 Constructor & Destructor Documentation

6.733.1.1 decaf::lang::Short::Short (short value)

Parameters

value - short to wrap

6.733.1.2 `decaf::lang::Short::Short (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters

value - string value to convert to short and wrap

Exceptions

NumberFormatException

6.733.1.3 `virtual decaf::lang::Short::~~Short () [inline, virtual]`

6.733.2 Member Function Documentation

6.733.2.1 `virtual unsigned char decaf::lang::Short::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.733.2.2 `virtual int decaf::lang::Short::compareTo (const short & s) const [virtual]`

Compares this **Short** (p. 3220) instance with another.

Parameters

s - the **Short** (p. 3220) instance to be compared

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements `decaf::lang::Comparable< short >` (p. 1126).

6.733.2.3 `virtual int decaf::lang::Short::compareTo (const Short & s) const [virtual]`

Compares this **Short** (p. 3220) instance with another.

Parameters

s - the **Short** (p. 3220) instance to be compared

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.733.2.4 `static Short decaf::lang::Short::decode (const std::string & value)
throw (exceptions::NumberFormatException) [static]`

Decodes a **String** (p. 3427) into a **Short** (p. 3220).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p. 3226) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a **NumberFormatException** will be thrown. The result is negated if first character of the specified **String** (p. 3427) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value - The string to decode

Returns

a **Short** (p. 3220) object containing the decoded value

Exceptions

NumberFormatException if the string is not formatted correctly.

6.733.2.5 `virtual double decaf::lang::Short::doubleValue () const [inline,
virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.733.2.6 `bool decaf::lang::Short::equals (const Short & s) const [inline]`

Returns

true if the two **Short** (p. 3220) Objects have the same value.

6.733.2.7 `bool decaf::lang::Short::equals (const short & s) const [inline,
virtual]`

Returns

true if the two **Short** (p. 3220) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p. 1126).

6.733.2.8 `virtual float decaf::lang::Short::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.733.2.9 `virtual int decaf::lang::Short::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.733.2.10 `virtual long long decaf::lang::Short::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.733.2.11 `virtual bool decaf::lang::Short::operator< (const Short & s) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.733.2.12 `virtual bool decaf::lang::Short::operator< (const short & s) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< short >` (p.1127).

6.733.2.13 `virtual bool decaf::lang::Short::operator==(const Short & s) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.733.2.14 `virtual bool decaf::lang::Short::operator==(const short & s) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< short >` (p.1127).

6.733.2.15 `static short decaf::lang::Short::parseShort (const std::string & s, int radix) throw (exceptions::NumberFormatException)` [static]

Parses the string argument as a signed short in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether `Character.digit(char, int)` (p.1022) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type `NumberFormatException` is thrown if any of the following situations occurs:
* The first argument is null or is a string of length zero. * The radix is either smaller than `Character.MIN_RADIX` (p.1026) or larger than `Character.MAX_RADIX` (p.1026). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type short.

Parameters

s - the **String** (p.3427) containing the short representation to be parsed

radix - the radix to be used while parsing *s*

Returns

the short represented by the string argument in the specified radix.

Exceptions

NumberFormatException - If **String** (p.3427) does not contain a parsable short.

6.733.2.16 `static short decaf::lang::Short::parseShort (const std::string & s)
throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal short.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseShort(const std::string, int)` method.

Parameters

s - **String** (p. 3427) to convert to a short

Returns

the converted short value

Exceptions

NumberFormatException if the string is not a short.

6.733.2.17 `static short decaf::lang::Short::reverseBytes (short value) [static]`

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters

value - the short whose bytes we are to reverse

Returns

the reversed short.

6.733.2.18 `virtual short decaf::lang::Short::shortValue () const [inline,
virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.733.2.19 `static std::string decaf::lang::Short::toString (short value) [static]`

Returns

a string representing the primitive value as Base 10

6.733.2.20 `std::string decaf::lang::Short::toString () const`**Returns**

this **Short** (p. 3220) Object as a **String** (p. 3427) Representation

6.733.2.21 `static Short decaf::lang::Short::valueOf (short value) [static]`

Returns a **Short** (p. 3220) instance representing the specified short value.

Parameters

value - the short to wrap

Returns

the new **Short** (p. 3220) object wrapping value.

6.733.2.22 `static Short decaf::lang::Short::valueOf (const std::string & value)
throw (exceptions::NumberFormatException) [static]`

Returns a **Short** (p. 3220) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the `parseShort(std::string)` method. The result is a **Short** (p. 3220) object that represents the short value specified by the string.

Parameters

value - std::string to parse as base 10

Returns

new **Short** (p. 3220) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a decimal short.

6.733.2.23 `static Short decaf::lang::Short::valueOf (const std::string & value, int
radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Short** (p. 3220) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the `parseShort(std::string, int)` method. The result is a **Short** (p. 3220) object that represents the short value specified by the string.

Parameters

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns

new **Short** (p. 3220) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a valid short.

6.733.3 Field Documentation

6.733.3.1 `const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF`
[static]

Max Value for this Object's primitive type.

6.733.3.2 `const short decaf::lang::Short::MIN_VALUE = (short)0x8000` [static]

Max Value for this Object's primitive type.

6.733.3.3 `const int decaf::lang::Short::SIZE = 16` [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Short.h`

6.734 decaf::internal::nio::ShortArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (int size, bool readOnly=false) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **ShortArrayBuffer** (p. 3229) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ShortArrayBuffer** (short *array, int size, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a **ShortArrayBuffer** (p. 3229) object that wraps the given array.*
- **ShortArrayBuffer** (const decaf::lang::Pointer< ByteArrayAdapter > &array, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **ShortArrayBuffer** (const **ShortArrayBuffer** &other)

Create a **ShortArrayBuffer** (p. 3229) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayAdapter** and when changes are made to that data it is reflected in both.

- virtual ~**ShortArrayBuffer** ()
- virtual short * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the **hasArray** method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 855)

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.
UnsupportedOperationException if the underlying store has no array.

- virtual int **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the **hasArray** method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.
UnsupportedOperationException if the underlying store has no array.

- virtual ShortBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the **duplicate** method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

- virtual ShortBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n + 1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 3238).

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

- virtual **ShortBuffer** * **duplicate** ()

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 855) which the caller owns.

- virtual short **get** () throw (decaf::nio::BufferUnderflowException)

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

- virtual short **get** (int index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the short is to be read.

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or the index is negative.

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

- virtual **ShortBuffer** & **put** (short value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value The shorts value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

- virtual ShortBuffer & put (int index, short value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given shorts into this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data.

value The shorts to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

- virtual ShortBuffer * slice () const

Creates a new **ShortBuffer** (p. 3238) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 3238) which the caller owns.

Protected Member Functions

- virtual void setReadOnly (bool value)

Sets this **ShortArrayBuffer** (p. 3229) as Read-Only.

6.734.1 Constructor & Destructor Documentation

6.734.1.1 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (int size, bool readOnly = false) throw (decaf::lang::exceptions::IllegalArgumentException)

Creates a **ShortArrayBuffer** (p. 3229) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArgumentException if the capacity value is negative.

6.734.1.2 `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * array, int size, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a **ShortArrayBuffer** (p. 3229) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.734.1.3 `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & array, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **ShortArrayBuffer** (p. 3229) will be that of the remaining capacity of the passed buffer.

Parameters

array The ByteArrayAdapter to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.734.1.4 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & *other*)

Create a **ShortArrayBuffer** (p. 3229) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters

other The **ShortArrayBuffer** (p. 3229) this one is to mirror.

6.734.1.5 virtual decaf::internal::nio::ShortArrayBuffer::~~ShortArrayBuffer () [virtual]

6.734.2 Member Function Documentation

6.734.2.1 virtual short* decaf::internal::nio::ShortArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 855)

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 3242).

6.734.2.2 virtual int decaf::internal::nio::ShortArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 3242).

6.734.2.3 `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer () const [virtual]`

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 3242).

6.734.2.4 `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 3238).

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 3243).

6.734.2.5 `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate () [virtual]`

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 855) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 3243).

6.734.2.6 virtual short decaf::internal::nio::ShortArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

Implements **decaf::nio::ShortBuffer** (p. 3245).

6.734.2.7 virtual short decaf::internal::nio::ShortArrayBuffer::get (int *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the short is to be read.

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or the index is negative.

Implements **decaf::nio::ShortBuffer** (p. 3244).

6.734.2.8 `virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray () const`
`[inline, virtual]`

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements `decaf::nio::ShortBuffer` (p. 3245).

6.734.2.9 `virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly ()`
`const [inline, virtual]`

6.734.2.10 `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put`
`(int index, short value) throw (`
`lang::exceptions::IndexOutOfBoundsException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given shorts into this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data.

value The shorts to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implements `decaf::nio::ShortBuffer` (p. 3246).

6.734.2.11 `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put`
`(short value) throw (decaf::nio::BufferOverflowException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value The shorts value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 3246).

6.734.2.12 `virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly (bool value)` [inline, protected, virtual]

Sets this **ShortArrayBuffer** (p. 3229) as Read-Only.

Parameters

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.734.2.13 `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice () const` [virtual]

Creates a new **ShortBuffer** (p. 3238) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 3238) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 3248).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/ShortArrayBuffer.h`

6.735 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:

```
#include <src/main/decaf/nio/ShortBuffer.h>
```

Inheritance diagram for decaf::nio::ShortBuffer:

Public Member Functions

- virtual `~ShortBuffer ()`
- virtual `std::string toString () const`
- virtual `short * array ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the short array that backs this buffer (optional operation).
- virtual `int arrayOffset ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual `ShortBuffer * asReadOnlyBuffer () const =0`
Creates a new, read-only short buffer that shares this buffer's content.
- virtual `ShortBuffer & compact ()=0 throw (ReadOnlyBufferException)`
Compacts this buffer.
- virtual `ShortBuffer * duplicate ()=0`
Creates a new short buffer that shares this buffer's content.
- virtual `short get ()=0 throw (BufferUnderflowException)`
Relative get method.
- virtual `short get (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
Absolute get method.
- `ShortBuffer & get (std::vector< short > buffer) throw (BufferUnderflowException)`
Relative bulk get method.
- `ShortBuffer & get (short *buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`
Relative bulk get method.
- virtual `bool hasArray () const =0`
Tells whether or not this buffer is backed by an accessible short array.
- `ShortBuffer & put (ShortBuffer &src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)`
This method transfers the shorts remaining in the given source buffer into this buffer.
- `ShortBuffer & put (const short *buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`
This method transfers shorts into this buffer from the given source array.

- **ShortBuffer** & **put** (std::vector< short > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source shorts array into this buffer.
- virtual **ShortBuffer** & **put** (short value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given shorts into this buffer at the current position, and then increments the position.
- virtual **ShortBuffer** & **put** (int index, short value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given shorts into this buffer at the given index.
- virtual **ShortBuffer** * **slice** () const =0
*Creates a new **ShortBuffer** (p. 3238) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **ShortBuffer** &value) const
- virtual bool **equals** (const **ShortBuffer** &value) const
- virtual bool **operator==** (const **ShortBuffer** &value) const
- virtual bool **operator<** (const **ShortBuffer** &value) const

Static Public Member Functions

- static **ShortBuffer** * **allocate** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
Allocates a new Double buffer.
- static **ShortBuffer** * **wrap** (short *array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Wraps the passed buffer with a new **ShortBuffer** (p. 3238).*
- static **ShortBuffer** * **wrap** (std::vector< short > &buffer)
*Wraps the passed STL short Vector in a **ShortBuffer** (p. 3238).*

Protected Member Functions

- **ShortBuffer** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **ShortBuffer** (p. 3238) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.735.1 Detailed Description

This class defines four categories of operations upon short buffers: o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.735.2 Constructor & Destructor Documentation

6.735.2.1 `decaf::nio::ShortBuffer::ShortBuffer (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException) [protected]`

Creates a **ShortBuffer** (p. 3238) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity The size and limit of the **Buffer** (p. 855) in doubles

Exceptions

IllegalArgumentException if capacity is negative.

6.735.2.2 `virtual decaf::nio::ShortBuffer::~~ShortBuffer () [inline, virtual]`

6.735.3 Member Function Documentation

6.735.3.1 `static ShortBuffer* decaf::nio::ShortBuffer::allocate (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException) [static]`

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity The size of the Double buffer in shorts.

Returns

the **ShortBuffer** (p. 3238) that was allocated, caller owns.

6.735.3.2 `virtual short* decaf::nio::ShortBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 855)

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3234).

6.735.3.3 `virtual int decaf::nio::ShortBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3234).

6.735.3.4 `virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer () const [pure virtual]`

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3235).

6.735.3.5 **virtual ShortBuffer& decaf::nio::ShortBuffer::compact () throw (ReadOnlyBufferException)** [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 3238).

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3235).

6.735.3.6 **virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & value) const** [virtual]

6.735.3.7 **virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate ()** [pure virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 855) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3235).

6.735.3.8 virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & *value*) const [virtual]

6.735.3.9 ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > *buffer*) throw (BufferUnderflowException)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 855).

Exceptions

BufferUnderflowException (p. 882) if there are fewer than length shorts remaining in this buffer.

6.735.3.10 virtual short decaf::nio::ShortBuffer::get (int *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the short is to be read.

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or the index is negative.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3236).

6.735.3.11 ShortBuffer& decaf::nio::ShortBuffer::get (short * *buffer*, int *size*, int *offset*, int *length*) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Relative bulk get method.

This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 860), then no bytes are transferred and a **BufferUnderflowException** (p. 882) is thrown.

Otherwise, this method copies length shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer The pointer to an allocated buffer to fill.
size The size of the buffer provided.
offset The position in the buffer to start filling.
length The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 855).

Exceptions

BufferUnderflowException (p. 882) if there are fewer than length shorts remaining in this buffer
NullPointerException if the passed buffer is null.
IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.735.3.12 `virtual short decaf::nio::ShortBuffer::get () throw (BufferUnderflowException) [pure virtual]`

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3236).

6.735.3.13 `virtual bool decaf::nio::ShortBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3237).

- 6.735.3.14** `virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & value) const` [virtual]
- 6.735.3.15** `virtual bool decaf::nio::ShortBuffer::operator== (const ShortBuffer & value) const` [virtual]
- 6.735.3.16** `virtual ShortBuffer& decaf::nio::ShortBuffer::put (short value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value The shorts value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implemented in `decaf::internal::nio::ShortArrayBuffer` (p. 3237).

- 6.735.3.17** `virtual ShortBuffer& decaf::nio::ShortBuffer::put (int index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given shorts into this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data.

value The shorts to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implemented in `decaf::internal::nio::ShortArrayBuffer` (p. 3237).

- 6.735.3.18** `ShortBuffer& decaf::nio::ShortBuffer::put (const short * buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`

This method transfers shorts into this buffer from the given source array.

If there are more shorts to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 860), then no shorts are transferred and a **BufferOverflowException** (p. 880) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

- buffer* The array from which shorts are to be read.
- size* The size of the buffer passed.
- offset* The offset within the array of the first char to be read.
- length* The number of shorts to be read from the given array.

Returns

a reference to this buffer.

Exceptions

- BufferOverflowException** (p. 880) if there is insufficient space in this buffer
- ReadOnlyBufferException** (p. 2966) if this buffer is read-only
- NullPointerException** if the passed buffer is null.
- IndexOutOfBoundsException** if the preconditions of size, offset, or length are not met.

6.735.3.19 ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source shorts array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`.

Parameters

- buffer* The buffer whose contents are copied to this **ShortBuffer** (p. 3238).

Returns

a reference to this buffer.

Exceptions

- BufferOverflowException** (p. 880) if there is insufficient space in this buffer.
- ReadOnlyBufferException** (p. 2966) if this buffer is read-only.

6.735.3.20 ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)

This method transfers the shorts remaining in the given source buffer into this buffer.

If there are more shorts remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 860), then no shorts are transferred and a **BufferOverflowException** (p. 880) is thrown.

Otherwise, this method copies `n = src.remaining()` shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src The buffer to take shorts from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if there is insufficient space in this buffer for the remaining shorts in the source buffer.

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

6.735.3.21 virtual ShortBuffer* decaf::nio::ShortBuffer::slice () const [pure virtual]

Creates a new **ShortBuffer** (p. 3238) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 3238) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 3238).

6.735.3.22 virtual std::string decaf::nio::ShortBuffer::toString () const [virtual]

Returns

a `std::string` describing this object

6.735.3.23 static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Wraps the passed buffer with a new **ShortBuffer** (p. 3238).

The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

- array*** The array that will back the new buffer.
- size*** The size of the passed in array.
- offset*** The offset of the subarray to be used.
- length*** The length of the subarray to be used.

Returns

a new **ShortBuffer** (p. 3238) that is backed by `buffer`, caller owns.

Exceptions

- NullPointerException*** if the array pointer is `NULL`.
- IndexOutOfBoundsException*** if the preconditions of `size`, `offset`, or `length` are not met.

6.735.3.24 `static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & buffer) [static]`

Wraps the passed STL short Vector in a **ShortBuffer** (p. 3238).

The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

- buffer*** The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns

a new **ShortBuffer** (p. 3238) that is backed by `buffer`, caller owns.

6.736 activemq::commands::ShutdownInfo Class Reference

```
#include <src/main/activemq/commands/ShutdownInfo.h>
```

Inheritance diagram for `activemq::commands::ShutdownInfo`:

Public Member Functions

- **ShutdownInfo** ()
- virtual **~ShutdownInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ShutdownInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual bool **isShutdownInfo** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SHUTDOWNINFO** = 11

6.736.1 Constructor & Destructor Documentation

6.736.1.1 **activemq::commands::ShutdownInfo::ShutdownInfo** ()

6.736.1.2 **virtual activemq::commands::ShutdownInfo::~~ShutdownInfo** ()
[virtual]

6.736.2 Member Function Documentation

6.736.2.1 **virtual ShutdownInfo* activemq::commands::ShutdownInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.736.2.2 `virtual void activemq::commands::ShutdownInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.736.2.3 `virtual bool activemq::commands::ShutdownInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.736.2.4 `virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new `DataStructure` (p. 1553) type copy.

Implements `activemq::commands::DataStructure` (p. 1557).

6.736.2.5 `virtual bool activemq::commands::ShutdownInfo::isShutdownInfo () const [inline, virtual]`

Returns

an answer of true to the `isShutdownInfo()` (p. 3251) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

6.736.2.6 `virtual std::string activemq::commands::ShutdownInfo::toString () const [virtual]`

Returns a string containing the information for this `DataStructure` (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

6.736.2.7 `virtual Pointer<Command> activemq::commands::ShutdownInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1112).

6.736.3 Field Documentation

6.736.3.1 `const unsigned char activemq::commands::ShutdownInfo::ID_ - SHUTDOWNINFO = 11` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ShutdownInfo.h`

6.737 activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3252).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/ShutdownInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller`:

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual **~ShutdownInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.737.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3252). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.737.2 Constructor & Destructor Documentation

6.737.2.1 **activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::ShutdownInfoMarshaller** () [inline]

6.737.2.2 virtual **activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller** () [inline, virtual]

6.737.3 Member Function Documentation

6.737.3.1 virtual **commands::DataStructure*** **activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.737.3.2 virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::getDataStructureType
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.737.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::looseMarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * *dataOut*) throw (
decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller**
(p. 729).

6.737.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::looseUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller**
(p. 730).

6.737.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

6.737.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

6.737.3.7 `virtual void activemq::wireformat::openwire::marshal::v6::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 733).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/ShutdownInfoMarshaller.h`

6.738 `activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller` Class Reference

Marshaling code for Open Wire Format for `ShutdownInfoMarshaller` (p. 3256).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ShutdownInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller`:

6.738.3 Member Function Documentation

6.738.3.1 **virtual commands::DataStructure* ac-**
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.738.3.2 **virtual unsigned char ac-**
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::getDataStructureTy
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.738.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.738.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

6.738.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

```
6.738.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

```
6.738.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

6.739.3 Member Function Documentation

6.739.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.739.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.739.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 716).

6.739.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 717).

6.739.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

```
6.739.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

```
6.739.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.740.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.740.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.740.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 722).

6.740.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 723).

6.740.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```
6.740.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.740.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

6.741.3 Member Function Documentation

6.741.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.741.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.741.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 702).

6.741.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 703).

6.741.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.741.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.741.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ShutdownInfoMarshaller.h`

6.742 activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3272).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ShutdownInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller**:

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual **~ShutdownInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.742.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 3272). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.742.2 Constructor & Destructor Documentation

6.742.2.1 activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::ShutdownInfoMarshaller () [inline]

6.742.2.2 virtual
activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller () [inline, virtual]

6.742.3 Member Function Documentation

6.742.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.742.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.742.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 709).

6.742.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 710).

6.742.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```
6.742.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.742.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/ShutdownInfoMarshaller.h`

6.743 decaf::security::SignatureException Class Reference

```
#include <src/main/decaf/security/SignatureException.h>
```

Inheritance diagram for decaf::security::SignatureException:

Public Member Functions

- **SignatureException** () throw ()
Default Constructor.
- **SignatureException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **SignatureException** (const **SignatureException** &ex) throw ()
Copy Constructor.
- **SignatureException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SignatureException** (const std::exception *cause) throw ()
Constructor.
- **SignatureException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SignatureException** * **clone** () const
Clones this exception.
- virtual ~**SignatureException** () throw ()

6.743.1 Constructor & Destructor Documentation

6.743.1.1 decaf::security::SignatureException::SignatureException () throw () [inline]

Default Constructor.

6.743.1.2 `decaf::security::SignatureException::SignatureException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.743.1.3 `decaf::security::SignatureException::SignatureException (const SignatureException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.743.1.4 `decaf::security::SignatureException::SignatureException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.743.1.5 `decaf::security::SignatureException::SignatureException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.743.1.6 `decaf::security::SignatureException::SignatureException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* name where exception occurs
- lineNumber* line number where the exception occurred.
- msg* message to report
- ... list of primitives that are formatted into the message

6.743.1.7 virtual decaf::security::SignatureException::~SignatureException ()
throw () [inline, virtual]

6.743.2 Member Function Documentation

6.743.2.1 virtual SignatureException* decaf::security::SignatureException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1847).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SignatureException.h**

6.744 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 2261) in a human readable format.

```
#include <src/main/decaf/util/logging/SimpleFormatter.h>
```

Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual ~**SimpleFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const
Format the given log record and return the formatted string.

6.744.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 2261) in a human readable format. The summary will typically be 1 or 2 lines.

Since

1.0

6.744.2 Constructor & Destructor Documentation

6.744.2.1 `decaf::util::logging::SimpleFormatter::SimpleFormatter ()`

6.744.2.2 `virtual decaf::util::logging::SimpleFormatter::~~SimpleFormatter ()`
[virtual]

6.744.3 Member Function Documentation

6.744.3.1 `virtual std::string decaf::util::logging::SimpleFormatter::format (const LogRecord & record) const` [virtual]

Format the given log record and return the formatted string.

Parameters

record The Log Record to Format.

Implements **decaf::util::logging::Formatter** (p. 1839).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/SimpleFormatter.h`

6.745 decaf::util::logging::SimpleLogger Class Reference

```
#include <src/main/decaf/util/logging/SimpleLogger.h>
```

Public Member Functions

6.746 decaf::net::Socket Class Reference

```
#include <src/main/decaf/net/Socket.h>
```

Inheritance diagram for decaf::net::Socket:

Public Member Functions

- **Socket** ()
*Creates an unconnected **Socket** (p. 3281) using the set **SocketImplFactory** (p. 3314) or if non is set than the default **SocketImpl** type is created.*
- **Socket** (**SocketImpl** *impl)
*Creates a **Socket** (p. 3281) wrapping the provided **SocketImpl** (p. 3306) instance, this **Socket** (p. 3281) is considered unconnected.*
- **Socket** (const **InetAddress** *address, int port)
*Creates a new **Socket** (p. 3281) instance and connects it to the given address and port.*
- **Socket** (const **InetAddress** *address, int port, const **InetAddress** *localAddress, int localPort)
*Creates a new **Socket** (p. 3281) instance and connects it to the given address and port.*
- **Socket** (const std::string &host, int port)
*Creates a new **Socket** (p. 3281) instance and connects it to the given host and port.*
- **Socket** (const std::string &host, int port, const **InetAddress** *localAddress, int localPort)
*Creates a new **Socket** (p. 3281) instance and connects it to the given host and port.*

- virtual `~Socket ()`
- virtual void **bind** (const std::string &ipaddress, int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
*Binds this **Socket** (p. 3281) to the given local address and port.*
- virtual void **close** () throw (decaf::io::IOException)
*Closes the **Socket** (p. 3281).*
- virtual void **connect** (const std::string &host, int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
Connects to the specified destination.
- virtual void **connect** (const std::string &host, int port, int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException)
Connects to the specified destination, with a specified timeout value.
- bool **isConnected** () const
Indicates whether or not this socket is connected to an end point.
- bool **isClosed** () const
- bool **isBound** () const
- bool **isInputShutdown** () const
- bool **isOutputShutdown** () const
- virtual `decaf::io::InputStream * getInputStream ()` throw (decaf::io::IOException)
Gets the `InputStream` for this socket if its connected.
- virtual `decaf::io::OutputStream * getOutputStream ()` throw (decaf::io::IOException)
Gets the `OutputStream` for this socket if it is connected.
- int **getPort** () const
*Gets the on the remote host this **Socket** (p. 3281) is connected to.*
- int **getLocalPort** () const
Gets the local port the socket is bound to.
- std::string **getInetAddress** () const
Returns the address to which the socket is connected.
- std::string **getLocalAddress** () const
Gets the local address to which the socket is bound.
- virtual void **shutdownInput** () throw (decaf::io::IOException)
Shuts down the `InputStream` for this socket essentially marking it as EOF.
- virtual void **shutdownOutput** () throw (decaf::io::IOException)
Shuts down the `OutputStream` for this socket, any data already written to the socket will be sent, any further calls to `OutputStream::write` will throw an `IOException`.
- virtual int **getSoLinger** () const throw (SocketException)

Gets the linger time for the socket, `SO_LINGER`.

- virtual void **setSoLinger** (bool state, int timeout) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)
Sets the linger time (`SO_LINGER`) using a specified time value, this limits of this value are platform specific.
- virtual bool **getKeepAlive** () const throw (SocketException)
Gets the keep alive flag for this socket, `SO_KEEPAIVE`.
- virtual void **setKeepAlive** (bool keepAlive) throw (SocketException)
Enables/disables the keep alive flag for this socket, `SO_KEEPAIVE`.
- virtual int **getReceiveBufferSize** () const throw (SocketException)
Gets the receive buffer size for this socket, `SO_RCVBUF`.
- virtual void **setReceiveBufferSize** (int size) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)
Sets the receive buffer size for this socket, `SO_RCVBUF`.
- virtual bool **getReuseAddress** () const throw (SocketException)
Gets the reuse address flag, `SO_REUSEADDR`.
- virtual void **setReuseAddress** (bool reuse) throw (SocketException)
Sets the reuse address flag, `SO_REUSEADDR`.
- virtual int **getSendBufferSize** () const throw (SocketException)
Gets the send buffer size for this socket, `SO_SNDBUF`, this value is used by the platform socket to buffer data written to the socket.
- virtual void **setSendBufferSize** (int size) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)
Gets the send buffer size for this socket, `SO_SNDBUF`, this value is used by the platform socket to buffer data written to the socket.
- virtual int **getSoTimeout** () const throw (SocketException)
Gets the timeout for socket operations, `SO_TIMEOUT`.
- virtual void **setSoTimeout** (int timeout) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)
Sets the timeout for socket operations, `SO_TIMEOUT`.
- virtual bool **getTcpNoDelay** () const throw (SocketException)
Gets the Status of the `TCP_NODELAY` setting for this socket.
- virtual void **setTcpNoDelay** (bool value) throw (SocketException)
*Sets the Status of the `TCP_NODELAY` param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p.3281).*
- virtual int **getTrafficClass** () const throw (SocketException)

*Gets the Traffic Class setting for this **Socket** (p. 3281), sometimes referred to as Type of Service setting.*

- virtual void **setTrafficClass** (int value) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException)

*Gets the Traffic Class setting for this **Socket** (p. 3281), sometimes referred to as Type of Service setting.*

- virtual bool **getOOBInline** () const throw (SocketException)

Gets the value of the OOBINLINE for this socket.

- virtual void **setOOBInline** (bool value) throw (SocketException)

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

- virtual void **sendUrgentData** (int data) throw (decaf::io::IOException)

*Sends on byte of urgent data to the **Socket** (p. 3281).*

- virtual std::string **toString** () const

Static Public Member Functions

- static void **setSocketImplFactory** (SocketImplFactory *factory) throw (decaf::io::IOException, decaf::net::SocketException)

6.746.1 Detailed Description

Since

1.0

6.746.2 Constructor & Destructor Documentation

6.746.2.1 decaf::net::Socket::Socket ()

Creates an unconnected **Socket** (p. 3281) using the set **SocketImplFactory** (p. 3314) or if non is set than the default **SocketImpl** type is created.

6.746.2.2 decaf::net::Socket::Socket (SocketImpl * impl)

Creates a **Socket** (p. 3281) wrapping the provided **SocketImpl** (p. 3306) instance, this **Socket** (p. 3281) is considered unconnected.

The **Socket** (p. 3281) class takes ownership of this **SocketImpl** (p. 3306) pointer and will delete it when the **Socket** (p. 3281) class is destroyed.

Parameters

impl The **SocketImpl** (p. 3306) instance to wrap.

Exceptions

NullPointerException if the passed **SocketImpl** (p. 3306) is Null.

6.746.2.3 decaf::net::Socket::Socket (const InetAddress * address, int port)

Creates a new **Socket** (p. 3281) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 3314) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 3281) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

address The address to connect to.

port The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 3281).

NullPointerException if the **InetAddress** (p. 1884) instance is NULL.

IllegalArgumentException if the port is not in range [0...65535]

6.746.2.4 decaf::net::Socket::Socket (const InetAddress * address, int port, const InetAddress * localAddress, int localPort)

Creates a new **Socket** (p. 3281) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 3314) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 3281) implementation is used. The **Socket** (p. 3281) will also bind to the local address and port specified.

Parameters

address The address to connect to.
port The port number to connect to [0...65535]
localAddress The IP address on the local machine to bind to.
localPort The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.
IOException if an I/O error occurs while connecting the **Socket** (p. 3281).
NullPointerException if the **InetAddress** (p. 1884) instance is NULL.
IllegalArgumentException if the port is not in range [0...65535]

6.746.2.5 decaf::net::Socket::Socket (const std::string & host, int port)

Creates a new **Socket** (p. 3281) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 3314) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 3281) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

host The host name or IP address to connect to, empty string means loopback.
port The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.
IOException if an I/O error occurs while connecting the **Socket** (p. 3281).
IllegalArgumentException if the port is not in range [0...65535]

6.746.2.6 decaf::net::Socket::Socket (const std::string & host, int port, const InetAddress * localAddress, int localPort)

Creates a new **Socket** (p. 3281) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 3314) set then the **SocketImpl** is created using the factory otherwise the default **Socket** (p. 3281) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

host The host name or IP address to connect to, empty string means loopback.
port The port number to connect to [0...65535]
localAddress The IP address on the local machine to bind to.
localPort The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 3281).

IllegalArgumentOutOfRangeException if the port is not in range [0...65535]

6.746.2.7 virtual `decaf::net::Socket::~~Socket ()` [virtual]

6.746.3 Member Function Documentation

6.746.3.1 void `decaf::net::Socket::accepted ()` [protected]

6.746.3.2 virtual void `decaf::net::Socket::bind (const std::string & ipaddress, int port) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentOutOfRangeException)` [virtual]

Binds this **Socket** (p. 3281) to the given local address and port.

If the **SocketAddress** (p. 3297) value is NULL then the **Socket** (p. 3281) will be bound to an available local address and port.

Parameters

ipaddress The local address and port to bind the socket to.

port The port on the local machine to bind to.

Exceptions

IOException if an error occurs during the bind operation.

IllegalArgumentOutOfRangeException if the **Socket** (p. 3281) can't process the subclass of **SocketAddress** (p. 3297) that has been provided.

6.746.3.3 void `decaf::net::Socket::checkClosed () const throw (decaf::io::IOException)` [protected]

6.746.3.4 virtual void `decaf::net::Socket::close () throw (decaf::io::IOException)` [virtual]

Closes the **Socket** (p. 3281).

Once closed a **Socket** (p. 3281) cannot be connected or otherwise operated upon, a new **Socket** (p. 3281) instance must be created.

Exceptions

IOException if an I/O error occurs while closing the **Socket** (p. 3281).

Implements **decaf::io::Closeable** (p. 1066).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2679).

6.746.3.5 virtual void decaf::net::Socket::connect (const std::string & *host*, int *port*, int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException) [virtual]

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 3319) is thrown. A timeout value of zero is treated as an infinite timeout.

Parameters

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

timeout The number of Milliseconds to wait before treating the connection as failed.

Exceptions

IOException Thrown if a failure occurred in the connect.

SocketTimeoutException (p. 3319) if the timeout for connection is exceeded.

IllegalArgumentException if the timeout value is negative or the endpoint is invalid.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2679).

6.746.3.6 virtual void decaf::net::Socket::connect (const std::string & *host*, int *port*) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException) [virtual]

Connects to the specified destination.

Parameters

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

Exceptions

IOException Thrown if a failure occurred in the connect.

IllegalArgumentException if the timeout value is negative or the endpoint is invalid.

6.746.3.7 void decaf::net::Socket::ensureCreated () const throw (decaf::io::IOException) [protected]

6.746.3.8 std::string decaf::net::Socket::getInetAddress () const

Returns the address to which the socket is connected.

Returns

the remote IP address to which this socket is connected, or null if the socket is not connected.

6.746.3.9 `virtual decaf::io::InputStream* decaf::net::Socket::getInputStream ()
throw (decaf::io::IOException) [virtual]`

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 3281) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broken the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 3281).

Returns

The InputStream for this socket.

Exceptions

IOException if an error occurs during creation of the InputStream, also if the **Socket** (p. 3281) is not connected or the input has been shutdown previously.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2680).

6.746.3.10 `virtual bool decaf::net::Socket::getKeepAlive () const throw (
SocketException) [virtual]`

Gets the keep alive flag for this socket, SO_KEEPALIVE.

Returns

true if keep alive is enabled for this socket.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.11 `std::string decaf::net::Socket::getLocalAddress () const`

Gets the local address to which the socket is bound.

Returns

the local address to which the socket is bound or InetAddress.anyLocalAddress() if the socket is not bound yet.

6.746.3.12 `int decaf::net::Socket::getLocalPort () const`

Gets the local port the socket is bound to.

Returns

the local port the socket was bound to, or -1 if the socket is not bound.

6.746.3.13 `virtual bool decaf::net::Socket::getOOBInline () const throw (SocketException) [virtual]`

Gets the value of the OOBINLINE for this socket.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException (p. 3298) if an error is encountered while performing this operation.

6.746.3.14 `virtual decaf::io::OutputStream* decaf::net::Socket::getOutputStream () throw (decaf::io::IOException) [virtual]`

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 3281) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 3281) will also close the underlying **Socket** (p. 3281).

Returns

the OutputStream for this socket.

Exceptions

IOException if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 3281) is closed or the output has been shutdown previously.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2681).

6.746.3.15 `int decaf::net::Socket::getPort () const`

Gets the on the remote host this **Socket** (p. 3281) is connected to.

Returns

the port on the remote host the socket is connected to, or 0 if not connected.

6.746.3.16 `virtual int decaf::net::Socket::getReceiveBufferSize () const throw (SocketException) [virtual]`

Gets the receive buffer size for this socket, SO_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

Returns

the receive buffer size in bytes.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.17 `virtual bool decaf::net::Socket::getReuseAddress () const throw (SocketException)` [virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns

True if the address can be reused.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.18 `virtual int decaf::net::Socket::getSendBufferSize () const throw (SocketException)` [virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Returns

the size in bytes of the send buffer.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.19 `virtual int decaf::net::Socket::getSoLinger () const throw (SocketException)` [virtual]

Gets the linger time for the socket, SO_LINGER.

A return value of -1 indicates that the option is disabled.

Returns

The linger time in seconds.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.20 `virtual int decaf::net::Socket::getSoTimeout () const throw (SocketException)` [virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 3298) Thrown if unable to retrieve the information.

6.746.3.21 `virtual bool decaf::net::Socket::getTcpNoDelay () const throw (SocketException)` [virtual]

Gets the Status of the TCP_NODELAY setting for this socket.

Returns

true if TCP_NODELAY is enabled for the socket.

Exceptions

SocketException (p. 3298) Thrown if unable to set the information.

6.746.3.22 `virtual int decaf::net::Socket::getTrafficClass () const throw (SocketException)` [virtual]

Gets the Traffic Class setting for this **Socket** (p. 3281), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 3281) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Returns

the bitset result of querying the traffic class setting.

Exceptions

SocketException (p. 3298) if an error is encountered while performing this operation.

6.746.3.23 `void decaf::net::Socket::initSocketImpl (const std::string & address, int port, const InetAddress * localAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)` [protected]

6.746.3.24 `bool decaf::net::Socket::isBound () const` [inline]

Returns

true if this **Socket** (p. 3281) has been bound to a Local address.

6.746.3.25 `bool decaf::net::Socket::isClosed () const` [inline]

Returns

true if the **Socket** (p. 3281) has been closed.

6.746.3.26 `bool decaf::net::Socket::isConnected () const [inline]`

Indicates whether or not this socket is connected to an end point.

Returns

true if connected, false otherwise.

6.746.3.27 `bool decaf::net::Socket::isInputShutdown () const [inline]`

Returns

true if input on this **Socket** (p. 3281) has been shutdown.

6.746.3.28 `bool decaf::net::Socket::isOutputShutdown () const [inline]`

Returns

true if output on this **Socket** (p. 3281) has been shutdown.

6.746.3.29 `virtual void decaf::net::Socket::sendUrgentData (int data) throw (decaf::io::IOException) [virtual]`

Sends one byte of urgent data to the **Socket** (p. 3281).

Parameters

data The value to write as urgent data, only the lower eight bits are sent.

Exceptions

IOException if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2682).

6.746.3.30 `virtual void decaf::net::Socket::setKeepAlive (bool keepAlive) throw (SocketException) [virtual]`

Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.

Parameters

keepAlive If true, enables the flag.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.31 `virtual void decaf::net::Socket::setOOBInline (bool value) throw (SocketException) [virtual]`

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException (p. 3298) if an error is encountered while performing this operation.

Reimplemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2684).

6.746.3.32 `virtual void decaf::net::Socket::setReceiveBufferSize (int size) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters

size Number of bytes to set the receive buffer to.

Exceptions

SocketException (p. 3298) if the operation fails.

IllegalArgumentException if the value is zero or negative.

6.746.3.33 `virtual void decaf::net::Socket::setReuseAddress (bool reuse) throw (SocketException) [virtual]`

Sets the reuse address flag, SO_REUSEADDR.

Parameters

reuse If true, sets the flag.

Exceptions

SocketException (p. 3298) if the operation fails.

6.746.3.34 `virtual void decaf::net::Socket::setSendBufferSize (int size) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Parameters

size The number of bytes to set the send buffer to, must be larger than zero.

Exceptions

SocketException (p. 3298) if the operation fails.

IllegalArgumentException if the value is zero or negative.

6.746.3.35 `static void decaf::net::Socket::setSocketImplFactory (SocketImplFactory * factory) throw (decaf::io::IOException, decaf::net::SocketException) [static]`

Sets the instance of a **SocketImplFactory** (p. 3314) that the **Socket** (p. 3281) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

Parameters

factory The instance of a **SocketImplFactory** (p. 3314) to use when new **Socket** (p. 3281) objects are created.

Exceptions

IOException if an I/O error occurs while performing this operation.

SocketException (p. 3298) if this method has already been called with a valid factory.

6.746.3.36 `virtual void decaf::net::Socket::setSoLinger (bool state, int timeout) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.

Parameters

state The state of SO_LINGER, true is on.

timeout The linger time in seconds, must be non-negative.

Exceptions

SocketException (p. 3298) if the operation fails.

IllegalArgumentException if state is true and timeout is negative.

6.746.3.37 `virtual void decaf::net::Socket::setSoTimeout (int timeout) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Sets the timeout for socket operations, SO_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

Parameters

timeout The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 3298) Thrown if unable to set the information.

IllegalArgumentException if the timeout value is negative.

6.746.3.38 `virtual void decaf::net::Socket::setTcpNoDelay (bool value) throw (SocketException) [virtual]`

Sets the Status of the TCP_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 3281).

Parameters

value The setting for the socket's TCP_NODELAY option, true to enable.

Exceptions

SocketException (p. 3298) Thrown if unable to set the information.

6.746.3.39 `virtual void decaf::net::Socket::setTrafficClass (int value) throw (SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Gets the Traffic Class setting for this **Socket** (p. 3281), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 3281) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Parameters

value The integer value representing the traffic class setting bitset.

Exceptions

SocketException (p. 3298) if an error is encountered while performing this operation.

IllegalArgumentException if the value is not in the range [0..255].

6.746.3.40 `virtual void decaf::net::Socket::shutdownInput () throw (decaf::io::IOException) [virtual]`

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions

IOException if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2685).

6.746.3.41 `virtual void decaf::net::Socket::shutdownOutput () throw (decaf::io::IOException) [virtual]`

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to `OuputStream::write` will throw an `IOException`.

Exceptions

IOException if an I/O error occurs while performing this operation.

Reimplemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2685).

6.746.3.42 `virtual std::string decaf::net::Socket::toString () const [virtual]`

Returns

a string representing this **Socket** (p. 3281).

6.746.4 Friends And Related Function Documentation

6.746.4.1 `friend class ServerSocket [friend]`

6.746.5 Field Documentation

6.746.5.1 `SocketImpl* decaf::net::Socket::impl [mutable, protected]`

The documentation for this class was generated from the following file:

- `src/main/decaf/net/Socket.h`

6.747 decaf::net::SocketAddress Class Reference

Base class for protocol specific **Socket** (p. 3281) addresses.

```
#include <src/main/decaf/net/SocketAddress.h>
```

Inheritance diagram for `decaf::net::SocketAddress`:

Public Member Functions

- `virtual ~SocketAddress ()`

6.747.1 Detailed Description

Base class for protocol specific **Socket** (p. 3281) addresses. These classes provide an immutable address object that is used by the **Socket** (p. 3281) classes.

Since

1.0

6.747.2 Constructor & Destructor Documentation

6.747.2.1 virtual decaf::net::SocketAddress::~SocketAddress () [inline, virtual]

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketAddress.h`

6.748 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

```
#include <src/main/decaf/net/SocketError.h>
```

Static Public Member Functions

- static int **getErrorCode** ()
Gets the last error appropriate for the platform.
- static std::string **getErrorString** ()
Gets the string description for the last error.

6.748.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

6.748.2 Member Function Documentation

6.748.2.1 static int decaf::net::SocketError::getErrorCode () [static]

Gets the last error appropriate for the platform.

6.748.2.2 static std::string decaf::net::SocketError::getErrorString () [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketError.h`

6.749 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

```
#include <src/main/decaf/net/SocketException.h>
```

Inheritance diagram for decaf::net::SocketException:

Public Member Functions

- **SocketException** () throw ()
- **SocketException** (const **lang::Exception** &ex) throw ()
- **SocketException** (const **SocketException** &ex) throw ()
- **SocketException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketException** (const std::exception *cause) throw ()
Constructor.
- **SocketException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketException** * **clone** () const
Clones this exception.
- virtual ~**SocketException** () throw ()

6.749.1 Detailed Description

Exception for errors when manipulating sockets.

6.749.2 Constructor & Destructor Documentation

- 6.749.2.1** decaf::net::SocketException::SocketException () throw () [inline]
- 6.749.2.2** decaf::net::SocketException::SocketException (const lang::Exception &ex) throw () [inline]
- 6.749.2.3** decaf::net::SocketException::SocketException (const SocketException &ex) throw () [inline]
- 6.749.2.4** decaf::net::SocketException::SocketException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.749.2.5 decaf::net::SocketException::SocketException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.749.2.6 decaf::net::SocketException::SocketException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.749.2.7 virtual decaf::net::SocketException::~~SocketException () throw () [inline, virtual]

6.749.3 Member Function Documentation

6.749.3.1 virtual SocketException* decaf::net::SocketException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 2005).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 2689), **decaf::net::BindException** (p. 770), **decaf::net::ConnectException** (p. 1167), **decaf::net::NoRouteToHostException** (p. 2642), and **decaf::net::PortUnreachableException** (p. 2783).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketException.h**

6.750 decaf::net::SocketFactory Class Reference

The **SocketFactory** (p. 3301) is used to create **Socket** (p. 3281) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

```
#include <src/main/decaf/net/SocketFactory.h>
```

Inheritance diagram for decaf::net::SocketFactory:

Public Member Functions

- virtual **~SocketFactory** ()
- virtual **Socket * createSocket** () throw (decaf::io::IOException)
*Creates an unconnected **Socket** (p. 3281) object.*

1.0

6.750.2 Constructor & Destructor Documentation

6.750.2.1 **decaf::net::SocketFactory::SocketFactory** () [protected]

6.750.2.2 **virtual decaf::net::SocketFactory::~~SocketFactory** () [virtual]

6.750.3 Member Function Documentation

6.750.3.1 **virtual Socket* decaf::net::SocketFactory::createSocket** () throw (**decaf::io::IOException**) [virtual]

Creates an unconnected **Socket** (p. 3281) object.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if the **Socket** (p. 3281) cannot be created.

Reimplemented in **decaf::internal::net::DefaultSocketFactory** (p. 1579), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1589), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2692).

6.750.3.2 **virtual Socket* decaf::net::SocketFactory::createSocket** (**const InetAddress * host**, **int port**) throw (**decaf::io::IOException**, **decaf::net::UnknownHostException**) [pure virtual]

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

host The host to connect the socket to.

port The port on the remote host to connect to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1581), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1590), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2693).

6.750.3.3 `virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & name, int port, const InetAddress * ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException) [pure virtual]`

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 3281) to.

localPort The local port to bind the **Socket** (p. 3281) to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1579), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1591), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2694).

6.750.3.4 `virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & name, int port) throw (decaf::io::IOException, decaf::net::UnknownHostException) [pure virtual]`

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1580), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1591), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2693).

6.750.3.5 `virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * host, int port, const InetAddress * ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException) [pure virtual]`

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

The **Socket** (p. 3281) will be bound to the specified local address and port.

Parameters

host The host to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 3281) to.

localPort The local port to bind the **Socket** (p. 3281) to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implemented in **decaf::internal::net::DefaultSocketFactory** (p. 1580), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 1592), and **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 2694).

6.750.3.6 `static SocketFactory* decaf::net::SocketFactory::getDefault () [static]`

Returns an pointer to the default **SocketFactory** (p. 3301) for this Application, there is only one default **SocketFactory** (p. 3301) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 3301) class and in not to be deleted by the caller.

Returns

pointer to the applications default **SocketFactory** (p. 3301).

Exceptions

SocketException (p. 3298) if an error occurs while getting the default instance.

Reimplemented in **decaf::net::ssl::SSLSocketFactory** (p. 3346).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketFactory.h`

6.751 decaf::internal::net::SocketFileDescriptor Class Reference

File Descriptor type used internally by Decaf Socket objects.

```
#include <src/main/decaf/internal/net/SocketFileDescriptor.h>
```

Inheritance diagram for `decaf::internal::net::SocketFileDescriptor`:

Public Member Functions

- **SocketFileDescriptor** (long value)
- virtual **~SocketFileDescriptor** ()
- long **getValue** () const
Gets the OS Level FileDescriptor.

6.751.1 Detailed Description

File Descriptor type used internally by Decaf Socket objects.

Since

6.752 decaf::net::SocketImpl Class Reference

Acts as a base class for all physical **Socket** (p. 3281) implementations.

```
#include <src/main/decaf/net/SocketImpl.h>
```

Inheritance diagram for decaf::net::SocketImpl:

Public Member Functions

- **SocketImpl** ()
- virtual **~SocketImpl** ()
- virtual void **create** ()=0 throw (decaf::io::IOException)
*Creates the underlying platform **Socket** (p. 3281) data structures which allows for **Socket** (p. 3281) options to be applied.*
- virtual void **accept** (**SocketImpl** *socket)=0 throw (decaf::io::IOException, decaf::net::SocketException, decaf::net::SocketTimeoutException)
*Accepts a new connection on the given **Socket** (p. 3281).*
- virtual void **connect** (const std::string &hostname, int **port**, int timeout)=0 throw (decaf::io::IOException, decaf::net::SocketTimeoutException, decaf::lang::exceptions::IllegalArgumentException)
Connects this socket to the given host and port.
- virtual void **bind** (const std::string &ipaddress, int **port**)=0 throw (decaf::io::IOException)
*Binds this **Socket** (p. 3281) instance to the local ip address and port number given.*
- virtual void **listen** (int backlog)=0 throw (decaf::io::IOException)
Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.
- virtual **decaf::io::InputStream** * **getInputStream** ()=0 throw (decaf::io::IOException)
*Gets the **InputStream** linked to this **Socket** (p. 3281).*
- virtual **decaf::io::OutputStream** * **getOutputStream** ()=0 throw (decaf::io::IOException)
*Gets the **OutputStream** linked to this **Socket** (p. 3281).*
- virtual int **available** ()=0 throw (decaf::io::IOException)
*Gets the number of bytes that can be read from the **Socket** (p. 3281) without blocking.*
- virtual void **close** ()=0 throw (decaf::io::IOException)
Closes the socket, terminating any blocked reads or writes.

- virtual void **shutdownInput** ()=0 throw (decaf::io::IOException)
Places the input stream for this socket at "end of stream".
- virtual void **shutdownOutput** ()=0 throw (decaf::io::IOException)
Disables the output stream for this socket.
- virtual int **getOption** (int option) const =0 throw (decaf::io::IOException)
*Gets the specified **Socket** (p. 3281) option.*
- virtual void **setOption** (int option, int value)=0 throw (decaf::io::IOException)
*Sets the specified option on the **Socket** (p. 3281) if supported.*
- int **getPort** () const
Gets the port that this socket has been assigned.
- int **getLocalPort** () const
Gets the value of this SocketImpl's local port field.
- std::string **getInetAddress** () const
Gets the value of this SocketImpl's address field.
- const decaf::io::FileDescriptor * **getFileDescriptor** () const
*Gets the FileDescriptor for this **Socket** (p. 3281), the Object is owned by this **Socket** (p. 3281) and should not be deleted by the caller.*
- virtual std::string **getLocalAddress** () const =0
*Gets the value of the local Inet address the **Socket** (p. 3281) is bound to if bound, otherwise return the **InetAddress** (p. 1884) ANY value "0.0.0.0".*
- std::string **toString** () const
*Returns a string containing the address and port of this **Socket** (p. 3281) instance.*
- virtual bool **supportsUrgentData** () const
- virtual void **sendUrgentData** (int data) throw (decaf::io::IOException)
*Sends on byte of urgent data to the **Socket** (p. 3281).*

Protected Attributes

- int **port**
*The remote port that this **Socket** (p. 3281) is connected to.*
- int **localPort**
*The port on the Local Machine that this **Socket** (p. 3281) is Bound to.*
- std::string **address**
*The Remote Address that the **Socket** (p. 3281) is connected to.*
- io::FileDescriptor * **fd**
*The File Descriptor for this **Socket** (p. 3281).*

6.752.1 Detailed Description

Acts as a base class for all physical **Socket** (p. 3281) implementations.

Since

1.0

6.752.2 Constructor & Destructor Documentation

6.752.2.1 decaf::net::SocketImpl::SocketImpl ()

6.752.2.2 virtual decaf::net::SocketImpl::~~SocketImpl () [virtual]

6.752.3 Member Function Documentation

6.752.3.1 virtual void decaf::net::SocketImpl::accept (SocketImpl * *socket*) throw (decaf::io::IOException, decaf::net::SocketException, decaf::net::SocketTimeoutException) [pure virtual]

Accepts a new connection on the given **Socket** (p. 3281).

Parameters

socket The accepted connection.

Exceptions

IOException if an I/O error occurs while attempting this operation.

SocketException (p. 3298) if an error occurs while performing an Accept on the socket.

SocketTimeoutException (p. 3319) if the accept call times out due to SO_TIMEOUT being set.

6.752.3.2 virtual int decaf::net::SocketImpl::available () throw (decaf::io::IOException) [pure virtual]

Gets the number of bytes that can be read from the **Socket** (p. 3281) without blocking.

Returns

the number of bytes that can be read from the **Socket** (p. 3281) without blocking.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3501).

6.752.3.3 virtual void decaf::net::SocketImpl::bind (const std::string & *ipaddress*, int *port*) throw (decaf::io::IOException) [pure virtual]

Binds this **Socket** (p. 3281) instance to the local ip address and port number given.

Parameters

ipaddress The address of local ip to bind to.
port The port number on the host to bind to.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in `decaf::internal::net::tcp::TcpSocket` (p. 3501).

6.752.3.4 `virtual void decaf::net::SocketImpl::close () throw (decaf::io::IOException) [pure virtual]`

Closes the socket, terminating any blocked reads or writes.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in `decaf::internal::net::tcp::TcpSocket` (p. 3501).

6.752.3.5 `virtual void decaf::net::SocketImpl::connect (const std::string & hostname, int port, int timeout) throw (decaf::io::IOException, decaf::net::SocketTimeoutException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]`

Connects this socket to the given host and port.

Parameters

hostname The name of the host to connect to, or IP address.
port The port number on the host to connect to.
timeout Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions

IOException if an I/O error occurs while attempting this operation.
SocketTimeoutException (p. 3319) if the connect call times out due to timeout being set.
IllegalArgumentException if a parameter has an illegal value.

Implemented in `decaf::internal::net::tcp::TcpSocket` (p. 3502).

6.752.3.6 `virtual void decaf::net::SocketImpl::create () throw (decaf::io::IOException) [pure virtual]`

Creates the underlying platform `Socket` (p. 3281) data structures which allows for `Socket` (p. 3281) options to be applied.

The created socket is in an unconnected state.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in `decaf::internal::net::tcp::TcpSocket` (p. 3502).

6.752.3.7 `const decaf::io::FileDescriptor* decaf::net::SocketImpl::getFileDescriptor () const [inline]`

Gets the FileDescriptor for this **Socket** (p. 3281), the Object is owned by this **Socket** (p. 3281) and should not be deleted by the caller.

Returns

a pointer to this Socket's FileDescriptor object.

6.752.3.8 `std::string decaf::net::SocketImpl::getInetAddress () const [inline]`

Gets the value of this SocketImpl's address field.

Returns

the value of the address field.

6.752.3.9 `virtual decaf::io::InputStream* decaf::net::SocketImpl::getInputStream () throw (decaf::io::IOException) [pure virtual]`

Gets the InputStream linked to this **Socket** (p. 3281).

Returns

an InputStream pointer owned by the **Socket** (p. 3281) object.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3502).

6.752.3.10 `virtual std::string decaf::net::SocketImpl::getLocalAddress () const [pure virtual]`

Gets the value of the local Inet address the **Socket** (p. 3281) is bound to if bound, otherwise return the **InetAddress** (p. 1884) ANY value "0.0.0.0".

Returns

the local address bound to, or ANY.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3503).

6.752.3.11 `int decaf::net::SocketImpl::getLocalPort () const [inline]`

Gets the value of this SocketImpl's local port field.

Returns

the value of localPort.

6.752.3.12 `virtual int decaf::net::SocketImpl::getOption (int option) const
throw (decaf::io::IOException) [pure virtual]`

Gets the specified **Socket** (p. 3281) option.

Parameters

option The **Socket** (p. 3281) options whose value is to be retrieved.

Returns

the value of the given socket option.

Exceptions

IOException if an I/O error occurs while performing this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3503).

6.752.3.13 `virtual decaf::io::OutputStream* decaf::net::SocketImpl::getOutputStream () throw (decaf::io::IOException) [pure virtual]`

Gets the OutputStream linked to this **Socket** (p. 3281).

Returns

an OutputStream pointer owned by the **Socket** (p. 3281) object.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3503).

6.752.3.14 `int decaf::net::SocketImpl::getPort () const [inline]`

Gets the port that this socket has been assigned.

Returns

the Socket's port number.

6.752.3.15 `virtual void decaf::net::SocketImpl::listen (int backlog) throw (decaf::io::IOException) [pure virtual]`

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

backlog The maximum length of the connection queue.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3504).

6.752.3.16 `virtual void decaf::net::SocketImpl::sendUrgentData (int data)
throw (decaf::io::IOException) [virtual]`

Sends on byte of urgent data to the **Socket** (p. 3281).

Parameters

data The value to write as urgent data, only the lower eight bits are sent.

Exceptions

IOException if an I/O error occurs while performing this operation.

6.752.3.17 `virtual void decaf::net::SocketImpl::setOption (int option, int value
) throw (decaf::io::IOException) [pure virtual]`

Sets the specified option on the **Socket** (p. 3281) if supported.

Parameters

option The **Socket** (p. 3281) option to set.

value The value of the socket option to apply to the socket.

Exceptions

IOException if an I/O error occurs while performing this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3505).

6.752.3.18 `virtual void decaf::net::SocketImpl::shutdownInput () throw (
decaf::io::IOException) [pure virtual]`

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 3312) on the socket, the stream will return EOF.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3505).

6.752.3.19 `virtual void decaf::net::SocketImpl::shutdownOutput () throw (decaf::io::IOException)` [pure virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 3313) on the socket, the stream will throw an **IOException**.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 3505).

6.752.3.20 `virtual bool decaf::net::SocketImpl::supportsUrgentData () const` [inline, virtual]

Returns

true if this **SocketImpl** (p. 3306) supports sending Urgent Data. The default implementation always returns false.

6.752.3.21 `std::string decaf::net::SocketImpl::toString () const`

Returns a string containing the address and port of this **Socket** (p. 3281) instance.

Returns

a string containing the address and port of this socket.

6.752.4 Field Documentation

6.752.4.1 `std::string decaf::net::SocketImpl::address` [protected]

The Remote Address that the **Socket** (p. 3281) is connected to.

6.752.4.2 `io::FileDescriptor* decaf::net::SocketImpl::fd` [protected]

The File Descriptor for this **Socket** (p. 3281).

6.752.4.3 `int decaf::net::SocketImpl::localPort` [protected]

The port on the Local Machine that this **Socket** (p. 3281) is Bound to.

6.752.4.4 `int decaf::net::SocketImpl::port` [protected]

The remote port that this **Socket** (p. 3281) is connected to.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketImpl.h`

6.753 decaf::net::SocketImplFactory Class Reference

Factory class interface for a Factory that creates SocketImpl objects.

```
#include <src/main/decaf/net/SocketImplFactory.h>
```

Public Member Functions

- virtual **~SocketImplFactory** ()
- virtual **SocketImpl * createSocketImpl** ()=0

*Creates a new SocketImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 3306).*

6.753.1 Detailed Description

Factory class interface for a Factory that creates SocketImpl objects. These factories can be used to create various types of Sockets, e.g. Streaming, Multicast, SSL, or platform specific variations of these types.

6.754 decaf::net::SocketOptions Class Reference

```
#include <src/main/decaf/net/SocketOptions.h>
```

Inheritance diagram for decaf::net::SocketOptions:

Public Member Functions

- virtual `~SocketOptions()`

Static Public Attributes

- static const int **SOCKET_OPTION_TCP_NODELAY**
Disable Nagle's algorithm for this connection.
- static const int **SOCKET_OPTION_BINDADDR**
Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).
- static const int **SOCKET_OPTION_REUSEADDR**
Sets SO_REUSEADDR for a socket.
- static const int **SOCKET_OPTION_BROADCAST**
Sets SO_BROADCAST for a socket.
- static const int **SOCKET_OPTION_IP_MULTICAST_IF**
Set which outgoing interface on which to send multicast packets.
- static const int **SOCKET_OPTION_IP_MULTICAST_IF2**
Same as above.
- static const int **SOCKET_OPTION_IP_MULTICAST_LOOP**
This option enables or disables local loopback of multicast datagrams.
- static const int **SOCKET_OPTION_IP_TOS**
This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.
- static const int **SOCKET_OPTION_LINGER**
Specify a linger-on-close timeout.
- static const int **SOCKET_OPTION_TIMEOUT**
*Set a timeout on blocking **Socket** (p. 3281) operations.*
- static const int **SOCKET_OPTION_SNDBUF**
Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.
- static const int **SOCKET_OPTION_RCVBUF**

Set a hint the size of the underlying buffers used by the platform for incoming network I/O.

- static const int **SOCKET_OPTION_KEEPAKIVE**

When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.

- static const int **SOCKET_OPTION_OOBNLINE**

When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

6.754.1 Detailed Description

Since

1.0

6.754.2 Constructor & Destructor Documentation

- 6.754.2.1** virtual decaf::net::SocketOptions::~SocketOptions () [virtual]

6.754.3 Field Documentation

- 6.754.3.1** const int decaf::net::SocketOptions::SOCKET_OPTION_BINDADDR [static]

Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).

The default local address of a socket is INADDR_ANY, meaning any local address on a multi-homed host. A multi-homed host can use this option to accept connections to only one of its addresses (in the case of a **ServerSocket** (p. 3136) or DatagramSocket), or to specify its return address to the peer (for a **Socket** (p. 3281) or DatagramSocket). The parameter of this option is an **InetAddress** (p. 1884).

- 6.754.3.2** const int decaf::net::SocketOptions::SOCKET_OPTION_BROADCAST [static]

Sets SO_BROADCAST for a socket.

This option enables and disables the ability of the process to send broadcast messages. It is supported for only datagram sockets and only on networks that support the concept of a broadcast message (e.g. Ethernet, token ring, etc.), and it is set by default for DatagramSockets.

- 6.754.3.3** const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_IF [static]

Set which outgoing interface on which to send multicast packets.

Useful on hosts with multiple network interfaces, where applications want to use other than the system default. Takes/returns an **InetAddress** (p. 1884).

Valid for Multicast: DatagramSocketImpl.

6.754.3.4 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_IF2` [static]

Same as above.

This option is introduced so that the behaviour with `IP_MULTICAST_IF` will be kept the same as before, while this new option can support setting outgoing interfaces with either IPv4 and IPv6 addresses.

6.754.3.5 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_LOOP` [static]

This option enables or disables local loopback of multicast datagrams.

This option is enabled by default for Multicast Sockets.

6.754.3.6 `const int decaf::net::SocketOptions::SOCKET_OPTION_IP_TOS` [static]

This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.

6.754.3.7 `const int decaf::net::SocketOptions::SOCKET_OPTION_KEEPALIVE` [static]

When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.

This probe is a TCP segment to which the peer must respond. One of three responses is expected:

1. The peer responds with the expected ACK. The application is not notified (since everything is OK). TCP will send another probe following another 2 hours of inactivity.
2. The peer responds with an RST, which tells the local TCP that the peer host has crashed and rebooted. The socket is closed.
3. There is no response from the peer. The socket is closed.

The purpose of this option is to detect if the peer host crashes.

Valid only for TCP socket: **SocketImpl** (p. 3306)

6.754.3.8 `const int decaf::net::SocketOptions::SOCKET_OPTION_LINGER` [static]

Specify a linger-on-close timeout.

This option disables/enables immediate return from a `close()` of a TCP **Socket** (p. 3281). Enabling this option with a non-zero Integer timeout means that a `close()` will block pending the transmission and acknowledgment of all data written to the peer, at which point the socket is closed gracefully. Upon reaching the linger timeout, the socket is closed forcefully, with a TCP RST. Enabling the option with a timeout of zero does a forceful close immediately. If the specified timeout value exceeds 65,535 it will be reduced to 65,535.

Valid only for TCP: **SocketImpl** (p. 3306)

6.754.3.9 const int decaf::net::SocketOptions::SOCKET_OPTION_OOBLINE
[static]

When the OOBLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

When the option is disabled (which is the default) urgent data is silently discarded.

6.754.3.10 const int decaf::net::SocketOptions::SOCKET_OPTION_RCVBUF
[static]

Set a hint the size of the underlying buffers used by the platform for incoming network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be received over the socket. When used in get, this must return the size of the buffer actually used by the platform when receiving in data on this socket. Valid for all sockets: **SocketImpl** (p. 3306), **DatagramSocketImpl**.

6.754.3.11 const int decaf::net::SocketOptions::SOCKET_OPTION_REUSEADDR [static]

Sets SO_REUSEADDR for a socket.

This is used only for MulticastSockets in decaf, and it is set by default for MulticastSockets.

6.754.3.12 const int decaf::net::SocketOptions::SOCKET_OPTION_SNDBUF
[static]

Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be sent over the socket. When used in get, this must return the size of the buffer actually used by the platform when sending out data on this socket. Valid for all sockets: **SocketImpl** (p. 3306), **DatagramSocketImpl**

6.754.3.13 const int decaf::net::SocketOptions::SOCKET_OPTION_TCP_NODELAY [static]

Disable Nagle's algorithm for this connection.

Written data to the network is not buffered pending acknowledgment of previously written data. Valid for TCP sockets.

6.754.3.14 const int decaf::net::SocketOptions::SOCKET_OPTION_TIMEOUT
[static]

Set a timeout on blocking **Socket** (p. 3281) operations.

The option must be set prior to entering a blocking operation to take effect.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketOptions.h**

6.755 decaf::net::SocketTimeoutException Class Reference

```
#include <src/main/decaf/net/SocketTimeoutException.h>
```

Inheritance diagram for decaf::net::SocketTimeoutException:

Public Member Functions

- **SocketTimeoutException** () throw ()
Default Constructor.
- **SocketTimeoutException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **SocketTimeoutException** (const **SocketTimeoutException** &ex) throw ()
Copy Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketTimeoutException** (const std::exception *cause) throw ()
Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketTimeoutException** * **clone** () const
Clones this exception.
- virtual ~**SocketTimeoutException** () throw ()

6.755.1 Constructor & Destructor Documentation

6.755.1.1 decaf::net::SocketTimeoutException::SocketTimeoutException () throw () [inline]

Default Constructor.

6.755.1.2 decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.755.1.3 decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.755.1.4 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.755.1.5 decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.755.1.6 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.755.1.7 `virtual decaf::net::SocketTimeoutException::~~SocketTimeoutException () throw () [inline, virtual]`

6.755.2 Member Function Documentation

6.755.2.1 `virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p.1992).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketTimeoutException.h`

6.756 decaf::net::ssl::SSLContext Class Reference

Represents an implementation of the Secure **Socket** (p.3281) Layer for streaming based sockets.

6.756.2.1 decaf::net::ssl::SSLContext::SSLContext (SSLContextSpi * *contextImpl*)

6.756.2.2 virtual decaf::net::ssl::SSLContext::~~SSLContext () [virtual]

6.756.3 Member Function Documentation

6.756.3.1 static SSLContext* decaf::net::ssl::SSLContext::getDefault () [static]

Gets the Default **SSLContext** (p. 3321).

The default instance of the **SSLContext** (p. 3321) should be immediately usable without any need for the client to initialize this context.

Returns

a pointer to the Default **SSLContext** (p. 3321) instance.

6.756.3.2 SSLParameters* decaf::net::ssl::SSLContext::getDefaultSSLParameters ()

Returns

a new instance of an **SSLParameters** (p. 3326) object containing the default set of settings for this **SSLContext** (p. 3321).

Exceptions

UnsupportedOperationException if the parameters cannot be retrieved.

6.756.3.3 ServerSocketFactory* decaf::net::ssl::SSLContext::getServerSocketFactory ()

Returns an **ServerSocketFactory** (p. 3145) instance for use with this Context, the **ServerSocketFactory** (p. 3145) is owned by the Context and should not be deleted by the caller.

Returns

a pointer to this SSLContext's **ServerSocketFactory** (p. 3145) for creating **SSLServerSocket** (p. 3329) objects.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) requires initialization but it has not yet been initialized.

6.756.3.4 **SocketFactory*** `decaf::net::ssl::SSLContext::getSocketFactory ()`

Returns an **SocketFactory** (p. 3301) instance for use with this Context, the **SocketFactory** (p. 3301) is owned by the Context and should not be deleted by the caller.

Returns

a pointer to this SSLContext's **SocketFactory** (p. 3301) for creating **SSLSocket** (p. 3337) objects.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) requires initialization but it has not yet been initialized.

6.756.3.5 **SSLParameters*** `decaf::net::ssl::SSLContext::getSupportedSSLParameters ()`

Returns

a new instance of an **SSLParameters** (p. 3326) object containing the complete set of settings for this **SSLContext** (p. 3321).

Exceptions

UnsupportedOperationException if the parameters cannot be retrieved.

6.756.3.6 `static void decaf::net::ssl::SSLContext::setDefault (SSLContext * context) [static]`

Sets the default **SSLContext** (p. 3321) to be returned from future calls to `getDefault`.

The set **SSLContext** (p. 3321) must be fully initialized and usable. The caller is responsible for deleting this object before the Library shutdown methods are called.

Exceptions

NullPointerException if the context passed is NULL.

The documentation for this class was generated from the following file:

6.757.1 Detailed Description

Defines the interface that should be provided by an **SSLContext** (p. 3321) provider.

Since

1.0

6.757.2 Constructor & Destructor Documentation

6.757.2.1 virtual decaf::net::ssl::SSLContextSpi::~SSLContextSpi () [virtual]

6.757.3 Member Function Documentation

6.757.3.1 virtual **SSLParameters*** decaf::net::ssl::SSLContextSpi::providerGetDefaultSSLParameters () [virtual]

Creates a returns a new **SSLParameters** (p. 3326) instance that contains the default settings for this Providers **SSLContext** (p. 3321).

The returned **SSLParameters** (p. 3326) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns

new **SSLParameters** (p. 3326) instance with the **SSLContext** (p. 3321) defaults.

Exceptions

UnsupportedOperationException if the defaults cannot be obtained.

6.757.3.2 `virtual ServerSocketFactory* decaf::net::ssl::SSLContextSpi::providerGetServerSocketFactory ()`
[pure virtual]

Returns a **ServerSocketFactory** (p. 3145) instance that can be used to create new **SSLServerSocket** (p. 3329) objects.

The **ServerSocketFactory** (p. 3145) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 3301) instance that can be used to create new SSLServerSockets.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) object requires initialization but has not been initialized yet.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2660).

6.757.3.3 `virtual SocketFactory* decaf::net::ssl::SSLContextSpi::providerGetSocketFactory ()`
[pure virtual]

Returns a **SocketFactory** (p. 3301) instance that can be used to create new **SSLSocket** (p. 3337) objects.

The **SocketFactory** (p. 3301) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 3301) instance that can be used to create new SSLSockets.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) object requires initialization but has not been initialized yet.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 2660).

6.757.3.4 virtual `SSLParameters*` `decaf::net::ssl::SSLContextSpi::providerGetSupportedSSLParameters ()` [virtual]

Creates and returns a new **SSLParameters** (p. 3326) instance that contains the full set of supported parameters for this SSL Context.

The returned **SSLParameters** (p. 3326) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns

a new **SSLParameters** (p. 3326) instance with the full set of settings that are supported.

Exceptions

UnsupportedOperationException if the supported parameters cannot be obtained.

6.757.3.5 virtual void `decaf::net::ssl::SSLContextSpi::providerInit (security::SecureRandom * random)` [pure virtual]

Perform the initialization of this Context.

Parameters

random Pointer to an instance of a secure random number generator.

Exceptions

NullPointerException if the SecureRandom instance is NULL.

KeyManagementException if an error occurs while initializing the context.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLContextSpi` (p. 2661).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLContextSpi.h`

- void **setWantClientAuth** (bool wantClientAuth)
Sets whether client authentication should be requested.

- bool **getNeedClientAuth** () const
- void **setNeedClientAuth** (bool needClientAuth)
Sets whether client authentication should be required.

6.758.1 Constructor & Destructor Documentation

6.758.1.1 decaf::net::ssl::SSLParameters::SSLParameters ()

Creates a new **SSLParameters** (p. 3326) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.

6.758.1.2 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & cipherSuites)

Creates a new **SSLParameters** (p. 3326) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.

Parameters

cipherSuites The vector of cipherSuites for this **SSLParameters** (p. 3326) instance (can be empty).

6.758.1.3 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & cipherSuites, const std::vector< std::string > & protocols)

Creates a new **SSLParameters** (p. 3326) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.

Parameters

cipherSuites The vector of cipherSuites for this **SSLParameters** (p. 3326) instance (can be empty).

protocols The vector of protocols for this **SSLParameters** (p. 3326) instance (can be empty).

6.758.1.4 virtual decaf::net::ssl::SSLParameters::~~SSLParameters () [virtual]

6.758.2 Member Function Documentation

6.758.2.1 std::vector<std::string> decaf::net::ssl::SSLParameters::getCipherSuites () const [inline]

Returns

a copy of the vector of ciphersuites or an empty vector if none have been set.

6.758.2.2 bool decaf::net::ssl::SSLParameters::getNeedClientAuth () const [inline]

Returns

whether client authentication should be required.

6.758.2.3 std::vector<std::string> decaf::net::ssl::SSLParameters::getProtocols () const [inline]

Returns

a copy of the vector of protocols or an empty vector if none have been set.

6.758.2.4 bool decaf::net::ssl::SSLParameters::getWantClientAuth () const [inline]

Returns

whether client authentication should be requested.

6.758.2.5 void decaf::net::ssl::SSLParameters::setCipherSuites (const std::vector<std::string> & *cipherSuites*) [inline]

Sets the vector of ciphersuites.

Parameters

cipherSuites The vector of cipherSuites (can be an empty vector).

6.758.2.6 `void decaf::net::ssl::SSLParameters::setNeedClientAuth (bool needClientAuth) [inline]`

Sets whether client authentication should be required.

Calling this method clears the wantClientAuth flag.

Parameters

needClientAuth whether client authentication should be required.

6.758.2.7 `void decaf::net::ssl::SSLParameters::setProtocols (const std::vector< std::string > & protocols) [inline]`

Sets the vector of protocols.

Parameters

protocols the vector of protocols (or an empty vector)

6.758.2.8 `void decaf::net::ssl::SSLParameters::setWantClientAuth (bool wantClientAuth) [inline]`

Sets whether client authentication should be requested.

Calling this method clears the needClientAuth flag.

Parameters

whether client authentication should be requested.

*Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.*

6.759.1 Detailed Description

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol. The main function of this class is to create **SSLSocket** (p. 3337) objects by accepting connections from client sockets over SSL.

Since

1.0

6.759.2 Constructor & Destructor Documentation

6.759.2.1 `decaf::net::ssl::SSLServerSocket::SSLServerSocket ()` [protected]

Creates a non-bound server socket.

6.759.2.2 `decaf::net::ssl::SSLServerSocket::SSLServerSocket (int port)` [protected]

Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 3314) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3306) is created.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

Exceptions

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.759.2.3 `decaf::net::ssl::SSLServerSocket::SSLServerSocket (int port, int backlog)` [protected]

Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3314) is registered then the `createSocketImpl` method on the factory will be called otherwise a default **SocketImpl** (p. 3306) is created.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

Exceptions

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.759.2.4 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port*, int *backlog*, const decaf::net::InetAddress * *address*) [protected]

Creates a new **ServerSocket** (p. 3136) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 3314) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 3306) is created.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The the number of incoming connection attempts to queue before connections are refused.

ifAddress The IP Address to bind to on the local machine.

Exceptions

IOException if there is an I/O error while performing this operation.

IllegalArgumentException if the port value is negative or greater than 65535.

6.759.2.5 virtual decaf::net::ssl::SSLServerSocket::~~SSLServerSocket () [virtual]

6.759.3 Member Function Documentation

6.759.3.1 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledCipherSuites () const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 3329).

Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2666).

6.759.3.2 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledProtocols () const [pure virtual]`

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 3329).

Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2667).

6.759.3.3 `virtual bool decaf::net::ssl::SSLServerSocket::getNeedClientAuth () const [pure virtual]`

Returns

true if the **Socket** (p. 3281) requires client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2667).

6.759.3.4 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedCipherSuites () const [pure virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 3329).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3281).

Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2667).

6.759.3.5 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedProtocols () const [pure virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 3329) instance.

Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2667).

6.759.3.6 virtual bool decaf::net::ssl::SSLServerSocket::getWantClientAuth ()
const [pure virtual]

Returns

true if the **Socket** (p. 3281) request client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2668).

6.759.3.7 virtual void decaf::net::ssl::SSLServerSocket::setEnabledCipherSuites (
const std::vector< std::string > & *suites*) [pure virtual]

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 3329) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2668).

6.759.3.8 virtual void decaf::net::ssl::SSLServerSocket::setEnabledProtocols (
const std::vector< std::string > & *protocols*) [pure virtual]

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 3329) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 2668).

6.759.3.9 virtual void decaf::net::ssl::SSLServerSocket::setNeedClientAuth (bool
value) [pure virtual]

Sets whether or not this **Socket** (p. 3281) will require Client Authentication.

If set to true the **Socket** (p. 3281) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters

value Whether the server socket should require client authentication.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLServerSocket` (p. 2668).

6.759.3.10 `virtual void decaf::net::ssl::SSLServerSocket::setWantClientAuth (bool value)` [pure virtual]

Sets whether or not this **Socket** (p. 3281) will request Client Authentication.

If set to true the **Socket** (p. 3281) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

Parameters

value Whether the server socket should request client authentication.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLServerSocket` (p. 2669).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLServerSocket.h`

6.760 `decaf::net::ssl::SSLServerSocketFactory` Class Reference

Factory class interface that provides methods to create SSL Server Sockets.

```
#include <src/main/decaf/net/ssl/SSLServerSocketFactory.h>
```

Inheritance diagram for `decaf::net::ssl::SSLServerSocketFactory`:

Public Member Functions

- `virtual ~SSLServerSocketFactory ()`
- `virtual std::vector< std::string > getDefaultCipherSuites ()=0`
Returns the list of cipher suites which are enabled by default.
- `virtual std::vector< std::string > getSupportedCipherSuites ()=0`
Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Static Public Member Functions

- `static ServerSocketFactory * getDefault ()`
*Returns the current default SSL **ServerSocketFactory** (p. 3145), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

6.760.1 Detailed Description

Factory class interface that provides methods to create SSL Server Sockets.

Since

1.0

6.760.2 Constructor & Destructor Documentation

6.760.2.1 `decaf::net::ssl::SSLServerSocketFactory::SSLServerSocketFactory ()`
[protected]

6.760.2.2 `virtual decaf::net::ssl::SSLServerSocketFactory::~~SSLServerSocketFactory ()` [virtual]

6.760.3 Member Function Documentation

6.760.3.1 `static ServerSocketFactory* decaf::net::ssl::SSLServerSocketFactory::getDefault ()`
[static]

Returns the current default SSL `ServerSocketFactory` (p.3145), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns `SSLContext::getDefault()` (p.3322)->`getServerSocketFactory()`. If that call fails, a non-functional factory is returned.

Returns

the default SSL `ServerSocketFactory` (p.3145) pointer.

See also

`decaf::net::ssl::SSLContext::getDefault()` (p.3322)

Reimplemented from `decaf::net::ServerSocketFactory` (p.3148).

6.760.3.2 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getDefaultCipherSuites ()`
[pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

`getSupportedCipherSuites()` (p. 3336)

Implemented in `decaf::internal::net::ssl::DefaultSSLServerSocketFactory` (p. 1586), and `decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory` (p. 2673).

6.760.3.3 `virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getSupportedCipherSuites ()`
[pure virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

`getDefaultCipherSuites()` (p. 3336)

Implemented in `decaf::internal::net::ssl::DefaultSSLServerSocketFactory` (p. 1586), and `decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory` (p. 2673).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLServerSocketFactory.h`

6.761 decaf::net::ssl::SSLSocket Class Reference

```

Determines the mode that the socket uses when a handshake is initiated, client or server.
- virtual bool **getUseClientMode** () const =0
*Gets whether this **Socket** (p. 3281) is in Client or Server mode, true indicates that the mode is set to Client.*
- virtual void **setNeedClientAuth** (bool value)=0
*Sets the **Socket** (p. 3281) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
- virtual bool **getNeedClientAuth** () const =0

Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.

- virtual void **setWantClientAuth** (bool value)=0

*Sets the **Socket** (p. 3281) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

- virtual bool **getWantClientAuth** () const =0

Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

6.761.1 Detailed Description

Since

1.0

6.761.2 Constructor & Destructor Documentation

6.761.2.1 decaf::net::ssl::SSLSocket::SSLSocket ()

6.761.2.2 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * *address*, int *port*)

Creates a new **SSLSocket** (p. 3337) instance and connects it to the given address and port.

If the host parameter is empty then the loop back address is used.

Parameters

address The address to connect to.

port The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 3281).

NullPointerException if the **InetAddress** (p. 1884) instance is NULL.

IllegalArgumentException if the port is not in range [0...65535]

6.761.2.3 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * *address*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **SSLSocket** (p. 3337) instance and connects it to the given address and port.

The **Socket** (p. 3281) will also bind to the local address and port specified.

Parameters

address The address to connect to.

port The port number to connect to [0...65535]

localAddress The IP address on the local machine to bind to.

localPort The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 3281).

NullPointerException if the **InetAddress** (p. 1884) instance is NULL.

IllegalArgumentException if the port is not in range [0...65535]

6.761.2.4 decaf::net::ssl::SSLSocket::SSLSocket (const std::string & host, int port)

Creates a new **SSLSocket** (p. 3337) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

Parameters

host The host name or IP address to connect to, empty string means loopback.

port The port number to connect to [0...65535]

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 3281).

IllegalArgumentException if the port is not in range [0...65535]

6.761.2.5 decaf::net::ssl::SSLSocket::SSLSocket (const std::string & host, int port, const InetAddress * localAddress, int localPort)

Creates a new **SSLSocket** (p. 3337) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

Parameters

host The host name or IP address to connect to, empty string means loopback.

port The port number to connect to [0...65535]

localAddress The IP address on the local machine to bind to.

localPort The port on the local machine to bind to.

Exceptions

UnknownHostException (p. 3649) if the host cannot be resolved.

IOException if an I/O error occurs while connecting the **Socket** (p. 3281).

IllegalArgumentException if the port is not in range [0...65535]

6.761.2.6 `virtual decaf::net::ssl::SSLSocket::~~SSLSocket () [virtual]`

6.761.3 Member Function Documentation

6.761.3.1 `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledCipherSuites () const [pure virtual]`

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSL Socket** (p. 3281).

Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2679).

6.761.3.2 `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledProtocols () const [pure virtual]`

Returns a vector containing the names of all the currently enabled Protocols for this **SSL Socket** (p. 3281).

Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2680).

6.761.3.3 `virtual bool decaf::net::ssl::SSLSocket::getNeedClientAuth () const [pure virtual]`

Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2680).

6.761.3.4 `virtual SSLParameters decaf::net::ssl::SSLSocket::getSSLParameters () const [virtual]`

Returns an **SSLParameters** (p. 3326) object for this **SSLSocket** (p. 3337) instance.

The cipherSuites and protocols vectors in the returned **SSLParameters** (p. 3326) reference will never be empty.

Returns

an **SSLParameters** (p. 3326) object with the settings in use for the **SSLSocket** (p. 3337).

6.761.3.5 `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedCipherSuites () const [pure virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3337).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3281).

Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2681).

6.761.3.6 `virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedProtocols () const [pure virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3337) instance.

Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2681).

6.761.3.7 `virtual bool decaf::net::ssl::SSLSocket::getUseClientMode () const [pure virtual]`

Gets whether this **Socket** (p. 3281) is in Client or Server mode, true indicates that the mode is set to Client.

Returns

true if the **Socket** (p. 3281) is in Client mode, false otherwise.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2681).

6.761.3.8 `virtual bool decaf::net::ssl::SSLSocket::getWantClientAuth () const [pure virtual]`

Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2682).

6.761.3.9 `virtual void decaf::net::ssl::SSLSocket::setEnabledCipherSuites (const std::vector< std::string > & suites) [pure virtual]`

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 3281) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2683).

6.761.3.10 `virtual void decaf::net::ssl::SSLSocket::setEnabledProtocols (const std::vector< std::string > & protocols) [pure virtual]`

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 3281) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2683).

6.761.3.11 `virtual void decaf::net::ssl::SSLSocket::setNeedClientAuth (bool value) [pure virtual]`

Sets the **Socket** (p. 3281) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters

value The value indicating if a client is required to authenticate itself or not.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2683).

6.761.3.12 virtual void decaf::net::ssl::SSLSocket::setSSLParameters (const SSLParameters & value) [virtual]

Sets the **SSLParameters** (p. 3326) for this **SSLSocket** (p. 3337) using the supplied **SSLParameters** (p. 3326) instance.

If the cipherSuites vector in the **SSLParameters** (p. 3326) instance is not empty then the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 3326) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.

Parameters

value The **SSLParameters** (p. 3326) instance that is used to update this **SSLSocket**'s settings.

Exceptions

IllegalArgumentException if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.

6.761.3.13 virtual void decaf::net::ssl::SSLSocket::setUseClientMode (bool value) [pure virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 3281), once a handshake has been initiated this socket remains in the set mode; client or server, for the life of this object.

Parameters

value The mode setting, true for client or false for server.

Exceptions

IllegalArgumentException if the handshake process has begun and mode is locked.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 2684).

6.761.3.14 virtual void decaf::net::ssl::SSLSocket::setWantClientAuth (bool value) [pure virtual]

Sets the **Socket** (p. 3281) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled and the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid then the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters

value The value indicating if a client is requested to authenticate itself or not.

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2684).

6.761.3.15 `virtual void decaf::net::ssl::SSLSocket::startHandshake ()` [pure virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not required to support multiple handshakes and can throw an `IOException` to indicate an error.

Exceptions

IOException if an I/O error occurs while performing the Handshake

Implemented in `decaf::internal::net::ssl::openssl::OpenSSLSocket` (p. 2685).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLSocket.h`

6.762 decaf::net::ssl::SSLSocketFactory Class Reference

Factory class interface for a `SocketFactory` (p. 3301) that can create `SSLSocket` (p. 3337) objects.

```
#include <src/main/decaf/net/ssl/SSLSocketFactory.h>
```

Inheritance diagram for `decaf::net::ssl::SSLSocketFactory`:

Public Member Functions

- `virtual ~SSLSocketFactory ()`
- `virtual std::vector< std::string > getDefaultCipherSuites ()=0`
Returns the list of cipher suites which are enabled by default.
- `virtual std::vector< std::string > getSupportedCipherSuites ()=0`
Returns the names of the cipher suites which could be enabled for use on an SSL connection.
- `virtual Socket * createSocket (Socket *socket, std::string host, int port, bool autoClose)=0`
Returns a socket layered over an existing socket connected to the named host, at the given port.

Static Public Member Functions

- static **SocketFactory** * **getDefault** ()

*Returns the current default SSL **SocketFactory** (p. 3301), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

Protected Member Functions

- **SSLSocketFactory** ()

6.762.1 Detailed Description

Factory class interface for a **SocketFactory** (p. 3301) that can create **SSLSocket** (p. 3337) objects.

Since

1.0

6.762.2 Constructor & Destructor Documentation

6.762.2.1 decaf::net::ssl::SSLSocketFactory::SSLSocketFactory () [protected]

6.762.2.2 virtual decaf::net::ssl::SSLSocketFactory::~~SSLSocketFactory ()
[virtual]

6.762.3 Member Function Documentation

6.762.3.1 virtual **Socket*** decaf::net::ssl::SSLSocketFactory::createSocket (**Socket** * *socket*, std::string *host*, int *port*, bool *autoClose*) [pure virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

socket The existing socket to layer over.

host The server host the original **Socket** (p. 3281) is connected to.

port The server port the original **Socket** (p. 3281) is connected to.

autoClose Should the layered over **Socket** (p. 3281) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 3281) instance that wraps the given **Socket** (p. 3281).

Exceptions

IOException if an I/O exception occurs while performing this operation.

UnknownHostException (p. 3649) if the host is unknown.

Implemented in `decaf::internal::net::ssl::DefaultSSLSocketFactory` (p.1590), and `decaf::internal::net::ssl::openssl::OpenSSLSocketFactory` (p.2692).

6.762.3.2 `static SocketFactory* decaf::net::ssl::SSLSocketFactory::getDefault ()`
[static]

Returns the current default SSL `SocketFactory` (p.3301), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns `SSLContext::getDefault()` (p.3322)->`getSocketFactory()`. If that call fails, a non-functional factory is returned.

Returns

the default SSL `SocketFactory` (p.3301) pointer.

See also

`decaf::net::ssl::SSLContext::getDefault()` (p.3322)

Reimplemented from `decaf::net::SocketFactory` (p.3304).

6.762.3.3 `virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getDefaultCipherSuites ()`
[pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

`getSupportedCipherSuites()` (p.3347)

Implemented in `decaf::internal::net::ssl::DefaultSSLSocketFactory` (p.1592), and `decaf::internal::net::ssl::openssl::OpenSSLSocketFactory` (p.2695).

6.762.3.4 `virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getSupportedCipherSuites ()`
[pure virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

`getDefaultCipherSuites()` (p. 3347)

Implemented in `decaf::internal::net::ssl::DefaultSSLSocketFactory` (p. 1592), and `decaf::internal::net::ssl::openssl::OpenSSLSocketFactory` (p. 2695).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ssl/SSLSocketFactory.h`

6.763 activemq::transport::tcp::SslTransport Class Reference

Transport (p. 3629) for connecting to a Broker using an SSL Socket.

`#include <src/main/activemq/transport/tcp/SslTransport.h>`

Inheritance diagram for `activemq::transport::tcp::SslTransport`:

Public Member Functions

- **SslTransport** (const **Pointer**< **Transport** > &next)
*Creates a new instance of the **SslTransport** (p. 3347), the transport will not attempt to connect to a remote host until the connect method is called.*
- virtual **~SslTransport** ()

Protected Member Functions

- virtual `decaf::net::Socket * createSocket ()`
Create an unconnected Socket instance to be used by the transport to communicate with the broker.
Returns
a newly created unconnected Socket instance.
Exceptions
IOException if there is an error while creating the unconnected Socket.
- virtual void **configureSocket** (decaf::net::Socket *socket, decaf::util::Properties &properties)

6.763.1 Detailed Description

Transport (p. 3629) for connecting to a Broker using an SSL Socket. This transport simply wraps the **TcpTransport** (p. 3510) and provides the **TcpTransport** (p. 3510) an SSL based Socket pointer allowing the core **TcpTransport** (p. 3510) logic to be reused.

Since

3.2.0

6.763.2 Constructor & Destructor Documentation

6.763.2.1 `activemq::transport::tcp::SslTransport::SslTransport (const Pointer< Transport > & next)`

Creates a new instance of the **SslTransport** (p. 3347), the transport will not attempt to connect to a remote host until the connect method is called.

Parameters

next the next transport in the chain

6.763.2.2 `virtual activemq::transport::tcp::SslTransport::~~SslTransport ()` [virtual]

6.763.3 Member Function Documentation

6.763.3.1 `virtual void activemq::transport::tcp::SslTransport::configureSocket (decaf::net::Socket * socket, decaf::util::Properties & properties)` [protected, virtual]

6.763.3.2 `virtual decaf::net::Socket* activemq::transport::tcp::SslTransport::createSocket ()` [protected, virtual]

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

Returns

a newly created unconnected Socket instance.

Exceptions

IOException if there is an error while creating the unconnected Socket.

Reimplemented from **activemq::transport::tcp::TcpTransport** (p. 3513).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/tcp/SslTransport.h`

6.764 activemq::transport::tcp::SslTransportFactory Class Reference

```

Protected Member Functions

- virtual `Pointer< Transport > doCreateComposite (const decaf::net::URI &location, const Pointer< wireformat::WireFormat > &wireFormat, const decaf::util::Properties &properties) throw (exceptions::ActiveMQException)`

*Creates a slimed down **Transport** (p. 3629) instance which can be used in composite transport instances.*

6.764.1 Constructor & Destructor Documentation

- 6.764.1.1 virtual
`activemq::transport::tcp::SslTransportFactory::~~SslTransportFactory () [virtual]`

6.764.2 Member Function Documentation

- 6.764.2.1 virtual `Pointer<Transport> activemq::transport::tcp::SslTransportFactory::doCreateComposite (const decaf::net::URI & location, const Pointer< wireformat::WireFormat > & wireFormat, const decaf::util::Properties & properties) throw (exceptions::ActiveMQException) [protected, virtual]`

Creates a slimed down **Transport** (p. 3629) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3629).

properties - Properties to apply to the transport.

Returns

new Pointer to a **SslTransport** (p. 3347).

Exceptions

ActiveMQException if an error occurs

Reimplemented from **activemq::transport::tcp::TcpTransportFactory** (p. 3515).

The documentation for this class was generated from the following file:

6.767 decaf::internal::io::StandardInputStream Class Reference

```
#include <src/main/decaf/internal/io/StandardInputStream.h>
```

Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()
- virtual **~StandardInputStream** ()
- virtual int **available** () const throw (decaf::io::IOException)

Indicates the number of bytes available.

Protected Member Functions

- virtual int **doReadByte** () throw (decaf::io::IOException)

6.767.1 Constructor & Destructor Documentation

6.767.1.1 decaf::internal::io::StandardInputStream::StandardInputStream ()

6.767.1.2 virtual decaf::internal::io::StandardInputStream::~~StandardInputStream () [virtual]

6.767.2 Member Function Documentation

6.767.2.1 virtual int decaf::internal::io::StandardInputStream::available () const throw (decaf::io::IOException) [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1911).

6.767.2.2 virtual int decaf::internal::io::StandardInputStream::doReadByte () throw (decaf::io::IOException) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1912).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/StandardInputStream.h

6.768 decaf::internal::io::StandardOutputStream Class Reference

```

6.769 cms::Startable Class Reference

Interface for a class that implements the start method.

```
#include <src/main/cms/Startable.h>
```

Inheritance diagram for cms::Startable:

Public Member Functions

- virtual ~**Startable** ()
- virtual void **start** ()=0 throw (CMSEException)

Starts the service.

6.769.1 Detailed Description

Interface for a class that implements the start method. An object that implements the **Startable** (p. 3355) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since

1.0

6.769.2 Constructor & Destructor Documentation

6.769.2.1 virtual cms::Startable::~~Startable () [inline, virtual]

6.769.3 Member Function Documentation

6.769.3.1 virtual void cms::Startable::start () throw (CMSEException) [pure virtual]

Starts the service.

Exceptions

CMSException (p. 1074) if an internal error occurs while starting.

The documentation for this class was generated from the following file:

- `src/main/cms/Startable.h`

6.772 decaf::util::StlList< E > Class Template Reference

List (p. 2190) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

```
#include <src/main/decaf/util/StlList.h>
```

Inheritance diagram for `decaf::util::StlList< E >`:

Data Structures

- class `ConstStlListIterator`
- class `StlListIterator`

Public Member Functions

- `StlList ()`
Default constructor - does nothing.

- **StlList** (const **StlList** &source)

Copy constructor - copies the content of the given set into this one.

- **StlList** (const **Collection**< E > &source)

Copy constructor - copies the content of the given set into this one.

- virtual ~**StlList** ()
- virtual bool **equals** (const **StlList** &source) const

- virtual **Iterator**< E > * **iterator** ()

- virtual **Iterator**< E > * **iterator** () const
- virtual **ListIterator**< E > * **listIterator** ()

Returns

a list iterator over the elements in this list (in proper sequence).

- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Parameters

index index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

***IndexOutOfBoundsException** if the index is out of range ($index < 0 \parallel index > size()$ (p. 1106))*

- virtual **ListIterator**< E > * **listIterator** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual void **copy** (const **StlList** &source)

- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

*This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 2014) operation. Most implementations will probably choose to override this method for efficiency.*

*Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*

Exceptions

***UnsupportedOperationException** if the clear operation is not supported by this collection*

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p. 1097).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

- virtual std::size_t **indexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that $get(i) == value$, or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NoSuchElementException if value is not in the list

- virtual std::size_t **lastIndexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that $get(i) == value$ or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NoSuchElementException if value is not in the list

- virtual bool **isEmpty** () const

Returns true if this collection contains no elements.

*This implementation returns **size()** (p. 1106) == 0.*

Returns

true if the size method return 0.

- virtual std::size_t **size** () const

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

- virtual E **get** (std::size_t index) const throw (default::lang::exceptions::IndexOutOfBoundsException)

Gets the element contained at position passed.

Parameters

index - position to get

Returns

value at index

- virtual E **set** (std::size_t index, const E &element) throw (default::lang::exceptions::IndexOutOfBoundsException)

Replaces the element at the specified position in this list with the specified element.

Parameters

index - index of the element to replace

element - element to be stored at the specified position

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1097) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

- virtual void **add** (std::size_t index, const E &element) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException)

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

- virtual bool **addAll** (std::size_t index, const **Collection**< E > &source) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1097) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1097).

- virtual E **remove** (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

*Removes the element at the specified position in this list.
Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.*

Parameters

***index** - the index of the element to be removed*

Returns

the element previously at the specified position

Exceptions

***IndexOutOfBoundsException** - if the index is greater than size
UnsupportedOperationException - If the collection is non-modifiable.*

6.772.1 Detailed Description

```
template<typename E> class decaf::util::StlList< E >
```

List (p. 2190) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.772.2 Constructor & Destructor Documentation

6.772.2.1 `template<typename E> decaf::util::StlList< E >::StlList () [inline]`

Default constructor - does nothing.

6.772.2.2 `template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

6.772.2.3 `template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

6.772.2.4 `template<typename E> virtual decaf::util::StlList< E >::~~StlList ()`
`[inline, virtual]`

6.772.3 Member Function Documentation

6.772.3.1 `template<typename E> virtual bool decaf::util::StlList< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p.1097) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p.1099).

Referenced by `decaf::util::StlList< cms::Connection * >::addAll()`.

6.772.3.2 `template<typename E> virtual void decaf::util::StlList< E >::add (std::size_t index, const E & element) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 2192).

```
6.772.3.3  template<typename E> virtual bool decaf::util::StlList< E >::addAll
            ( std::size_t index, const Collection< E > & source )
            throw ( decaf::lang::exceptions::UnsupportedOperationException,
                    decaf::lang::exceptions::IndexOutOfBoundsException ) [inline,
                                virtual]
```

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1097) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 2192).

```
6.772.3.4  template<typename E> virtual void decaf::util::StlList< E >::clear ( )
            throw ( lang::exceptions::UnsupportedOperationException ) [inline,
                                virtual]
```

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 2014) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 147).

6.772.3.5 `template<typename E> virtual bool decaf::util::StlList< E >::contains (const E & value) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p. 1097).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 148).

6.772.3.6 `template<typename E> virtual void decaf::util::StlList< E >::copy (const StlList< E > & source) [inline, virtual]`

Referenced by `decaf::util::StlList< cms::Connection * >::StlList()`.

6.772.3.7 `template<typename E> virtual bool decaf::util::StlList< E >::equals (const StlList< E > & source) const [inline, virtual]`

6.772.3.8 `template<typename E> virtual E decaf::util::StlList< E >::get (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Gets the element contained at position passed.

Parameters

index - position to get

Returns

value at index

Implements `decaf::util::List< E >` (p. 2193).

6.772.3.9 `template<typename E> virtual std::size_t decaf::util::StlList< E >::indexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NoSuchElementException if value is not in the list

Implements `decaf::util::List< E >` (p. 2193).

6.772.3.10 `template<typename E> virtual bool decaf::util::StlList< E >::isEmpty () const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns `size() (p. 1106) == 0`.

Returns

true if the size method return 0.

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 150).

6.772.3.11 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () [inline, virtual]`

6.772.3.12 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () const [inline, virtual]`

6.772.3.13 `template<typename E> virtual std::size_t decaf::util::StlList< E >::lastIndexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index *i* such that `get(i) == value` or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NoSuchElementException if value is not in the list

Implements **decaf::util::List< E >** (p. 2194).

6.772.3.14 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Parameters

index index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBoundsException if the index is out of range (`index < 0 || index > size()` (p. 1106))

Implements **decaf::util::List< E >** (p. 2195).

6.772.3.15 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () [inline, virtual]`

Returns

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 2195).

6.772.3.16 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () const [inline, virtual]`

Implements **decaf::util::List< E >** (p. 2195).

6.772.3.17 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Implements **decaf::util::List< E >** (p. 2195).

6.772.3.18 `template<typename E> virtual E decaf::util::StlList< E >::remove (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index - the index of the element to be removed

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements `decaf::util::List< E >` (p. 2196).

6.772.3.19 `template<typename E> virtual bool decaf::util::StlList< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1097).

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 151).

6.772.3.20 `template<typename E> virtual E decaf::util::StlList< E >::set (std::size_t index, const E & element) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Replaces the element at the specified position in this list with the specified element.

Parameters

index - index of the element to replace

element - element to be stored at the specified position

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

Implements `decaf::util::List< E >` (p. 2196).

6.772.3.21 `template<typename E> virtual std::size_t decaf::util::StlList< E >::size () const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

Implements `decaf::util::Collection< E >` (p. 1106).

Referenced by `decaf::util::StlList< cms::Connection * >::add()`, `decaf::util::StlList< cms::Connection * >::addAll()`, `decaf::util::StlList< cms::Connection * >::get()`, `decaf::util::StlList< cms::Connection * >::lastIndexOf()`, `decaf::util::StlList< cms::Connection * >::listIterator()`, `decaf::util::StlList< cms::Connection * >::remove()`, and `decaf::util::StlList< cms::Connection * >::set()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlList.h`

6.773 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 2305) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

`#include <src/main/decaf/util/StlMap.h>`

Inheritance diagram for `decaf::util::StlMap< K, V, COMPARATOR >`:

Public Member Functions

- **StlMap** ()
Default constructor - does nothing.
- **StlMap** (const **StlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **StlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual ~**StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
Parameters
source - **Map** (p. 2305) to compare to this one.
Returns
*true if the **Map** (p. 2305) passed is equal in value to this one.*
- virtual void **copy** (const **StlMap** &source)
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
Copies the content of the source map into this map.
Erases all existing data in this map.
Parameters
source The source object to copy from.
- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
Exceptions
UnsupportedOperationException if this map is unmodifiable.
- virtual bool **containsKey** (const K &key) const
Indicates whether or this map contains a value for the given key.
Parameters
key The key to look up.
Returns
true if this map contains the value, otherwise false.
- virtual bool **containsValue** (const V &value) const
Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.
Parameters
value The Value to look up.

Returns

true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const

Returns

*if the **Map** (p. 2305) contains any element or not, TRUE or FALSE*

- virtual std::size_t **size** () const

Returns

The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)

*Gets the value mapped to the specified key in the **Map** (p. 2305).*

*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

Parameters

key The search key.

Returns

A reference to the value for the given key.

Exceptions

***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 2305).*

- virtual const V & **get** (const K &key) const throw (lang::exceptions::NoSuchElementException)

*Gets the value mapped to the specified key in the **Map** (p. 2305).*

*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 2305).*

- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

***UnsupportedOperationException** if this map is unmodifiable.*

- virtual void **putAll** (const StlMap< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual void **putAll** (const Map< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

*Stores a copy of the Mappings contained in the other **Map** (p. 2305) in this one.*

Parameters

*other A **Map** (p. 2305) instance whose elements are to all be inserted in this **Map** (p. 2305).*

Exceptions

UnsupportedOperationException *If the implementing class does not support the putAll operation.*

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException *if this key is not in the **Map** (p. 2305).*
UnsupportedOperationException *if this map is unmodifiable.*

- virtual std::vector< K > **keySet** () const

*Returns a **Set** (p. 3220) view of the mappings contained in this map.*

*The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2014), **Set.remove** (p. 151), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

Returns

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

Returns

the entire set of values in this map as a std::vector.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.773.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::StlMap< K, V, COMPARATOR >
```

Map (p. 2305) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

Since

1.0

6.773.2 Constructor & Destructor Documentation

6.773.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap () [inline]`

Default constructor - does nothing.

6.773.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

source The source map.

6.773.2.3 `template<typename K, typename V, typename COMPARTOR =
std::less<K>> decaf::util::StlMap< K, V, COMPARTOR >::StlMap (`
`const Map< K, V, COMPARTOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

source The source map.

6.773.2.4 `template<typename K, typename V, typename COMPARTOR =
std::less<K>> virtual decaf::util::StlMap< K, V, COMPARTOR
>::~StlMap () [inline, virtual]`

6.773.3 Member Function Documentation

6.773.3.1 `template<typename K, typename V, typename COMPARTOR
= std::less<K>> virtual void decaf::util::StlMap<
K, V, COMPARTOR >::clear () throw (
decaf::lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARTOR >` (p. 2307).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

6.773.3.2 `template<typename K, typename V, typename COMPARTOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARTOR
>::containsKey (const K & key) const [inline, virtual]`

Indicates whether or this map contains a value for the given key.

Parameters

key The key to look up.

Returns

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARTOR >` (p. 2308).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`.

6.773.3.3 `template<typename K, typename V, typename COMPARTOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARTOR
>::containsValue (const V & value) const [inline, virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2309).

6.773.3.4 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::copy (const StlMap< K, V, COMPARATOR > & source)
[inline, virtual]`

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::StlMap()`.

6.773.3.5 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::copy (const Map< K, V, COMPARATOR > & source) [inline,
virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source The source object to copy from.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2309).

6.773.3.6 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
>::equals (const Map< K, V, COMPARATOR > & source) const
[inline, virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source - **Map** (p. 2305) to compare to this one.

Returns

true if the **Map** (p. 2305) passed is equal in value to this one.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2310).

6.773.3.7 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
>::equals (const StlMap< K, V, COMPARATOR > & source) const
[inline, virtual]`

6.773.3.8 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual V& decaf::util::StlMap< K, V,
COMPARATOR >::get (const K & key) throw (
lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the **Map** (p. 2305).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters

key The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2305).

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2310).

6.773.3.9 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual const V& decaf::util::StlMap< K, V,
COMPARATOR >::get (const K & key) const throw (
lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the **Map** (p. 2305).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2305).

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2311).

6.773.3.10 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::isEmpty () const [inline, virtual]`

Returns

if the **Map** (p. 2305) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2312).

6.773.3.11 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::StlMap< K, V, COMPARATOR >::keySet () const [inline, virtual]`

Returns a **Set** (p. 3220) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2014), **Set.remove** (p. 151), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns

the entire set of keys in this map as a `std::vector`.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2313).

6.773.3.12 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3463).

6.773.3.13 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 3464).

```
6.773.3.14  template<typename K, typename V, typename COMPARATOR =
            std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
            >::notifyAll (    ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException ) [inline,
            virtual]
```

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 3465).

```
6.773.3.15  template<typename K, typename V, typename COMPARATOR =
            std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
            >::put ( const K & key, const V & value ) throw (
            decaf::lang::exceptions::UnsupportedOperationException ) [inline,
            virtual]
```

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2314).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::putAll()`.

```
6.773.3.16  template<typename K, typename V, typename COMPARATOR =
            std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
            >::putAll ( const StlMap< K, V, COMPARATOR > & other ) throw
            ( decaf::lang::exceptions::UnsupportedOperationException ) [inline,
            virtual]
```

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

6.773.3.17 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 2305) in this one.

Parameters

other A **Map** (p. 2305) instance whose elements are to all be inserted in this **Map** (p. 2305).

Exceptions

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2314).

6.773.3.18 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove (const K & key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException if this key is not in the **Map** (p. 2305).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2315).

6.773.3.19 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::size_t decaf::util::StlMap< K, V, COMPARATOR >::size () const [inline, virtual]`

Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2316).

6.773.3.20 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
>::tryLock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3466).

6.773.3.21 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::unlock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3467).

6.773.3.22 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual std::vector<V> decaf::util::StlMap< K, V,
COMPARATOR >::values () const [inline, virtual]`

Returns

the entire set of values in this map as a `std::vector`.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 2317).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::values()`.

6.773.3.23 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::wait () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3468).

```
6.773.3.24  template<typename K, typename V, typename COMPARATOR
            = std::less<K>> virtual void decaf::util::StlMap< K, V,
            COMPARATOR >::wait ( long long millisecs, int
            nanos ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalArgumentException,
            decaf::lang::exceptions::IllegalMonitorStateException,
            decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3471).

```
6.773.3.25  template<typename K, typename V, typename COMPARATOR
            = std::less<K>> virtual void decaf::util::StlMap< K,
            V, COMPARATOR >::wait ( long long millisecs )
            throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException,
            decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3470).

The documentation for this class was generated from the following file:

- src/main/decaf/util/StlMap.h

6.774 decaf::util::StlQueue< T > Class Template Reference

The **Queue** (p. 2948) class accepts messages with an psuh(m) command where m is the message to be queued.

```
#include <src/main/decaf/util/StlQueue.h>
```

Inheritance diagram for decaf::util::StlQueue< T >:

Data Structures

- class **QueueIterator**

Public Member Functions

- **StlQueue** ()
- virtual **~StlQueue** ()
- **Iterator**< T > * **iterator** ()
*Gets an **Iterator** (p. 2012) over this **Queue** (p. 2948).*
- void **clear** ()
Empties this queue.
- T & **front** ()
Returns a Reference to the element at the head of the queue.
- const T & **front** () const
Returns a Reference to the element at the head of the queue.
- T & **back** ()
Returns a Reference to the element at the tail of the queue.

- `const T & back () const`
Returns a Reference to the element at the tail of the queue.
- `void push (const T &t)`
Places a new Object at the Tail of the queue.
- `void enqueueFront (const T &t)`
Places a new Object at the front of the queue.
- `T pop ()`
Removes and returns the element that is at the Head of the queue.
- `size_t size () const`
*Gets the Number of elements currently in the **Queue** (p. 2948).*
- `bool empty () const`
*Checks if this **Queue** (p. 2948) is currently empty.*
- `virtual std::vector< T > toArray () const`
- `void reverse (StlQueue< T > &target) const`
Reverses the order of the contents of this queue and stores them in the target queue.
- `virtual void lock () throw (decaf::lang::exceptions::RuntimeException)`
Locks the object.
- `virtual bool tryLock () throw (decaf::lang::exceptions::RuntimeException)`
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- `virtual void unlock () throw (decaf::lang::exceptions::RuntimeException)`
Unlocks the object.
- `virtual void wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)`
Waits on a signal from this object, which is generated by a call to Notify.
- `virtual void wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)`
Waits on a signal from this object, which is generated by a call to Notify.
- `virtual void wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)`
Waits on a signal from this object, which is generated by a call to Notify.
- `virtual void notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)`

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

- T & **getSafeValue** ()

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.774.1 Detailed Description

template<typename T> class decaf::util::StlQueue< T >

The **Queue** (p. 2948) class accepts messages with an psuh(m) command where m is the message to be queued. It destructively returns the message with **pop()** (p. 3387). **pop()** (p. 3387) returns messages in the order they were enqueued.

Queue (p. 2948) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the pop method actually reaturns a reference to the element popped. This frees the app from having to call the **front** method before calling pop.

```
Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues a message
m string s = sq.pop(); // dequeues a message
```

= DESIGN CONSIDERATIONS

The **Queue** (p. 2948) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 2948).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.774.2 Constructor & Destructor Documentation

6.774.2.1 **template<typename T> decaf::util::StlQueue< T >::StlQueue ()**
[inline]

6.774.2.2 **template<typename T> virtual decaf::util::StlQueue< T >::~~StlQueue ()**
[inline, virtual]

6.774.3 Member Function Documentation

6.774.3.1 **template<typename T> T& decaf::util::StlQueue< T >::back ()**
[inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

6.774.3.2 `template<typename T> const T& decaf::util::StlQueue< T >::back ()`
`const [inline]`

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

6.774.3.3 `template<typename T> void decaf::util::StlQueue< T >::clear ()`
`[inline]`

Empties this queue.

6.774.3.4 `template<typename T> bool decaf::util::StlQueue< T >::empty ()`
`const [inline]`

Checks if this **Queue** (p. 2948) is currently empty.

Returns

boolean indicating queue emptiness

6.774.3.5 `template<typename T> void decaf::util::StlQueue< T >::enqueueFront (`
`const T & t) [inline]`

Places a new Object at the front of the queue.

Parameters

t - **Queue** (p. 2948) Object Type reference.

6.774.3.6 `template<typename T> const T& decaf::util::StlQueue< T >::front ()`
`const [inline]`

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

6.774.3.7 `template<typename T> T& decaf::util::StlQueue< T >::front ()`
`[inline]`

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

6.774.3.8 `template<typename T> T& decaf::util::StlQueue< T >::getSafeValue () [inline]`

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns

Reference to this Queues safe object

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::back()`, `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::front()`, and `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::pop()`.

6.774.3.9 `template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator () [inline]`

Gets an **Iterator** (p. 2012) over this **Queue** (p. 2948).

Returns

new iterator pointer that is owned by the caller.

6.774.3.10 `template<typename T> virtual void decaf::util::StlQueue< T >::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3463).

6.774.3.11 `template<typename T> virtual void decaf::util::StlQueue< T >::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 3464).

6.774.3.12 `template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3465).

6.774.3.13 `template<typename T> T decaf::util::StlQueue< T >::pop () [inline]`

Removes and returns the element that is at the Head of the queue.

Returns

reference to a queue type object or (safe)

6.774.3.14 `template<typename T> void decaf::util::StlQueue< T >::push (const T & t) [inline]`

Places a new Object at the Tail of the queue.

Parameters

t - **Queue** (p. 2948) Object Type reference.

6.774.3.15 `template<typename T> void decaf::util::StlQueue< T >::reverse (StlQueue< T > & target) const [inline]`

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters

target - The target queue that will receive the contents of this queue in reverse order.

6.774.3.16 `template<typename T> size_t decaf::util::StlQueue< T >::size () const [inline]`

Gets the Number of elements currently in the **Queue** (p. 2948).

Returns

Queue (p. 2948) Size

6.774.3.17 `template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray () const [inline, virtual]`

Returns

the all values in this queue as a std::vector.

6.774.3.18 `template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3466).

6.774.3.19 `template<typename T> virtual void decaf::util::StlQueue< T >::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3467).

6.774.3.20 `template<typename T> virtual void decaf::util::StlQueue< T >::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3468).

6.774.3.21 `template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3470).

6.774.3.22 `template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentOutOfRangeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentOutOfRangeException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3471).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlQueue.h`

6.775 decaf::util::StlSet< E > Class Template Reference

Set (p. 3220) template that wraps around a `std::set` to provide a more user-friendly interface and to provide common functions that do not exist in `std::set`.

```
#include <src/main/decaf/util/StlSet.h>
```

Inheritance diagram for `decaf::util::StlSet< E >`:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()
Default constructor - does nothing.
- **StlSet** (const **StlSet** &source)
Copy constructor - copies the content of the given set into this one.
- **StlSet** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual **~StlSet** ()
- **Iterator**< E > * **iterator** ()
- **Iterator**< E > * **iterator** () const
- virtual bool **equals** (const **StlSet** &source) const
- virtual void **copy** (const **StlSet** &source)
- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)
*Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 2014) operation. Most implementations will probably choose to override this method for efficiency.
Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*
Exceptions
***UnsupportedOperationException** if the clear operation is not supported by this collection*

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p. 1097).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

- virtual bool **isEmpty** () const
- virtual std::size_t **size** () const
- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1097) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1097).

6.775.1 Detailed Description

```
template<typename E> class decaf::util::StlSet< E >
```

Set (p. 3220) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

6.775.2 Constructor & Destructor Documentation

```
6.775.2.1  template<typename E> decaf::util::StlSet< E >::StlSet (    ) [inline]
```

Default constructor - does nothing.

```
6.775.2.2  template<typename E> decaf::util::StlSet< E >::StlSet ( const StlSet<
E > & source ) [inline]
```

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

```
6.775.2.3  template<typename E> decaf::util::StlSet< E >::StlSet ( const
Collection< E > & source ) [inline]
```

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

```
6.775.2.4  template<typename E> virtual decaf::util::StlSet< E >::~~StlSet (    )
[inline, virtual]
```

6.775.3 Member Function Documentation

```
6.775.3.1  template<typename E> virtual bool decaf::util::StlSet< E >::add ( const
E & value ) throw ( lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException,
lang::exceptions::IllegalStateException ) [inline,
virtual]
```

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p.1097) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p.1099).

6.775.3.2 `template<typename E> virtual void decaf::util::StlSet< E >::clear ()
throw (lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p.2014) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p.147).

6.775.3.3 `template<typename E> virtual bool decaf::util::StlSet< E >::contains (const E & value) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p.1097).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

Reimplemented from `decaf::util::AbstractCollection< E >` (p.148).

6.775.3.4 `template<typename E> virtual void decaf::util::StlSet< E >::copy (const StlSet< E > & source) [inline, virtual]`

Referenced by `decaf::util::StlSet< ActiveMQSession * >::StlSet()`.

6.775.3.5 `template<typename E> virtual bool decaf::util::StlSet< E >::equals (const StlSet< E > & source) const [inline, virtual]`

6.775.3.6 `template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty () const [inline, virtual]`

Returns

if the set contains any element or not, TRUE or FALSE

Reimplemented from `decaf::util::AbstractCollection< E >` (p.150).

6.775.3.7 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () const [inline]`

6.775.3.8 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () [inline]`

6.775.3.9 `template<typename E> virtual bool decaf::util::StlSet< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1097).

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 151).

6.775.3.10 `template<typename E> virtual std::size_t decaf::util::StlSet< E >::size () const [inline, virtual]`

Returns

The number of elements in this set.

Implements `decaf::util::Collection< E >` (p. 1106).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlSet.h`

6.777 `activemq::wireformat::stomp::StompFrame` Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

```
#include <src/main/activemq/wireformat/stomp/StompFrame.h>
```

Public Member Functions

- **StompFrame** ()
Default constructor.
- virtual **~StompFrame** ()
Destruction.
- **StompFrame * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (const **StompFrame** *src)
Copies the contents of the passed Frame to this one.
- void **setCommand** (const std::string &cmd)
Sets the command for this stomp frame.
- const std::string & **getCommand** () const
Accessor for this frame's command field.
- bool **hasProperty** (const std::string &name) const
Checks if the given property is present in the Frame.
- std::string **getProperty** (const std::string &name, const std::string &fallback="") const
Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (const std::string &name)
Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (const std::string &name, const std::string &value)
Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties** & **getProperties** ()
Gets access to the header properties for this frame.
- const **decaf::util::Properties** & **getProperties** () const
- const std::vector< unsigned char > & **getBody** () const
Accessor for the body data of this frame.

- `std::vector< unsigned char > & getBody ()`
Non-const version of the body accessor.
- `std::size_t getBodyLength () const`
Return the number of bytes contained in this frames body.
- `void setBody (const unsigned char *bytes, std::size_t numBytes)`
Sets the body data of this frame as a byte sequence.
- `void toStream (decaf::io::DataOutputStream *stream) const throw (decaf::io::IOException)`
Writes this Frame to an OuputStream in the Stomp Wire Format.
- `void fromStream (decaf::io::DataInputStream *stream) throw (decaf::io::IOException)`
Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.777.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.777.2 Constructor & Destructor Documentation

6.777.2.1 `activemq::wireformat::stomp::StompFrame::StompFrame ()` [inline]

Default constructor.

6.777.2.2 `virtual activemq::wireformat::stomp::StompFrame::~~StompFrame ()` [inline, virtual]

Destruction.

6.777.3 Member Function Documentation

6.777.3.1 `StompFrame* activemq::wireformat::stomp::StompFrame::clone () const`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

6.777.3.2 `void activemq::wireformat::stomp::StompFrame::copy (const StompFrame * src)`

Copies the contents of the passed Frame to this one.

Parameters

src - Frame to copy

6.777.3.3 `void activemq::wireformat::stomp::StompFrame::fromStream (decaf::io::DataInputStream * stream) throw (decaf::io::IOException)`

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters

stream - The stream to read the Frame from.

Exceptions

IOException if an error occurs while writing the Frame.

6.777.3.4 `const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () const [inline]`

Accessor for the body data of this frame.

Returns

char pointer to body data

6.777.3.5 `std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () [inline]`

Non-const version of the body accessor.

6.777.3.6 `std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength () const [inline]`

Return the number of bytes contained in this frames body.

Returns

Body bytes length.

6.777.3.7 `const std::string& activemq::wireformat::stomp::StompFrame::getCommand () const [inline]`

Accessor for this frame's command field.

6.777.3.8 `decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () [inline]`

Gets access to the header properties for this frame.

Returns

the Properties object owned by this Frame

6.777.3.9 `const decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () const [inline]`

6.777.3.10 `std::string activemq::wireformat::stomp::StompFrame::getProperty (const std::string & name, const std::string & fallback = "") const [inline]`

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters

name - The name of the property to lookup

fallback - The default value to return if this value isn't set

Returns

string value of the property asked for.

6.777.3.11 `bool activemq::wireformat::stomp::StompFrame::hasProperty (const std::string & name) const [inline]`

Checks if the given property is present in the Frame.

Parameters

name - The name of the property to check for.

6.777.3.12 `std::string activemq::wireformat::stomp::StompFrame::removeProperty (const std::string & name) [inline]`

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters

name - the Name of the property to get and return.

6.777.3.13 `void activemq::wireformat::stomp::StompFrame::setBody (const unsigned char * bytes, std::size_t numBytes)`

Sets the body data of this frame as a byte sequence.

Parameters

bytes The byte buffer to be set in the body.

numBytes The number of bytes in the buffer.

6.777.3.14 `void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & cmd) [inline]`

Sets the command for this stomp frame.

Parameters

cmd command The command to be set.

6.777.3.15 `void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & name, const std::string & value) [inline]`

Sets the property given to the value specified in this Frame's Properties.

Parameters

name - Name of the property.

value - Value to set the property to.

6.777.3.16 `void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * stream) const throw (decaf::io::IOException)`

Writes this Frame to an OutputStream in the Stomp Wire Format.

Parameters

stream - The stream to write the Frame to.

Exceptions

IOException if an error occurs while reading the Frame.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompFrame.h`

6.778 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from StompFrame's.

`#include <src/main/activemq/wireformat/stomp/StompHelper.h>`

Public Member Functions

- **StompHelper** ()
- virtual **~StompHelper** ()
- void **convertProperties** (const **Pointer**< **StompFrame** > &frame, const **Pointer**< **Message** > &message)

Converts the Headers in a Stomp Frame into Headers in the given Message Command.
- void **convertProperties** (const **Pointer**< **Message** > &message, const **Pointer**< **StompFrame** > &frame)

*Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 3398).*
- **Pointer**< **ActiveMQDestination** > **convertDestination** (const std::string &destination)

Converts from a Stomp Destination to an ActiveMQDestination.
- std::string **convertDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

Converts from a ActiveMQDestination to a Stomp Destination Name.
- std::string **convertMessageId** (const **Pointer**< **MessageId** > &messageId)

Converts a MessageId instance to a Stomp MessageId String.
- **Pointer**< **MessageId** > **convertMessageId** (const std::string &messageId)

Converts a Stomp MessageId string to a MessageId.
- std::string **convertConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)

Converts a ConsumerId instance to a Stomp ConsumerId String.
- **Pointer**< **ConsumerId** > **convertConsumerId** (const std::string &consumerId)

Converts a Stomp ConsumerId string to a ConsumerId.
- std::string **convertProducerId** (const **Pointer**< **ProducerId** > &producerId)

Converts a ProducerId instance to a Stomp ProducerId String.
- **Pointer**< **ProducerId** > **convertProducerId** (const std::string &producerId)

Converts a Stomp ProducerId string to a ProducerId.
- std::string **convertTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

Converts a TransactionId instance to a Stomp TransactionId String.
- **Pointer**< **TransactionId** > **convertTransactionId** (const std::string &transactionId)

Converts a Stomp TransactionId string to a TransactionId.

6.778.1 Detailed Description

Utility Methods used when marshaling to and from StompFrame's.

Since

3.0

6.778.2 Constructor & Destructor Documentation

6.778.2.1 `activemq::wireformat::stomp::StompHelper::StompHelper () [inline]`

6.778.2.2 `virtual activemq::wireformat::stomp::StompHelper::~~StompHelper () [inline, virtual]`

6.778.3 Member Function Documentation

6.778.3.1 `std::string activemq::wireformat::stomp::StompHelper::convertConsumerId (const Pointer< ConsumerId > & consumerId)`

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters

consumerId - the Consumer instance to convert.

Returns

a Stomp Consumer Id String.

6.778.3.2 `Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & consumerId)`

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters

consumerId - the String Consumer Id to convert.

Returns

Pointer to a new ConsumerId.

6.778.3.3 `std::string activemq::wireformat::stomp::StompHelper::convertDestination (const Pointer< ActiveMQDestination > & destination)`

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters

destination - The ActiveMQDestination to Convert

Returns

the Stomp String name that defines the destination.

6.778.3.4 `Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & destination)`

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters

destination - The Stomp Destination name string.

Returns

Pointer to a new ActiveMQDestination.

6.778.3.5 `std::string activemq::wireformat::stomp::StompHelper::convertMessageId (const Pointer< MessageId > & messageId)`

Converts a MessageId instance to a Stomp MessageId String.

Parameters

messageId - the MessageId instance to convert.

Returns

a Stomp Message Id String.

6.778.3.6 `Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId (const std::string & messageId)`

Converts a Stomp MessageId string to a MessageId.

Parameters

messageId - the String message Id to convert.

Returns

Pointer to a new MessageId.

6.778.3.7 `std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & producerId)`

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters

producerId - the Producer instance to convert.

Returns

a Stomp Producer Id String.

6.778.3.8 `Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & producerId)`

Converts a Stomp ProducerId string to a ProducerId.

Parameters

producerId - the String Producer Id to convert.

Returns

Pointer to a new ProducerId.

6.778.3.9 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & message, const Pointer< StompFrame > & frame)`

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 3398).

Parameters

message - The message to move the Headers to.

frame - The frame to extract headers from.

6.778.3.10 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & frame, const Pointer< Message > & message)`

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters

frame - The frame to extract headers from.

message - The message to move the Headers to.

6.778.3.11 `Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & transactionId)`

Converts a Stomp TransactionId string to a TransactionId.

Parameters

transactionId - the String Transaction Id to convert.

Returns

Pointer to a new TransactionId.

6.778.3.12 std::string activemq::wireformat::stomp::StompHelper::convertTransactionId (const Pointer< TransactionId > & transactionId)

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters

transactionId - the Transaction instance to convert.

Returns

a Stomp Transaction Id String.

The documentation for this class was generated from the following file:

6.779 activemq::wireformat::stomp::StompWireFormat Class Reference

```
#include <src/main/activemq/wireformat/stomp/StompWireFormat.h>
```

Inheritance diagram for activemq::wireformat::stomp::StompWireFormat:

Public Member Functions

- **StompWireFormat** ()
- virtual **~StompWireFormat** ()
- virtual void **marshal** (const **Pointer< commands::Command >** &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out) throw (**decaf::io::IOException**)
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer< commands::Command >** **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in) throw (**decaf::io::IOException**)
Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- virtual void **setVersion** (int version AMQCPP_UNUSED)
Set the Version.
- virtual int **getVersion** () const
Get the Version.
- virtual bool **inReceive** () const
Is there a Message being unmarshaled?

- virtual bool **hasNegotiator** () const

*Returns true if this **WireFormat** (p. 3712) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual **Pointer< transport::Transport > createNegotiator**
(const **Pointer< transport::Transport > &transport**) throw (decaf::lang::exceptions::UnsupportedOperationException)

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.779.1 Constructor & Destructor Documentation

6.779.1.1 **activemq::wireformat::stomp::StompWireFormat::StompWireFormat (**
)

6.779.1.2 **virtual**
activemq::wireformat::stomp::StompWireFormat::~~StompWireFormat (
) [virtual]

6.779.2 Member Function Documentation

6.779.2.1 **virtual Pointer<transport::Transport> ac-**
tivemq::wireformat::stomp::StompWireFormat::createNegotiator
(const Pointer< transport::Transport > & transport) throw (
decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns

new instance of a **WireFormatNegotiator** (p. 3751).

Exceptions

***UnsupportedOperationException** if the **WireFormat** (p. 3712) doesn't have a Negotiator.*

Implements **activemq::wireformat::WireFormat** (p. 3714).

6.779.2.2 **virtual int activemq::wireformat::stomp::StompWireFormat::getVersion (**
) const [inline, virtual]

Get the Version.

Returns

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3714).

6.779.2.3 `virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator () const` [inline, virtual]

Returns true if this **WireFormat** (p. 3712) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 3712) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3714).

6.779.2.4 `virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive () const` [inline, virtual]

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3715).

6.779.2.5 `virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) throw (decaf::io::IOException)` [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command The Command to Marshal to the output stream.

transport The Transport that initiated this marshal call.

out The output stream to write the command to.

Exceptions

IOException

Implements **activemq::wireformat::WireFormat** (p. 3715).

6.779.2.6 `virtual void activemq::wireformat::stomp::StompWireFormat::setVersion (int version AMQCPP_UNUSED)` [inline, virtual]

Set the Version.

Parameters

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3715).

```

6.779.2.7 virtual Pointer<commands::Command> ac-
    tivemq::wireformat::stomp::StompWireFormat::unmarshal
    ( const activemq::transport::Transport * transport,
      decaf::io::DataInputStream * in ) throw ( decaf::io::IOException )
    [virtual]

```

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

- transport* - Pointer to the transport that is making this request.
- in* - the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException

Implements **activemq::wireformat::WireFormat** (p. 3716).

- 6.780.3.1** `virtual Pointer<WireFormat> activemq::wireformat::stomp::StompWireFormatFactory::createWireFormat (const decaf::util::Properties & properties) throw (decaf::lang::exceptions::IllegalStateException) [virtual]`

Creates a new **WireFormat** (p. 3712) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties - the Properties for this **WireFormat** (p. 3712)

Implements **activemq::wireformat::WireFormatFactory** (p. 3717).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompWireFormatFactory.h`

6.781 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

```
#include <src/main/cms/Stoppable.h>
```

Inheritance diagram for cms::Stoppable:

Public Member Functions

- `virtual ~Stoppable ()`
- `virtual void stop ()=0 throw (CMSException)`
Stops this service.

6.781.1 Detailed Description

Interface for a class that implements the stop method. An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since

1.0

6.781.2 Constructor & Destructor Documentation

6.781.2.1 virtual `cms::Stoppable::~~Stoppable ()` [inline, virtual]

6.781.3 Member Function Documentation

6.781.3.1 virtual void `cms::Stoppable::stop ()` throw (`CMSEException`) [pure virtual]

Stops this service.

Exceptions

CMSEException (p. 1074) - if an internal error occurs while stopping the Service.

The documentation for this class was generated from the following file:

- `src/main/cms/Stoppable.h`

6.782 decaf::util::logging::StreamHandler Class Reference

Stream based logging **Handler** (p. 1852).

```
#include <src/main/decaf/util/logging/StreamHandler.h>
```

Inheritance diagram for `decaf::util::logging::StreamHandler`:

Public Member Functions

- **StreamHandler** ()
*Create a **StreamHandler** (p. 3412), with no current output stream.*
- **StreamHandler** (`decaf::io::OutputStream` *stream, `Formatter` *formatter)
*Create a **StreamHandler** (p. 3412), with no current output stream.*
- virtual `~StreamHandler` ()
- virtual void **close** () throw (`decaf::io::IOException`)
Close the current output stream.
- virtual void **flush** ()
Flush the Handler's output, clears any buffers.
- virtual void **publish** (const `LogRecord` &record)
*Publish the Log Record to this **Handler** (p. 1852).*

- virtual bool **isLoggable** (const **LogRecord** &record) const

*Check if this **Handler** (p. 1852) would actually log a given **LogRecord** (p. 2261).*

Protected Member Functions

- virtual void **setOutputStream** (decaf::io::OutputStream *stream) throw (decaf::lang::exceptions::NullPointerException)

Change the output stream.

- void **close** (bool closeStream)

Closes this handler, but the underlying output stream is only closed if closeStream is true.

6.782.1 Detailed Description

Stream based logging **Handler** (p.1852). This is primarily intended as a base class or support class to be used in implementing other logging Handlers.

LogRecords are published to a given decaf::io::OutputStream (p. 2718).

Configuration: By default each **StreamHandler** (p.3412) is initialized using the following **Log-Manager** (p. 2254) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

* decaf.util.logging.StreamHandler.level specifies the default level for the **Handler** (p.1852) (defaults to **Level.INFO** (p.2190)). * decaf.util.logging.StreamHandler.filter specifies the name of a **Filter** (p.1770) class to use (defaults to no **Filter** (p.1770)). * decaf.util.logging.StreamHandler.formatter specifies the name of a **Formatter** (p.1838) class to use (defaults to **decaf.util.logging.SimpleFormatter** (p. 3278)).

Since

1.0

6.782.2 Constructor & Destructor Documentation

6.782.2.1 decaf::util::logging::StreamHandler::StreamHandler ()

Create a **StreamHandler** (p. 3412), with no current output stream.

6.782.2.2 decaf::util::logging::StreamHandler::StreamHandler (decaf::io::OutputStream * stream, Formatter * formatter)

Create a **StreamHandler** (p. 3412), with no current output stream.

6.782.2.3 `virtual decaf::util::logging::StreamHandler::~~StreamHandler ()`
[virtual]

6.782.3 Member Function Documentation

6.782.3.1 `virtual void decaf::util::logging::StreamHandler::close () throw (decaf::io::IOException)` [virtual]

Close the current output stream.

The close method will perform a flush and then close the **Handler** (p.1852). After close has been called this **Handler** (p.1852) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions

IOException if an I/O error occurs.

Implements `decaf::io::Closeable` (p.1066).

Reimplemented in `decaf::util::logging::ConsoleHandler` (p.1301).

6.782.3.2 `void decaf::util::logging::StreamHandler::close (bool closeStream)`
[protected]

Closes this handler, but the underlying output stream is only closed if `closeStream` is true.

Parameters

closeStream whether to close the underlying output stream.

6.782.3.3 `virtual void decaf::util::logging::StreamHandler::flush ()` [virtual]

Flush the Handler's output, clears any buffers.

Implements `decaf::util::logging::Handler` (p.1853).

6.782.3.4 `virtual bool decaf::util::logging::StreamHandler::isLoggable (const LogRecord & record) const` [virtual]

Check if this **Handler** (p.1852) would actually log a given **LogRecord** (p.2261).

Parameters

record LogRecord (p.2261) to check

Returns

true if the record can be logged with current settings.

Reimplemented from `decaf::util::logging::Handler` (p.1854).

6.782.3.5 virtual void decaf::util::logging::StreamHandler::publish (const LogRecord & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 1852).

Parameters

record The LogRecord (p. 2261) to Publish

Implements **decaf::util::logging::Handler** (p. 1854).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 1302).

6.782.3.6 virtual void decaf::util::logging::StreamHandler::setOutputStream (decaf::io::OutputStream * *stream*) throw (decaf::lang::exceptions::NullPointerException) [protected, virtual]

Change the output stream.

If there is a current output stream then the Formatter's tail string is written and the stream is flushed and closed. Then the output stream is replaced with the new output stream.

Parameters

stream The new output stream. May not be NULL.

Exceptions

NullPointerException if the passed stream is NULL.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.783 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 3415).

```
#include <src/main/cms/StreamMessage.h>
```

Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual **~StreamMessage** ()
- virtual bool **readBoolean** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)
Reads a Boolean from the Stream message stream.
- virtual void **writeBoolean** (bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

Writes a boolean to the Stream message stream as a 1-byte value.

- virtual unsigned char **readByte** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a Byte from the Stream message stream.

- virtual void **writeByte** (unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a byte to the Stream message stream as a 1-byte value.

- virtual int **readBytes** (std::vector< unsigned char > &value) const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a byte array from the Stream message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

- virtual int **readBytes** (unsigned char *buffer, int length) const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a portion of the Stream message stream.

- virtual void **writeBytes** (const unsigned char *value, int offset, int length)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a portion of a byte array to the Stream message stream.

- virtual char **readChar** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a Char from the Stream message stream.

- virtual void **writeChar** (char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a char to the Stream message stream as a 1-byte value.

- virtual float **readFloat** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 32 bit float from the Stream message stream.

- virtual void **writeFloat** (float value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 16 bit unsigned short from the Stream message stream.

- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a unsigned short to the Stream message stream as a 2 byte value.

- virtual int **readInt** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a signed int to the Stream message stream as a 4 byte value.

- virtual long long **readLong** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 64 bit long from the Stream message stream.

- virtual void **writeLong** (long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a long long to the Stream message stream as a 8 byte value.

- virtual std::string **readString** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads an ASCII String from the Stream message stream.

- virtual void **writeString** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes an ASCII String to the Stream message stream.

6.783.1 Detailed Description

Interface for a **StreamMessage** (p. 3415). The stream Messages provides a **Message** (p. 2375) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 3415) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 1074). The string-to-primitive conversions may throw a runtime exception if the primitive's `valueOf()` method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X
double								X	X	X
String	X	X	X		X	X	X	X	X	
byte[]										X

Since

1.3

6.783.2 Constructor & Destructor Documentation

6.783.2.1 `virtual cms::StreamMessage::~StreamMessage () [inline, virtual]`

6.783.3 Member Function Documentation

6.783.3.1 `virtual bool cms::StreamMessage::readBoolean () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Boolean from the Stream message stream.

Returns

boolean value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.2 virtual unsigned char cms::StreamMessage::readByte () const
throw (cms::MessageEOFException, cms::MessageFormatException,
cms::MessageNotReadableException, cms::CMSException) [pure
virtual]

Reads a Byte from the Stream message stream.

Returns

unsigned char value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.3 virtual int cms::StreamMessage::readBytes (std::vector< unsigned
char > & value) const throw (cms::MessageEOFException,
cms::MessageFormatException, cms::MessageNotReadableException,
cms::CMSException) [pure virtual]

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.4 `virtual int cms::StreamMessage::readBytes (unsigned char *
buffer, int length) const throw (cms::MessageEOFException,
cms::MessageFormatException, cms::MessageNotReadableException,
cms::CMSException) [pure virtual]`

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p.1074) is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.5 `virtual char cms::StreamMessage::readChar () const throw
(cms::MessageEOFException, cms::MessageFormatException,
cms::MessageNotReadableException, cms::CMSException) [pure
virtual]`

Reads a Char from the Stream message stream.

Returns

char value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.6 virtual double cms::StreamMessage::readDouble () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 64 bit double from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.7 virtual float cms::StreamMessage::readFloat () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.8 virtual int cms::StreamMessage::readInt () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns

int value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.9 `virtual long long cms::StreamMessage::readLong () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 64 bit long from the Stream message stream.

Returns

long long value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.10 `virtual short cms::StreamMessage::readShort () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 16 bit signed short from the Stream message stream.

Returns

short value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.11 `virtual std::string cms::StreamMessage::readString () const
 throw (cms::MessageEOFException, cms::MessageFormatException,
 cms::MessageNotReadableException, cms::CMSException) [pure
 virtual]`

Reads an ASCII String from the Stream message stream.

Returns

String from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.12 `virtual unsigned short cms::StreamMessage::readUnsignedShort
 () const throw (cms::MessageEOFException,
 cms::MessageFormatException, cms::MessageNotReadableException,
 cms::CMSException) [pure virtual]`

Reads a 16 bit unsigned short from the Stream message stream.

Returns

unsigned short value from stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2492) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2493) - if this type conversion is invalid.

MessageNotReadableException (p. 2548) - if the message is in write-only mode.

6.783.3.13 `virtual void cms::StreamMessage::writeBoolean (bool value) throw
 (cms::MessageNotWriteableException, cms::CMSException) [pure
 virtual]`

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value boolean to write to the stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.14 `virtual void cms::StreamMessage::writeByte (unsigned char value)
throw (cms::MessageNotWriteableException, cms::CMSException)
[pure virtual]`

Writes a byte to the Stream message stream as a 1-byte value.

Parameters

value byte to write to the stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.15 `virtual void cms::StreamMessage::writeBytes (const
unsigned char * value, int offset, int length) throw (cms::MessageNotWriteableException, cms::CMSException) [pure
virtual]`

Writes a portion of a byte array to the Stream message stream.

size as the number of bytes to write.

Parameters

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions

CMSException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.16 `virtual void cms::StreamMessage::writeBytes (const
std::vector< unsigned char > & value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure
virtual]`

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters

value bytes to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.17 `virtual void cms::StreamMessage::writeChar (char value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a char to the Stream message stream as a 1-byte value.

Parameters

value char to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.18 `virtual void cms::StreamMessage::writeDouble (double value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a double to the Stream message stream as a 8 byte value.

Parameters

value double to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.19 `virtual void cms::StreamMessage::writeFloat (float value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a float to the Stream message stream as a 4 byte value.

Parameters

value float to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.20 `virtual void cms::StreamMessage::writeInt (int value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters

value signed int to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.21 `virtual void cms::StreamMessage::writeLong (long long value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a long long to the Stream message stream as a 8 byte value.

Parameters

value signed long long to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.22 `virtual void cms::StreamMessage::writeShort (short value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters

value signed short to write to the stream

Exceptions

CMSEException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.23 `virtual void cms::StreamMessage::writeString (const std::string
& value) throw (cms::MessageNotWriteableException,
cms::CMSException) [pure virtual]`

Writes an ASCII String to the Stream message stream.

Parameters

value String to write to the stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

6.783.3.24 `virtual void cms::StreamMessage::writeUnsignedShort (unsigned
short value) throw (cms::MessageNotWriteableException,
cms::CMSException) [pure virtual]`

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters

value unsigned short to write to the stream

Exceptions

CMSException (p. 1074) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode.

The documentation for this class was generated from the following file:

- `src/main/cms/StreamMessage.h`

6.784 decaf::lang::String Class Reference

The **String** (p. 3427) class represents an immutable sequence of chars.

`#include <src/main/decaf/lang/String.h>`

Inheritance diagram for decaf::lang::String:

Public Member Functions

- **String** ()
*Creates a new empty **String** (p. 3427) object.*

- **String** (const std::string &source)

Create a new **String** (p. 3427) object that represents the given STL string.

- virtual ~**String** ()
- bool **isEmpty** () const
- virtual int **length** () const

Returns

the length of the underlying character sequence.

- virtual char **charAt** (int index) const throw (lang::exceptions::IndexOutOfBoundsException)

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

index - position to return the char at.

Returns

the char at the given position

Exceptions

IndexOutOfBoundsException if index is > than **length()** (p. 1054) or negative

- virtual **CharSequence** * **subSequence** (int start, int end) const throw (lang::exceptions::IndexOutOfBoundsException)

Returns a new **CharSequence** (p. 1053) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters

start - the start index, inclusive
end - the end index, exclusive

Returns

a new **CharSequence** (p. 1053)

Exceptions

IndexOutOfBoundsException if start or end > **length()** (p. 1054) or start or end are negative.

- virtual std::string **toString** () const

Returns

the string representation of this **CharSequence** (p. 1053)

6.784.1 Detailed Description

The **String** (p. 3427) class represents an immutable sequence of chars.

Since

1.0

6.784.2 Constructor & Destructor Documentation

6.784.2.1 decaf::lang::String::String ()

Creates a new empty **String** (p. 3427) object.

6.784.2.2 decaf::lang::String::String (const std::string & *source*)

Create a new **String** (p. 3427) object that represents the given STL string.

Parameters

source The string to copy into this new **String** (p. 3427) object.

6.784.2.3 virtual decaf::lang::String::~~String () [virtual]

6.784.3 Member Function Documentation

6.784.3.1 virtual char decaf::lang::String::charAt (int *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

index - position to return the char at.

Returns

the char at the given position

Exceptions

IndexOutOfBoundsException if index is > than **length()** (p. 1054) or negative

Implements **decaf::lang::CharSequence** (p. 1054).

6.784.3.2 bool decaf::lang::String::isEmpty () const

Returns

true if the length of this **String** (p. 3427) is zero.

6.784.3.3 virtual int decaf::lang::String::length () const [virtual]

Returns

the length of the underlying character sequence.

Implements **decaf::lang::CharSequence** (p. 1054).

6.784.3.4 `virtual CharSequence* decaf::lang::String::subSequence (int start, int end) const throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Returns a new **CharSequence** (p. 1053) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index `end - 1`. The length (in chars) of the returned sequence is `end - start`, so if `start == end` then an empty sequence is returned.

Parameters

start - the start index, inclusive

end - the end index, exclusive

Returns

a new **CharSequence** (p. 1053)

Exceptions

IndexOutOfBoundsException if `start` or `end > length()` (p. 1054) or `start` or `end` are negative.

Implements **decaf::lang::CharSequence** (p. 1054).

6.784.3.5 `virtual std::string decaf::lang::String::toString () const` [virtual]

Returns

the string representation of this **CharSequence** (p. 1053)

Implements **decaf::lang::CharSequence** (p. 1055).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/String.h`

6.785 decaf::util::StringTokenizer Class Reference

```
#include <src/main/decaf/util/StringTokenizer.h>
```

Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)

Constructs a string tokenizer for the specified string.

- virtual **~StringTokenizer** ()
- virtual int **countTokens** () const

Calculates the number of times that this tokenizer's `nextToken` method can be called before it generates an exception.

- virtual bool **hasMoreTokens** () const
Tests if there are more tokens available from this tokenizer's string.
- virtual std::string **nextToken** () throw (lang::exceptions::NoSuchElementException)
Returns the next token from this string tokenizer.
- virtual std::string **nextToken** (const std::string &delim) throw (lang::exceptions::NoSuchElementException)
Returns the next token in this string tokenizer's string.
- virtual unsigned int **toArray** (std::vector< std::string > &array)
Grab all remaining tokens in the String and return them in the vector that is passed in by reference.
- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)
Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.785.1 Constructor & Destructor Documentation

6.785.1.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & *str*, const std::string & *delim* = " \t\n\r\f", bool *returnDelims* = false)

Constructs a string tokenizer for the specified string.

All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 3430) may result in an Exception.

Parameters

str - The string to tokenize

delim - String containing the delimiters

returnDelims - boolean indicating if the delimiters are returned as tokens

6.785.1.2 virtual decaf::util::StringTokenizer::~~StringTokenizer () [virtual]

6.785.2 Member Function Documentation

6.785.2.1 virtual int decaf::util::StringTokenizer::countTokens () const [virtual]

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

The current position is not advanced.

Returns

Count of remaining tokens

6.785.2.2 `virtual bool decaf::util::StringTokenizer::hasMoreTokens () const`
[virtual]

Tests if there are more tokens available from this tokenizer's string.

Returns

true if there are more tokens remaining

6.785.2.3 `virtual std::string decaf::util::StringTokenizer::nextToken (const`
`std::string & delim) throw (lang::exceptions::NoSuchElementException`
`) [virtual]`

Returns the next token in this string tokenizer's string.

First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 3430) object is changed to be the characters in the string *delim*. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters

delim - string containing the new set of delimiters

Returns

next string in the token list

Exceptions

NoSuchElementException

6.785.2.4 `virtual std::string decaf::util::StringTokenizer::nextToken () throw (`
`lang::exceptions::NoSuchElementException) [virtual]`

Returns the next token from this string tokenizer.

Returns

string value of next token

Exceptions

NoSuchElementException

6.785.2.5 `virtual void decaf::util::StringTokenizer::reset (const std::string & str = "", const std::string & delim = "", bool returnDelims = false) [virtual]`

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing. If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. If set the delim param will reset the string that this Tokenizer is using to tokenize the string. If set to "", no change is made. If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters

str - New String to tokenize or "", defaults to ""

delim - New Delimiter String to use or "", defaults to ""

returnDelims - Should the Tokenizer return delimiters as Tokens, default false

6.785.2.6 `virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector< std::string > & array) [virtual]`

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters

array - vector to place token strings in

Returns

number of string placed into the vector

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StringTokenizer.h`

6.786 activemq::commands::SubscriptionInfo Class Reference

```
#include <src/main/activemq/commands/SubscriptionInfo.h>
```

Inheritance diagram for activemq::commands::SubscriptionInfo:

Public Member Functions

- `SubscriptionInfo ()`
- `virtual ~SubscriptionInfo ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.

- virtual **SubscriptionInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const

- **Pointer**< **ActiveMQDestination** > **subscribedDestination**

6.786.1 Constructor & Destructor Documentation

6.786.1.1 `activemq::commands::SubscriptionInfo::SubscriptionInfo ()`

6.786.1.2 `virtual activemq::commands::SubscriptionInfo::~~SubscriptionInfo ()`
[virtual]

6.786.2 Member Function Documentation

6.786.2.1 `virtual SubscriptionInfo* activemq::commands::SubscriptionInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.786.2.2 `virtual void activemq::commands::SubscriptionInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1555).

6.786.2.3 `virtual bool activemq::commands::SubscriptionInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1556).

6.786.2.4 `virtual const std::string& activemq::commands::SubscriptionInfo::getClientId () const [virtual]`

6.786.2.5 `virtual std::string& activemq::commands::SubscriptionInfo::getClientId () [virtual]`

6.786.2.6 `virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.786.2.7 `virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () const` [virtual]
- 6.786.2.8 `virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination ()` [virtual]
- 6.786.2.9 `virtual const std::string& activemq::commands::SubscriptionInfo::getSelector () const` [virtual]
- 6.786.2.10 `virtual std::string& activemq::commands::SubscriptionInfo::getSelector ()` [virtual]
- 6.786.2.11 `virtual std::string& activemq::commands::SubscriptionInfo::getSubscriptionName ()` [virtual]
- 6.786.2.12 `virtual const std::string& activemq::commands::SubscriptionInfo::getSubscriptionName () const` [virtual]
- 6.786.2.13 `virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination () const` [virtual]
- 6.786.2.14 `virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination ()` [virtual]
- 6.786.2.15 `virtual void activemq::commands::SubscriptionInfo::setClientId (const std::string & clientId)` [virtual]
- 6.786.2.16 `virtual void activemq::commands::SubscriptionInfo::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.786.2.17 `virtual void activemq::commands::SubscriptionInfo::setSelector (const std::string & selector)` [virtual]
- 6.786.2.18 `virtual void activemq::commands::SubscriptionInfo::setSubscriptionName (const std::string & subscriptionName)` [virtual]
- 6.786.2.19 `virtual void activemq::commands::SubscriptionInfo::setSubscribedDestination (const Pointer< ActiveMQDestination > & subscribedDestination)` [virtual]
- 6.786.2.20 `virtual std::string activemq::commands::SubscriptionInfo::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 767).

6.786.3 Field Documentation

6.786.3.1 `std::string activemq::commands::SubscriptionInfo::clientId` [protected]

6.786.3.2 `Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::destination` [protected]

6.786.3.3 `const unsigned char activemq::commands::SubscriptionInfo::ID_ - SUBSCRIPTIONINFO = 55` [static]

6.786.3.4 `std::string activemq::commands::SubscriptionInfo::selector` [protected]

6.786.3.5 `std::string activemq::commands::SubscriptionInfo::subscriptionName` [protected]

```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller`:

Public Member Functions

- `SubscriptionInfoMarshaller ()`
- `virtual ~SubscriptionInfoMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaller.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.787.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3438). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.787.2 Constructor & Destructor Documentation

6.787.2.1 activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller () [inline]

6.787.2.2 virtual
activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller () [inline, virtual]

6.787.3 Member Function Documentation

6.787.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.787.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.787.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.787.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

```
6.787.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

```
6.787.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```

6.787.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

6.788.3 Member Function Documentation

6.788.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.788.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::getDataStructureType() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.788.3.3 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1518).

6.788.3.4 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.788.3.5 virtual int ac-
tivismq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal1
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.788.3.6 virtual void ac-
tivismq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal2
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.788.3.7 virtual void ac-
tivismq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataInputStream * *dataIn*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.789.3 Member Function Documentation

6.789.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.789.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.789.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.789.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.789.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.789.3.6 virtual void **activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.789.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.790.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.790.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.790.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.790.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.790.3.7 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/SubscriptionInfoMarshaller.h

6.791 activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3453).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/SubscriptionInfoMarshaller.h>
```

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3453). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.791.2 Constructor & Destructor Documentation

6.791.2.1 `activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller()` [inline]

6.791.2.2 `virtual activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller()` [inline, virtual]

6.791.3 Member Function Documentation

6.791.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.791.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.791.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.791.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.791.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.791.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.791.3.7 virtual void activemq::wireformat::openwire::marshal::v6::SubscriptionInfoMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataInputStream * *dataIn*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.792.3 Member Function Documentation

6.792.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.792.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.792.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.792.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.792.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.792.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.792.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

6.793 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

```
#include <src/main/decaf/util/concurrent/Synchronizable.h>
```

Inheritance diagram for `decaf::util::concurrent::Synchronizable`:

Public Member Functions

- virtual `~Synchronizable ()`
- virtual void **lock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
*Attempts to **Lock** (p. 2228) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
*Waits on a signal from this object, which is generated by a call to *Notify*.*
- virtual void **wait** (long long millisecs)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
*Waits on a signal from this object, which is generated by a call to *Notify*.*
- virtual void **wait** (long long millisecs, int nanos)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
*Waits on a signal from this object, which is generated by a call to *Notify*.*
- virtual void **notify** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.793.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since

1.0

6.793.2 Constructor & Destructor Documentation

6.793.2.1 virtual decaf::util::concurrent::Synchronizable::~~Synchronizable ()
[inline, virtual]

6.793.3 Member Function Documentation

6.793.3.1 virtual void decaf::util::concurrent::Synchronizable::lock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implemented in `activemq::core::MessageDispatchChannel` (p. 2434), `decaf::internal::util::concurrent::SynchronizableImpl` (p. 3474), `decaf::io::InputStream` (p. 1913), `decaf::io::OutputStream` (p. 2721), `decaf::util::AbstractCollection< E >` (p. 150), `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1149), `decaf::util::concurrent::Mutex` (p. 2605), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3377), `decaf::util::StlQueue< T >` (p. 3386), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 150), `decaf::util::AbstractCollection< Pointer< Synchroniza-tion > >` (p. 150), `decaf::util::AbstractCollection< Resource * >` (p. 150), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 150), `decaf::util::AbstractCollection< CompositeTask * >` (p. 150), `decaf::util::AbstractCollection< URI >` (p. 150), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 150), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 150), `decaf::util::AbstractCollection< Prim-itiveValueNode >` (p. 150), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 150), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 150), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 150), `decaf::util::AbstractCollection< cms::Destination * >` (p. 150), `decaf::util::AbstractCollection< cms::Session * >` (p. 150), `decaf::util::AbstractCollection< cms::Connection * >` (p. 150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< Mes-sageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< Connec-tionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< Con-sumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1149), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3377), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3377), `decaf::util::StlMap< std::string, PrimitiveVal-ueNode >` (p. 3377), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, com-mands::ProducerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ConsumerId`

>, `ActiveMQConsumer *`, `commands::ConsumerId::COMPARATOR` > (p. 3377), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3377), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 3377), `decaf::util::StlMap< std::string, cms::Topic * >` (p. 3377), `decaf::util::StlQueue< Pointer< Transport > >` (p. 3386), `decaf::util::StlQueue< Pointer< MessageDispatch > >` (p. 3386), `decaf::util::StlQueue< Task >` (p. 3386), `decaf::util::StlQueue< Pointer< Command > >` (p. 3386), and `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >` (p. 3386).

6.793.3.2 `virtual void decaf::util::concurrent::Synchronizable::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)` [pure virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implemented in `activemq::core::MessageDispatchChannel` (p. 2435), `decaf::internal::util::concurrent::SynchronizableImpl` (p. 3474), `decaf::io::InputStream` (p. 1914), `decaf::io::OutputStream` (p. 2722), `decaf::util::AbstractCollection< E >` (p. 150), `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1149), `decaf::util::concurrent::Mutex` (p. 2606), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3377), `decaf::util::StlQueue< T >` (p. 3386), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 150), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 150), `decaf::util::AbstractCollection< Resource * >` (p. 150), `decaf::util::AbstractCollection< cms::MessageConsumer * >` (p. 150), `decaf::util::AbstractCollection< CompositeTask * >` (p. 150), `decaf::util::AbstractCollection< URI >` (p. 150), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 150), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 150), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 150), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 150), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 150), `decaf::util::AbstractCollection< cms::MessageProducer * >` (p. 150), `decaf::util::AbstractCollection< cms::Destination * >` (p. 150), `decaf::util::AbstractCollection< cms::Session * >` (p. 150), `decaf::util::AbstractCollection< cms::Connection * >` (p. 150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1149), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR`

> (p. 1149), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1149), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1149), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1149), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 3377), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 3377), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3377), decaf::util::StlMap< std::string, cms::Queue * > (p. 3377), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3377), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3377), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3377), decaf::util::StlMap< std::string, TransportFactory * > (p. 3377), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3377), decaf::util::StlMap< int, Pointer< Command > > (p. 3377), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3377), decaf::util::StlMap< std::string, CachedProducer * > (p. 3377), decaf::util::StlMap< std::string, cms::Topic * > (p. 3377), decaf::util::StlQueue< Pointer< Transport > > (p. 3386), decaf::util::StlQueue< Pointer< MessageDispatch > > (p. 3386), decaf::util::StlQueue< Task > (p. 3386), decaf::util::StlQueue< Pointer< Command > > (p. 3386), and decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > > (p. 3386).

6.793.3.3 virtual void decaf::util::concurrent::Synchronizable::notifyAll
 () throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

RuntimeException if an error occurs while notifying the waiting threads.

6.793.3.8 virtual void decaf::util::concurrent::Synchronizable::wait (long long *milliseconds*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of

[0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2437), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 3476), **decaf::io::InputStream** (p. 1919), **decaf::io::OutputStream** (p. 2724), **decaf::util::AbstractCollection< E >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1155), **decaf::util::concurrent::Mutex** (p. 2608), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3381), **decaf::util::StlQueue< T >** (p. 3389), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 154), **decaf::util::AbstractCollection< Pointer< Synchroniza- tion > >** (p. 154), **decaf::util::AbstractCollection< Resource * >** (p. 154), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 154), **decaf::util::AbstractCollection< CompositeTask * >** (p. 154), **decaf::util::AbstractCollection< URI >** (p. 154), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 154), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 154), **decaf::util::AbstractCollection< Prim- itiveValueNode >** (p. 154), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 154), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 154), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 154), **decaf::util::AbstractCollection< cms::Destination * >** (p. 154), **decaf::util::AbstractCollection< cms::Session * >** (p. 154), **decaf::util::AbstractCollection< cms::Connection * >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< Pointer< Mes- sageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1155), **decaf::util::concurrent::ConcurrentStlMap< Pointer< Connec- tionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1155), **decaf::util::concurrent::ConcurrentStlMap< Pointer< Con- sumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1155), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1155), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 1155), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1155), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3381), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3381), **decaf::util::StlMap< std::string, PrimitiveVal- ueNode >** (p. 3381), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3381), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, com- mands::ProducerId::COMPARATOR >** (p. 3381), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3381), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3381), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3381), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 3381), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3381), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, com- mands::ConsumerId::COMPARATOR >** (p. 3381), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3381), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3381), **decaf::util::StlQueue< Pointer< Transport > >** (p. 3389), **decaf::util::StlQueue< Pointer< MessageDispatch > >** (p. 3389), **decaf::util::StlQueue<**

Task > (p. 3389), **decaf::util::StlQueue< Pointer< Command > >** (p. 3389), and **decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >** (p. 3389).

6.794 decaf::internal::util::concurrent::SynchronizableImpl Class Reference

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

```
#include <src/main/decaf/internal/util/concurrent/SynchronizableImpl.h>
```

Inheritance diagram for `decaf::internal::util::concurrent::SynchronizableImpl`:

Public Member Functions

- **SynchronizableImpl** ()
- virtual **~SynchronizableImpl** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.794.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since

1.0

6.794.2 Constructor & Destructor Documentation

6.794.2.1 decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ()

6.794.2.2 virtual decaf::internal::util::concurrent::SynchronizableImpl::~~SynchronizableImpl () [virtual]

6.794.3 Member Function Documentation

6.794.3.1 virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements decaf::util::concurrent::Synchronizable (p. 3463).

6.794.3.2 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3464).

6.794.3.3 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3465).

6.794.3.4 virtual bool decaf::internal::util::concurrent::SynchronizableImpl::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3466).

6.794.3.5 virtual void decaf::internal::util::concurrent::SynchronizableImpl::unlock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3467).

6.794.3.6 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3468).

6.794.3.7 `virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3470).

6.794.3.8 `virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3471).

6.796 decaf::util::concurrent::SynchronousQueue< E > Class Template Reference

A **blocking queue** (p. 774) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.

```
#include <src/main/decaf/util/concurrent/SynchronousQueue.h>
```

Inheritance diagram for `decaf::util::concurrent::SynchronousQueue< E >`:

Data Structures

- class **EmptyIterator**

Public Member Functions

- **SynchronousQueue** ()
- virtual **~SynchronousQueue** ()
- virtual void **put** (const E &value) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

- virtual bool **offer** (const E &e, long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

- virtual bool **offer** (const E &value) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)
Inserts the specified element into this queue, if another thread is waiting to receive it.
- virtual E **take** () throw (decaf::lang::exceptions::InterruptedException)
Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.
- virtual bool **poll** (E &result, long long timeout, const TimeUnit &unit) throw (decaf::lang::exceptions::InterruptedException)
Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.
- virtual bool **poll** (E &result)
Retrieves and removes the head of this queue, if another thread is currently making an element available.
- virtual bool **equals** (const Collection< E > &value) const
*Answers true if this **Collection** (p. 1097) and the one given are the same size and if each element contained in the **Collection** (p. 1097) given is equal to an element contained in this collection.*
- virtual decaf::util::Iterator< E > * **iterator** ()
- virtual decaf::util::Iterator< E > * **iterator** () const
- virtual bool **isEmpty** () const
Returns true if this collection contains no elements.
- virtual std::size_t **size** () const
Returns the number of elements in this collection.
- virtual int **remainingCapacity** () const
*Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or **Integer::MAX_VALUE** if there is no intrinsic limit.*
- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)
Removes all elements of the queue.
- virtual bool **contains** (const E &value DECAF_UNUSED) const throw (lang::Exception)
- virtual bool **containsAll** (const Collection< E > &collection) const throw (lang::Exception)
Returns true if this collection contains all of the elements in the specified collection.
- virtual bool **remove** (const E &value DECAF_UNUSED) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
- virtual bool **removeAll** (const Collection< E > &collection DECAF_UNUSED) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
- virtual bool **retainAll** (const Collection< E > &collection DECAF_UNUSED) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

- virtual bool **peek** (E &result DECAF_UNUSED) const
- virtual std::vector< E > **toArray** () const

*Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1097).*

- virtual std::size_t **drainTo** (**Collection**< E > &c) throw
(decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)

Removes all available elements from this queue and adds them to the given collection.

- virtual std::size_t **drainTo** (**Collection**< E > &c, std::size_t maxElements) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)

Removes at most the given number of available elements from this queue and adds them to the given collection.

6.796.1 Detailed Description

template<typename E> class decaf::util::concurrent::SynchronousQueue< E >

A **blocking queue** (p. 774) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa. A synchronous queue does not have any internal capacity, not even a capacity of one. You cannot **peek** at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and **poll()** (p. 3484) will return **null**. For purposes of other **Collection** (p. 1097) methods (for example **contains**), a **SynchronousQueue** (p. 3477) acts as an empty collection. This queue does not permit **null** elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to **true** grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the **Collection** (p. 1097) and **Iterator** (p. 2012) interfaces.

Since

1.0

6.796.2 Constructor & Destructor Documentation

6.796.2.1 `template<typename E > decaf::util::concurrent::SynchronousQueue< E >::SynchronousQueue () [inline]`

6.796.2.2 `template<typename E > virtual decaf::util::concurrent::SynchronousQueue< E >::~~SynchronousQueue () [inline, virtual]`

6.796.3 Member Function Documentation

6.796.3.1 `template<typename E > virtual void decaf::util::concurrent::SynchronousQueue< E >::clear () throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes all elements of the queue.

This implementation repeatedly invokes poll until it returns the empty marker.

Reimplemented from `decaf::util::AbstractQueue< E >` (p. 160).

6.796.3.2 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::contains (const E &value DECAF_UNUSED) const throw (lang::Exception) [inline, virtual]`

6.796.3.3 `template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::containsAll (const Collection< E > & collection) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains all of the elements in the specified collection.

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Parameters

collection collection to be checked for containment in this collection

Returns

true if this collection contains all of the elements in the specified collection.

Exceptions

Exception if an error occurs,

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 149).

```

6.796.3.4  template<typename E > virtual std::size_t
             decaf::util::concurrent::SynchronousQueue< E
             >::drainTo ( Collection< E > & c ) throw (
             decaf::lang::exceptions::UnsupportedOperationException,
             decaf::lang::exceptions::IllegalArgumentException ) [inline, virtual]

```

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c the collection to transfer elements into

Returns

the number of elements transferred

Exceptions

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements `decaf::util::concurrent::BlockingQueue< E >` (p. 777).

References `decaf::util::concurrent::SynchronousQueue< E >::poll()`.

```

6.796.3.5  template<typename E > virtual std::size_t
             decaf::util::concurrent::SynchronousQueue< E >::drainTo
             ( Collection< E > & c, std::size_t maxElements ) throw
             ( decaf::lang::exceptions::UnsupportedOperationException,
             decaf::lang::exceptions::IllegalArgumentException ) [inline, virtual]

```

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection *c* may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c the collection to transfer elements into

maxElements the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

UnsupportedOperationException if addition of elements is not supported by the specified collection

IllegalArgumentException if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 778).

References **decaf::util::concurrent::SynchronousQueue< E >::poll()**.

6.796.3.6 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::equals (
const Collection< E > & collection) const [inline, virtual]`

Answers true if this **Collection** (p. 1097) and the one given are the same size and if each element contained in the **Collection** (p. 1097) given is equal to an element contained in this collection.

Parameters

collection - The **Collection** (p. 1097) to be compared to this one.

Returns

true if this **Collection** (p. 1097) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 149).

6.796.3.7 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::isEmpty
() const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 3486) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 150).

- 6.796.3.8** `template<typename E > virtual decaf::util::Iterator<E>*`
`decaf::util::concurrent::SynchronousQueue< E >::iterator () const`
`[inline, virtual]`
- 6.796.3.9** `template<typename E > virtual decaf::util::Iterator<E>*`
`decaf::util::concurrent::SynchronousQueue< E >::iterator () [inline,`
`virtual]`
- 6.796.3.10** `template<typename E > virtual bool`
`decaf::util::concurrent::SynchronousQueue< E >::offer (`
`const E & e, long timeout, const TimeUnit & unit`
`) throw (decaf::lang::exceptions::InterruptedException,`
`decaf::lang::exceptions::NullPointerException, de-`
`caf::lang::exceptions::IllegalArgumentException) [inline,`
`virtual]`

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

Returns

`true` if successful, or `false` if the specified waiting time elapses before a consumer appears.

Exceptions

- InterruptedException*** Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
- NullPointerException*** Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
- IllegalArgumentException*** Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Implements `decaf::util::concurrent::BlockingQueue< E >` (p. 779).

- 6.796.3.11** `template<typename E > virtual bool`
`decaf::util::concurrent::SynchronousQueue< E >::offer (const E`
`& value) throw (decaf::lang::exceptions::NullPointerException,`
`decaf::lang::exceptions::IllegalArgumentException) [inline, virtual]`

Inserts the specified element into this queue, if another thread is waiting to receive it.

Parameters

value the element to add to the **Queue** (p. 2948)

Returns

`true` if the element was added to this queue, else `false`

Exceptions

- NullPointerException*** if the **Queue** (p. 2948) implementation does not allow Null values to be inserted into the **Queue** (p. 2948).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2949).

6.796.3.12 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::peek (
E &result DECAF_UNUSED) const [inline, virtual]`

6.796.3.13 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::poll (
E & result, long long timeout, const TimeUnit & unit) throw (
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

Parameters

result a reference to the value where the head of the **Queue** (p. 2948) should be copied to.

timeout the time that the method should block if there is no element available to return.

unit the Time Units that the timeout value represents.

Returns

true if the head of the **Queue** (p. 2948) was copied to the result param or false if no value could be returned.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 779).

Referenced by **decaf::util::concurrent::SynchronousQueue< E >::drainTo()**.

6.796.3.14 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::poll (
E & result) [inline, virtual]`

Retrieves and removes the head of this queue, if another thread is currently making an element available.

Parameters

result a reference to the value where the head of the **Queue** (p. 2948) should be copied to.

Returns

true if the head of the **Queue** (p. 2948) was copied to the result param or false if no value could be returned.

Implements **decaf::util::Queue< E >** (p. 2950).

```

6.796.3.15  template<typename E > virtual void
               decaf::util::concurrent::SynchronousQueue< E >::put (  const E
               &  value ) throw ( decaf::lang::exceptions::InterruptedException,
               decaf::lang::exceptions::NullPointerException, de-
               ccaf::lang::exceptions::IllegalArgumentException ) [inline,
               virtual]

```

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

Parameters

value the element to add to the **Queue** (p. 2948).

Exceptions

InterruptedException Inserts the specified element into this queue, waiting if necessary for space to become available.

NullPointerException Inserts the specified element into this queue, waiting if necessary for space to become available.

IllegalArgumentException Inserts the specified element into this queue, waiting if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 780).

```

6.796.3.16  template<typename E > virtual int
               decaf::util::concurrent::SynchronousQueue< E
               >::remainingCapacity (  ) const [inline, virtual]

```

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or **Integer::MAX_VALUE** if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting **remainingCapacity** because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 780).

- 6.796.3.17** `template<typename E> virtual bool
decaf::util::concurrent::SynchronousQueue< E >::remove
(const E &value DECAF_UNUSED) throw (
lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException) [inline, virtual]`
- 6.796.3.18** `template<typename E> virtual bool
decaf::util::concurrent::SynchronousQueue< E
>::removeAll (const Collection< E > &collection DECAF_UNUSED
) throw (lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException) [inline, virtual]`
- 6.796.3.19** `template<typename E> virtual bool
decaf::util::concurrent::SynchronousQueue< E
>::retainAll (const Collection< E > &collection DECAF_UNUSED
) throw (lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException) [inline, virtual]`
- 6.796.3.20** `template<typename E> virtual std::size_t
decaf::util::concurrent::SynchronousQueue< E >::size () const
[inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

Implements `decaf::util::Collection< E >` (p. 1106).

- 6.796.3.21** `template<typename E> virtual E
decaf::util::concurrent::SynchronousQueue< E >::take (
) throw (decaf::lang::exceptions::InterruptedException) [inline,
virtual]`

Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.

Returns

the head of this queue

Exceptions

InterruptedException Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Implements `decaf::util::concurrent::BlockingQueue< E >` (p. 780).

- 6.796.3.22** `template<typename E> virtual std::vector<E>
decaf::util::concurrent::SynchronousQueue< E >::toArray () const
[inline, virtual]`

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 1097).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 1097)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 153).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/SynchronousQueue.h`

6.797 decaf::lang::System Class Reference

The **System** (p. 3487) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.

```
#include <src/main/decaf/lang/System.h>
```

Public Member Functions

- `virtual ~System ()`

Static Public Member Functions

- static void **arraycopy** (const unsigned char *src, std::size_t srcPos, unsigned char *dest, std::size_t destPos, std::size_t length)
Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.
- static void **arraycopy** (const short *src, std::size_t srcPos, short *dest, std::size_t destPos, std::size_t length)
Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.
- static void **arraycopy** (const int *src, std::size_t srcPos, int *dest, std::size_t destPos, std::size_t length)
Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.
- static void **arraycopy** (const long long *src, std::size_t srcPos, long long *dest, std::size_t destPos, std::size_t length)
Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

- static const **util::Map**< std::string, std::string > & **getenv** ()
Enumerates the system environment and returns a map of env variable names to the string values they hold.
- static std::string **getenv** (const std::string &name)
Reads an environment value from the system and returns it as a string object.
- static void **unsetenv** (const std::string &name)
Clears a set environment value if one is set.
- static void **setenv** (const std::string &name, const std::string &value)
Sets the specified system property to the value given.
- static long long **currentTimeMillis** ()
Returns the current time in milliseconds.
- static long long **nanoTime** ()
Returns the current value of the most precise available system timer, in nanoseconds.
- static int **availableProcessors** ()
Returns the number of processors available for execution of Decaf Threads.
- static **decaf::util::Properties** & **getProperties** ()
Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.
- static std::string **getProperty** (const std::string &key)
*Gets the specified **System** (p. 3487) property if set, otherwise returns an empty string.*
- static std::string **getProperty** (const std::string &key, const std::string &defaultValue)
*Gets the specified **System** (p. 3487) property if set, otherwise returns the specified default value.*
- static std::string **setProperty** (const std::string &key, const std::string &value)
*Sets the **System** (p. 3487) Property to the specified value.*
- static std::string **clearProperty** (const std::string &key)
Clear any value associated with the system property specified.

6.797.1 Detailed Description

The **System** (p.3487) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.

Since

1.0

6.797.2 Constructor & Destructor Documentation

6.797.2.1 `decaf::lang::System::System ()` [protected]

6.797.2.2 `virtual decaf::lang::System::~~System ()` [inline, virtual]

6.797.3 Member Function Documentation

6.797.3.1 `static void decaf::lang::System::arraycopy (const unsigned char * src, std::size_t srcPos, unsigned char * dest, std::size_t destPos, std::size_t length)` [static]

Copies the number of elements specified by *length* from the source array starting at the given source offset specified by *srcPos* to the dest array starting at the given destination offset given by *destPos*.

Parameters

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from *src* to *dest*.

Exceptions

NullPointerException if *src* or *dest* are NULL.

Referenced by `decaf::lang::ArrayPointer< unsigned char >::clone()`.

6.797.3.2 `static void decaf::lang::System::arraycopy (const short * src, std::size_t srcPos, short * dest, std::size_t destPos, std::size_t length)` [static]

Copies the number of elements specified by *length* from the source array starting at the given source offset specified by *srcPos* to the dest array starting at the given destination offset given by *destPos*.

Parameters

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions

NullPointerException if src or dest are NULL.

6.797.3.3 `static void decaf::lang::System::arraycopy (const long long * src, std::size_t srcPos, long long * dest, std::size_t destPos, std::size_t length) [static]`

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions

NullPointerException if src or dest are NULL.

6.797.3.4 `static void decaf::lang::System::arraycopy (const int * src, std::size_t srcPos, int * dest, std::size_t destPos, std::size_t length) [static]`

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src The source array to copy from.

srcPos The position in the array to start copying from.

dest The destination array to copy to.

destPos The position in the destination array to start writing at.

length The number of elements to copy from src to dest.

Exceptions

NullPointerException if src or dest are NULL.

6.797.3.5 `static int decaf::lang::System::availableProcessors () [static]`

Returns the number of processors available for execution of Decaf Threads.

This value may change during a particular execution of a Decaf based application. Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

Returns

the number of available processors.

6.797.3.6 `static std::string decaf::lang::System::clearProperty (const std::string &key) [static]`

Clear any value associated with the system property specified.

Parameters

key The key name of the system property to clear.

Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions

IllegalArgumentException if key is an empty string.

6.797.3.7 `static long long decaf::lang::System::currentTimeMillis () [static]`

Returns the current time in milliseconds.

Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

Returns

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

6.797.3.8 `static const util::Map<std::string, std::string>& decaf::lang::System::getenv () [static]`

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns

A Map of all environment variables.

Exceptions

Exception (p. 1712) if an error occurs while getting the Environment Map.

6.797.3.9 `static std::string decaf::lang::System::getenv (const std::string & name) [static]`

Reads an environment value from the system and returns it as a string object.

Parameters

name The environment variable to read.

Returns

a string with the value from the variables or ""

Exceptions

an Exception (p. 1712) if an error occurs while reading the Env.

6.797.3.10 `static decaf::util::Properties& decaf::lang::System::getProperties () [static]`

Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Returns

a reference to the static system Properties object.

6.797.3.11 `static std::string decaf::lang::System::getProperty (const std::string & key) [static]`

Gets the specified **System** (p. 3487) property if set, otherwise returns an empty string.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters

key The key name of the desired system property to retrieve.

Returns

an empty string if the named property is not set, otherwise returns the value.

Exceptions

IllegalArgumentException if key is an empty string.

6.797.3.12 `static std::string decaf::lang::System::getProperty (const std::string & key, const std::string & defaultValue) [static]`

Gets the specified **System** (p. 3487) property if set, otherwise returns the specified default value.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters

key The key name of the desired system property to retrieve.

defaultValue The default value to return if the key is not set in the **System** (p. 3487) properties.

Returns

the value of the named system property or the defaultValue if the property isn't set..

Exceptions

IllegalArgumentException if key is an empty string.

6.797.3.13 `static long long decaf::lang::System::nanoTime () [static]`

Returns the current value of the most precise available system timer, in nanoseconds.

This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

```
long long startTime = System::nanoTime() (p. 3493); // ... the code being measured ... long
long estimatedTime = System::nanoTime() (p. 3493) - startTime;
```

Returns

The current value of the system timer, in nanoseconds.

6.797.3.14 `static void decaf::lang::System::setenv (const std::string & name, const std::string & value) [static]`

Sets the specified system property to the value given.

Parameters

name The name of the environment variables to set.

value The value to assign to name.

Exceptions

an Exception (p. 1712) if an error occurs when setting the environment variable.

6.797.3.15 `static std::string decaf::lang::System::setProperty (const std::string & key, const std::string & value) [static]`

Sets the **System** (p.3487) Property to the specified value.

Parameters

key The key name of the system property to set to the given value.

value The value to assign to the key.

Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions

IllegalArgumentException if key is an empty string.

6.797.3.16 `static void decaf::lang::System::unsetenv (const std::string & name) [static]`

Clears a set environment value if one is set.

Parameters

name The environment variables to clear.

Exceptions

an Exception (p.1712) if an error occurs while reading the environment.

6.797.4 Friends And Related Function Documentation

6.797.4.1 `friend class decaf::lang::Runtime [friend]`

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/System.h`

6.798 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

`#include <src/main/activemq/threads/Task.h>`

Inheritance diagram for `activemq::threads::Task`:

Public Member Functions

- virtual `~Task()`
- virtual bool `iterate()`=0

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.798.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since

3.0

6.798.2 Constructor & Destructor Documentation

6.798.2.1 virtual `activemq::threads::Task::~Task()` [inline, virtual]

6.798.3 Member Function Documentation

6.798.3.1 virtual bool `activemq::threads::Task::iterate()` [pure virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in `activemq::core::ActiveMQSessionExecutor` (p. 485), `activemq::transport::failover::BackupTransportPool` (p. 694), `activemq::transport::failover::CloseTransportsTask` (p. 1067), and `activemq::transport::failover::FailoverTransport` (p. 1758).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/Task.h`

6.799 decaf::util::concurrent::TaskListener Class Reference

```
#include <src/main/decaf/util/concurrent/TaskListener.h>
```

Public Member Functions

- virtual `~TaskListener()`
- virtual void `onTaskComplete(lang::Runnable *task)`=0

Called when a queued task has completed, the task that finished is passed along for user consumption.

- virtual void **onTaskException** (lang::Runnable *task, lang::Exception &ex)=0

Called when a queued task has thrown an exception while being run.

6.799.1 Constructor & Destructor Documentation

- 6.799.1.1** virtual decaf::util::concurrent::TaskListener::~~TaskListener ()
[inline, virtual]

6.799.2 Member Function Documentation

- 6.799.2.1** virtual void decaf::util::concurrent::TaskListener::onTaskComplete (lang::Runnable * *task*) [pure virtual]

Called when a queued task has completed, the task that finished is passed along for user consumption.

Parameters

task Runnable Pointer to the task that finished

- 6.799.2.2** virtual void decaf::util::concurrent::TaskListener::onTaskException (lang::Runnable * *task*, lang::Exception & *ex*) [pure virtual]

Called when a queued task has thrown an exception while being run.

The Callee should assume that this was an unrecoverable exception and that this task is now defunct.

Parameters

task Runnable Pointer to the task

ex The ActiveMQException that was thrown.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**TaskListener.h**

6.800 activemq::threads::TaskRunner Class Reference

```
#include <src/main/activemq/threads/TaskRunner.h>
```

Inheritance diagram for activemq::threads::TaskRunner:

Public Member Functions

- virtual ~TaskRunner ()
- virtual void **shutdown** (unsigned int timeout)=0

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

- virtual void **shutdown** ()=0

Shutdown once the task has finished and the TaskRunner's thread has exited.

- virtual void **wakeup** ()=0

*Signal the **TaskRunner** (p. 3496) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3494) instance will be run until its iterate method has returned false indicating it is done.*

6.800.1 Constructor & Destructor Documentation

- 6.800.1.1 virtual **activemq::threads::TaskRunner::~TaskRunner** () [inline, virtual]

6.800.2 Member Function Documentation

- 6.800.2.1 virtual void **activemq::threads::TaskRunner::shutdown** (unsigned int *timeout*) [pure virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

timeout - Time in Milliseconds to wait for the task to stop.

- 6.800.2.2 virtual void **activemq::threads::TaskRunner::shutdown** () [pure virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

- 6.800.2.3 virtual void **activemq::threads::TaskRunner::wakeup** () [pure virtual]

Signal the **TaskRunner** (p. 3496) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3494) instance will be run until its iterate method has returned false indicating it is done.

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**TaskRunner.h**

6.801 decaf::internal::net::tcp::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

```
#include <src/main/decaf/internal/net/tcp/TcpSocket.h>
```

Inheritance diagram for decaf::internal::net::tcp::TcpSocket:

Public Member Functions

- **TcpSocket** () throw (decaf::net::SocketException)
Construct a non-connected socket.
- virtual ~**TcpSocket** ()
Releases the socket handle but not gracefully shut down the connection.
- SocketHandle **getSocketHandle** ()
Gets the handle for the socket.
- bool **isConnected** () const
- bool **isClosed** () const
- virtual std::string **getLocalAddress** () const
*Gets the value of the local Inet address the **Socket** (p. 3281) is bound to if bound, otherwise return the **InetAddress** (p. 1884) ANY value "0.0.0.0".*
Returns
the local address bound to, or ANY.
- virtual void **create** () throw (decaf::io::IOException)
*Creates the underlying platform **Socket** (p. 3281) data structures which allows for **Socket** (p. 3281) options to be applied.*
The created socket is in an unconnected state.
Exceptions
***IOException** if an I/O error occurs while attempting this operation.*
- virtual void **accept** (SocketImpl *socket) throw (decaf::io::IOException)
- virtual void **bind** (const std::string &ipaddress, int **port**) throw (decaf::io::IOException)
*Binds this **Socket** (p. 3281) instance to the local ip address and port number given.*
Parameters
***ipaddress** The address of local ip to bind to.*
***port** The port number on the host to bind to.*
Exceptions
***IOException** if an I/O error occurs while attempting this operation.*
- virtual void **connect** (const std::string &hostname, int **port**, int timeout) throw (decaf::io::IOException, decaf::net::SocketException, decaf::lang::exceptions::IllegalArgumentException)
Connects this socket to the given host and port.
Parameters
***hostname** The name of the host to connect to, or IP address.*
***port** The port number on the host to connect to.*
***timeout** Time in milliseconds to wait for a connection, 0 indicates forever.*
Exceptions
***IOException** if an I/O error occurs while attempting this operation.*
***SocketTimeoutException** (p. 3319) if the connect call times out due to timeout being set.*
***IllegalArgumentException** if a parameter has an illegal value.*

- virtual void **listen** (int backlog) throw (decaf::io::IOException)
Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.
If a connection indication arrives when the queue is full, the connection is refused.
Parameters
backlog The maximum length of the connection queue.
Exceptions
IOException if an I/O error occurs while attempting this operation.

- virtual decaf::io::InputStream * **getInputStream** () throw (decaf::io::IOException)
*Gets the InputStream linked to this **Socket** (p. 3281).*
Returns
*an InputStream pointer owned by the **Socket** (p. 3281) object.*
Exceptions
IOException if an I/O error occurs while attempting this operation.

- virtual decaf::io::OutputStream * **getOutputStream** () throw (decaf::io::IOException)
*Gets the OutputStream linked to this **Socket** (p. 3281).*
Returns
*an OutputStream pointer owned by the **Socket** (p. 3281) object.*
Exceptions
IOException if an I/O error occurs while attempting this operation.

- virtual int **available** () throw (decaf::io::IOException)
*Gets the number of bytes that can be read from the **Socket** (p. 3281) without blocking.*
Returns
*the number of bytes that can be read from the **Socket** (p. 3281) without blocking.*
Exceptions
IOException if an I/O error occurs while attempting this operation.

- virtual void **close** () throw (decaf::io::IOException)
Closes the socket, terminating any blocked reads or writes.
Exceptions
IOException if an I/O error occurs while attempting this operation.

- virtual void **shutdownInput** () throw (decaf::io::IOException)
Places the input stream for this socket at "end of stream".
*Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 3312) on the socket, the stream will return EOF.*
Exceptions
IOException if an I/O error occurs while attempting this operation.

- virtual void **shutdownOutput** () throw (decaf::io::IOException)

Disables the output stream for this socket.

*For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 3313) on the socket, the stream will throw an *IOException*.*

Exceptions

***IOException** if an I/O error occurs while attempting this operation.*

- virtual int **getOption** (int option) const throw (decaf::io::IOException)

*Gets the specified **Socket** (p. 3281) option.*

Parameters

***option** The **Socket** (p. 3281) options whose value is to be retrieved.*

Returns

the value of the given socket option.

Exceptions

***IOException** if an I/O error occurs while performing this operation.*

- virtual void **setOption** (int option, int value) throw (decaf::io::IOException)

*Sets the specified option on the **Socket** (p. 3281) if supported.*

Parameters

***option** The **Socket** (p. 3281) option to set.*

***value** The value of the socket option to apply to the socket.*

Exceptions

***IOException** if an I/O error occurs while performing this operation.*

- int **read** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

*Reads the requested data from the **Socket** and write it into the passed in buffer.*

- void **write** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

*Writes the specified data in the passed in buffer to the **Socket**.*

Protected Member Functions

- void **checkResult** (apr_status_t value) const throw (decaf::net::SocketException)

6.801.1 Detailed Description

Platform-independent implementation of the socket interface.

6.801.2 Constructor & Destructor Documentation

- 6.801.2.1** decaf::internal::net::tcp::TcpSocket::TcpSocket () throw (decaf::net::SocketException)

Construct a non-connected socket.

Exceptions

SocketException thrown if an error occurs while creating the Socket.

6.801.2.2 virtual decaf::internal::net::tcp::TcpSocket::~~TcpSocket () [virtual]

Releases the socket handle but not gracefully shut down the connection.

6.801.3 Member Function Documentation

6.801.3.1 virtual void decaf::internal::net::tcp::TcpSocket::accept (SocketImpl * *socket*) throw (decaf::io::IOException) [virtual]

6.801.3.2 virtual int decaf::internal::net::tcp::TcpSocket::available () throw (decaf::io::IOException) [virtual]

Gets the number of bytes that can be read from the **Socket** (p. 3281) without blocking.

Returns

the number of bytes that can be read from the **Socket** (p. 3281) without blocking.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 3308).

6.801.3.3 virtual void decaf::internal::net::tcp::TcpSocket::bind (const std::string & *ipaddress*, int *port*) throw (decaf::io::IOException) [virtual]

Binds this **Socket** (p. 3281) instance to the local ip address and port number given.

Parameters

ipaddress The address of local ip to bind to.

port The port number on the host to bind to.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 3308).

6.801.3.4 void decaf::internal::net::tcp::TcpSocket::checkResult (apr_status_t *value*) const throw (decaf::net::SocketException) [protected]

6.801.3.5 virtual void decaf::internal::net::tcp::TcpSocket::close () throw (decaf::io::IOException) [virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 3309).

6.801.3.6 `virtual void decaf::internal::net::tcp::TcpSocket::connect (const std::string & hostname, int port, int timeout) throw (decaf::io::IOException, decaf::net::SocketException, decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Connects this socket to the given host and port.

Parameters

hostname The name of the host to connect to, or IP address.

port The port number on the host to connect to.

timeout Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions

IOException if an I/O error occurs while attempting this operation.

SocketTimeoutException (p. 3319) if the connect call times out due to timeout being set.

IllegalArgumentException if a parameter has an illegal value.

Implements **decaf::net::SocketImpl** (p. 3309).

6.801.3.7 `virtual void decaf::internal::net::tcp::TcpSocket::create () throw (decaf::io::IOException) [virtual]`

Creates the underlying platform **Socket** (p. 3281) data structures which allows for **Socket** (p. 3281) options to be applied.

The created socket is in an unconnected state.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 3309).

6.801.3.8 `virtual decaf::io::InputStream* decaf::internal::net::tcp::TcpSocket::getInputStream () throw (decaf::io::IOException) [virtual]`

Gets the InputStream linked to this **Socket** (p. 3281).

Returns

an InputStream pointer owned by the **Socket** (p. 3281) object.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 3310).

6.801.3.9 `virtual std::string decaf::internal::net::tcp::TcpSocket::getLocalAddress () const [virtual]`

Gets the value of the local Inet address the **Socket** (p. 3281) is bound to if bound, otherwise return the **InetAddress** (p. 1884) ANY value "0.0.0.0".

Returns

the local address bound to, or ANY.

Implements **decaf::net::SocketImpl** (p. 3310).

6.801.3.10 `virtual int decaf::internal::net::tcp::TcpSocket::getOption (int option) const throw (decaf::io::IOException) [virtual]`

Gets the specified **Socket** (p. 3281) option.

Parameters

option The **Socket** (p. 3281) options whose value is to be retrieved.

Returns

the value of the given socket option.

Exceptions

IOException if an I/O error occurs while performing this operation.

Implements **decaf::net::SocketImpl** (p. 3311).

6.801.3.11 `virtual decaf::io::OutputStream* decaf::internal::net::tcp::TcpSocket::getOutputStream () throw (decaf::io::IOException) [virtual]`

Gets the OutputStream linked to this **Socket** (p. 3281).

Returns

an OutputStream pointer owned by the **Socket** (p. 3281) object.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 3311).

6.801.3.12 `SocketHandle decaf::internal::net::tcp::TcpSocket::getSocketHandle () [inline]`

Gets the handle for the socket.

Returns

SocketHabler for this Socket, can be NULL

6.801.3.13 `bool decaf::internal::net::tcp::TcpSocket::isClosed () const [inline]`

Returns

true if the close method has been called on this Socket.

6.801.3.14 `bool decaf::internal::net::tcp::TcpSocket::isConnected () const [inline]`

Returns

true if the socketHandle is not in a disconnected state.

6.801.3.15 `virtual void decaf::internal::net::tcp::TcpSocket::listen (int backlog) throw (decaf::io::IOException) [virtual]`

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

backlog The maximum length of the connection queue.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements `decaf::net::SocketImpl` (p. 3311).

6.801.3.16 `int decaf::internal::net::tcp::TcpSocket::read (unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`

Reads the requested data from the Socket and write it into the passed in buffer.

Parameters

buffer The buffer to read into

size The size of the specified buffer

offset The offset into the buffer where reading should start filling.

length The number of bytes past offset to fill with data.

Returns

the actual number of bytes read or -1 if at EOF.

Exceptions

IOException if an I/O error occurs during the read.

NullPointerException if buffer is Null.

IndexOutOfBoundsException if offset + length is greater than buffer size.

6.801.3.17 `virtual void decaf::internal::net::tcp::TcpSocket::setOption (int option,
int value) throw (decaf::io::IOException) [virtual]`

Sets the specified option on the **Socket** (p.3281) if supported.

Parameters

option The **Socket** (p.3281) option to set.

value The value of the socket option to apply to the socket.

Exceptions

IOException if an I/O error occurs while performing this operation.

Implements **decaf::net::SocketImpl** (p.3312).

6.801.3.18 `virtual void decaf::internal::net::tcp::TcpSocket::shutdownInput ()
throw (decaf::io::IOException) [virtual]`

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p.3312) on the socket, the stream will return EOF.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p.3312).

6.801.3.19 `virtual void decaf::internal::net::tcp::TcpSocket::shutdownOutput ()
throw (decaf::io::IOException) [virtual]`

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p.3313) on the socket, the stream will throw an *IOException*.

Exceptions

IOException if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p.3313).

6.801.3.20 `void decaf::internal::net::tcp::TcpSocket::write (
const unsigned char * buffer, int size, int
offset, int length) throw (decaf::io::IOException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::NullPointerException)`

Writes the specified data in the passed in buffer to the **Socket**.

Parameters

- buffer* The buffer to write to the socket.
- size* The size of the specified buffer.
- offset* The offset into the buffer where the data to write starts at.
- length* The number of bytes past offset to write.

Exceptions

- IOException* if an I/O error occurs during the write.
- NullPointerException* if buffer is Null.
- IndexOutOfBoundsException* if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocket.h**

6.802 decaf::internal::net::tcp::TcpSocketInputStream Class Reference

Input stream for performing reads on a socket.

```
#include <src/main/decaf/internal/net/tcp/TcpSocketInputStream.h>
```

Inheritance diagram for decaf::internal::net::tcp::TcpSocketInputStream:

Public Member Functions

- **TcpSocketInputStream** (**TcpSocket** *socket)
Create a new InputStream to use for reading from the TCP/IP socket.
- virtual **~TcpSocketInputStream** ()
- virtual int **available** () const throw (decaf::io::IOException)
*Indicates the number of bytes available.
The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.
The default implementation of this method returns zero.*
Returns
the number of bytes available on this input stream.
Exceptions
IOException (p. 2003) if an I/O error occurs.
- virtual void **close** () throw (decaf::io::IOException)
Close - does nothing.
- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Not supported.

Protected Member Functions

- virtual int **doReadByte** () throw (io::IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.802.1 Detailed Description

Input stream for performing reads on a socket. This class will only work properly for blocking sockets.

Since

1.0

6.802.2 Constructor & Destructor Documentation

6.802.2.1 decaf::internal::net::tcp::TcpSocketInputStream::TcpSocketInputStream (TcpSocket * *socket*)

Create a new InputStream to use for reading from the TCP/IP socket.

Parameters

socket The parent SocketImpl for this stream.

6.802.2.2 virtual decaf::internal::net::tcp::TcpSocketInputStream::~~TcpSocketInputStream () [virtual]

6.802.3 Member Function Documentation

6.802.3.1 virtual int decaf::internal::net::tcp::TcpSocketInputStream::available () const throw (decaf::io::IOException) [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1911).

6.802.3.2 virtual void decaf::internal::net::tcp::TcpSocketInputStream::close ()
throw (decaf::io::IOException) [virtual]

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1909) freeing any resources that might have been aquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::InputStream** (p. 1912).

6.802.3.3 virtual int de-
caf::internal::net::tcp::TcpSocketInputStream::doReadArrayBounded
(unsigned char * *buffer*, int *size*, int *off-*
set, int *length*) throw (decaf::io::IOException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::NullPointerException) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1912).

6.802.3.4 virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadByte ()
throw (io::IOException) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1912).

6.802.3.5 virtual long long decaf::internal::net::tcp::TcpSocketInputStream::skip
(long long *num*) throw (decaf::io::IOException,
decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported.

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1909) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException (p. 2003) if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1917).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/tcp/TcpSocketInputStream.h`

6.803 decaf::internal::net::tcp::TcpSocketOutputStream Class Reference

Output stream for performing write operations on a socket.

```
#include <src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h>
```

Inheritance diagram for `decaf::internal::net::tcp::TcpSocketOutputStream`:

Public Member Functions

- **TcpSocketOutputStream** (**TcpSocket** *socket)
Create a new instance of a Socket OutputStream class.
- virtual **~TcpSocketOutputStream** ()
- virtual void **close** () throw (decaf::io::IOException)
The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c) throw (decaf::io::IOException)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

6.803.1 Detailed Description

Output stream for performing write operations on a socket.

Since

1.0

6.803.2 Constructor & Destructor Documentation

6.803.2.1 decaf::internal::net::tcp::TcpSocketOutputStream::TcpSocketOutputStream (**TcpSocket** * *socket*)

Create a new instance of a Socket OutputStream class.

Parameters

socket The socket to use to write out the data.

6.803.2.2 virtual
 decaf::internal::net::tcp::TcpSocketOutputStream::~~TcpSocketOutputStream
 () [virtual]

6.803.3 Member Function Documentation

6.803.3.1 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::close ()
 throw (decaf::io::IOException) [virtual]

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2720).

6.803.3.2 virtual void de-
 caf::internal::net::tcp::TcpSocketOutputStream::doWriteArrayBounded (
 const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw
 (decaf::io::IOException, decaf::lang::exceptions::NullPointerException,
 decaf::lang::exceptions::IndexOutOfBoundsException) [protected,
 virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2721).

6.803.3.3 virtual void de-
 caf::internal::net::tcp::TcpSocketOutputStream::doWriteByte (unsigned
 char *c*) throw (decaf::io::IOException) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 2721).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h

6.804 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 2005).

```
#include <src/main/activemq/transport/tcp/TcpTransport.h>
```

Inheritance diagram for activemq::transport::tcp::TcpTransport:

Public Member Functions

- **TcpTransport** (const **Pointer**< **Transport** > &next)

*Creates a new instance of a **TcpTransport** (p. 3510), the transport is left unconnected and is in a unusable state until the connect method is called.*

- virtual `~TcpTransport ()`
- virtual `void connect (const decaf::net::URI &uri, const decaf::util::Properties &properties)`
Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.
- virtual `void close () throw (decaf::io::IOException)`
Delegates to the superclass and then closes the socket.
- virtual `bool isFaultTolerant () const`
*Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual `bool isConnected () const`
*Is the **Transport** (p. 3629) Connected to its Broker.*
- virtual `bool isClosed () const`
*Has the **Transport** (p. 3629) been shutdown and no longer usable.*

Protected Member Functions

- virtual `decaf::net::Socket * createSocket ()`
Create an unconnected Socket instance to be used by the transport to communicate with the broker.
- virtual `void configureSocket (decaf::net::Socket *socket, const decaf::util::Properties &properties)`
Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

6.804.1 Detailed Description

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 2005). The lower level transport should take care of managing stream reads and writes.

6.804.2 Constructor & Destructor Documentation

6.804.2.1 `activemq::transport::tcp::TcpTransport::TcpTransport (const Pointer< Transport > & next)`

Creates a new instance of a **TcpTransport** (p. 3510), the transport is left unconnected and is in a unusable state until the connect method is called.

Parameters

next The next transport in the chain

6.804.2.2 virtual `activemq::transport::tcp::TcpTransport::~~TcpTransport ()`
[virtual]

6.804.3 Member Function Documentation

6.804.3.1 virtual void `activemq::transport::tcp::TcpTransport::close ()` throw (`decaf::io::IOException`) [virtual]

Delegates to the superclass and then closes the socket.

Exceptions

IOException if errors occur.

Reimplemented from `activemq::transport::TransportFilter` (p. 3638).

6.804.3.2 virtual void `activemq::transport::tcp::TcpTransport::configureSocket (decaf::net::Socket * socket, const decaf::util::Properties & properties)`
[protected, virtual]

Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.

Parameters

socket The Socket instance to configure using options from the given Properties.

Exceptions

NullPointerException if the Socket instance is null.

IllegalArgumentException if the socket instance is not handled by the class.

SocketException if there is an error while setting one of the Socket options.

6.804.3.3 void `activemq::transport::tcp::TcpTransport::connect (const decaf::net::URI & uri, const decaf::util::Properties & properties)`

Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.

The Socket is configured using parameters in the properties that are passed to this method.

Parameters

uri The URI that the **Transport** (p. 3629) is to connect to once initialized.

properties The Properties that have been parsed from the URI or from configuration files.

6.804.3.4 `virtual decaf::net::Socket* activemq::transport::tcp::TcpTransport::createSocket ()`
[protected, virtual]

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

Returns

a newly created unconnected Socket instance.

Exceptions

IOException if there is an error while creating the unconnected Socket.

Reimplemented in `activemq::transport::tcp::SslTransport` (p. 3349).

6.804.3.5 `virtual bool activemq::transport::tcp::TcpTransport::isClosed () const`
[inline, virtual]

Has the **Transport** (p. 3629) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3629)

Reimplemented from `activemq::transport::TransportFilter` (p. 3639).

6.804.3.6 `virtual bool activemq::transport::tcp::TcpTransport::isConnected () const`
[inline, virtual]

Is the **Transport** (p. 3629) Connected to its Broker.

Returns

true if a connection has been made.

Reimplemented from `activemq::transport::TransportFilter` (p. 3639).

6.804.3.7 `virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant () const`
[inline, virtual]

Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3629) is fault tolerant.

Reimplemented from `activemq::transport::TransportFilter` (p. 3640).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/tcp/TcpTransport.h`

6.805 activemq::transport::tcp::TcpTransportFactory Class Reference

Factory Responsible for creating the **TcpTransport** (p. 3510).

```
#include <src/main/activemq/transport/tcp/TcpTransportFactory.h>
```

Inheritance diagram for activemq::transport::tcp::TcpTransportFactory:

Public Member Functions

- virtual **~TcpTransportFactory** ()

6.805.1 Detailed Description

Factory Responsible for creating the **TcpTransport** (p. 3510).

6.805.2 Constructor & Destructor Documentation

6.805.2.1 `virtual`
`activemq::transport::tcp::TcpTransportFactory::~~TcpTransportFactory (`
`) [inline, virtual]`

6.805.3 Member Function Documentation

6.805.3.1 `virtual Pointer<Transport> ac-`
`tivemq::transport::tcp::TcpTransportFactory::create`
`(const decaf::net::URI & location) throw (`
`exceptions::ActiveMQException) [virtual]`

Creates a fully configured **Transport** (p. 3629) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements `activemq::transport::TransportFactory` (p. 3635).

6.805.3.2 `virtual Pointer<Transport> ac-`
`tivemq::transport::tcp::TcpTransportFactory::createComposite (const`
`decaf::net::URI & location) throw (exceptions::ActiveMQException)`
`[virtual]`

Creates a slimed down **Transport** (p. 3629) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements `activemq::transport::TransportFactory` (p. 3635).

6.805.3.3 `virtual Pointer<Transport> ac-`
`tivemq::transport::tcp::TcpTransportFactory::doCreateComposite (const`
`decaf::net::URI & location, const Pointer< wireformat::WireFormat >`
`& wireFormat, const decaf::util::Properties & properties) throw (`
`exceptions::ActiveMQException) [protected, virtual]`

Creates a slimed down **Transport** (p. 3629) instance which can be used in composite transport instances.

Parameters

- location* - URI location to connect to.
- wireFormat* - the assigned WireFormat for the new **Transport** (p. 3629).
- properties* - Properties to apply to the transport.

Returns

new Pointer to a **TcpTransport** (p. 3510).

Exceptions

ActiveMQException if an error occurs

Reimplemented in **activemq::transport::tcp::SslTransportFactory** (p. 3350).

The documentation for this class was generated from the following file:

6.808 cms::TextMessage Class Reference

Interface for a text message.

```
#include <src/main/cms/TextMessage.h>
```

Inheritance diagram for cms::TextMessage:

Public Member Functions

- virtual `~TextMessage` ()
- virtual `std::string getText` () const =0 throw (cms::CMSEException)
Gets the message character buffer.
- virtual void `setText` (const char *msg)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual void `setText` (const std::string &msg)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets the message contents.

6.808.1 Detailed Description

Interface for a text message. A **TextMessage** (p. 3519) can contain any Text based pay load such as an XML Document or other Text based document.

Like all Messages, a **TextMessage** (p. 3519) is received in Read-Only mode, any attempt to write to the **Message** (p. 2375) will result in a MessageNotWritableException being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since

1.0

6.808.2 Constructor & Destructor Documentation

6.808.2.1 virtual cms::TextMessage::~TextMessage () [inline, virtual]

6.808.3 Member Function Documentation

6.808.3.1 virtual std::string cms::TextMessage::getText () const throw (cms::CMSEException) [pure virtual]

Gets the message character buffer.

Returns

The message character buffer.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

```
6.808.3.2 virtual void cms::TextMessage::setText ( const std::string & msg )
          throw ( cms::MessageNotWriteableException, cms::CMSEException )
          [pure virtual]
```

Sets the message contents.

Parameters

msg The message buffer.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode..

```
6.808.3.3 virtual void cms::TextMessage::setText ( const char * msg ) throw
          ( cms::MessageNotWriteableException, cms::CMSEException ) [pure
          virtual]
```

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters

msg The message buffer.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

MessageNotWriteableException (p. 2549) - if the message is in read-only mode..

The documentation for this class was generated from the following file:

- src/main/cms/TextMessage.h

6.809 decaf::lang::Thread Class Reference

A **Thread** (p. 3520) is a concurrent unit of execution.

```
#include <src/main/decaf/lang/Thread.h>
```

Inheritance diagram for decaf::lang::Thread:

Data Structures

- class **UncaughtExceptionHandler**

Interface for handlers invoked when a Thread (p. 3520) abruptly terminates due to an uncaught exception.

Public Types

- enum **State** {
NEW = 0, **RUNNABLE** = 1, **BLOCKED** = 2, **WAITING** = 3,
TIMED_WAITING = 4, **SLEEPING** = 5, **TERMINATED** = 6 }
*Represents the various states that the **Thread** (p. 3520) can be in during its lifetime.*

Public Member Functions

- **Thread** ()
*Constructs a new **Thread** (p. 3520).*
- **Thread** (**Runnable** *task)
*Constructs a new **Thread** (p. 3520) with the given target **Runnable** (p. 3111) task.*

*Forces the Current **Thread** (p. 3520) to wait until the thread exits.*
- virtual void **run** ()
Default implementation of the run method - does nothing.
- std::string **getName** () const
Returns the Thread's assigned name.
- void **setName** (const std::string &name)
*Sets the name of the **Thread** (p. 3520) to the new Name given by the argument name*
- int **getPriority** () const

*Gets the currently set priority for this **Thread** (p. 3520).*

- void **setPriority** (int value) throw (decaf::lang::exceptions::IllegalArgumentException)
Sets the current Thread's priority to the newly specified value.
- const **UncaughtExceptionHandler** * **getUncaughtExceptionHandler** () const
Set the handler invoked when this thread abruptly terminates due to an uncaught exception.
- void **setUncaughtExceptionHandler** (**UncaughtExceptionHandler** *handler)
Set the handler invoked when this thread abruptly terminates due to an uncaught exception.
- std::string **toString** () const
*Returns a string that describes the **Thread** (p. 3520).*
- bool **isAlive** () const
*Returns true if the **Thread** (p. 3520) is alive, meaning it has been started and has not yet died.*
- **Thread::State** **getState** () const
*Returns the currently set State of this **Thread** (p. 3520).*

Static Public Member Functions

- static void **sleep** (long long millisecs) throw (lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException)
Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.
- static void **sleep** (long long millisecs, unsigned int nanos) throw (lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException)
Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.
- static void **yield** ()
Causes the currently executing thread object to temporarily pause and allow other threads to execute.
- static long long **getId** ()
*Obtains the **Thread** (p. 3520) Id of the current thread.*
- static **Thread** * **currentThread** ()
Returns a pointer to the currently executing thread object.

Static Public Attributes

- static const int **MIN_PRIORITY** = 1
The minimum priority that a thread can have.

- static const int **NORM_PRIORITY** = 5

The default priority that a thread is given at create time.

- static const int **MAX_PRIORITY** = 10

The maximum priority that a thread can have.

Friends

- class **decaf::lang::Runtime**

6.809.1 Detailed Description

A **Thread** (p. 3520) is a concurrent unit of execution. It has its own call stack for methods being invoked, their arguments and local variables. Each process has at least one main **Thread** (p. 3520) running when it is started; typically, there are several others for housekeeping. The application might decide to launch additional Threads for specific purposes.

Threads in the same process interact and synchronize by the use of shared objects and monitors associated with these objects.

There are basically two main ways of having a **Thread** (p. 3520) execute application code. One is providing a new class that extends **Thread** (p. 3520) and overriding its **run()** (p. 3527) method. The other is providing a new **Thread** (p. 3520) instance with a **Runnable** (p. 3111) object during its creation. In both cases, the **start()** (p. 3528) method must be called to actually execute the new **Thread** (p. 3520).

Each **Thread** (p. 3520) has an integer priority that basically determines the amount of CPU time the **Thread** (p. 3520) gets. It can be set using the **setPriority(int)** (p. 3527) method. A **Thread** (p. 3520) can also be made a daemon, which makes it run in the background. The latter also affects VM termination behavior: the VM does not terminate automatically as long as there are non-daemon threads running.

6.809.2 Member Enumeration Documentation

6.809.2.1 enum **decaf::lang::Thread::State**

Represents the various states that the **Thread** (p. 3520) can be in during its lifetime.

Enumerator:

NEW Before a **Thread** (p. 3520) is started it exists in this State.

RUNNABLE While a **Thread** (p. 3520) is running and is not blocked it is in this State.

BLOCKED A **Thread** (p. 3520) that is waiting to acquire a lock is in this state.

WAITING A **Thread** (p. 3520) that is waiting for another **Thread** (p. 3520) to perform an action is in this state.

TIMED_WAITING A **Thread** (p. 3520) that is waiting for another **Thread** (p. 3520) to perform an action up to a specified time interval is in this state.

SLEEPING A **Thread** (p. 3520) that is blocked in a **Sleep** call is in this state.

TERMINATED A **Thread** (p. 3520) whose **run** method has exited is in this state.

6.809.3 Constructor & Destructor Documentation

6.809.3.1 decaf::lang::Thread::Thread ()

Constructs a new **Thread** (p. 3520).

This constructor has the same effect as **Thread**(**NULL**, **NULL**, **GIVEN_NAME**), where **GIVEN_NAME** is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

6.809.3.2 decaf::lang::Thread::Thread (**Runnable** * *task*)

Constructs a new **Thread** (p. 3520) with the given target **Runnable** (p. 3111) task.

This constructor has the same effect as **Thread**(**NULL**, *task*, **GIVEN_NAME**), where **GIVEN_NAME** is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

task the **Runnable** (p. 3111) that this thread manages, if the task is **NULL** the **Thread**'s **run** method is used instead.

6.809.3.3 decaf::lang::Thread::Thread (**const** **std::string** & *name*)

Constructs a new **Thread** (p. 3520) with the given name.

This constructor has the same effect as **Thread**(**NULL**, **NULL**, **GIVEN_NAME**), where **GIVEN_NAME** is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

name the name to assign to this **Thread** (p. 3520).

6.809.3.4 decaf::lang::Thread::Thread (**Runnable** * *task*, **const** **std::string** & *name*)

Constructs a new **Thread** (p. 3520) with the given target **Runnable** (p. 3111) task and name.

This constructor has the same effect as **Thread**(**NULL**, *task*, **GIVEN_NAME**), where **GIVEN_NAME** is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

task the **Runnable** (p. 3111) that this thread manages, if the task is NULL the Thread's run method is used instead.

name the name to assign to this **Thread** (p. 3520).

6.809.3.5 `virtual decaf::lang::Thread::~~Thread () [virtual]`

6.809.4 Member Function Documentation

6.809.4.1 `static Thread* decaf::lang::Thread::currentThread () [static]`

Returns a pointer to the currently executing thread object.

Returns

Pointer (p. 2756) to the **Thread** (p. 3520) object representing the currently running **Thread** (p. 3520).

6.809.4.2 `static long long decaf::lang::Thread::getId () [static]`

Obtains the **Thread** (p. 3520) Id of the current thread.

Returns

Thread (p. 3520) Id

6.809.4.3 `std::string decaf::lang::Thread::getName () const`

Returns the Thread's assigned name.

Returns

the Name of the **Thread** (p. 3520).

6.809.4.4 `int decaf::lang::Thread::getPriority () const`

Gets the currently set priority for this **Thread** (p. 3520).

Returns

an int value representing the Thread's current priority.

6.809.4.5 `Thread::State decaf::lang::Thread::getState () const`

Returns the currently set State of this **Thread** (p. 3520).

Returns

the Thread's current state.

6.809.4.6 `const UncaughtExceptionHandler* decaf::lang::Thread::getUncaughtExceptionHandler () const`

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Returns

a pointer to the set **UncaughtExceptionHandler** (p. 3648).

6.809.4.7 `bool decaf::lang::Thread::isAlive () const`

Returns true if the **Thread** (p. 3520) is alive, meaning it has been started and has not yet died.

Returns

true if the thread is alive.

6.809.4.8 `virtual void decaf::lang::Thread::join (long long millisecs, unsigned int nanos) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::InterruptedException) [virtual]`

Forces the Current **Thread** (p. 3520) to wait until the thread exits.

Parameters

millisecs the time in Milliseconds before the thread resumes

nanos 0-999999 extra nanoseconds to sleep.

Exceptions

IllegalArgumentException if the nanoseconds parameter is out of range or the milliseconds paramter is negative.

InterruptedException if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.809.4.9 `virtual void decaf::lang::Thread::join () throw (decaf::lang::exceptions::InterruptedException) [virtual]`

Forces the Current **Thread** (p. 3520) to wait until the thread exits.

Exceptions

InterruptedException if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.809.4.10 `virtual void decaf::lang::Thread::join (long long millisecs)
 throw (decaf::lang::exceptions::IllegalArgumentException,
 decaf::lang::exceptions::InterruptedException) [virtual]`

Forces the Current **Thread** (p. 3520) to wait until the thread exits.

Parameters

millisecs the time in Milliseconds before the thread resumes

Exceptions

IllegalArgumentException if the milliseconds parameter is negative.

InterruptedException if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.809.4.11 `virtual void decaf::lang::Thread::run () [virtual]`

Default implementation of the run method - does nothing.

Implements **decaf::lang::Runnable** (p. 3112).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 1987), and **decaf::util::concurrent::PooledThread** (p. 2778).

6.809.4.12 `void decaf::lang::Thread::setName (const std::string & name)`

Sets the name of the **Thread** (p. 3520) to the new Name given by the argument *name*
 name the new name of the **Thread** (p. 3520).

6.809.4.13 `void decaf::lang::Thread::setPriority (int value) throw (decaf::lang::exceptions::IllegalArgumentException)`

Sets the current Thread's priority to the newly specified value.

The given value must be within the range **Thread::MIN_PRIORITY** (p. 3529) and **Thread::MAX_PRIORITY** (p. 3529).

Parameters

value the new priority value to assign to this **Thread** (p. 3520).

Exceptions

IllegalArgumentException if the value is out of range.

6.809.4.14 `void decaf::lang::Thread::setUncaughtExceptionHandler (UncaughtExceptionHandler * handler)`

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Parameters

handler the `UncaughtExceptionHandler` to invoke when the **Thread** (p. 3520) terminates due to an uncaught exception.

6.809.4.15 `static void decaf::lang::Thread::sleep (long long millisecs, unsigned int nanos) throw (lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException) [static]`

Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters

millisecs time in milliseconds to halt execution.

nanos 0-999999 extra nanoseconds to sleep.

Exceptions

IllegalArgumentException if the nanoseconds parameter is out of range or the milliseconds parameter is negative.

InterruptedException if the **Thread** (p. 3520) was interrupted while sleeping.

6.809.4.16 `static void decaf::lang::Thread::sleep (long long millisecs) throw (lang::exceptions::InterruptedException, lang::exceptions::IllegalArgumentException) [static]`

Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters

millisecs time in milliseconds to halt execution.

Exceptions

IllegalArgumentException if the milliseconds parameter is negative.

InterruptedException if the **Thread** (p. 3520) was interrupted while sleeping.

6.809.4.17 `virtual void decaf::lang::Thread::start () throw (decaf::lang::exceptions::IllegalThreadStateException, decaf::lang::exceptions::RuntimeException) [virtual]`

Creates a system thread and starts it in a joinable mode.

Upon creation, the `run()` (p. 3527) method of either this object or the provided **Runnable** (p. 3111) object will be invoked in the context of this thread.

Exceptions

IllegalThreadStateException if the thread has already been started.

RuntimeException if the **Thread** (p. 3520) cannot be created for some reason.

6.809.4.18 `std::string decaf::lang::Thread::toString () const`

Returns a string that describes the **Thread** (p. 3520).

Returns

string describing the **Thread** (p. 3520).

6.809.4.19 `static void decaf::lang::Thread::yield () [static]`

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

6.809.5 Friends And Related Function Documentation

6.809.5.1 `friend class decaf::lang::Runtime [friend]`

6.809.5.2 `friend class decaf::util::concurrent::locks::LockSupport [friend]`

6.809.6 Field Documentation

6.809.6.1 `const int decaf::lang::Thread::MAX_PRIORITY = 10 [static]`

The maximum priority that a thread can have.

6.809.6.2 `const int decaf::lang::Thread::MIN_PRIORITY = 1 [static]`

The minimum priority that a thread can have.

6.809.6.3 `const int decaf::lang::Thread::NORM_PRIORITY = 5 [static]`

The default priority that a thread is given at create time.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Thread.h`

6.810 `decaf::util::concurrent::ThreadFactory` Class Reference

public interface **ThreadFactory** (p. 3529)

```
#include <src/main/decaf/util/concurrent/ThreadFactory.h>
```

Public Member Functions

- virtual `~ThreadFactory()`
- virtual `decaf::lang::Thread * newThread (decaf::lang::Runnable *r)=0`
Constructs a new Thread.

6.810.1 Detailed Description

public interface **ThreadFactory** (p. 3529) An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

```
class SimpleThreadFactory : public ThreadFactory (p. 3529) { public: Thread* newThread(
Runnable* r ) { return new Thread(r); } }
```

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since

1.0

6.810.2 Constructor & Destructor Documentation

- 6.810.2.1** virtual `decaf::util::concurrent::ThreadFactory::~~ThreadFactory ()`
[inline, virtual]

6.810.3 Member Function Documentation

- 6.810.3.1** virtual `decaf::lang::Thread* decaf::util::concurrent::ThreadFactory::newThread (decaf::lang::Runnable * r)` [pure virtual]

Constructs a new Thread.

Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

Parameters

r A pointer to a Runnable instance to be executed by new Thread instance returned.

Returns

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadFactory.h**

6.811 decaf::lang::ThreadGroup Class Reference

6.812 decaf::util::concurrent::ThreadPool Class Reference

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

```
#include <src/main/decaf/util/concurrent/ThreadPool.h>
```

Inheritance diagram for decaf::util::concurrent::ThreadPool:

Public Types

- typedef std::pair< lang::Runnable *, TaskListener * > **Task**

Public Member Functions

- **ThreadPool** ()
- virtual **~ThreadPool** ()
- virtual void **queueTask** (**Task** task) throw (lang::Exception)
Queue (p. 2948) a task to be completed by one of the Pooled Threads.
- virtual **Task deQueueTask** () throw (lang::Exception)
DeQueue a task to be completed by one of the Pooled Threads.

- virtual `std::size_t` **getPoolSize** () const
Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.
- virtual `std::size_t` **getBacklog** () const
Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.
- virtual void **reserve** (std::size_t size)
Ensures that there is at least the specified number of Threads allocated to the pool.
- virtual `std::size_t` **getMaxThreads** () const
Get the Max Number of Threads this Pool can contain.
- virtual void **setMaxThreads** (std::size_t maxThreads)
Sets the Max number of threads this pool can contain.
- virtual `std::size_t` **getBlockSize** () const
Gets the Max number of threads that can be allocated at a time when new threads are needed.
- virtual void **setBlockSize** (std::size_t blockSize)
Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.
- virtual `std::size_t` **getFreeThreadCount** () const
Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.
- virtual void **onTaskStarted** (PooledThread *thread)
Called by a pooled thread when it is about to begin executing a new task.
- virtual void **onTaskCompleted** (PooledThread *thread)
Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.
- virtual void **onTaskException** (PooledThread *thread, lang::Exception &ex)
*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2777) is now no longer running.*

Static Public Member Functions

- static `ThreadPool *` **getInstance** ()
Return the one and only Thread Pool instance.

Static Public Attributes

- static const `size_t` **DEFAULT_MAX_POOL_SIZE** = 10
- static const `size_t` **DEFAULT_MAX_BLOCK_SIZE** = 3

6.812.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks. The Thread Pool has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the `Runnable` interface and one of the worker threads will be executing it in its thread context.

6.812.2 Member Typedef Documentation

6.812.2.1 `typedef std::pair<lang::Runnable*, TaskListener*>
decaf::util::concurrent::ThreadPool::Task`

6.812.3 Constructor & Destructor Documentation

6.812.3.1 `decaf::util::concurrent::ThreadPool::ThreadPool ()`

6.812.3.2 `virtual decaf::util::concurrent::ThreadPool::~~ThreadPool () [virtual]`

6.812.4 Member Function Documentation

6.812.4.1 `virtual Task decaf::util::concurrent::ThreadPool::deQueueTask ()
throw (lang::Exception) [virtual]`

DeQueue a task to be completed by one of the Pooled Threads.

A caller of this method will block until there is something in the tasks queue, therefore care must be taken when calling this function. Normally clients of **ThreadPool** (p. 3531) don't use this, only the **PooledThread** (p. 2777) objects owned by this **ThreadPool** (p. 3531).

Returns

object that derives from `Runnable`

Exceptions

ActiveMQException

6.812.4.2 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBacklog ()
const [inline, virtual]`

Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.

Returns

number of outstanding tasks.

6.812.4.3 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBlockSize () const [inline, virtual]`

Gets the Max number of threads that can be allocated at a time when new threads are needed.

Returns

max Thread Block Size

6.812.4.4 `virtual std::size_t decaf::util::concurrent::ThreadPool::getFreeThreadCount () const [inline, virtual]`

Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.

This value could change immediately after calling as Threads could finish right after and be available again. This is informational only.

Returns

total free threads

6.812.4.5 `static ThreadPool* decaf::util::concurrent::ThreadPool::getInstance () [static]`

Return the one and only Thread Pool instance.

Returns

The Thread Pool Pointer

6.812.4.6 `virtual std::size_t decaf::util::concurrent::ThreadPool::getMaxThreads () const [inline, virtual]`

Get the Max Number of Threads this Pool can contain.

Returns

max size

6.812.4.7 `virtual std::size_t decaf::util::concurrent::ThreadPool::getPoolSize () const [inline, virtual]`

Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.

Returns

integer number of threads in existence.

6.812.4.8 **virtual void decaf::util::concurrent::ThreadPool::onTaskCompleted (PooledThread * *thread*) [virtual]**

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

Parameters

thread Pointer the the Pooled Thread that is making this call.

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2780).

6.812.4.9 **virtual void decaf::util::concurrent::ThreadPool::onTaskException (PooledThread * *thread*, lang::Exception & *ex*) [virtual]**

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2777) is now no longer running.

Parameters

thread Pointer to the Pooled Thread that is making this call

ex The Exception that occurred.

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2780).

6.812.4.10 **virtual void decaf::util::concurrent::ThreadPool::onTaskStarted (PooledThread * *thread*) [virtual]**

Called by a pooled thread when it is about to begin executing a new task.

This will decrement the available threads counter so that this object knows when there are no more free threads and must create new ones.

Parameters

thread Pointer to the Pooled Thread that is making this call

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2780).

6.812.4.11 **virtual void decaf::util::concurrent::ThreadPool::queueTask (Task *task*) throw (lang::Exception) [virtual]**

Queue (p. 2948) a task to be completed by one of the Pooled Threads.

tasks are serviced as soon as a **PooledThread** (p. 2777) is available to run it.

Parameters

task object that derives from Runnable

Exceptions

ActiveMQException

6.812.4.12 virtual void decaf::util::concurrent::ThreadPool::reserve (std::size_t *size*) [virtual]

Ensures that there is at least the specified number of Threads allocated to the pool.

If the size is greater than the MAX number of threads in the pool, then only MAX threads are reserved. If the size is smaller than the number of threads currently in the pool, than nothing is done.

Parameters

size the number of threads to reserve.

6.812.4.13 virtual void decaf::util::concurrent::ThreadPool::setBlockSize (std::size_t *blockSize*) [virtual]

Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.

Parameters

blockSize Max Thread Block Size

6.812.4.14 virtual void decaf::util::concurrent::ThreadPool::setMaxThreads (std::size_t *maxThreads*) [virtual]

Sets the Max number of threads this pool can contain.

if this value is smaller than the current size of the pool nothing is done.

Parameters

maxThreads total number of threads that can be pooled

6.812.5 Field Documentation

6.812.5.1 const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_BLOCK_SIZE = 3 [static]

6.812.5.2 const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_POOL_SIZE = 10 [static]

6.813 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

```
#include <src/main/decaf/lang/Throwable.h>
```

Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** () throw ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () const =0
Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.
- virtual const std::exception * **getCause** () const =0
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (const std::exception *cause)=0
Initializes the contained cause exception with the one given.
- virtual void **setMark** (const char *file, const int lineNumber)=0
Adds a file/line number to the stack trace.
- virtual **Throwable** * **clone** () const =0
Clones this exception.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const =0
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () const =0
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const =0
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const =0
Gets the stack trace as one contiguous string.

6.813.1 Detailed Description

This class represents an error that has occurred. All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1712) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 3536) can wrap another **Throwable** (p. 3536) as the cause if the error being thrown. The user can inspect the cause by calling **getCause**, the pointer returned is the property of the **Throwable** (p. 3536) instance and will be deleted when it is deleted or goes out of scope.

6.813.3.2 `virtual const std::exception* decaf::lang::Throwable::getCause () const` [pure virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1716).

6.813.3.3 `virtual std::string decaf::lang::Throwable::getMessage () const` [pure virtual]

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

Returns

string errors message

Implemented in **decaf::lang::Exception** (p. 1716).

6.813.3.4 `virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace () const` [pure virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1716).

6.813.3.5 `virtual std::string decaf::lang::Throwable::getStackTraceString () const`
[pure virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1717).

6.813.3.6 `virtual void decaf::lang::Throwable::initCause (const std::exception *
cause)` [pure virtual]

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

cause The exception that was the cause of this one.

Implemented in **decaf::lang::Exception** (p. 1717).

6.813.3.7 `virtual void decaf::lang::Throwable::printStackTrace () const` [pure
virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 1717).

6.813.3.8 `virtual void decaf::lang::Throwable::printStackTrace (std::ostream &
stream) const` [pure virtual]

Prints the stack trace to the given output stream.

Parameters

stream the target output stream.

Implemented in **decaf::lang::Exception** (p. 1717).

6.813.3.9 `virtual void decaf::lang::Throwable::setMark (const char * file, const
int lineNumber)` [pure virtual]

Adds a file/line number to the stack trace.

Parameters

file The name of the file calling this method (use `__FILE__`).

lineNumber The line number in the calling file (use `__LINE__`).

Implemented in **decaf::lang::Exception** (p. 1718).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Throwable.h`

6.814 decaf::util::concurrent::TimeoutException Class Reference

```
#include <src/main/decaf/util/concurrent/TimeoutException.h>
```

Inheritance diagram for `decaf::util::concurrent::TimeoutException`:

Public Member Functions

- **TimeoutException** () throw ()
Default Constructor.
- **TimeoutException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **TimeoutException** (const **TimeoutException** &ex) throw ()
Copy Constructor.
- **TimeoutException** (const std::exception *cause) throw ()
Constructor.
- **TimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **TimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **TimeoutException** * clone () const
Clones this exception.
- virtual ~**TimeoutException** () throw ()

6.814.1 Constructor & Destructor Documentation

6.814.1.1 decaf::util::concurrent::TimeoutException::TimeoutException () throw () [inline]

Default Constructor.

6.814.1.2 decaf::util::concurrent::TimeoutException::TimeoutException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.814.1.3 decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex The exception to copy from.

References decaf::lang::Exception::Exception().

6.814.1.4 decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.814.1.5 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The string message to report

... list of primitives that are formatted into the message

6.814.1.6 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The string message to report
 ... list of primitives that are formatted into the message

6.814.1.7 `virtual decaf::util::concurrent::TimeoutException::~~TimeoutException () throw () [inline, virtual]`

6.814.2 Member Function Documentation

6.814.2.1 `virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new **TimeoutException** (p. 3541) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TimeoutException.h`

6.815 decaf::util::Timer Class Reference

A facility for threads to schedule tasks for future execution in a background thread.

```
#include <src/main/decaf/util/Timer.h>
```

Public Member Functions

- **Timer** ()
- virtual **~Timer** ()
- void **cancel** ()
Terminates this timer, discarding any currently scheduled tasks.
- `std::size_t` **purge** ()
Removes all canceled tasks from this timer's task queue.
- void **schedule** (**TimerTask** *task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for execution after the specified delay.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for execution after the specified delay.
- void **schedule** (**TimerTask** *task, const **Date** &time) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for execution at the specified time.
- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &time) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for execution at the specified time.
- void **schedule** (**TimerTask** *task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.
- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.
- void **schedule** (**TimerTask** *task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.
- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.
- void **scheduleAtFixedRate** (**TimerTask** *task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.
- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- `void scheduleAtFixedRate (TimerTask *task, const Date &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

- `void scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > &task, const Date &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

6.815.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread. Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 3543) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 3543) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 3543) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the `wait(long)` method.

Since

1.0

6.815.2 Constructor & Destructor Documentation

6.815.2.1 `decaf::util::Timer::Timer ()`

6.815.2.2 `virtual decaf::util::Timer::~~Timer () [virtual]`

6.815.3 Member Function Documentation

6.815.3.1 `void decaf::util::Timer::cancel ()`

Terminates this timer, discarding any currently scheduled tasks.

Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the `run` method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.815.3.2 std::size_t decaf::util::Timer::purge ()

Removes all canceled tasks from this timer's task queue.

Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p. 3543) to destroy the **TimerTask** (p. 3554) pointer it was originally given, the caller should ensure that they no longer have any references to TimerTasks that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to $n + c \log n$, where n is the number of tasks in the queue and c is the number of canceled tasks.

This method can be called on a **Timer** (p. 3543) object that has no scheduled tasks without error.

Returns

the number of tasks removed from the queue.

6.815.3.3 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution after the specified delay.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, or timer was cancelled.

6.815.3.4 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will

generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if delay is negative, or delay + `System.currentTimeMillis()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.815.3.5 void decaf::util::Timer::schedule ( TimerTask * task,
const Date & firstTime, long long period )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3554) pointer is considered to be owned by the **Timer** (p. 3543) class once it has been scheduled, the **Timer** (p. 3543) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3543) itself is cancelled. A **TimerTask** (p. 3554) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3543) and the caller should ensure that the **TimerTask** (p. 3554) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3554) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.815.3.6 void decaf::util::Timer::schedule (TimerTask * *task*, const Date & *time*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 3554) pointer is considered to be owned by the **Timer** (p. 3543) class once it has been scheduled, the **Timer** (p. 3543) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3543) itself is cancelled. A **TimerTask** (p. 3554) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3543) and the caller should ensure that the **TimerTask** (p. 3554) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3554) instance are planned.

Parameters

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.815.3.7 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *firstTime*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if `time.getTime()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.815.3.8 void decaf::util::Timer::schedule ( TimerTask * task, long long
delay ) throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for execution after the specified delay.

The **TimerTask** (p. 3554) pointer is considered to be owned by the **Timer** (p. 3543) class once it has been scheduled, the **Timer** (p. 3543) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3543) itself is cancelled. A **TimerTask** (p. 3554) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3543) and the caller should ensure that the **TimerTask** (p. 3554) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3554) instance are planned.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if delay is negative, or delay + `System.currentTimeMillis()` is negative.

IllegalStateException - if task was already scheduled or cancelled, or timer was cancelled.

6.815.3.9 void decaf::util::Timer::schedule (TimerTask * *task*, long long *delay*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3554) pointer is considered to be owned by the **Timer** (p. 3543) class once it has been scheduled, the **Timer** (p. 3543) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3543) itself is cancelled. A **TimerTask** (p. 3554) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3543) and the caller should ensure that the **TimerTask** (p. 3554) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3554) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if delay is negative, or delay + `System.currentTimeMillis()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.815.3.10 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *time*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

Parameters

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.815.3.11 void decaf::util::Timer::scheduleAtFixedRate ( TimerTask
* task, long long delay, long long period )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3554) pointer is considered to be owned by the **Timer** (p. 3543) class once it has been scheduled, the **Timer** (p. 3543) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3543) itself is cancelled. A **TimerTask** (p. 3554) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3543) and the caller should ensure that the **TimerTask** (p. 3554) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3554) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.815.3.12 `void decaf::util::Timer::scheduleAtFixedRate (const
decaf::lang::Pointer< TimerTask > & task, long long delay, long
long period) throw (decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if delay is negative, or delay + `System.currentTimeMillis()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.815.3.13 `void decaf::util::Timer::scheduleAtFixedRate (const
decaf::lang::Pointer< TimerTask > & task, const
Date & firstTime, long long period) throw
(decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3554) value is Null.

IllegalArgumentException - if `time.getTime()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.815.3.14 void decaf::util::Timer::scheduleAtFixedRate ( TimerTask
* task, const Date & firstTime, long long period )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3554) pointer is considered to be owned by the **Timer** (p. 3543) class once it has been scheduled, the **Timer** (p. 3543) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 3543) itself is cancelled. A **TimerTask** (p. 3554) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3543) and the caller should ensure that the **TimerTask** (p. 3554) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3554) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a

fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

- task*** - task to be scheduled.
- firstTime*** - First time at which task is to be executed.
- period*** - time in milliseconds between successive task executions.

Exceptions

- NullPointerException*** - if the **TimerTask** (p. 3554) value is Null.
- IllegalArgumentException*** - if time.getTime() is negative.
- IllegalStateException*** - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.816.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a `Timer` (p. 3543).

Since

1.0

6.816.2 Constructor & Destructor Documentation

6.816.2.1 `decaf::util::TimerTask::TimerTask ()`

6.816.2.2 `virtual decaf::util::TimerTask::~~TimerTask () [inline, virtual]`

6.816.3 Member Function Documentation

6.816.3.1 `bool decaf::util::TimerTask::cancel ()`

Cancels this timer task.

If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

Returns

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

6.816.3.2 `long long decaf::util::TimerTask::getWhen () const [protected]`

6.816.3.3 `bool decaf::util::TimerTask::isScheduled () const [protected]`

6.816.3.4 `long long decaf::util::TimerTask::scheduledExecutionTime () const`

Returns the scheduled execution time of the most recent actual execution of this task.

(If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

```
void run() (p. 3112) { if( System::currentTimeMillis() - scheduledExecutionTime() (p. 3555)
>= MAX_TARDINESS) return; // Too late; skip this execution. // Perform the task }
```

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

Returns

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 1561). The return value is undefined if the task has yet to commence its first execution.

6.816.3.5 void decaf::util::TimerTask::setScheduledTime (long long *time*)

6.817 decaf::internal::util::TimerTaskHeap Class Reference

A Binary Heap implemented specifically for the Timer class in Decaf Util.

```
#include <src/main/decaf/internal/util/TimerTaskHeap.h>
```

Public Member Functions

- **TimerTaskHeap** ()
- virtual **~TimerTaskHeap** ()
- **Pointer< TimerTask > peek** ()

Peeks at the Head of the Heap, returns the task with the nearest scheduled run time.

- bool **isEmpty** () const
- std::size_t **size** () const
- void **insert** (const **Pointer< TimerTask >** &task)

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

- void **remove** (std::size_t pos)

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

- void **reset** ()

Clear all contents from the heap.

- void **adjustMinimum** ()

Resorts the heap starting at the top.

- std::size_t **deleteIfCancelled** ()

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a cancellation of a large number of tasks the user can perform this purge.

- std::size_t **find** (const **Pointer**< **TimerTask** > &task) const

Searches the heap for the specified TimerTask element and returns its position in the heap.

6.817.1 Detailed Description

A Binary Heap implemented specifically for the Timer class in Decaf Util.

Since

1.0

6.817.2 Constructor & Destructor Documentation

6.817.2.1 **decaf::internal::util::TimerTaskHeap::TimerTaskHeap** ()

6.817.2.2 **virtual decaf::internal::util::TimerTaskHeap::~~TimerTaskHeap** ()
[virtual]

6.817.3 Member Function Documentation

6.817.3.1 **void decaf::internal::util::TimerTaskHeap::adjustMinimum** ()

Resorts the heap starting at the top.

6.817.3.2 **std::size_t decaf::internal::util::TimerTaskHeap::deleteIfCancelled** ()

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a cancellation of a large number of tasks the user can perform this purge.

Returns

the number of task that were removed from the heap because they were cancelled.

6.817.3.3 `std::size_t decaf::internal::util::TimerTaskHeap::find (const Pointer< TimerTask > & task) const`

Searches the heap for the specified TimerTask element and returns its position in the heap.

Returns the unsigned equivalent of -1 if the element is not found.

Returns

the position in the Heap where the Task is stored, or npos.

6.817.3.4 `void decaf::internal::util::TimerTaskHeap::insert (const Pointer< TimerTask > & task)`

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

Parameters

task The TimerTask to insert into the heap.

6.817.3.5 `bool decaf::internal::util::TimerTaskHeap::isEmpty () const`**Returns**

true if the heap is empty.

6.817.3.6 `Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ()`

Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

Returns

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

6.817.3.7 `void decaf::internal::util::TimerTaskHeap::remove (std::size_t pos)`

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

Parameters

pos The position at which to remove the TimerTask and begin a resort of the heap.

6.817.3.8 `void decaf::internal::util::TimerTaskHeap::reset ()`

Clear all contents from the heap.

6.817.3.9 `std::size_t decaf::internal::util::TimerTaskHeap::size () const`

Returns

the size of the heap.

6.818.1 Detailed Description

A **TimeUnit** (p. 3559) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units. A **TimeUnit** (p. 3559) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 3559) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

```
Lock (p. 2228) lock = ...; if ( lock.tryLock( 50, TimeUnit.MILLISECONDS (p. 3567) ) ) ...
```

while this code will timeout in 50 seconds:

```
Lock (p. 2228) lock = ...; if ( lock.tryLock( 50, TimeUnit.SECONDS (p. 3568) ) ) ...
```

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 3559).

6.818.2 Constructor & Destructor Documentation

6.818.2.1 `decaf::util::concurrent::TimeUnit::TimeUnit (int index, const std::string & name)` [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters

index - Index into the Time Unit set.

name - Name of the unit type being represented.

6.818.2.2 `virtual decaf::util::concurrent::TimeUnit::~~TimeUnit ()` [inline, virtual]

6.818.3 Member Function Documentation

6.818.3.1 `virtual int decaf::util::concurrent::TimeUnit::compareTo (const TimeUnit & value) const` [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all `x` and `y`. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementor must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all `z`.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the `Comparable` interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.818.3.2 long long decaf::util::concurrent::TimeUnit::convert (long long *sourceDuration*, const TimeUnit & *sourceUnit*) const

Convert the given time duration in the given unit to this unit.

Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to `Long.MIN_VALUE` if negative or `Long.MAX_VALUE` if positive.

For example, to convert 10 minutes to milliseconds, use: `TimeUnit.MILLISECONDS.convert(10L, TimeUnit.MINUTES)` (p. 3567)

Parameters

sourceDuration - Duration value to convert.

sourceUnit - Unit type of the source duration.

Returns

the converted duration in this unit, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

6.818.3.3 virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & *value*) const [virtual]

Returns

true if this value is considered equal to the passed value.

6.818.3.4 `virtual bool decaf::util::concurrent::TimeUnit::operator< (const
TimeUnit & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.818.3.5 `virtual bool decaf::util::concurrent::TimeUnit::operator== (const
TimeUnit & value) const [virtual]`

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.818.3.6 `void decaf::util::concurrent::TimeUnit::sleep (long long timeout) const
throw (decaf::lang::exceptions::InterruptedException)`

Perform a `Thread.sleep` using this unit.

This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

Parameters

timeout the minimum time to sleep

See also

`Thread::sleep`

6.818.3.7 `void decaf::util::concurrent::TimeUnit::timedJoin (decaf::lang::Thread * thread, long long timeout)
throw (decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::NullPointerException)`

Perform a timed `Thread.join` using this time unit.

This is a convenience method that converts time arguments into the form required by the `Thread.join` method.

Parameters

thread the thread to wait for

timeout the maximum time to wait

Exceptions

InterruptedException if interrupted while waiting.

NullPointerException if the thread object is null.

See also

Thread::join(long long, long long)

6.818.3.8 void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * *obj*, long long *timeout*) const
throw (decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::NullPointerException)

Perform a timed Object.wait using this time unit.

This is a convenience method that converts timeout arguments into the form required by the Object.wait method.

For example, you could implement a blocking poll method (see **BlockingQueue.poll** (p. 779)) using:

```
Object poll( long long timeout, const TimeUnit& unit )
    throw( InterruptedException ) {

    while( empty ) {
        unit.timedWait(this, timeout);
        ...
    }
}
```

Parameters

obj the object to wait on

timeout the maximum time to wait.

Exceptions

InterruptedException if interrupted while waiting.

NullPointerException if the **Synchronizable** (p. 3461) object is null.

See also

Synchronizable::wait(long long, long long)

6.818.3.9 long long decaf::util::concurrent::TimeUnit::toDays (long long *duration*) const [inline]

Equivalent to DAYS.convert(duration, this).

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3562)

6.818.3.10 `long long decaf::util::concurrent::TimeUnit::toHours (long long
duration) const [inline]`

Equivalent to `HOURS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3562)

6.818.3.11 `long long decaf::util::concurrent::TimeUnit::toMicros (long long
duration) const [inline]`

Equivalent to `MICROSECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

`convert` (p. 3562)

6.818.3.12 `long long decaf::util::concurrent::TimeUnit::toMillis (long long
duration) const [inline]`

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX_VALUE if it would positively overflow.

See also

`convert` (p. 3562)

6.818.3.13 `long long decaf::util::concurrent::TimeUnit::toMinutes (long long duration) const [inline]`

Equivalent to `MINUTES.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3562)

6.818.3.14 `long long decaf::util::concurrent::TimeUnit::toNanos (long long duration) const [inline]`

Equivalent to `NANOSECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX_VALUE if it would positively overflow.

See also

`convert` (p. 3562)

6.818.3.15 `long long decaf::util::concurrent::TimeUnit::toSeconds (long long duration) const [inline]`

Equivalent to `SECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3562)

6.818.3.16 `virtual std::string decaf::util::concurrent::TimeUnit::toString () const`
[virtual]

Converts the **TimeUnit** (p. 3559) type to the Name of the **TimeUnit** (p. 3559).

Returns

String name of the **TimeUnit** (p. 3559)

6.818.3.17 `static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf`
`(const std::string & name) throw (de-`
`cafe::lang::exceptions::IllegalArgumentException)`
[static]

Returns the **TimeUnit** (p. 3559) constant of this type with the specified name.

The string must match exactly an identifier used to declare an **TimeUnit** (p. 3559) constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters

name The Name of the **TimeUnit** (p. 3559) constant to be returned.

Returns

A constant reference to the **TimeUnit** (p. 3559) Constant with the given name.

Exceptions

IllegalArgumentException if this enum type has no constant with the specified name

6.818.4 Field Documentation

6.818.4.1 `const TimeUnit decaf::util::concurrent::TimeUnit::DAYS` [static]

6.818.4.2 `const TimeUnit decaf::util::concurrent::TimeUnit::HOURS` [static]

6.818.4.3 `const TimeUnit decaf::util::concurrent::TimeUnit::MICROSECONDS`
[static]

6.818.4.4 `const TimeUnit decaf::util::concurrent::TimeUnit::MILLISECONDS`
[static]

6.818.4.5 `const TimeUnit decaf::util::concurrent::TimeUnit::MINUTES` [static]

6.818.4.6 `const TimeUnit decaf::util::concurrent::TimeUnit::NANOSECONDS`
[static]

The Actual **TimeUnit** (p. 3559) enumerations.

6.818.4.7 `const TimeUnit decaf::util::concurrent::TimeUnit::SECONDS` [static]

6.818.4.8 `const TimeUnit* const decaf::util::concurrent::TimeUnit::values[]`
[static]

The An Array of **TimeUnit** (p. 3559) Instances.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TimeUnit.h`

6.819 cms::Topic Class Reference

An interface encapsulating a provider-specific topic name.

```
#include <src/main/cms/Topic.h>
```

Inheritance diagram for cms::Topic:

Public Member Functions

- `virtual ~Topic ()`
- `virtual std::string getTopicName () const =0 throw (CMSEException)`
Gets the name of this topic.

6.819.1 Detailed Description

An interface encapsulating a provider-specific topic name. A **Topic** (p. 3568) is a Publish / Subscribe type **Destination** (p. 1610). All Messages sent to a **Topic** (p. 3568) are broadcast to all Subscribers of that **Topic** (p. 3568) unless the Subscriber defines a **Message** (p. 2375) selector that filters out that **Message** (p. 2375).

Since

1.0

6.819.2 Constructor & Destructor Documentation

6.819.2.1 `virtual cms::Topic::~~Topic ()` [inline, virtual]

6.819.3 Member Function Documentation

6.819.3.1 `virtual std::string cms::Topic::getTopicName () const throw (CMSEException)` [pure virtual]

Gets the name of this topic.

Returns

The topic name.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in `activemq::commands::ActiveMQTopic` (p. 636).

The documentation for this class was generated from the following file:

- `src/main/cms/Topic.h`

6.820 `activemq::state::Tracked` Class Reference

```
#include <src/main/activemq/state/Tracked.h>
```

Inheritance diagram for `activemq::state::Tracked`:

Public Member Functions

- `Tracked ()`
- `Tracked (const Pointer< decaf::lang::Runnable > &runnable)`
- `virtual ~Tracked ()`
- `void onResponse ()`
- `bool isWaitingForResponse () const`

6.820.1 Constructor & Destructor Documentation

6.820.1.1 `activemq::state::Tracked::Tracked () [inline]`

6.820.1.2 `activemq::state::Tracked::Tracked (const Pointer< decaf::lang::Runnable > & runnable)`

#include <src/main/activemq/commands/TransactionId.h>
```

Inheritance diagram for activemq::commands::TransactionId:

Public Types

- typedef decaf::lang::PointerComparator< TransactionId > COMPARATOR

Public Member Functions

- TransactionId ()
- TransactionId (const TransactionId &other)
- virtual ~TransactionId ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual TransactionId * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const DataStructure *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const DataStructure *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual int **compareTo** (const TransactionId &value) const
- virtual bool **equals** (const TransactionId &value) const
- virtual bool **operator==** (const TransactionId &value) const
- virtual bool **operator<** (const TransactionId &value) const
- TransactionId & **operator=** (const TransactionId &other)

Static Public Attributes

- static const unsigned char **ID_TRANSACTIONID** = 0

6.821.1 Member Typedef Documentation

6.821.1.1 `typedef decaf::lang::PointerComparator<TransactionId>
activemq::commands::TransactionId::COMPARATOR`

6.821.2 Constructor & Destructor Documentation

6.821.2.1 `activemq::commands::TransactionId::TransactionId ()`

6.821.2.2 `activemq::commands::TransactionId::TransactionId (const
TransactionId & other)`

6.821.2.3 `virtual activemq::commands::TransactionId::~~TransactionId ()
[virtual]`

6.821.3 Member Function Documentation

6.821.3.1 `virtual TransactionId* ac-
tivemq::commands::TransactionId::cloneDataStructure (
) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.821.3.2 `virtual int activemq::commands::TransactionId::compareTo (const
TransactionId & value) const [virtual]`

6.821.3.3 `virtual void activemq::commands::TransactionId::copyDataStructure (
const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.821.3.4 `virtual bool activemq::commands::TransactionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.821.3.5 virtual bool activemq::commands::TransactionId::equals (const TransactionId & *value*) const [virtual]

6.821.3.6 virtual unsigned char activemq::commands::TransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaller share.

Returns

new **DataStructure** (p. 1553) type copy.

6.821.3.7 virtual bool activemq::commands::TransactionId::operator< (const TransactionId & *value*) const [virtual]

6.821.3.8 TransactionId& activemq::commands::TransactionId::operator= (const TransactionId & *other*)

6.821.3.9 virtual bool activemq::commands::TransactionId::operator== (const TransactionId & *value*) const [virtual]

6.821.3.10 virtual std::string activemq::commands::TransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.821.4 Field Documentation

6.821.4.1 const unsigned char activemq::commands::TransactionId::ID_TRANSACTIONID = 0 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**TransactionId.h**

6.822 activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3572).

#include <src/main/activemq/wireformat/openwire/marshal/v5/TransactionIdMarshaller.h>

Inheritance diagram for activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller:

Public Member Functions

- **TransactionIdMarshaller** ()
- virtual **~TransactionIdMarshaller** ()
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.822.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3572). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.822.2 Constructor & Destructor Documentation

6.822.2.1 `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::TransactionIdMarshaller()` [inline]

6.822.2.2 `virtual activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::~~TransactionIdMarshaller()` [inline, virtual]

6.822.3 Member Function Documentation

6.822.3.1 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller` (p. 2218), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 3791).

6.822.3.2 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller` (p. 2218), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 3791).

```
6.822.3.3  virtual int ac-
            tivemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat,  commands::DataStructure
            * dataStructure,  utils::BooleanStream * bs ) throw (
            decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller` (p. 2218), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 3791).

```
6.822.3.4  virtual void ac-
            tivemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::tightMarshal2
            ( OpenWireFormat * wireFormat,  commands::DataStructure
            * dataStructure,  decaf::io::DataOutputStream * dataOut,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

6.823 activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller Class Reference 3583

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller` (p. 2219), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 3792).

6.822.3.5 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller` (p. 2219), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 3792).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/TransactionIdMarshaller.h`

6.823 activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller Class Reference

6.823.3.1 virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1518).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2226), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3783).

6.823.3.2 virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2226), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3783).

6.823.3.3 virtual int activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 2226), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 3783).

6.823.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 2227), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 3784).

6.823.3.5 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2227), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3784).

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 2210), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3775).

6.824.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 2211), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 3776).

```
6.824.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 2211), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 3776).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/TransactionIdMarshaller.h`

6.825 activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for `TransactionIdMarshaller` (p. 3583).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/TransactionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller`:

Public Member Functions

- **TransactionIdMarshaller** ()
- virtual **~TransactionIdMarshaller** ()
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.825.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3583). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.825.2 Constructor & Destructor Documentation

6.825.2.2 `virtual activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::~~TransactionIdMarshaller () [inline, virtual]`

6.825.3 Member Function Documentation

6.825.3.1 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller` (p. 2214), and `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller` (p. 3787).

6.825.3.2 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 2214), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 3787).

6.825.3.3 `virtual int activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 2214), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 3787).

6.825.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller` (p. 2215), and `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller` (p. 3788).

```
6.825.3.5 virtual void ac-
      tivemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightUnmarshal
      ( OpenWireFormat * wireFormat, commands::DataStructure
      * dataStructure, decaf::io::DataInputStream * dataIn,
      utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller` (p. 2215), and `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller` (p. 3788).

The documentation for this class was generated from the following file:

6.828 activemq::commands::TransactionInfo Class Reference

```
#include <src/main/activemq/commands/TransactionInfo.h>
```

Inheritance diagram for **activemq::commands::TransactionInfo**:

Public Member Functions

- **TransactionInfo** ()

- virtual `~TransactionInfo ()`
- virtual unsigned char `getDataStructureType ()` const
Get the unique identifier that this object and its own Marshaler share.
- virtual `TransactionInfo * cloneDataStructure ()` const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void `copyDataStructure (const DataStructure *src)`
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string `toString ()` const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool `equals (const DataStructure *value)` const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual const `Pointer< ConnectionId > & getConnectionId ()` const
- virtual `Pointer< ConnectionId > & getConnectionId ()`
- virtual void `setConnectionId (const Pointer< ConnectionId > &connectionId)`
- virtual const `Pointer< TransactionId > & getTransactionId ()` const
- virtual `Pointer< TransactionId > & getTransactionId ()`
- virtual void `setTransactionId (const Pointer< TransactionId > &transactionId)`
- virtual unsigned char `getType ()` const
- virtual void `setType (unsigned char type)`
- virtual bool `isTransactionInfo ()` const
- virtual `Pointer< Command > visit (activemq::state::CommandVisitor *visitor)`
`throw (exceptions::ActiveMQException)`
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char `ID_TRANSACTIONINFO = 7`

Protected Attributes

- `Pointer< ConnectionId > connectionId`
- `Pointer< TransactionId > transactionId`
- unsigned char `type`

6.828.1 Constructor & Destructor Documentation

6.828.1.1 `activemq::commands::TransactionInfo::TransactionInfo ()`

6.828.1.2 `virtual activemq::commands::TransactionInfo::~~TransactionInfo ()`
[virtual]

6.828.2 Member Function Documentation

6.828.2.1 `virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.828.2.2 `virtual void activemq::commands::TransactionInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.828.2.3 `virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

- 6.828.2.4** `virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () const [virtual]`
- 6.828.2.5** `virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () [virtual]`
- 6.828.2.6** `virtual unsigned char activemq::commands::TransactionInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSetructure** (p. 1553) type copy.

Implements **activemq::commands::DataSetructure** (p. 1557).

- 6.828.2.7** `virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () const [virtual]`
- 6.828.2.8** `virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () [virtual]`
- 6.828.2.9** `virtual unsigned char activemq::commands::TransactionInfo::getType () const [virtual]`
- 6.828.2.10** `virtual bool activemq::commands::TransactionInfo::isTransactionInfo () const [inline, virtual]`

Returns

an answer of true to the **isTransactionInfo()** (p. 3597) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

- 6.828.2.11** `virtual void activemq::commands::TransactionInfo::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`
- 6.828.2.12** `virtual void activemq::commands::TransactionInfo::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`
- 6.828.2.13** `virtual void activemq::commands::TransactionInfo::setType (unsigned char type) [virtual]`
- 6.828.2.14** `virtual std::string activemq::commands::TransactionInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSetructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

6.828.2.15 `virtual Pointer<Command> activemq::commands::TransactionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1112).

6.828.3 Field Documentation

6.828.3.1 `Pointer<ConnectionId> activemq::commands::TransactionInfo::connectionId [protected]`

Write a object instance to data output stream.

6.829.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3598). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.829.2 Constructor & Destructor Documentation

6.829.2.1 `activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.829.2.2 `virtual activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.829.3 Member Function Documentation

6.829.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.829.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.829.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

```

6.829.3.4 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

```

6.829.3.5 virtual int activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```

6.829.3.6 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 726).

```
6.829.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.830.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3602). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.830.2 Constructor & Destructor Documentation

6.830.2.1 `activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.830.2.2 `virtual activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.830.3 Member Function Documentation

6.830.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.830.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.830.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.830.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

6.830.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

6.830.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

```
6.830.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.831.3 Member Function Documentation

6.831.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.831.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.831.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.831.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.831.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

6.831.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.831.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 707).

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::~~TransactionInfoMarshaller() [inline, virtual]`

6.832.3 Member Function Documentation

6.832.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::createObject() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.832.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.832.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

```

6.832.3.4 virtual void activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

```

6.832.3.5 virtual int activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

```

6.832.3.6 virtual void activemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 732).

6.832.3.7 virtual void ac-
 tivemq::wireformat::openwire::marshal::v6::TransactionInfoMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataInputStream * *dataIn*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3614). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.833.2 Constructor & Destructor Documentation

6.833.2.1 `activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.833.2.2 `virtual activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.833.3 Member Function Documentation

6.833.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.833.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.833.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

```

6.833.3.4 virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

```

6.833.3.5 virtual int activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```

6.833.3.6 virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 712).

6.833.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.834.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3618). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.834.2 Constructor & Destructor Documentation

6.834.2.1 `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.834.2.2 `virtual activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.834.3 Member Function Documentation

6.834.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.834.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.834.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.834.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

6.834.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

6.834.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

6.834.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 740).

*Node class for **TransferQueue** (p. 3625).*
- virtual ~**TransferQueue** ()
- virtual void **transfer** (E *e, bool timed, long long nanos) throw (decaf::util::concurrent::TimeoutException, decaf::lang::exceptions::InterruptedException)
Performs a put.
- virtual E * **transfer** (bool timed, long long nanos) throw (decaf::util::concurrent::TimeoutException, decaf::lang::exceptions::InterruptedException)
Performs a take.

6.837.1 Detailed Description

template<typename E> class decaf::internal::util::concurrent::TransferQueue< E >

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using nodes within nodes rather than marked pointers. The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

6.837.2 Constructor & Destructor Documentation

6.837.2.1 template<typename E > decaf::internal::util::concurrent::TransferQueue< E >::TransferQueue () [inline]

Node class for **TransferQueue** (p. 3625).

Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.837.2.2 template<typename E > virtual
decaf::internal::util::concurrent::TransferQueue< E
>::~~TransferQueue () [inline, virtual]

6.837.3 Member Function Documentation

6.837.3.1 template<typename E > virtual void
decaf::internal::util::concurrent::TransferQueue< E
>::transfer (E * e, bool *timed*, long long *nanos*
) throw (decaf::util::concurrent::TimeoutException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]

Performs a put.

Parameters

e the item to be handed to a consumer;

timed if this operation should timeout

nanos the timeout, in nanoseconds

Exceptions

TimeoutException if the operation timed out waiting for the consumer to accept the item offered.

InterruptedException if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3625).

```

6.837.3.2  template<typename E > virtual E*
             decaf::internal::util::concurrent::TransferQueue< E
             >::transfer ( bool timed, long long nanos )
             throw ( decaf::util::concurrent::TimeoutException,
             decaf::lang::exceptions::InterruptedException ) [inline, virtual]

```

Performs a take.

Parameters

timed if this operation should timeout
nanos the timeout, in nanoseconds

Returns

the item provided or received;

Exceptions

TimeoutException if the operation timed out waiting for the producer to offer an item.
InterruptedException if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3625).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**TransferQueue.h**

6.838 decaf::internal::util::concurrent::TransferStack< E > Class Template Reference

*Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const =0
*Is the **Transport** (p. 3629) Connected to its Broker.*
- virtual bool **isClosed** () const =0
*Has the **Transport** (p. 3629) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () const =0
- virtual void **reconnect** (const **decaf::net::URI** &uri)=0 throw (**decaf::io::IOException**)
reconnect to another location

6.839.1 Detailed Description

Interface for a transport layer for command objects. Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 3629) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 3629) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.839.2 Constructor & Destructor Documentation

- 6.839.2.1** virtual **activemq::transport::Transport::~~Transport** () [inline, virtual]

6.839.3 Member Function Documentation

- 6.839.3.1** virtual std::string **activemq::transport::Transport::getRemoteAddress** () const [pure virtual]

Returns

the remote address for this connection

Implemented in **activemq::transport::mock::MockTransport** (p. 2596).

6.839.3.2 `virtual TransportListener* activemq::transport::Transport::getTransportListener () const [pure virtual]`

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implemented in `activemq::transport::mock::MockTransport` (p. 2596).

6.839.3.3 `virtual bool activemq::transport::Transport::isClosed () const [pure virtual]`

Has the **Transport** (p. 3629) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3629)

Implemented in `activemq::transport::mock::MockTransport` (p. 2597).

6.839.3.4 `virtual bool activemq::transport::Transport::isConnected () const [pure virtual]`

Is the **Transport** (p. 3629) Connected to its Broker.

Returns

true if a connection has been made.

Implemented in `activemq::transport::mock::MockTransport` (p. 2597).

6.839.3.5 `virtual bool activemq::transport::Transport::isFaultTolerant () const [pure virtual]`

Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3629) is fault tolerant.

Implemented in `activemq::transport::mock::MockTransport` (p. 2597).

6.839.3.6 `virtual Transport* activemq::transport::Transport::narrow (const std::type_info & typeId) [pure virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3629) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::mock::MockTransport** (p. 2598).

Referenced by **activemq::transport::failover::FailoverTransport::narrow()**.

6.839.3.7 `virtual void activemq::transport::Transport::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2598).

6.839.3.8 `virtual void activemq::transport::Transport::reconnect (const decaf::net::URI & uri) throw (decaf::io::IOException) [pure virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.839.3.9 `virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command the command to be sent.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2599).

```
6.839.3.10  virtual Pointer<Response> activemq::transport::Transport::request
              ( const Pointer< Command > & command, unsigned
                int timeout ) throw ( decaf::io::IOException,
                decaf::lang::exceptions::UnsupportedOperationException ) [pure
                virtual]
```

Sends the given command to the broker and then waits for the response.

Parameters

command - The command to be sent.

timeout - The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2599).

```
6.839.3.11  virtual void activemq::transport::Transport::setTransportListener (
              TransportListener * listener ) [pure virtual]
```

Sets the observer of asynchronous events from this transport.

Parameters

listener the listener of transport events.

Implemented in **activemq::transport::mock::MockTransport** (p. 2601).

```
6.839.3.12  virtual void activemq::transport::Transport::setWireFormat ( const
              Pointer< wireformat::WireFormat > & wireFormat ) [pure virtual]
```

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.839.3.13 virtual void activemq::transport::Transport::start () throw (decaf::io::IOException) [pure virtual]

Starts the **Transport** (p. 3629), the send methods of a **Transport** (p. 3629) will throw an exception if used before the **Transport** (p. 3629) is started.

Exceptions

IOException if and error occurs while starting the **Transport** (p. 3629).

Implemented in **activemq::transport::mock::MockTransport** (p. 2601).

6.839.3.14 virtual void activemq::transport::Transport::stop () throw (decaf::io::IOException) [pure virtual]

Stops the **Transport** (p. 3629).

Exceptions

IOException if an error occurs while stopping the transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2601).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**Transport.h**

6.840 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

```
#include <src/main/activemq/transport/TransportFactory.h>
```

Inheritance diagram for activemq::transport::TransportFactory:

Public Member Functions

- virtual ~**TransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (const decaf::net::URI &location)=0 throw (exceptions::ActiveMQException)
*Creates a fully configured **Transport** (p. 3629) instance which could be a chain of filters and transports.*
- virtual **Pointer**< **Transport** > **createComposite** (const decaf::net::URI &location)=0 throw (exceptions::ActiveMQException)
*Creates a slimed down **Transport** (p. 3629) instance which can be used in composite transport instances.*

6.840.1 Detailed Description

Defines the interface for Factories that create **Transports** or **TransportFilters**. The factory should be able to create either a completely configured **Transport** (p. 3629) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since

3.0

6.840.2 Constructor & Destructor Documentation

6.840.2.1 `virtual activemq::transport::TransportFactory::~~TransportFactory ()`
[inline, virtual]

6.840.3 Member Function Documentation

6.840.3.1 `virtual Pointer<Transport> activemq::transport::TransportFactory::create (const decaf::net::URI & location) throw (exceptions::ActiveMQException)`
[pure virtual]

Creates a fully configured **Transport** (p. 3629) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implemented in `activemq::transport::failover::FailoverTransportFactory` (p. 1764), `activemq::transport::mock::MockTransportFactory` (p. 2603), and `activemq::transport::tcp::TcpTransportFactory` (p. 3515).

6.840.3.2 `virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite (const decaf::net::URI & location) throw (exceptions::ActiveMQException)` [pure virtual]

Creates a slimed down **Transport** (p. 3629) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1765), **activemq::transport::mock::MockTransportFactory** (p. 2603), and **activemq::transport::tcp::TcpTransportFactory** (p. 3515).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFactory.h`

6.841 activemq::transport::TransportFilter Class Reference

A filter on the transport layer.

```
#include <src/main/activemq/transport/TransportFilter.h>
```

Inheritance diagram for `activemq::transport::TransportFilter`:

Public Member Functions

- **TransportFilter** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual **~TransportFilter** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
The transport has resumed after an interruption.
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Not supported by this class - throws an exception.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Not supported by this class - throws an exception.
- virtual void **setTransportListener** (**TransportListener** *listener)
Sets the observer of asynchronous exceptions from this transport.

- virtual **TransportListener** * **getTransportListener** () const
Gets the observer of asynchronous exceptions from this transport.
- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)
Sets the WireFormat instance to use.
- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **stop** () throw (decaf::io::IOException)
*Stops the **Transport** (p. 3629).*
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.
- virtual **Transport** * **narrow** (const std::type_info &typeId)
*Narrows down a Chain of Transports to a specific **Transport** (p. 3629) to allow a higher level transport to skip intermediate Transports in certain circumstances.*
- virtual bool **isFaultTolerant** () const
*Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const
*Is the **Transport** (p. 3629) Connected to its Broker.*
- virtual bool **isClosed** () const
*Has the **Transport** (p. 3629) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const **decaf::net::URI** &uri) throw (decaf::io::IOException)
reconnect to another location

Protected Member Functions

- void **fire** (const **decaf::lang::Exception** &ex)
Notify the listener of the thrown Exception.
- void **fire** (const **Pointer**< **Command** > &command)
Notify the listener of the new incoming Command.

Protected Attributes

- **Pointer**< **Transport** > **next**
The transport that this filter wraps around.

- **TransportListener * listener**

Listener of this transport.

6.841.1 Detailed Description

A filter on the transport layer. **Transport** (p. 3629) filters implement the **Transport** (p. 3629) interface and optionally delegate calls to another **Transport** (p. 3629) object.

Since

1.0

6.841.2 Constructor & Destructor Documentation

6.841.2.1 **activemq::transport::TransportFilter::TransportFilter** (**const** **Pointer**< **Transport** > & *next*)

Constructor.

Parameters

next - the next **Transport** (p. 3629) in the chain

6.841.2.2 **virtual** **activemq::transport::TransportFilter::~~TransportFilter** () [inline, virtual]

6.841.3 Member Function Documentation

6.841.3.1 **virtual** **void** **activemq::transport::TransportFilter::close** () **throw** (**decaf::io::IOException**) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if an error occurs while closing the **Transport** (p. 3629).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3082), **activemq::transport::inactivity::InactivityMonitor** (p. 1875), **activemq::transport::tcp::TcpTransport** (p. 3512), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2714).

6.841.3.2 **void** **activemq::transport::TransportFilter::fire** (**const** **Pointer**< **Command** > & *command*) [protected]

Notify the listener of the new incoming Command.

Parameters

command - the command to send to the listener

6.841.3.3 `void activemq::transport::TransportFilter::fire (const decaf::lang::Exception & ex)` [protected]

Notify the listener of the thrown Exception.

Parameters

ex - the exception to send to listeners

6.841.3.4 `virtual std::string activemq::transport::TransportFilter::getRemoteAddress () const` [inline, virtual]

Returns

the remote address for this connection

6.841.3.5 `virtual TransportListener* activemq::transport::TransportFilter::getTransportListener () const` [inline, virtual]

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

6.841.3.6 `virtual bool activemq::transport::TransportFilter::isClosed () const` [inline, virtual]

Has the **Transport** (p. 3629) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3629)

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3513).

6.841.3.7 `virtual bool activemq::transport::TransportFilter::isConnected () const` [inline, virtual]

Is the **Transport** (p. 3629) Connected to its Broker.

Returns

true if a connection has been made.

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3513).

6.841.3.8 `virtual bool activemq::transport::TransportFilter::isFaultTolerant ()
const [inline, virtual]`

Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3629) is fault tolerant.

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3513).

6.841.3.9 `virtual Transport* activemq::transport::TransportFilter::narrow (const
std::type_info & typeId) [virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3629) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

6.841.3.10 `virtual void activemq::transport::TransportFilter::onCommand (const
Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

Parameters

command - the received command object.

Implements **activemq::transport::TransportListener** (p. 3644).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3083), **activemq::transport::inactivity::InactivityMonitor** (p. 1876), **activemq::transport::logging::LoggingTransport** (p. 2253), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2715).

6.841.3.11 `virtual void activemq::transport::TransportFilter::oneway (const
Pointer< Command > & command) throw (decaf::io::IOException,
decaf::lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3083), **activemq::transport::inactivity::InactivityMonitor** (p. 1876), **activemq::transport::logging::LoggingTransport** (p. 2253), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2715).

6.841.3.12 `virtual void activemq::transport::TransportFilter::onException (const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

ex The exception to handle.

Implements **activemq::transport::TransportListener** (p. 3645).

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1876).

6.841.3.13 `virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & uri) throw (decaf::io::IOException) [virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.841.3.14 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Not supported by this class - throws an exception.

Parameters

command - The command that is sent as a request

timeout - The the time to wait for a response.

Exceptions

IOException

UnsupportedOperationException.

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 3084), `activemq::transport::logging::LoggingTransport` (p. 2254), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2716).

6.841.3.15 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Not supported by this class - throws an exception.

Parameters

command the command that is sent as a request

Exceptions

IOException

UnsupportedOperationException.

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 3083), `activemq::transport::logging::LoggingTransport` (p. 2254), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2716).

6.841.3.16 `virtual void activemq::transport::TransportFilter::setTransportListener (TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

Parameters

listener the listener of transport events.

6.841.3.17 `virtual void activemq::transport::TransportFilter::setWireFormat (const Pointer< wireformat::WireFormat > & wireFormat) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.841.3.18 `virtual void activemq::transport::TransportFilter::start () throw (decaf::io::IOException) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

IOException if an error occurs or if this transport has already been closed.

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 3084), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2716).

6.841.3.19 **virtual void activemq::transport::TransportFilter::stop () throw (decaf::io::IOException)** [virtual]

Stops the **Transport** (p. 3629).

Exceptions

IOException if an error occurs while stopping the **Transport** (p. 3629).

6.841.3.20 **virtual void activemq::transport::TransportFilter::transportInterrupted ()** [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3645).

6.841.3.21 **virtual void activemq::transport::TransportFilter::transportResumed ()** [virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3645).

6.841.4 Field Documentation

6.841.4.1 **TransportListener* activemq::transport::TransportFilter::listener** [protected]

Listener of this transport.

6.841.4.2 **Pointer<Transport> activemq::transport::TransportFilter::next** [protected]

The transport that this filter wraps around.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFilter.h**

6.842 activemq::transport::TransportListener Class Reference

A listener of asynchronous exceptions from a command transport object.

```
#include <src/main/activemq/transport/TransportListener.h>
```

Inheritance diagram for activemq::transport::TransportListener:

Public Member Functions

- virtual `~TransportListener ()`
- virtual void `onCommand (const Pointer< Command > &command)=0`
Event handler for the receipt of a command.
- virtual void `onException (const decaf::lang::Exception &ex)=0`
Event handler for an exception from a command transport.
- virtual void `transportInterrupted ()=0`
The transport has suffered an interruption from which it hopes to recover.
- virtual void `transportResumed ()=0`
The transport has resumed after an interruption.

6.842.1 Detailed Description

A listener of asynchronous exceptions from a command transport object.

6.842.2 Constructor & Destructor Documentation

6.842.2.1 virtual `activemq::transport::TransportListener::~~TransportListener ()`
[inline, virtual]

6.842.3 Member Function Documentation

6.842.3.1 virtual void `activemq::transport::TransportListener::onCommand (const Pointer< Command > & command)` [pure virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3629) deletes the command upon receipt.

Parameters

command the received command object.

Implemented in `activemq::core::ActiveMQConnection` (p. 246), `activemq::transport::correlator::ResponseCorrelator` (p. 3083), `activemq::transport::failover::FailoverTransportListener` (p. 1767), `activemq::transport::inactivity::InactivityMonitor` (p. 1876), `activemq::transport::logging::LoggingTransport` (p. 2253), `activemq::transport::TransportFilter` (p. 3640), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2715).

6.842.3.2 virtual void activemq::transport::TransportListener::onException (const decaf::lang::Exception & *ex*) [pure virtual]

Event handler for an exception from a command transport.

Parameters

ex The exception being propagated to this listener to handle.

Implemented in **activemq::core::ActiveMQConnection** (p. 246),
activemq::transport::failover::BackupTransport (p. 691), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1767), **ac-**
tivemq::transport::inactivity::InactivityMonitor (p. 1876), and **ac-**
tivemq::transport::TransportFilter (p. 3641).

6.842.3.3 virtual void activemq::transport::TransportListener::transportInterrupted () [pure virtual]

The transport has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 251),
activemq::transport::DefaultTransportListener (p. 1594), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1767), and **ac-**
tivemq::transport::TransportFilter (p. 3643).

6.842.3.4 virtual void activemq::transport::TransportListener::transportResumed () [pure virtual]

The transport has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnection** (p. 251),
activemq::transport::DefaultTransportListener (p. 1594), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1767), and **ac-**
tivemq::transport::TransportFilter (p. 3643).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportListener.h`

6.843 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 3629) Factories that are available to the client at runtime.

```
#include <src/main/activemq/transport/TransportRegistry.h>
```

Public Member Functions

- virtual **~TransportRegistry** ()
- **TransportFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)

*Gets a Registered **TransportFactory** (p. 3634) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **TransportFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

*Registers a new **TransportFactory** (p. 3634) with this Registry.*

- void **unregisterFactory** (const std::string &name)

Unregisters the Factory with the given name and deletes that instance of the Factory.

- std::vector< std::string > **getTransportNames** () const

Retrieves a list of the names of all the Registered Transport's in this Registry.

Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

*Gets the single instance of the **TransportRegistry** (p. 3645).*

6.843.1 Detailed Description

Registry of all **Transport** (p. 3629) Factories that are available to the client at runtime. New Transport's must have a factory registered here before a connection attempt is made.

Since

3.0

6.843.2 Constructor & Destructor Documentation

- 6.843.2.1 virtual **activemq::transport::TransportRegistry::~TransportRegistry** ()
[virtual]

6.843.3 Member Function Documentation

- 6.843.3.1 **TransportFactory*** **activemq::transport::TransportRegistry::findFactory**
(const std::string & *name*) const throw (decaf::lang::exceptions::NoSuchElementException)

Gets a Registered **TransportFactory** (p. 3634) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

name The name of the Factory to find in the Registry.

Returns

the Factory registered under the given name.

Exceptions

NoSuchElementException if no factory is registered with that name.

6.843.3.2 `static TransportRegistry& activemq::transport::TransportRegistry::getInstance ()`
[static]

Gets the single instance of the **TransportRegistry** (p. 3645).

Returns

reference to the single instance of this Registry

6.843.3.3 `std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames () const`

Retrieves a list of the names of all the Registered Transport's in this Registry.

Returns

stl vector of strings with all the **Transport** (p. 3629) names registered.

6.843.3.4 `void activemq::transport::TransportRegistry::registerFactory (const std::string & name, TransportFactory * factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)`

Registers a new **TransportFactory** (p. 3634) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.843.3.5 `void activemq::transport::TransportRegistry::unregisterFactory (const std::string & name)`

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

- name* Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

6.845 decaf::lang::Thread::UncaughtExceptionHandler Class Reference

Interface for handlers invoked when a **Thread** (p. 3520) abruptly terminates due to an uncaught exception.

```
#include <src/main/decaf/lang/Thread.h>
```

Public Member Functions

- virtual ~**UncaughtExceptionHandler** ()
- virtual void **uncaughtException** (const **Thread** *thread, const **Throwable** &error)=0
throw ()

Method invoked when the given thread terminates due to the given uncaught exception.

6.845.1 Detailed Description

Interface for handlers invoked when a **Thread** (p. 3520) abruptly terminates due to an uncaught exception.

6.845.2 Constructor & Destructor Documentation

6.845.2.1 **virtual**
decaf::lang::Thread::UncaughtExceptionHandler::~~UncaughtExceptionHandler
() [inline, virtual]

6.845.3 Member Function Documentation

6.845.3.1 **virtual void de-**
caf::lang::Thread::UncaughtExceptionHandler::uncaughtException (
const Thread * *thread*, const Throwable & *error*) throw () [pure
 virtual]

Method invoked when the given thread terminates due to the given uncaught exception.

This method is defined to indicate that it will not throw an exception, throwing an exception from this method will on most systems result in a segmentation fault.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Thread.h**

6.846 decaf::net::UnknownHostException Class Reference

```
#include <src/main/decaf/net/UnknownHostException.h>
```

Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException ()** throw ()
Default Constructor.
- **UnknownHostException (const Exception &ex)** throw ()
Conversion Constructor from some other Exception.
- **UnknownHostException (const UnknownHostException &ex)** throw ()
Copy Constructor.
- **UnknownHostException (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...)** throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownHostException (const std::exception *cause)** throw ()

Constructor.

- **UnknownHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **UnknownHostException** * clone () const

Clones this exception.

- virtual ~**UnknownHostException** () throw ()

6.846.1 Constructor & Destructor Documentation

6.846.1.1 decaf::net::UnknownHostException::UnknownHostException () throw () [inline]

Default Constructor.

6.846.1.2 decaf::net::UnknownHostException::UnknownHostException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.846.1.3 decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.846.1.4 decaf::net::UnknownHostException::UnknownHostException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.846.1.5 `decaf::net::UnknownHostException::UnknownHostException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.846.1.6 `decaf::net::UnknownHostException::UnknownHostException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.846.1.7 `virtual decaf::net::UnknownHostException::~~UnknownHostException () throw () [inline, virtual]`

6.846.2 Member Function Documentation

6.846.2.1 `virtual UnknownHostException* decaf::net::UnknownHostException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 2005).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownHostException.h`

6.847 decaf::net::UnknownServiceException Class Reference

```
#include <src/main/decaf/net/UnknownServiceException.h>
```

Inheritance diagram for decaf::net::UnknownServiceException:

Public Member Functions

- **UnknownServiceException** () throw ()
Default Constructor.
- **UnknownServiceException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownServiceException** (const **UnknownServiceException** &ex) throw ()
Copy Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownServiceException** (const std::exception *cause) throw ()
Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownServiceException** * clone () const
Clones this exception.
- virtual ~**UnknownServiceException** () throw ()

6.847.1 Constructor & Destructor Documentation

6.847.1.1 decaf::net::UnknownServiceException::UnknownServiceException () throw () [inline]

Default Constructor.

6.847.1.2 decaf::net::UnknownServiceException::UnknownServiceException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.847.1.3 `decaf::net::UnknownServiceException::UnknownServiceException (const UnknownServiceException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.847.1.4 `decaf::net::UnknownServiceException::UnknownServiceException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.847.1.5 `decaf::net::UnknownServiceException::UnknownServiceException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.847.1.6 `decaf::net::UnknownServiceException::UnknownServiceException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.847.1.7 `virtual`
`decaf::net::UnknownServiceException::~UnknownServiceException ()`
`throw ()` [`inline`, `virtual`]

6.847.2 Member Function Documentation

6.847.2.1 `virtual UnknownServiceException* decaf::net::UnknownServiceException::clone () const`
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 2005).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownServiceException.h`

6.848 decaf::io::UnsupportedEncodingException Class Reference

Thrown when the the Character Encoding is not supported.

```
#include <src/main/decaf/io/UnsupportedEncodingException.h>
```

Inheritance diagram for `decaf::io::UnsupportedEncodingException`:

Public Member Functions

- `UnsupportedEncodingException () throw ()`
Default Constructor.
- `UnsupportedEncodingException (const lang::Exception &ex) throw ()`
Copy Constructor.
- `UnsupportedEncodingException (const UnsupportedEncodingException &ex) throw ()`
Copy Constructor.
- `UnsupportedEncodingException (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()`
Constructor - Initializes the file name and line number where this message occurred.

- **UnsupportedEncodingException** (const std::exception ***cause**) throw ()
Constructor.
- **UnsupportedEncodingException** (const char ***file**, const int **lineNumber**, const char ***msg**,...) throw ()
Constructor.
- virtual **UnsupportedEncodingException * clone** () const
Clones this exception.
- virtual ~**UnsupportedEncodingException** () throw ()

6.848.1 Detailed Description

Thrown when the the Character Encoding is not supported.

Since

1.0

6.848.2 Constructor & Destructor Documentation

6.848.2.1 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException () throw () [inline]

Default Constructor.

6.848.2.2 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.848.2.3 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const UnsupportedEncodingException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.848.2.4 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.848.2.5 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException
(const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.848.2.6 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException
(const char * file, const int lineNumber, const char * msg, ...)
throw () [inline]`

Constructor.

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.848.2.7 `virtual
decaf::io::UnsupportedEncodingException::~~UnsupportedEncodingException
() throw () [inline, virtual]`

6.848.3 Member Function Documentation

6.848.3.1 `virtual UnsupportedEncodingException* de-
caf::io::UnsupportedEncodingException::clone () const [inline,
virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 2005).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/UnsupportedEncodingException.h`

6.849 decaf::lang::exceptions::UnsupportedOperationException Class Reference

```
#include <src/main/decaf/lang/exceptions/UnsupportedOperationException.h>
```

Inheritance diagram for `decaf::lang::exceptions::UnsupportedOperationException`:

Public Member Functions

- **UnsupportedOperationException** () throw ()
Default Constructor.
- **UnsupportedOperationException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1712).*
- **UnsupportedOperationException** (const **UnsupportedOperationException** &ex) throw ()
Copy Constructor.
- **UnsupportedOperationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnsupportedOperationException** (const std::exception *cause) throw ()
Constructor.
- **UnsupportedOperationException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnsupportedOperationException** * clone () const
Clones this exception.
- virtual ~**UnsupportedOperationException** () throw ()

6.849.1 Constructor & Destructor Documentation

6.849.1.1 **decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException** () throw () [inline]

Default Constructor.

6.849.1.2 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex An exception that should become this type of **Exception** (p. 1712)

6.849.1.3 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const UnsupportedOperationException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of **Exception** (p. 1712)

6.849.1.4 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.849.1.5 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.849.1.6 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...)
throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.849.1.7 **virtual**
decaf::lang::exceptions::UnsupportedOperationException::~~UnsupportedOperationException
() throw () [inline, virtual]

6.849.2 Member Function Documentation

6.849.2.1 **virtual UnsupportedOperationException* de-**
caf::lang::exceptions::UnsupportedOperationException::clone () const
 [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

- an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

Reimplemented in **decaf::nio::ReadOnlyBufferException** (p. 2968).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/UnsupportedOperationException.h`

6.850 cms::UnsupportedOperationException Class Reference

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

```
#include <src/main/cms/UnsupportedOperationException.h>
```

Inheritance diagram for cms::UnsupportedOperationException:

Public Member Functions

6.851 decaf::net::URI Class Reference

This class represents an instance of a **URI** (p. 3660) as defined by RFC 2396.

```
#include <src/main/decaf/net/URI.h>
```

Inheritance diagram for decaf::net::URI:

Public Member Functions

- **URI** ()

Default Constructor, same as calling a Constructor with all fields empty.

- **URI** (const **URI** &uri) throw (**URISyntaxException**)
*Constructs a **URI** (p. 3660) as a copy of another **URI** (p. 3660).*
- **URI** (const std::string &uri) throw (**URISyntaxException**)
*Constructs a **URI** (p. 3660) from the given string.*
- **URI** (const std::string &scheme, const std::string &ssp, const std::string &fragment) throw (**URISyntaxException**)
*Constructs a **URI** (p. 3660) from the given components.*
- **URI** (const std::string &scheme, const std::string &userInfo, const std::string &host, int port, const std::string &path, const std::string &query, const std::string &fragment) throw (**URISyntaxException**)
*Constructs a **URI** (p. 3660) from the given components.*
- **URI** (const std::string &scheme, const std::string &host, const std::string &path, const std::string &fragment) throw (**URISyntaxException**)
*Constructs a **URI** (p. 3660) from the given components.*
- **URI** (const std::string &scheme, const std::string &authority, const std::string &path, const std::string &query, const std::string &fragment) throw (**URISyntaxException**)
*Constructs a **URI** (p. 3660) from the given components.*
- virtual ~**URI** ()
- virtual int **compareTo** (const **URI** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **URI** &value) const
- virtual bool **operator==** (const **URI** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **URI** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **getAuthority** () const
- std::string **getFragment** () const
- std::string **getHost** () const
- std::string **getPath** () const
- int **getPort** () const
- std::string **getQuery** () const
- std::string **getScheme** () const
- std::string **getUserInfo** () const
- std::string **getRawAuthority** () const
*Returns the raw authority component of this **URI** (p. 3660).*
- std::string **getRawFragment** () const
*Returns the raw fragment component of this **URI** (p. 3660).*

- `std::string getRawPath () const`
Returns the raw path component of this **URI** (p. 3660).
- `std::string getRawQuery () const`
Returns the raw query component of this **URI** (p. 3660).
- `std::string getRawSchemeSpecificPart () const`
Returns the raw scheme-specific part of this **URI** (p. 3660).
- `std::string getSchemeSpecificPart () const`
Returns the decoded scheme-specific part of this **URI** (p. 3660).
- `std::string getRawUserInfo () const`
Returns the raw user-information component of this **URI** (p. 3660).
- `bool isAbsolute () const`
Tells whether or not this **URI** (p. 3660) is absolute.
- `bool isOpaque () const`
Tells whether or not this **URI** (p. 3660) is opaque.
- `URI normalize () const`
Normalizes this **URI**'s path.
- `URI parseServerAuthority () const throw (URISyntaxException)`
Attempts to parse this **URI**'s authority component, if defined, into user-information, host, and port components.
- `URI relativize (const URI &uri) const`
Relativizes the given **URI** (p. 3660) against this **URI** (p. 3660).
- `URI resolve (const std::string &str) const throw (lang::exceptions::IllegalArgumentException)`
Constructs a new **URI** (p. 3660) by parsing the given string and then resolving it against this **URI** (p. 3660).
- `URI resolve (const URI &uri) const`
Resolves the given **URI** (p. 3660) against this **URI** (p. 3660).
- `std::string toString () const`
Returns the content of this **URI** (p. 3660) as a string.
- `URL toURL () const throw (MalformedURLException, lang::exceptions::IllegalArgumentException)`
Constructs a **URL** (p. 3697) from this **URI** (p. 3660).

Static Public Member Functions

- static **URI** **create** (const std::string uri) throw (lang::exceptions::IllegalArgumentException)

*Creates a **URI** (p. 3660) by parsing the given string.*

6.851.1 Detailed Description

This class represents an instance of a **URI** (p. 3660) as defined by RFC 2396.

6.851.2 Constructor & Destructor Documentation

6.851.2.1 decaf::net::URI::URI ()

Default Constructor, same as calling a Constructor with all fields empty.

6.851.2.2 decaf::net::URI::URI (const **URI** & *uri*) throw (URISyntaxException)

Constructs a **URI** (p. 3660) as a copy of another **URI** (p. 3660).

Parameters

uri - uri to copy

6.851.2.3 decaf::net::URI::URI (const std::string & *uri*) throw (URISyntaxException)

Constructs a **URI** (p. 3660) from the given string.

Parameters

uri - string uri to parse.

6.851.2.4 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *ssp*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3660) from the given components.

Parameters

scheme - the uri scheme

ssp - Scheme specific part

fragment - Fragment

6.851.2.5 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *userInfo*, const std::string & *host*, int *port*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3660) from the given components.

Parameters

scheme - Scheme name

userInfo - User name and authorization information

host - Host name

port - Port number

path - Path

query - Query

fragment - Fragment

6.851.2.6 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *host*, const std::string & *path*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3660) from the given components.

Parameters

scheme - Scheme name

host - Host name

path - Path

fragment - Fragment

6.851.2.7 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *authority*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3660) from the given components.

Parameters

scheme - Scheme name

authority - Authority

path - Path

query - Query

fragment - Fragment

6.851.2.8 `virtual decaf::net::URI::~~URI () [inline, virtual]`

6.851.3 Member Function Documentation

6.851.3.1 `virtual int decaf::net::URI::compareTo (const URI & value) const [virtual]`

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the value to compare to this one.

Returns

zero if equal minus one if less than and one if greater than.

6.851.3.2 `static URI decaf::net::URI::create (const std::string uri) throw (lang::exceptions::IllegalArgumentException) [static]`

Creates a **URI** (p. 3660) by parsing the given string.

This convenience factory method works as if by invoking the `URI(string)` constructor; any **URISyntaxException** (p. 3686) thrown by the constructor is caught and wrapped in a new `IllegalArgumentException` object, which is then thrown.

Parameters

uri - **URI** (p. 3660) string to parse

Exceptions

IllegalArgumentException

6.851.3.3 `virtual bool decaf::net::URI::equals (const URI & value) const [virtual]`

Returns

true if this value is considered equal to the passed value.

6.851.3.4 `std::string decaf::net::URI::getAuthority () const`

Returns

the decoded authority component of this **URI** (p. 3660).

6.851.3.5 `std::string decaf::net::URI::getFragment () const`

Returns

the decoded fragment component of this **URI** (p. 3660).

6.851.3.6 `std::string decaf::net::URI::getHost () const`**Returns**

the host component of this **URI** (p. 3660).

6.851.3.7 `std::string decaf::net::URI::getPath () const`**Returns**

the path component of this **URI** (p. 3660).

6.851.3.8 `int decaf::net::URI::getPort () const`**Returns**

the port component of this **URI** (p. 3660).

6.851.3.9 `std::string decaf::net::URI::getQuery () const`**Returns**

the query component of this **URI** (p. 3660).

6.851.3.10 `std::string decaf::net::URI::getRawAuthority () const`

Returns the raw authority component of this **URI** (p. 3660).

The authority component of a **URI** (p. 3660), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns

the raw authority component of the **URI** (p. 3660)

6.851.3.11 `std::string decaf::net::URI::getRawFragment () const`

Returns the raw fragment component of this **URI** (p. 3660).

The fragment component of a **URI** (p. 3660), if defined, only contains legal **URI** (p. 3660) characters.

Returns

the raw fragment component of this **URI** (p. 3660)

6.851.3.12 `std::string decaf::net::URI::getRawPath () const`

Returns the raw path component of this **URI** (p. 3660).

The path component of a **URI** (p. 3660), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns

the raw path component of this **URI** (p. 3660)

6.851.3.13 `std::string decaf::net::URI::getRawQuery () const`

Returns the raw query component of this **URI** (p. 3660).

The query component of a **URI** (p. 3660), if defined, only contains legal **URI** (p. 3660) characters.

Returns

the raw query component of the **URI** (p. 3660).

6.851.3.14 `std::string decaf::net::URI::getRawSchemeSpecificPart () const`

Returns the raw scheme-specific part of this **URI** (p. 3660).

The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 3660) only contains legal **URI** (p. 3660) characters.

Returns

the raw scheme special part of the uri

6.851.3.15 `std::string decaf::net::URI::getRawUserInfo () const`

Returns the raw user-information component of this **URI** (p. 3660).

The user-information component of a **URI** (p. 3660), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns

the raw user-information component of the **URI** (p. 3660)

6.851.3.16 `std::string decaf::net::URI::getScheme () const`**Returns**

the scheme component of this **URI** (p. 3660)

6.851.3.17 `std::string decaf::net::URI::getSchemeSpecificPart () const`

Returns the decoded scheme-specific part of this **URI** (p. 3660).

The string returned by this method is equal to that returned by the `getRawSchemeSpecificPart` method except that all sequences of escaped octets are decoded.

Returns

the raw scheme specific part of the uri.

6.851.3.18 `std::string decaf::net::URI::getUserInfo () const`**Returns**

the user info component of this **URI** (p. 3660)

6.851.3.19 `bool decaf::net::URI::isAbsolute () const`

Tells whether or not this **URI** (p. 3660) is absolute.

A **URI** (p. 3660) is absolute if, and only if, it has a scheme component.

Returns

true if, and only if, this **URI** (p. 3660) is absolute

6.851.3.20 `bool decaf::net::URI::isOpaque () const`

Tells whether or not this **URI** (p. 3660) is opaque.

A **URI** (p. 3660) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 3660) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns

true if, and only if, this **URI** (p. 3660) is opaque

6.851.3.21 `URI decaf::net::URI::normalize () const`

Normalizes this **URI**'s path.

If this **URI** (p. 3660) is opaque, or if its path is already in normal form, then this **URI** (p. 3660) is returned. Otherwise a new **URI** (p. 3660) is constructed that is identical to this **URI** (p. 3660) except that its path is computed by normalizing this **URI**'s path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed.
2. If a ".." segment is preceded by a non- ".." segment then both of these segments are removed. This step is repeated until it is no longer applicable.
3. If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 3660) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 3660) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more "." segments if there were insufficient non- "." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or "." segments.

Returns

A **URI** (p. 3660) equivalent to this **URI** (p. 3660), but whose path is in normal form

6.851.3.22 `virtual bool decaf::net::URI::operator< (const URI & value) const`
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.851.3.23 `virtual bool decaf::net::URI::operator== (const URI & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.851.3.24 `URI decaf::net::URI::parseServerAuthority () const throw (`
`URISyntaxException)`

Attempts to parse this URI's authority component, if defined, into user-information, host, and port components.

If this URI's authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p. 3660) has no authority component, this method simply returns this **URI** (p. 3660).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns

A **URI** (p. 3660) whose authority field has been parsed as a server-based authority

Exceptions

URISyntaxException (p. 3686) - If the authority component of this **URI** (p. 3660) is defined but cannot be parsed as a server-based authority.

6.851.3.25 URI decaf::net::URI::relativize (const URI & uri) const

Relativizes the given **URI** (p. 3660) against this **URI** (p. 3660).

The relativization of the given **URI** (p. 3660) against this **URI** (p. 3660) is computed as follows:

1. If either this **URI** (p. 3660) or the given **URI** (p. 3660) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 3660) is not a prefix of the path of the given **URI** (p. 3660), then the given **URI** (p. 3660) is returned.
2. Otherwise a new relative hierarchical **URI** (p. 3660) is constructed with query and fragment components taken from the given **URI** (p. 3660) and with a path component computed by removing this URI's path from the beginning of the given URI's path.

Parameters

uri - The **URI** (p. 3660) to be relativized against this **URI** (p. 3660)

Returns

The resulting **URI** (p. 3660)

6.851.3.26 URI decaf::net::URI::resolve (const std::string & str) const throw (lang::exceptions::IllegalArgumentException)

Constructs a new **URI** (p. 3660) by parsing the given string and then resolving it against this **URI** (p. 3660).

This convenience method works as if invoking it were equivalent to evaluating the expression `resolve(URI::create(str))`.

Parameters

str - The string to be parsed into a **URI** (p. 3660)

Returns

The resulting **URI** (p. 3660)

Exceptions

IllegalArgumentException - If the given string violates RFC 2396

6.851.3.27 URI decaf::net::URI::resolve (const URI & uri) const

Resolves the given **URI** (p. 3660) against this **URI** (p. 3660).

If the given **URI** (p. 3660) is already absolute, or if this **URI** (p. 3660) is opaque, then a copy of the given **URI** (p. 3660) is returned.

If the given URI's fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 3660) with the given fragment but with all other components equal to those of this **URI** (p. 3660) is returned. This allows a **URI** (p. 3660) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 3660).

Otherwise this method constructs a new hierarchical **URI** (p. 3660) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 3660) is constructed with this URI's scheme and the given URI's query and fragment components.
2. If the given **URI** (p. 3660) has an authority component then the new URI's authority and path are taken from the given **URI** (p. 3660).
3. Otherwise the new URI's authority component is copied from this **URI** (p. 3660), and its path is computed as follows:

1. If the given URI's path is absolute then the new URI's path is taken from the given **URI** (p. 3660).
2. Otherwise the given URI's path is relative, and so the new URI's path is computed by resolving the path of the given **URI** (p. 3660) against the path of this **URI** (p. 3660). This is done by concatenating all but the last segment of this URI's path, if any, with the given URI's path and then normalizing the result as if by invoking the `normalize` method.

The result of this method is absolute if, and only if, either this **URI** (p. 3660) is absolute or the given **URI** (p. 3660) is absolute.

Parameters

uri - The **URI** (p. 3660) to be resolved against this **URI** (p. 3660)

Returns

The resulting **URI** (p. 3660)

6.851.3.28 `std::string decaf::net::URI::toString () const`

Returns the content of this **URI** (p. 3660) as a string.

If this **URI** (p. 3660) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 3660) was created by normalization, resolution, or relativization, and so a string is constructed from this URI's components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns

the string form of this **URI** (p. 3660)

6.851.3.29 `URL decaf::net::URI::toURL () const throw (MalformedURLException, lang::exceptions::IllegalArgumentException)`

Constructs a **URL** (p. 3697) from this **URI** (p. 3660).

This convenience method works as if invoking it were equivalent to evaluating the expression `new URL (p. 3697)(this.toString())` after first checking that this **URI** (p. 3660) is absolute.

Returns

A **URL** (p. 3697) constructed from this **URI** (p. 3660)

Exceptions

IllegalArgumentException - If this **URL** (p. 3697) is not absolute

MalformedURLException (p. 2303) - If a protocol handler for the **URL** (p. 3697) could not be found, or if some other error occurred while constructing the **URL** (p. 3697)

The documentation for this class was generated from the following file:

6.852 decaf::internal::net::URIEncoderDecoder Class Reference

```
#include <src/main/decaf/internal/net/URIEncoderDecoder.h>
```

Public Member Functions

- **URIEncoderDecoder** ()
- virtual **~URIEncoderDecoder** ()

Static Public Member Functions

- static void **validate** (const std::string &s, const std::string &legal) throw (decaf::net::URISyntaxException)

Validate a string by checking if it contains any characters other than:

- static void **validateSimple** (const std::string &s, const std::string &legal) throw (decaf::net::URISyntaxException)

Validate a string by checking if it contains any characters other than:

- static std::string **quoteIllegal** (const std::string &s, const std::string &legal)

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ".

- static std::string **encodeOthers** (const std::string &s)

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

- static std::string **decode** (const std::string &s)

*Decodes the string argument which is assumed to be encoded in the **x-www-form-urlencoded** MIME content type using the UTF-8 encoding scheme.*

6.852.1 Constructor & Destructor Documentation

6.852.1.1 `decaf::internal::net::URIEncoderDecoder::URIEncoderDecoder ()`

6.852.1.2 `virtual decaf::internal::net::URIEncoderDecoder::~~URIEncoderDecoder () [inline, virtual]`

6.852.2 Member Function Documentation

6.852.2.1 `static std::string decaf::internal::net::URIEncoderDecoder::decode (const std::string & s) [static]`

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

” and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C \$%"

Parameters

s - The encoded string.

Returns

The decoded version.

6.852.2.2 `static std::string decaf::internal::net::URIEncoderDecoder::encodeOthers (const std::string & s) [static]`

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

They are converted into their hexadecimal value prepended by ”.

For example: Euro currency symbol -> "%E2%82%AC".

Parameters

s - the string to be converted

Returns

the converted string

6.852.2.3 `static std::string decaf::internal::net::URIEncoderDecoder::quoteIllegal (const std::string & s, const std::string & legal) [static]`

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ”.

For example: '#' -> "23"

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters

- s* - the string to be converted
legal - the characters allowed to be preserved in the string *s*

Returns

converted string

6.852.2.4 static void decaf::internal::net::URIEncoderDecoder::validate
(const std::string & *s*, const std::string & *legal*) throw (
decaf::net::URISyntaxException) [static]

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter
4. characters that are not ISO Control or are not ISO Space characters)

Parameters

- s* - the string to be validated
legal - the characters allowed in the string *s*

6.852.2.5 static void decaf::internal::net::URIEncoderDecoder::validateSimple
(const std::string & *s*, const std::string & *legal*) throw (
decaf::net::URISyntaxException) [static]

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter

Parameters

- s* - the string to be validated
legal - the characters allowed in the string *s*

6.853 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

```
#include <src/main/decaf/internal/net/URIHelper.h>
```

Public Member Functions

- **URIHelper** (const std::string &unreserved, const std::string &punct, const std::string &reserved, const std::string &someLegal, const std::string &allLegal)

Setup the **URIHelper** (p. 3674) with values assigned to the various fields that are used in the validation process.

- **URIHelper** ()

Sets up the filter strings with sane defaults.

- virtual **~URIHelper** ()

- **URIType parseURI** (const std::string &uri, bool forceServer) throw (decaf::net::URISyntaxException)

Parse the passed in URI.

- void **validateScheme** (const std::string &uri, const std::string &scheme, int index) throw (decaf::net::URISyntaxException)

Validate the schema portin of the URI.

- void **validateSsp** (const std::string &uri, const std::string &ssp, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Ssp Segment contains no invalid encodings.

- void **validateAuthority** (const std::string &uri, const std::string &authority, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Authority Segment contains no invalid encodings.

- void **validatePath** (const std::string &uri, const std::string &path, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Path Segment contains no invalid encodings.

- void **validateQuery** (const std::string &uri, const std::string &query, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Query Segment contains no invalid encodings.

- void **validateFragment** (const std::string &uri, const std::string &fragment, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI fragment contains no invalid encodings.

- **URIType parseAuthority** (bool forceServer, const std::string &authority) throw (decaf::net::URISyntaxException)

determine the host, port and user-info if the authority parses successfully to a server based authority

- void **validateUserinfo** (const std::string &uri, const std::string &userinfo, std::size_t index) throw (decaf::net::URISyntaxException)

Check the supplied user info for validity.

- bool **isValidHost** (bool forceServer, const std::string &host) throw (decaf::net::URISyntaxException)

distinguish between IPv4, IPv6, domain name and validate it based on its type

- bool **isValidDomainName** (const std::string &host)

Validates the string past to determine if it is a well formed domain name.

- **bool isValidIPv4Address** (const std::string &host)
Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.
- **bool isValidIPv6Address** (const std::string &ipAddress)
Determines if the given address is valid according to the IPv6 spec.
- **bool isValidIPv4Word** (const std::string &word)
Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.
- **bool isValidHexChar** (char c)
Determines if the given char is a valid Hex char.

6.853.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.853.2 Constructor & Destructor Documentation

6.853.2.1 decaf::internal::net::URIHelper::URIHelper (const std::string & *unreserved*, const std::string & *punct*, const std::string & *reserved*, const std::string & *someLegal*, const std::string & *allLegal*)

Setup the **URIHelper** (p. 3674) with values assigned to the various fields that are used in the validation process.

The defaults are overridden by these values.

Parameters

unreserved - characters not reserved for use.
punct - allowable punctuation symbols.
reserved - characters not allowed for general use in the URI.
someLegal - characters that are legal in certain cases.
allLegal - characters that are always legal.

6.853.2.2 decaf::internal::net::URIHelper::URIHelper ()

Sets up the filter strings with sane defaults.

6.853.2.3 virtual decaf::internal::net::URIHelper::~~URIHelper () [inline, virtual]

6.853.3 Member Function Documentation

6.853.3.1 bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & *host*)

Validates the string past to determine if it is a well formed domain name.

Parameters

host - domain name to validate.

Returns

true if host is well formed.

6.853.3.2 `bool decaf::internal::net::URIHelper::isValidHexChar (char c)`

Determines if the given char is a valid Hex char.

Valid chars are A-F (upper or lower case) and 0-9.

Parameters

c - char to inspect

Returns

true if c is a valid hex char.

6.853.3.3 `bool decaf::internal::net::URIHelper::isValidHost (bool forceServer, const std::string & host) throw (decaf::net::URISyntaxException)`

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters

forceServer - true if the forceServer mode should be active.

host - Host string to validate.

Returns

true if the host value if a valid domain name.

Exceptions

URISyntaxException if the host is invalid and forceServer is true.

6.853.3.4 `bool decaf::internal::net::URIHelper::isValidIP4Word (const std::string & word)`

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters

word - string value to check.

Returns

true if the word is a valid IPv4 word.

6.853.3.5 bool decaf::internal::net::URIHelper::isValidIPv6Address (const std::string & *ipAddress*)

Determines if the given address is valid according to the IPv6 spec.

Parameters

ipAddress - string ip address value to validate.

Returns

true if the address string is valid.

6.853.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & *host*)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.

and XXX is not greater than 255.

Parameters

host - IPv4 address string to parse.

Returns

true if host is a well formed IPv4 address.

6.853.3.7 URIType decaf::internal::net::URIHelper::parseAuthority (bool *forceServer*, const std::string & *authority*) throw (decaf::net::URISyntaxException)

determine the host, port and user-info if the authority parses successfully to a server based authority

behavior in error cases: if forceServer is true, throw URISyntaxException with the proper diagnostic messages. if forceServer is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the forceServer parameter e.g. mal-formed ipv6 address

Parameters

forceServer

authority

Returns

a URIType (p. 3690) instance containing the parsed data.

Exceptions

URISyntaxException

6.853.3.8 `URIType decaf::internal::net::URIHelper::parseURI (const std::string & uri, bool forceServer) throw (decaf::net::URISyntaxException)`

Parse the passed in URI.

Parameters

uri - the URI to Parse

forceServer - if true invalid URI data throws an Exception

Returns

a `URIType` (p. 3690) instance containing the parsed data.

Exceptions

URISyntaxException if forceServer is true and the URI is invalid.

6.853.3.9 `void decaf::internal::net::URIHelper::validateAuthority (const std::string & uri, const std::string & authority, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI Authority Segment contains no invalid encodings.

Parameters

uri - the full uri.

authority - the Authority to check.

index - position in the uri where Authority starts.

Exceptions

URISyntaxException if the fragment has errors.

6.853.3.10 `void decaf::internal::net::URIHelper::validateFragment (const std::string & uri, const std::string & fragment, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI fragment contains no invalid encodings.

Parameters

uri - the full uri.

fragment - the fragment to check.

index - position in the uri where fragment starts.

Exceptions

URISyntaxException if the fragment has errors.

6.853.3.11 void decaf::internal::net::URIHelper::validatePath (const std::string & *uri*, const std::string & *path*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Path Segment contains no invalid encodings.

Parameters

uri - the full uri.

path - the path to check.

index - position in the uri where path starts.

Exceptions

URISyntaxException if the fragment has errors.

6.853.3.12 void decaf::internal::net::URIHelper::validateQuery (const std::string & *uri*, const std::string & *query*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Query Segment contains no invalid encodings.

Parameters

uri - the full uri.

query - the query to check.

index - position in the uri where fragment starts.

Exceptions

URISyntaxException if the fragment has errors.

6.853.3.13 void decaf::internal::net::URIHelper::validateScheme (const std::string & *uri*, const std::string & *scheme*, int *index*) throw (decaf::net::URISyntaxException)

Validate the schema portin of the URI.

Parameters

uri - the URI to check.

scheme - the schema section of the URI.

index - index in uri where schema starts.

Exceptions

URISyntaxException if the fragment has errors.

6.853.3.14 `void decaf::internal::net::URIHelper::validateSsp (const std::string & uri, const std::string & ssp, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters

- uri* - the full uri.
- ssp* - the SSP to check.
- index* - position in the uri where Ssp starts.

Exceptions

URISyntaxException if the fragment has errors.

6.853.3.15 `void decaf::internal::net::URIHelper::validateUserinfo (const std::string & uri, const std::string & userinfo, std::size_t index) throw (decaf::net::URISyntaxException)`

Check the supplied user info for validity.

Parameters

- uri* - the uri to parse.
- userinfo* - supplied user info
- index* - index into the URI string where the data is located.

Returns

true if valid

Exceptions

URISyntaxException if an error occurs

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIHelper.h`

6.854 activemq::transport::failover::URIPool Class Reference

```
#include <src/main/activemq/transport/failover/URIPool.h>
```

Public Member Functions

- `URIPool ()`
Create an Empty URI Pool.

- **URIPool** (const decaf::util::List< URI > &uris)
Creates a new URI Pool using the given list as the initial Free List.
- **~URIPool** ()
- **URI getURI** () throw (decaf::lang::exceptions::NoSuchElementException)
Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.
- void **addURI** (const URI &uri)
*Adds a URI to the free list, callers that have previously taken one using the **getURI** method should always return the URI when they close the resource that was connected to that URI.*
- void **addURIs** (const StlList< URI > &uris)
Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.
- void **removeURI** (const URI &uri)
Remove a given URI from the Free List.
- bool **isRandomize** () const
Is the URI that is given randomly picked from the pool or is each one taken in sequence.
- void **setRandomize** (bool value)
Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

6.854.1 Constructor & Destructor Documentation

6.854.1.1 activemq::transport::failover::URIPool::URIPool ()

Create an Empty URI Pool.

6.854.1.2 activemq::transport::failover::URIPool::URIPool (const decaf::util::List< URI > & *uris*)

Creates a new URI Pool using the given list as the initial Free List.

Parameters

uris - List of URI to place in the Pool.

6.854.1.3 activemq::transport::failover::URIPool::~~URIPool ()

6.854.2 Member Function Documentation

6.854.2.1 void activemq::transport::failover::URIPool::addURI (const URI & *uri*)

Adds a URI to the free list, callers that have previously taken one using the **getURI** method should always return the URI when they close the resource that was connected to that URI.

Parameters

uri - a URI previously taken from the pool.

6.854.2.2 void activemq::transport::failover::URIPool::addURIs (const StlList< URI > & *uris*)

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters

uris - List of URIs to add into the Pool.

6.854.2.3 URI activemq::transport::failover::URIPool::getURI () throw (decaf::lang::exceptions::NoSuchElementException)

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.

Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns

the next free URI in the Pool.

Exceptions

NoSuchElementException if there are none free currently.

6.854.2.4 bool activemq::transport::failover::URIPool::isRandomize () const [inline]

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns

true if URI gets are random.

6.854.2.5 void activemq::transport::failover::URIPool::removeURI (const URI & *uri*)

Remove a given URI from the Free List.

Parameters

uri - the URI to find and remove from the free list

6.854.2.6 void activemq::transport::failover::URIPool::setRandomize (bool *value*) [inline]

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters

value - true indicates URI gets are random.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/URIPool.h

6.855 activemq::util::URISupport Class Reference

```
#include <src/main/activemq/util/URISupport.h>
```

Static Public Member Functions

- static void **parseURL** (const std::string &URI, decaf::util::Properties &properties) throw (decaf::lang::exceptions::IllegalArgumentException)

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

- static **CompositeData** **parseComposite** (const URI &uri) throw (decaf::net::URISyntaxException)

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

- static decaf::util::Properties **parseQuery** (std::string query) throw (decaf::lang::exceptions::IllegalArgumentException)

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static void **parseQuery** (std::string query, decaf::util::Properties *properties) throw (decaf::lang::exceptions::IllegalArgumentException)

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static std::string **createQueryString** (const Properties &options) throw (decaf::net::URISyntaxException)

Given a properties object create a string that can be appended to a URI as a valid Query string.

6.855.1 Member Function Documentation

6.855.1.1 `static std::string activemq::util::URISupport::createQueryString (const Properties & options) throw (decaf::net::URISyntaxException) [static]`

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters

options Properties object containing key / value query values.

Returns

a valid URI query string.

Exceptions

URISyntaxException if the string in the Properties object can't be encoded into a valid URI Query string.

6.855.1.2 `static CompositeData activemq::util::URISupport::parseComposite (const URI & uri) throw (decaf::net::URISyntaxException) [static]`

Parses a Composite URI into a Composite Data instance, the Composite URI takes the form scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

Parameters

uri - The Composite URI to parse.

Returns

a new **CompositeData** (p. 1129) object with the parsed data

Exceptions

URISyntaxException if the URI is not well formed.

6.855.1.3 `static void activemq::util::URISupport::parseQuery (std::string query, decaf::util::Properties * properties) throw (decaf::lang::exceptions::IllegalArgumentException) [static]`

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

query - the query string to parse.

properties - object pointer to get the parsed output.

Exceptions

IllegalArgumentException if the Query string is not well formed.

6.855.1.4 static decaf::util::Properties activemq::util::URISupport::parseQuery (std::string *query*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

query The query string to parse and extract the encoded properties.

Returns

Properties object with the parsed output.

Exceptions

IllegalArgumentException if the Query string is not well formed.

6.855.1.5 static void activemq::util::URISupport::parseURL (const std::string & *URI*, decaf::util::Properties & *properties*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

Parameters

URI a Broker URI to parse

properties a Properties object to set the parsed values in

Exceptions

IllegalArgumentException if the passed URI is invalid

The documentation for this class was generated from the following file:

6.856 decaf::net::URISyntaxException Class Reference

```
#include <src/main/decaf/net/URISyntaxException.h>
```

Inheritance diagram for decaf::net::URISyntaxException:

Public Member Functions

- **URISyntaxException** () throw ()
Default Constructor.

- **URISyntaxException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **URISyntaxException** (const **URISyntaxException** &ex) throw ()
Copy Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const std::exception *cause) throw ()
Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const char *msg DECAF_ - UNUSED) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason, int index) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **URISyntaxException * clone** () const
Clones this exception.
- virtual **~URISyntaxException** () throw ()
- std::string **getInput** () const
- std::string **getReason** () const
- int **getIndex** () const

6.856.1 Constructor & Destructor Documentation

6.856.1.1 decaf::net::URISyntaxException::URISyntaxException () throw () [inline]

Default Constructor.

6.856.1.2 decaf::net::URISyntaxException::URISyntaxException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.856.1.3 decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.856.1.4 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.856.1.5 decaf::net::URISyntaxException::URISyntaxException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.856.1.6 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const char **msg* *DECAF_UNUSED*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.856.1.7 `decaf::net::URISyntaxException::URISyntaxException (const char *
file, const int lineNumber, const std::string & input, const std::string
& reason) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the input string that caused the error and the reason for the error.

Parameters

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

input The **URL** (p.3697) that caused the exception.

reason The reason for the failure.

6.856.1.8 `decaf::net::URISyntaxException::URISyntaxException (const char *
file, const int lineNumber, const std::string & input, const std::string
& reason, int index) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the input string that caused the error and the reason for the error.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

input The input **URI** (p.3660) that caused the exception

reason The reason for the failure.

index The index in the **URI** (p.3660) string where the error occurred.

6.856.1.9 `virtual decaf::net::URISyntaxException::~~URISyntaxException ()
throw () [inline, virtual]`

6.856.2 Member Function Documentation

6.856.2.1 `virtual URISyntaxException* decaf::net::URISyntaxException::clone (
) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p.1715).

6.856.2.2 `int decaf::net::URISyntaxException::getIndex () const [inline]`**Returns**

the index in the input string where the error occurred or -1

6.856.2.3 `std::string decaf::net::URISyntaxException::getInput () const [inline]`**Returns**

the Input string that cause this exception or ""

6.856.2.4 `std::string decaf::net::URISyntaxException::getReason () const [inline]`**Returns**

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URISyntaxException.h`

6.857 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

```
#include <src/main/decaf/internal/net/URIType.h>
```

Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () const
*Gets the source URI string that was parsed to obtain this **URIType** (p. 3690) instance and the resulting data,.*
- void **setSource** (const std::string &source)
*Sets the source URI string that was parsed to obtain this **URIType** (p. 3690) instance and the resulting data,.*
- std::string **getScheme** () const
Gets the Scheme of the URI, e.g.
- void **setScheme** (const std::string &scheme)
Sets the Scheme of the URI, e.g.
- std::string **getSchemeSpecificPart** () const

Gets the Scheme Specific Part of the URI.

- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)
Sets the Scheme Specific Part of the URI.
- std::string **getAuthority** () const
Gets the Authority of the URI.
- void **setAuthority** (const std::string &authority)
Sets the Authority of the URI.
- std::string **getUserInfo** () const
Gets the user info part of the URI, e.g.
- void **setUserInfo** (const std::string &userinfo)
Sets the user info part of the URI, e.g.
- std::string **getHost** () const
Gets the Host name part of the URI.
- void **setHost** (const std::string &host)
Sets the Host name part of the URI.
- int **getPort** () const
Gets the port part of the URI.
- void **setPort** (int port)
Sets the port part of the URI.
- std::string **getPath** () const
Gets the Path part of the URI.
- void **setPath** (const std::string &path)
Sets the Path part of the URI.
- std::string **getQuery** () const
Gets the Query part of the URI.
- void **setQuery** (const std::string &query)
Sets the Query part of the URI.
- std::string **getFragment** () const
Gets the Fragment part of the URI.
- void **setFragment** (const std::string &fragment)
Sets the Fragment part of the URI.
- bool **isOpaque** () const
Gets if the URI is Opaque.

- void **setOpaque** (bool opaque)
Sets if the URI is Opaque.
- bool **isAbsolute** () const
Gets if the URI is Absolute.
- void **setAbsolute** (bool absolute)
Sets if the URI is Absolute.
- bool **isServerAuthority** () const
Gets if the URI is a Server Authority.
- void **setServerAuthority** (bool serverAuthority)
Sets if the URI is a Server Authority.
- bool **isValid** () const
Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.
- void **setValid** (bool valid)
Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.857.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.857.2 Constructor & Destructor Documentation

6.857.2.1 `decaf::internal::net::URIType::URIType (const std::string & source)`
[inline]

6.857.2.2 `decaf::internal::net::URIType::URIType ()` [inline]

6.857.2.3 `virtual decaf::internal::net::URIType::~~URIType ()` [inline, virtual]

6.857.3 Member Function Documentation

6.857.3.1 `std::string decaf::internal::net::URIType::getAuthority ()` const
[inline]

Gets the Authority of the URI.

Returns

Authority part string.

6.857.3.2 `std::string decaf::internal::net::URIType::getFragment () const` `[inline]`

Gets the Fragment part of the URI.

Returns

Fragment part string.

6.857.3.3 `std::string decaf::internal::net::URIType::getHost () const` `[inline]`

Gets the Host name part of the URI.

Returns

Host name part string.

6.857.3.4 `std::string decaf::internal::net::URIType::getPath () const` `[inline]`

Gets the Path part of the URI.

Returns

Path part string.

6.857.3.5 `int decaf::internal::net::URIType::getPort () const` `[inline]`

Gets the port part of the URI.

Returns

port part string, -1 if not set.

6.857.3.6 `std::string decaf::internal::net::URIType::getQuery () const` `[inline]`

Gets the Query part of the URI.

Returns

Query part string.

6.857.3.7 `std::string decaf::internal::net::URIType::getScheme () const` `[inline]`

Gets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Returns

scheme part string.

6.857.3.8 `std::string decaf::internal::net::URIType::getSchemeSpecificPart () const [inline]`

Gets the Scheme Specific Part of the URI.

Returns

scheme specific part string.

6.857.3.9 `std::string decaf::internal::net::URIType::getSource () const [inline]`

Gets the source URI string that was parsed to obtain this **URIType** (p.3690) instance and the resulting data,.

Returns

the source URI string

6.857.3.10 `std::string decaf::internal::net::URIType::getUserInfo () const [inline]`

Gets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Returns

user info part string.

6.857.3.11 `bool decaf::internal::net::URIType::isAbsolute () const [inline]`

Gets if the URI is Absolute.

Returns

true if Absolute.

6.857.3.12 `bool decaf::internal::net::URIType::isOpaque () const [inline]`

Gets if the URI is Opaque.

Returns

true if opaque.

6.857.3.13 `bool decaf::internal::net::URIType::isServerAuthority () const [inline]`

Gets if the URI is a Server Authority.

Returns

true if Server Authority.

6.857.3.14 `bool decaf::internal::net::URIType::isValid () const [inline]`

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns

true if the **URIType** (p. 3690) contains valid data.

6.857.3.15 `void decaf::internal::net::URIType::setAbsolute (bool absolute) [inline]`

Sets if the URI is Absolute.

Parameters

absolute - true if Absolute.

6.857.3.16 `void decaf::internal::net::URIType::setAuthority (const std::string & authority) [inline]`

Sets the Authority of the URI.

Parameters

authority Authority part string.

6.857.3.17 `void decaf::internal::net::URIType::setFragment (const std::string & fragment) [inline]`

Sets the Fragment part of the URI.

Parameters

fragment - Fragment part string.

6.857.3.18 `void decaf::internal::net::URIType::setHost (const std::string & host) [inline]`

Sets the Host name part of the URI.

Parameters

host - Host name part string.

6.857.3.19 `void decaf::internal::net::URIType::setOpaque (bool opaque) [inline]`

Sets if the URI is Opaque.

Parameters

opaque true if opaque.

6.857.3.20 void decaf::internal::net::URIType::setPath (const std::string & *path*) [inline]

Sets the Path part of the URL.

Parameters

path - Path part string.

6.857.3.21 void decaf::internal::net::URIType::setPort (int *port*) [inline]

Sets the port part of the URL.

Parameters

port - port part string, -1 if not set.

6.857.3.22 void decaf::internal::net::URIType::setQuery (const std::string & *query*) [inline]

Sets the Query part of the URL.

Parameters

query - Query part string.

6.857.3.23 void decaf::internal::net::URIType::setScheme (const std::string & *scheme*) [inline]

Sets the Scheme of the URL, e.g.

scheme ("http"/"ftp"/...).

Parameters

scheme - scheme part string.

6.857.3.24 void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & *schemeSpecificPart*) [inline]

Sets the Scheme Specific Part of the URL.

Parameters

schemeSpecificPart - scheme specific part string.

6.857.3.25 `void decaf::internal::net::URIType::setServerAuthority (bool
 serverAuthority) [inline]`

Sets if the URI is a Server Authority.

Parameters

serverAuthority - true if Server Authority.

6.857.3.26 `void decaf::internal::net::URIType::setSource (const std::string &
 source) [inline]`

Sets the source URI string that was parsed to obtain this **URIType** (p. 3690) instance and the resulting data,.

Parameters

source - the source URI string

6.857.3.27 `void decaf::internal::net::URIType::setUserInfo (const std::string &
 userinfo) [inline]`

Sets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Parameters

userinfo - user info part string.

6.857.3.28 `void decaf::internal::net::URIType::setValid (bool valid) [inline]`

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters

valid - true if the **URIType** (p. 3690) contains valid data.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIType.h`

6.858 decaf::net::URL Class Reference

Class **URL** (p. 3697) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

`#include <src/main/decaf/net/URL.h>`

Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

6.858.1 Detailed Description

Class **URL** (p. 3697) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web. A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

`http://www.ksc.nasa.gov/facts/internet/url-primer.html`

In general, a **URL** (p. 3697) can be broken into several parts. The previous example of a **URL** (p. 3697) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named `www.ksc.nasa.gov`. The information on that host machine is named `/facts/internet/url-primer.html`. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 3697) is called the path component.

A **URL** (p. 3697) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

`http://www.ksc.nasa.gov:80/facts/internet/url-primer.html`

The syntax of **URL** (p. 3697) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 3660)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports `scope_ids`. The syntax and usage of `scope_ids` is described here.

A **URL** (p. 3697) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

`http://www.apache.org/cms/index.html#chapter1`

This fragment is not technically part of the **URL** (p. 3697). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag `chapter1` attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 3697). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 3697):

`http://www.apache.org/cms/index.html`

contained within it the relative **URL** (p. 3697):

`FAQ.html`

it would be a shorthand for:

`http://www.apache.org/cms/FAQ.html`

The relative **URL** (p. 3697) need not specify all the components of a **URL** (p. 3697). If the protocol, host name, or port number is missing, the value is inherited from the fully specified

URL (p. 3697). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 3697) class does not itself encode or decode any **URL** (p. 3697) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 3697), and also to decode any escaped fields, that are returned from **URL** (p. 3697). Furthermore, because **URL** (p. 3697) has no knowledge of **URL** (p. 3697) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 3697). For example, the two URLs:

`http://foo.com/hello world/` and `http://foo.com/hello%20world`

would be considered not equal to each other.

Note, the **URI** (p. 3660) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 3660), and to convert between these two classes using `toURI()` and `URI.toURL()` (p. 3671).

The **URLEncoder** (p. 3700) and **URLDecoder** (p. 3699) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

6.858.2 Constructor & Destructor Documentation

6.858.2.1 `decaf::net::URL::URL ()`

6.858.2.2 `decaf::net::URL::URL (const std::string & url)`

6.858.2.3 `virtual decaf::net::URL::~~URL ()` [inline, virtual]

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URL.h`

6.859 decaf::net::URLDecoder Class Reference

```
#include <src/main/decaf/net/URLDecoder.h>
```

Public Member Functions

- `virtual ~URLDecoder ()`

Static Public Member Functions

- `static std::string decode (const std::string &value)`

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type.

6.859.1 Constructor & Destructor Documentation

6.859.1.1 `virtual decaf::net::URLDecoder::~~URLDecoder ()` [inline, virtual]

6.859.2 Member Function Documentation

6.859.2.1 `static std::string decaf::net::URLDecoder::decode (const std::string & value)` [static]

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type.

'+' will be converted to space, '%' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C \$%"

Parameters

value - string The encoded string.

Returns

The decoded version as a string.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLDecoder.h`

6.860 decaf::net::URLEncoder Class Reference

```
#include <src/main/decaf/net/URLEncoder.h>
```

Public Member Functions

- `virtual ~URLEncoder ()`

Static Public Member Functions

- `static std::string encode (const std::string &value)`

This class contains a utility method for converting a string to the format required by the application/x-www-form-urlencoded MIME content type.

6.860.1 Constructor & Destructor Documentation

6.860.1.1 `virtual decaf::net::URLEncoder::~~URLEncoder () [inline, virtual]`

6.860.2 Member Function Documentation

6.860.2.1 `static std::string decaf::net::URLEncoder::encode (const std::string & value) [static]`

This class contains a utility method for converting a string to the format required by the application/x-www-form-urlencoded MIME content type.

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexadecimal value prepended by ' '.

For example: '#' -> '23'

In addition, spaces are substituted by '+'

Parameters

value - the string to be converted

Returns

the converted string

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URLEncoder.h**

6.861 activemq::util::Usage Class Reference

```
#include <src/main/activemq/util/Usage.h>
```

Inheritance diagram for activemq::util::Usage:

Public Member Functions

- virtual `~Usage ()`
- virtual void `waitForSpace ()=0`
*Waits forever for more space to be returned to this **Usage** (p. 3701) Manager.*
- virtual void `waitForSpace (unsigned int timeout)=0`
*Waits for more space to be returned to this **Usage** (p. 3701) Manager, times out when the given time span in milliseconds elapses.*
- virtual void `enqueueUsage (unsigned long long value)=0`
Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void `increaseUsage (unsigned long long value)=0`

Increases the usage by the value amount.

- virtual void **decreaseUsage** (unsigned long long value)=0

Decreases the usage by the value amount.

- virtual bool **isFull** () const =0

*Returns true if this **Usage** (p. 3701) instance is full, i.e.*

6.861.1 Constructor & Destructor Documentation

6.861.1.1 virtual **activemq::util::Usage::~Usage** () [inline, virtual]

6.861.2 Member Function Documentation

6.861.2.1 virtual void **activemq::util::Usage::decreaseUsage** (unsigned long long *value*) [pure virtual]

Decreases the usage by the value amount.

Parameters

value Amount of space to return to the pool

Implemented in **activemq::util::MemoryUsage** (p. 2356).

6.861.2.2 virtual void **activemq::util::Usage::enqueueUsage** (unsigned long long *value*) [pure virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters

value Amount of usage in bytes to add.

Implemented in **activemq::util::MemoryUsage** (p. 2356).

6.861.2.3 virtual void **activemq::util::Usage::increaseUsage** (unsigned long long *value*) [pure virtual]

Increases the usage by the value amount.

Parameters

value Amount of usage to add.

Implemented in **activemq::util::MemoryUsage** (p. 2357).

6.861.2.4 virtual bool activemq::util::Usage::isFull () const [pure virtual]

Returns true if this **Usage** (p. 3701) instance is full, i.e.

Usage (p. 3701) $\geq 100\%$

Returns

true if **Usage** (p. 3701) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 2357).

6.861.2.5 virtual void activemq::util::Usage::waitForSpace (unsigned int *timeout*) [pure virtual]

Waits for more space to be returned to this **Usage** (p. 3701) Manager, times out when the given time span in milliseconds elapses.

Parameters

timeout The time to wait for more space.

Implemented in **activemq::util::MemoryUsage** (p. 2357).

6.861.2.6 virtual void activemq::util::Usage::waitForSpace () [pure virtual]

Waits forever for more space to be returned to this **Usage** (p. 3701) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 2357).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**Usage.h**

6.862 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

```
#include <src/main/decaf/io/UTFDataFormatException.h>
```

Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** () throw ()
Default Constructor.
- **UTFDataFormatException** (const lang::Exception &ex) throw ()
Copy Constructor.

- **UTFDataFormatException** (const **UTFDataFormatException** &ex) throw ()
Copy Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UTFDataFormatException** (const std::exception *cause) throw ()
Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **UTFDataFormatException** * clone () const
Clones this exception.
- virtual ~**UTFDataFormatException** () throw ()

6.862.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since

1.0

6.862.2 Constructor & Destructor Documentation

6.862.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException () throw () [inline]

Default Constructor.

6.862.2.2 decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.862.2.3 decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.862.2.4 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- cause* The exception that was the cause for this one to be thrown.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.862.2.5 `decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

- cause* Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.862.2.6 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.862.2.7 `virtual decaf::io::UTFDataFormatException::~~UTFDataFormatException () throw () [inline, virtual]`

6.862.3 Member Function Documentation

6.862.3.1 `virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 2005).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/UTFDataFormatException.h`

6.863 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 3706)).

```
#include <src/main/decaf/util/UUID.h>
```

Inheritance diagram for `decaf::util::UUID`:

Public Member Functions

*Creates a **UUID** (p. 3706) from the string standard representation as described in the **toString()** (p. 3711) method.*

6.863.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 3706)). A **UUID** (p. 3706) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 3706) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 3706) is as follows: The most significant long consists of the following unsigned fields:

```
0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000 version
0x00000000000000FF time_hi
```

The least significant long consists of the following unsigned fields:

```
0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFFFF node
```

The variant field contains a value which identifies the layout of the **UUID** (p. 3706). The bit layout described above is valid only for a **UUID** (p. 3706) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 3706). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.863.2 Constructor & Destructor Documentation

6.863.2.1 decaf::util::UUID::UUID (long long *mostSigBits*, long long *leastSigBits*)

Constructs a new **UUID** (p. 3706) using the specified data.

mostSigBits is used for the most significant 64 bits of the **UUID** (p. 3706) and *leastSigBits* becomes the least significant 64 bits of the **UUID** (p. 3706).

Parameters

mostSigBits

leastSigBits

6.863.2.2 virtual decaf::util::UUID::~~UUID () [virtual]

6.863.3 Member Function Documentation

6.863.3.1 virtual int decaf::util::UUID::clockSequence () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The clock sequence value associated with this **UUID** (p. 3706).

The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 3706). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 3706).

The *clockSequence* value is only meaningful in a time-based **UUID** (p. 3706), which has version type 1. If this **UUID** (p. 3706) is not a time-based **UUID** (p. 3706) then this method throws *UnsupportedOperationException*.

Returns

the *clockSequence* associated with a V1 **UUID** (p. 3706)

Exceptions

UnsupportedOperationException

6.863.3.2 virtual int decaf::util::UUID::compareTo (const UUID & *value*) const [virtual]

Compare the given **UUID** (p. 3706) to this one.

Parameters

value - the **UUID** (p. 3706) to compare to

6.863.3.3 `virtual bool decaf::util::UUID::equals (const UUID & value) const`
[virtual]

Compares this **UUID** (p. 3706) to the one given, returns true if they are equal.

Parameters

value - the **UUID** (p. 3706) to compare to.

Returns

true if UUIDs are the same.

6.863.3.4 `static UUID decaf::util::UUID::fromString (const std::string & name)`
`throw (lang::exceptions::IllegalArgumentException)` [static]

Creates a **UUID** (p. 3706) from the string standard representation as described in the `toString()` (p. 3711) method.

Parameters

name - a string to be used to construct a **UUID** (p. 3706).

Returns

type 3 **UUID** (p. 3706)

6.863.3.5 `virtual long long decaf::util::UUID::getLeastSignificantBits () const`
[virtual]

Returns

the most significant 64 bits of this UUID's 128 bit value.

6.863.3.6 `virtual long long decaf::util::UUID::getMostSignificantBits () const`
[virtual]

Returns

the most significant 64 bits of this UUID's 128 bit value.

6.863.3.7 `static UUID decaf::util::UUID::nameUUIDFromBytes (const`
`std::vector< char > & name)` [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3706) based on the specified byte array.

Parameters

name - a byte array to be used to construct a **UUID** (p. 3706).

Returns

type 3 **UUID** (p. 3706)

```
6.863.3.8 static UUID decaf::util::UUID::nameUUIDFromBytes ( const char *
name, std::size_t size ) [static]
```

Static factory to retrieve a type 3 (name based) **UUID** (p. 3706) based on the specified byte array.

Parameters

name - a byte array to be used to construct a **UUID** (p. 3706).

size - the size of the byte array, or number of bytes to use.

Returns

type 3 **UUID** (p. 3706)

```
6.863.3.9 virtual long long decaf::util::UUID::node ( ) throw (
lang::exceptions::UnsupportedOperationException ) [virtual]
```

The node value associated with this **UUID** (p. 3706).

The 48 bit node value is constructed from the node field of this **UUID** (p.3706). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p.3706) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 3706), which has version type 1. If this **UUID** (p. 3706) is not a time-based **UUID** (p. 3706) then this method throws `UnsupportedOperationException`.

Returns

the node value of this **UUID** (p. 3706)

Exceptions

UnsupportedOperationException

```

6.863.3.10 virtual bool decaf::util::UUID::operator< ( const UUID & value )
const [virtual]

```

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.863.3.11 `virtual bool decaf::util::UUID::operator==(const UUID & value) const [virtual]`

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.863.3.12 `static UUID decaf::util::UUID::randomUUID () [static]`

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3706).

The **UUID** (p. 3706) is generated using a cryptographically strong pseudo random number generator.

Returns

type 4 **UUID** (p. 3706)

6.863.3.13 `virtual long long decaf::util::UUID::timestamp () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The timestamp value associated with this **UUID** (p. 3706).

The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p. 3706). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 3706), which has version type 1. If this **UUID** (p. 3706) is not a time-based **UUID** (p. 3706) then this method throws `UnsupportedOperationException`.

Returns

the timestamp associated with a V1 **UUID** (p. 3706)

Exceptions

UnsupportedOperationException

6.863.3.14 `virtual std::string decaf::util::UUID::toString () const [virtual]`

Returns a String object representing this **UUID** (p. 3706).

UUID's are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

Returns

formatted string for this **UUID** (p. 3706)

6.863.3.15 `virtual int decaf::util::UUID::variant () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The variant number associated with this **UUID** (p. 3706).

The variant number describes the layout of the **UUID** (p. 3706). The variant number has the following meaning:

* 0 Reserved for NCS backward compatibility * 2 The Leach-Salz variant (used by this class) * 6 Reserved, Microsoft Corporation backward compatibility * 7 Reserved for future definition

Returns

the variant associated with a V1 **UUID** (p. 3706)

Exceptions

UnsupportedOperationException

6.863.3.16 `virtual int decaf::util::UUID::version () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The version number associated with this **UUID** (p. 3706).

The version number describes how this **UUID** (p. 3706) was generated. The version number has the following meaning:

* 1 Time-based **UUID** (p. 3706) * 2 DCE security **UUID** (p. 3706) * 3 Name-based **UUID** (p. 3706) * 4 Randomly generated **UUID** (p. 3706)

Returns

the version associated with a V1 **UUID** (p. 3706)

Exceptions

UnsupportedOperationException

The documentation for this class was generated from the following file:

- `src/main/decaf/util/UUID.h`

6.864 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

```
#include <src/main/activemq/wireformat/WireFormat.h>
```

Inheritance diagram for `activemq::wireformat::WireFormat`:

Public Member Functions

- virtual `~WireFormat ()`
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0
throw (**decaf::io::IOException**)

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0
throw (**decaf::io::IOException**)

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version)=0

Set the Version.

- virtual int **getVersion** () const =0

Get the Version.

- virtual bool **hasNegotiator** () const =0

*Returns true if this **WireFormat** (p. 3712) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual bool **inReceive** () const =0

Indicates if the WireFormat object is in the process of receiving a message.

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)=0 throw (**decaf::lang::exceptions::UnsupportedOperationException**)

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.864.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

Version

Revision:

1.1

6.864.2 Constructor & Destructor Documentation

6.864.2.1 virtual `activemq::wireformat::WireFormat::~~WireFormat ()` [inline, virtual]

6.864.3 Member Function Documentation

6.864.3.1 virtual `Pointer<transport::Transport> activemq::wireformat::WireFormat::createNegotiator (const Pointer< transport::Transport > & transport) throw (decaf::lang::exceptions::UnsupportedOperationException)` [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters

transport - the Transport to Wrap the Negotiator around.

Returns

new instance of a **WireFormatNegotiator** (p. 3751) as a **Pointer<Transport>** (p. 2756).

Exceptions

UnsupportedOperationException if the **WireFormat** (p. 3712) doesn't have a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2703), and **activemq::wireformat::stomp::StompWireFormat** (p. 3408).

6.864.3.2 virtual `int activemq::wireformat::WireFormat::getVersion () const` [pure virtual]

Get the Version.

Returns

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2705), and **activemq::wireformat::stomp::StompWireFormat** (p. 3408).

6.864.3.3 virtual `bool activemq::wireformat::WireFormat::hasNegotiator () const` [pure virtual]

Returns true if this **WireFormat** (p. 3712) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 3712) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2705), and **activemq::wireformat::stomp::StompWireFormat** (p. 3409).

6.864.3.4 `virtual bool activemq::wireformat::WireFormat::inReceive () const` [pure virtual]

Indicates if the WireFormat object is in the process of receiving a message.

This is useful for monitoring inactivity and the **WireFormat** (p. 3712) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 3712) instance to determine if its busy or not and not mark the connection as inactive if so.

Returns

true if the **WireFormat** (p. 3712) object is unmarshaling a message.

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 2705), and `activemq::wireformat::stomp::StompWireFormat` (p. 3409).

6.864.3.5 `virtual void activemq::wireformat::WireFormat::marshal` (`const Pointer< commands::Command > & command,` `const activemq::transport::Transport * transport,` `decaf::io::DataOutputStream * out`) `throw (decaf::io::IOException)` [pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command The Command to Marshal

transport The Transport that called this method.

out The output stream to write the command to.

Exceptions

IOException

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 2707), and `activemq::wireformat::stomp::StompWireFormat` (p. 3409).

6.864.3.6 `virtual void activemq::wireformat::WireFormat::setVersion (int version`) [pure virtual]

Set the Version.

Parameters

version the version of the wire format

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 2710), and `activemq::wireformat::stomp::StompWireFormat` (p. 3409).

6.864.3.7 virtual `Pointer<commands::Command>` `activemq::wireformat::WireFormat::unmarshal` (const `activemq::transport::Transport` * *transport*, `decaf::io::DataInputStream` * *in*) throw (`decaf::io::IOException`) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

- transport* - Pointer to the transport that is making this request.
- in* - the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 2711), and `activemq::wireformat::stomp::StompWireFormat` (p. 3410).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormat.h`

6.865 activemq::wireformat::WireFormatFactory Class Reference

The `WireFormatFactory` (p. 3716) is the interface that all `WireFormatFactory` (p. 3716) classes must extend.

```
#include <src/main/activemq/wireformat/WireFormatFactory.h>
```

Inheritance diagram for `activemq::wireformat::WireFormatFactory`:

Public Member Functions

- virtual `~WireFormatFactory` ()
- virtual `Pointer< WireFormat >` `createWireFormat` (const `decaf::util::Properties` &properties)=0 throw (`decaf::lang::exceptions::IllegalStateException`)

Creates a new `WireFormat` (p. 3712) Object passing it a set of properties from which it can obtain any optional settings.

6.865.1 Detailed Description

The **WireFormatFactory** (p. 3716) is the interface that all **WireFormatFactory** (p. 3716) classes must extend. The Factory creates a **WireFormat** (p. 3712) Object based on the properties that are set in the passed **Properties** object.

6.865.2 Constructor & Destructor Documentation

6.865.2.1 `virtual activemq::wireformat::WireFormatFactory::~~WireFormatFactory () [inline, virtual]`

6.865.3 Member Function Documentation

6.865.3.1 `virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat (const decaf::util::Properties & properties) throw (decaf::lang::exceptions::IllegalStateException) [pure virtual]`

Creates a new **WireFormat** (p. 3712) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties - the Properties for this **WireFormat** (p. 3712)

Returns

Pointer to a new instance of a **WireFormat** (p. 3712) object.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 2713), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 3411).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormatFactory.h`

6.866 activemq::commands::WireFormatInfo Class Reference

```
#include <src/main/activemq/commands/WireFormatInfo.h>
```

Inheritance diagram for `activemq::commands::WireFormatInfo`:

Public Member Functions

- **WireFormatInfo** ()
- virtual **~WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.

- virtual **DataSet** * **cloneDataSet** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataSet** (const **DataSet** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataSet** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataSet** *value) const
*Compares the **DataSet** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- int **getVersion** () const
Get the current Wireformat Version.
- void **setVersion** (int version)
Set the current Wireformat Version.
- long long **getMaxInactivityDuration** () const
Returns the currently configured Max Inactivity duration.
- void **setMaxInactivityDuration** (long long maxInactivityDuration)
Sets the Max inactivity duration value.
- long long **getMaxInactivityDurationInitialDelay** () const
Returns the currently configured Max Inactivity Initial Delay duration.
- void **setMaxInactivityDurationInitialDelay** (long long maxInactivityDurationInitialDelay)
Sets the Max inactivity initial delay duration value.
- bool **isStackTraceEnabled** () const
Checks if the stackTraceEnabled flag is on.
- void **setStackTraceEnabled** (bool stackTraceEnabled)
Sets if the stackTraceEnabled flag is on.
- bool **isTcpNoDelayEnabled** () const

Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)
Sets if the tcpNoDelayEnabled flag is on.
- bool **isCacheEnabled** () const
Checks if the cacheEnabled flag is on.
- void **setCacheEnabled** (bool cacheEnabled)
Sets if the cacheEnabled flag is on.
- int **getCacheSize** () const
Gets the Cache Size setting.
- void **setCacheSize** (int value)
Sets the Cache Size setting.
- bool **isTightEncodingEnabled** () const
Checks if the tightEncodingEnabled flag is on.
- void **setTightEncodingEnabled** (bool tightEncodingEnabled)
Sets if the tightEncodingEnabled flag is on.
- bool **isSizePrefixDisabled** () const
Checks if the sizePrefixDisabled flag is on.
- void **setSizePrefixDisabled** (bool sizePrefixDisabled)
Sets if the sizePrefixDisabled flag is on.
- const std::vector< unsigned char > & **getMagic** () const
Get the Magic field.
- void **setMagic** (const std::vector< unsigned char > &magic)
Sets the value of the magic field.
- const std::vector< unsigned char > & **getMarshaledProperties** () const
Get the marshalledProperties field.
- void **setMarshaledProperties** (const std::vector< unsigned char > &marshalledProperties)
Sets the value of the marshalledProperties field.
- virtual const **util::PrimitiveMap** & **getProperties** () const
*Gets the Properties for this **Command** (p. 1107).*
- virtual **util::PrimitiveMap** & **getProperties** ()
*Gets the Properties for this **Command** (p. 1107).*
- virtual void **setProperties** (const **util::PrimitiveMap** &map)
*Sets the Properties for this **Command** (p. 1107).*

- bool **isValid** () const
*Determines if we think this is a Valid **WireFormatInfo** (p. 3717) command.*
- virtual bool **isWireFormatInfo** () const
- virtual void **beforeMarshal** (wireformat::WireFormat *wireFormat AMQCPP_ - UNUSED) throw (decaf::io::IOException)
Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.
- virtual void **afterUnmarshal** (wireformat::WireFormat *wireFormat AMQCPP_ - UNUSED) throw (decaf::io::IOException)
Called after unmarshaling is started to cleanup the object being unmarshaled.

Static Public Attributes

- static const unsigned char **ID_WIREFORMATINFO** = 1

6.866.1 Constructor & Destructor Documentation

6.866.1.1 activemq::commands::WireFormatInfo::WireFormatInfo ()

6.866.1.2 virtual activemq::commands::WireFormatInfo::~~WireFormatInfo ()
[virtual]

6.866.2 Member Function Documentation

6.866.2.1 virtual void activemq::commands::WireFormatInfo::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_ UNUSED) throw (decaf::io::IOException) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 765).

6.866.2.2 virtual void activemq::commands::WireFormatInfo::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_ UNUSED) throw (decaf::io::IOException) [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

Parameters

wireFormat - the wire formatting controller

Reimplemented from **activemq::commands::BaseDataStructure** (p. 765).

6.866.2.3 `virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.866.2.4 `virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.866.2.5 `virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.866.2.6 `int activemq::commands::WireFormatInfo::getCacheSize () const`

Gets the Cache Size setting.

Returns

currently set cache size.

6.866.2.7 `virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1553) type copy.

Implements **activemq::commands::DataSet** (p. 1557).

6.866.2.8 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic () const [inline]`

Get the Magic field.

Returns

const reference to a `std::vector<char>`

6.866.2.9 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshaledProperties () const [inline]`

Get the marshaledProperties field.

Returns

const reference to a `std::vector<char>`

6.866.2.10 `long long activemq::commands::WireFormatInfo::getMaxInactivityDuration () const`

Returns the currently configured Max Inactivity duration.

Returns

the set inactivity duration value.

6.866.2.11 `long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitialDelay () const`

Returns the currently configured Max Inactivity Initial Delay duration.

Returns

the set inactivity duration initial delay value.

6.866.2.12 `virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ()`
[inline, virtual]

Gets the Properties for this **Command** (p. 1107).

Returns

the Properties object for this **Command** (p. 1107).

6.866.2.13 `virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ()`
`const` [inline, virtual]

Gets the Properties for this **Command** (p. 1107).

Returns

the Properties object for this **Command** (p. 1107).

6.866.2.14 `int activemq::commands::WireFormatInfo::getVersion () const`
[inline]

Get the current Wireformat Version.

Returns

int that identifies the version

6.866.2.15 `bool activemq::commands::WireFormatInfo::isCacheEnabled () const`

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.866.2.16 `virtual bool activemq::commands::WireFormatInfo::isMarshalAware () const` [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 767).

6.866.2.17 **bool** **activemq::commands::WireFormatInfo::isSizePrefixDisabled** ()
 const

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.866.2.18 **bool** **activemq::commands::WireFormatInfo::isStackTraceEnabled** ()
 const

Checks if the stackTraceEnabled flag is on.

Returns

true if the flag is on.

6.866.2.19 **bool** **activemq::commands::WireFormatInfo::isTcpNoDelayEnabled** ()
 const

Checks if the tcpNoDelayEnabled flag is on.

Returns

true if the flag is on.

6.866.2.20 **bool** **activemq::commands::WireFormatInfo::isTightEncodingEnabled** ()
 const

Checks if the tightEncodingEnabled flag is on.

Returns

true if the flag is on.

6.866.2.21 **bool** **activemq::commands::WireFormatInfo::isValid** () **const**

Determines if we think this is a Valid **WireFormatInfo** (p. 3717) command.

Returns

true if its valid.

6.866.2.22 **virtual bool** **activemq::commands::WireFormatInfo::isWireFormatInfo** () **const** [inline, virtual]

Returns

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

6.866.2.23 `void activemq::commands::WireFormatInfo::setCacheEnabled (bool cacheEnabled)`

Sets if the `cacheEnabled` flag is on.

Parameters

cacheEnabled - true to turn flag is on

6.866.2.24 `void activemq::commands::WireFormatInfo::setCacheSize (int value)`

Sets the Cache Size setting.

Parameters

value - value to set to the cache size.

6.866.2.25 `void activemq::commands::WireFormatInfo::setMagic (const std::vector< unsigned char > & magic) [inline]`

Sets the value of the magic field.

Parameters

magic - const std::vector<char>

6.866.2.26 `void activemq::commands::WireFormatInfo::setMarshaledProperties (const std::vector< unsigned char > & marshalledProperties) [inline]`

Sets the value of the `marshalledProperties` field.

Parameters

marshalledProperties The Byte Array vector that contains the marshaled form of the Message (p. 2358) properties, this is the data sent over the wire.

6.866.2.27 `void activemq::commands::WireFormatInfo::setMaxInactivityDuration (long long maxInactivityDuration)`

Sets the Max inactivity duration value.

Parameters

maxInactivityDuration - max time a client can be inactive.

6.866.2.28 `void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitialDelay (long long maxInactivityDurationInitialDelay)`

Sets the Max inactivity initial delay duration value.

Parameters

maxInactivityDurationInitialDelay - time before the inactivity delay is checked.

6.866.2.29 `virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & map) [inline, virtual]`

Sets the Properties for this **Command** (p. 1107).

Parameters

map - PrimitiveMap to copy

6.866.2.30 `void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool sizePrefixDisabled)`

Sets if the sizePrefixDisabled flag is on.

Parameters

sizePrefixDisabled - true to turn flag is on

6.866.2.31 `void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool stackTraceEnabled)`

Sets if the stackTraceEnabled flag is on.

Parameters

stackTraceEnabled - ture to turn flag is on

6.866.2.32 `void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool tcpNoDelayEnabled)`

Sets if the tcpNoDelayEnabled flag is on.

Parameters

tcpNoDelayEnabled - ture to turn flag is on

6.866.2.33 `void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool tightEncodingEnabled)`

Sets if the `tightEncodingEnabled` flag is on.

Parameters

tightEncodingEnabled - true to turn flag is on

6.866.2.34 `void activemq::commands::WireFormatInfo::setVersion (int version)`
[inline]

Set the current Wireformat Version.

Parameters

version - int that identifies the version

6.866.2.35 `virtual std::string activemq::commands::WireFormatInfo::toString ()`
`const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

6.866.2.36 `virtual decaf::lang::Pointer<commands::Command>`
`activemq::commands::WireFormatInfo::visit (`
`activemq::state::CommandVisitor * visitor) throw (`
`exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p.1112).

6.866.3 Field Documentation

6.866.3.1 `const unsigned char activemq::commands::WireFormatInfo::ID_ - WIREFORMATINFO = 1` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/WireFormatInfo.h`

6.867 activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3728).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/WireFormatInfoMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller:

Public Member Functions

- **WireFormatInfoMarshaller** ()
- virtual **~WireFormatInfoMarshaller** ()

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.867.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3728). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.867.2 Constructor & Destructor Documentation

6.867.2.1 `activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::WireFormatInfoMarshaller()` [inline]

6.867.2.2 `virtual activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller()` [inline, virtual]

6.867.3 Member Function Documentation

6.867.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.867.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.867.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.867.3.4 virtual void `activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.867.3.5 virtual int `activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.867.3.6 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.867.3.7 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.868.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3731). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.868.2 Constructor & Destructor Documentation

6.868.2.1 `activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::WireFormatInfoMarshaller()` [inline]

6.868.2.2 `virtual activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller()` [inline, virtual]

6.868.3 Member Function Documentation

6.868.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.868.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.868.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.868.3.4 virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.868.3.5 virtual int activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.868.3.6 virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.868.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.869.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3735). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.869.2 Constructor & Destructor Documentation

6.869.2.1 `activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::WireFormatInfoMarshaller () [inline]`

6.869.2.2 `virtual activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller () [inline, virtual]`

6.869.3 Member Function Documentation

6.869.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.869.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.869.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.869.3.4 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.869.3.5 virtual int activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.869.3.6 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.869.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.870.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3739). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.870.2 Constructor & Destructor Documentation

6.870.2.1 `activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::WireFormatInfoMarshaller () [inline]`

6.870.2.2 `virtual activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller () [inline, virtual]`

6.870.3 Member Function Documentation

6.870.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.870.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.870.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.870.3.4 virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.870.3.5 virtual int activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.870.3.6 virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.870.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/WireFormatInfoMarshaller.h`

6.871 **activemq::wireformat::openwire::marshal::v1::WireFormatInfoMar** Class Reference

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3743).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/WireFormatInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller**:

Public Member Functions

- **WireFormatInfoMarshaller** ()
- virtual **~WireFormatInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.871.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3743). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.871.2 Constructor & Destructor Documentation

6.871.2.1 `activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::WireFormatInfoMarshaller () [inline]`

6.871.2.2 `virtual activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller () [inline, virtual]`

6.871.3 Member Function Documentation

6.871.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.871.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.871.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.871.3.4 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.871.3.5 virtual int activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.871.3.6 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.871.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

6.872.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3747). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.872.2 Constructor & Destructor Documentation

6.872.2.1 `activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::WireFormatInfoMarshaller () [inline]`

6.872.2.2 `virtual activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller () [inline, virtual]`

6.872.3 Member Function Documentation

6.872.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.872.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.872.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.872.3.4 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.872.3.5 virtual int activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.872.3.6 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.872.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**WireFormatInfoMarshaller.h**

6.873 activemq::wireformat::WireFormatNegotiator Class Reference

Defines a **WireFormatNegotiator** (p. 3751) which allows a **WireFormat** (p. 3712) to.

```
#include <src/main/activemq/wireformat/WireFormatNegotiator.h>
```

Inheritance diagram for **activemq::wireformat::WireFormatNegotiator**:

Public Member Functions

Constructor.
- virtual ~**WireFormatNegotiator** ()

6.873.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 3751) which allows a **WireFormat** (p. 3712) to.

6.873.2 Constructor & Destructor Documentation

- 6.873.2.1** **activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator** (
const **Pointer**< **transport::Transport** > & *next*) [inline]

Constructor.

Parameters

next - the next Transport in the chain

- 6.873.2.2** virtual
activemq::wireformat::WireFormatNegotiator::~~WireFormatNegotiator (
) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatNegotiator.h**

6.874 activemq::wireformat::WireFormatRegistry Class Reference

Registry of all **WireFormat** (p. 3712) Factories that are available to the client at runtime.

```
#include <src/main/activemq/wireformat/WireFormatRegistry.h>
```

Public Member Functions

- virtual ~**WireFormatRegistry** ()
- **WireFormatFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)
*Gets a Registered **WireFormatFactory** (p. 3716) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*
- void **registerFactory** (const std::string &name, **WireFormatFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

*Registers a new **WireFormatFactory** (p. 3716) with this Registry.*

- void **unregisterFactory** (const std::string &name)
Unregisters the Factory with the given name and deletes that instance of the Factory.
- std::vector< std::string > **getWireFormatNames** () const
Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()
*Gets the single instance of the **WireFormatRegistry** (p. 3752).*

6.874.1 Detailed Description

Registry of all **WireFormat** (p. 3712) Factories that are available to the client at runtime. New WireFormat's must have a factory registered here before a connection attempt is made.

Since

3.0

6.874.2 Constructor & Destructor Documentation

- 6.874.2.1 **virtual**
activemq::wireformat::WireFormatRegistry::~~WireFormatRegistry ()
[virtual]

6.874.3 Member Function Documentation

- 6.874.3.1 **WireFormatFactory*** **activemq::wireformat::WireFormatRegistry::findFactory**
(const std::string & *name*) const throw (
decaf::lang::exceptions::NoSuchElementException)

Gets a Registered **WireFormatFactory** (p. 3716) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

name The name of the Factory to find in the Registry.

Returns

the Factory registered under the given name.

Exceptions

NoSuchElementException if no factory is registered with that name.

6.874.3.2 `static WireFormatRegistry& activemq::wireformat::WireFormatRegistry::getInstance () [static]`

Gets the single instance of the **WireFormatRegistry** (p. 3752).

Returns

reference to the single instance of this Registry

6.874.3.3 `std::vector<std::string> activemq::wireformat::WireFormatRegistry::getWireFormatNames () const`

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Returns

stl vector of strings with all the **WireFormat** (p. 3712) names registered.

6.874.3.4 `void activemq::wireformat::WireFormatRegistry::registerFactory (const std::string & name, WireFormatFactory * factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)`

Registers a new **WireFormatFactory** (p. 3716) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.874.3.5 `void activemq::wireformat::WireFormatRegistry::unregisterFactory (const std::string & name)`

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

name Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatRegistry.h**

6.875 activemq::transport::inactivity::WriteChecker Class Reference

Runnable class used by the {}.

```
#include <src/main/activemq/transport/inactivity/WriteChecker.h>
```

Inheritance diagram for `activemq::transport::inactivity::WriteChecker`:

Public Member Functions

- **WriteChecker** (**InactivityMonitor** *parent)
- virtual ~**WriteChecker** ()
- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.875.1 Detailed Description

Runnable class used by the {}.

See also

InactivityMonitor (p. 1874)} to make periodic writes to the underlying **transport** (p. 89) if no other write activity is going on in order to more quickly detect failures of the connection to the broker.

Since

3.1.0

6.875.2 Constructor & Destructor Documentation

6.875.2.1 `activemq::transport::inactivity::WriteChecker::WriteChecker (InactivityMonitor * parent)`

6.875.3 Member Function Documentation

6.875.3.1 `virtual void activemq::transport::inactivity::WriteChecker::run () [virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 3112).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/inactivity/WriteChecker.h`

6.876 decaf::io::Writer Class Reference

```
#include <src/main/decaf/io/Writer.h>
```

Inheritance diagram for decaf::io::Writer:

Public Member Functions

- **Writer** ()
- virtual **~Writer** ()
- virtual void **write** (char v) throw (decaf::io::IOException)
Writes an single byte char value.
- virtual void **write** (const std::vector< char > &buffer) throw (decaf::io::IOException)
Writes an array of Chars.
- virtual void **write** (const char *buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Writes a byte array to the output stream.
- virtual void **write** (const char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Writes a byte array to the output stream.
- virtual void **write** (const std::string &str) throw (decaf::io::IOException)
Writes a string.
- virtual void **write** (const std::string &str, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)
Writes a string.
- virtual **decaf::lang::Appendable** & **append** (char value) throw (decaf::io::IOException)
Appends the specified character to this Appendable.
- virtual **decaf::lang::Appendable** & **append** (const **decaf::lang::CharSequence** *csq) throw (decaf::io::IOException)
Appends the specified character sequence to this Appendable.
- virtual **decaf::lang::Appendable** & **append** (const **decaf::lang::CharSequence** *csq, int start, int end) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)
Appends a subsequence of the specified character sequence to this Appendable.

Protected Member Functions

- virtual void **doWriteArrayBounded** (const char *buffer, int size, int offset, int length)=0 throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Override this method to customize the functionality of the method write(char buffer, int size, int offset, int length).*

- virtual void **doWriteChar** (char v) throw (decaf::io::IOException)
- virtual void **doWriteVector** (const std::vector< char > &buffer) throw (decaf::io::IOException)

- virtual void **doWriteString** (const std::string &str) throw (decaf::io::IOException)
- virtual void **doWriteStringBounded** (const std::string &str, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual **decaf::lang::Appendable** & **doAppendChar** (char value) throw (decaf::io::IOException)
- virtual **decaf::lang::Appendable** & **doAppendCharSequence** (const **decaf::lang::CharSequence** *csq) throw (decaf::io::IOException)
- virtual **decaf::lang::Appendable** & **doAppendCharSequenceStartEnd** (const **decaf::lang::CharSequence** *csq, int start, int end) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)

6.876.1 Constructor & Destructor Documentation

6.876.1.1 decaf::io::Writer::Writer ()

6.876.1.2 virtual decaf::io::Writer::~~Writer () [virtual]

6.876.2 Member Function Documentation

6.876.2.1 virtual decaf::lang::Appendable& decaf::io::Writer::append (char value) throw (decaf::io::IOException) [virtual]

Appends the specified character to this Appendable.

Parameters

value The character to append.

Returns

a Reference to this Appendable

Exceptions

Exception if an error occurs.

Implements **decaf::lang::Appendable** (p. 667).

6.876.2.2 `virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * csq) throw (decaf::io::IOException)`
[virtual]

Appends the specified character sequence to this Appendable.

Parameters

csq The character sequence from which a subsequence will be appended. If *csq* is NULL, then characters will be appended as if *csq* contained the string "null".

Returns

a Reference to this Appendable.

Exceptions

Exception if an error occurs.

Implements **decaf::lang::Appendable** (p. 668).

6.876.2.3 `virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * csq, int start, int end) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Appends a subsequence of the specified character sequence to this Appendable.

Parameters

csq - The character sequence from which a subsequence will be appended. If *csq* is NULL, then characters will be appended as if *csq* contained the string "null".

start The index of the first character in the subsequence.

end The index of the character following the last character in the subsequence.

Returns

a Reference to this Appendable

Exceptions

Exception if an error occurs.

IndexOutOfBoundsException *start* is greater than *end*, or *end* is greater than *csq.length()*

Implements **decaf::lang::Appendable** (p. 667).

- 6.876.2.4 virtual `decaf::lang::Appendable& decaf::io::Writer::doAppendChar (char value) throw (decaf::io::IOException)` [protected, virtual]
- 6.876.2.5 virtual `decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequence (const decaf::lang::CharSequence * csq) throw (decaf::io::IOException)` [protected, virtual]
- 6.876.2.6 virtual `decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequenceStartEnd (const decaf::lang::CharSequence * csq, int start, int end) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)` [protected, virtual]
- 6.876.2.7 virtual `void decaf::io::Writer::doWriteArray (const char * buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)` [protected, virtual]
- 6.876.2.8 virtual `void decaf::io::Writer::doWriteArrayBounded (const char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)` [protected, pure virtual]

Override this method to customize the functionality of the method `write(char* buffer, int size, int offset, int length)`.

All subclasses must override this method to provide the basic **Writer** (p. 3756) functionality.

Implemented in **decaf::io::OutputStreamWriter** (p. 2727).

- 6.876.2.9 virtual `void decaf::io::Writer::doWriteChar (char v) throw (decaf::io::IOException)` [protected, virtual]
- 6.876.2.10 virtual `void decaf::io::Writer::doWriteString (const std::string & str) throw (decaf::io::IOException)` [protected, virtual]
- 6.876.2.11 virtual `void decaf::io::Writer::doWriteStringBounded (const std::string & str, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException)` [protected, virtual]
- 6.876.2.12 virtual `void decaf::io::Writer::doWriteVector (const std::vector< char > & buffer) throw (decaf::io::IOException)` [protected, virtual]
- 6.876.2.13 virtual `void decaf::io::Writer::write (char v) throw (decaf::io::IOException)` [virtual]

Writes an single byte char value.

Parameters

- v* The value to be written.

Exceptions

IOException (p. 2003) thrown if an error occurs.

6.876.2.14 virtual void decaf::io::Writer::write (const std::string & *str*) throw (decaf::io::IOException) [virtual]

Writes a string.

Parameters

str The string to be written.

Exceptions

IOException (p. 2003) thrown if an error occurs.

6.876.2.15 virtual void decaf::io::Writer::write (const std::string & *str*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Writes a string.

Parameters

str The string to be written.

offset The position in the array to start writing from.

length The number of bytes in the array to write.

Exceptions

IOException (p. 2003) thrown if an error occurs.

IndexOutOfBoundsException if offset+length is greater than the string length.

6.876.2.16 virtual void decaf::io::Writer::write (const char * *buffer*, int *size*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) [virtual]

Writes a byte array to the output stream.

Parameters

buffer The byte array to write (cannot be NULL).

size The size in bytes of the buffer passed.

Exceptions

IOException (p. 2003) if an I/O error occurs.

NullPointerException if buffer is NULL.

6.876.2.17 `virtual void decaf::io::Writer::write (const std::vector< char > & buffer) throw (decaf::io::IOException) [virtual]`

Writes an array of Chars.

Parameters

buffer The array to be written.

Exceptions

IOException (p. 2003) thrown if an error occurs.

6.876.2.18 `virtual void decaf::io::Writer::write (const char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Writes a byte array to the output stream.

Parameters

buffer The byte array to write (cannot be NULL).

size The size in bytes of the buffer passed.

offset The position in the array to start writing from.

length The number of bytes in the array to write.

Exceptions

IOException (p. 2003) if an I/O error occurs.

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if offset + length > size of the buffer.

 [virtual]

6.879.3 Member Function Documentation

6.879.3.1 virtual XATransactionId* ac-
 tivemq::commands::XATransactionId::cloneDataStructure
 () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.879.3.2 virtual int activemq::commands::XATransactionId::compareTo (const
 XATransactionId & *value*) const [virtual]

6.879.3.3 virtual void activemq::commands::XATransactionId::copyDataStructure (const
 DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.879.3.4 `virtual bool activemq::commands::XATransactionId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.879.3.5 `virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & value) const` [virtual]

6.879.3.6 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () const` [virtual]

6.879.3.7 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ()` [virtual]

6.879.3.8 `virtual unsigned char activemq::commands::XATransactionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

- 6.879.3.9 virtual int activemq::commands::XATransactionId::getFormatId ()
 const [virtual]

- 6.879.3.10 virtual const std::vector<unsigned char>& ac-
 tivemq::commands::XATransactionId::getGlobalTransactionId ()
 const [virtual]

- 6.879.3.11 virtual std::vector<unsigned char>& ac-
 tivemq::commands::XATransactionId::getGlobalTransactionId ()
 [virtual]

- 6.879.3.12 virtual bool activemq::commands::XATransactionId::operator< (const
 XATransactionId & *value*) const [virtual]

- 6.879.3.13 XATransactionId& activemq::commands::XATransactionId::operator= (const
 XATransactionId & *other*)

- 6.879.3.14 virtual bool activemq::commands::XATransactionId::operator== (const
 XATransactionId & *value*) const [virtual]

- 6.879.3.15 virtual void activemq::commands::XATransactionId::setBranchQualifier
 (const std::vector< unsigned char > & *branchQualifier*) [virtual]

- 6.879.3.16 virtual void activemq::commands::XATransactionId::setFormatId (int
 formatId) [virtual]

- 6.879.3.17 virtual void ac-
 tivemq::commands::XATransactionId::setGlobalTransactionId (const
 std::vector< unsigned char > & *globalTransactionId*) [virtual]

- 6.879.3.18 virtual std::string activemq::commands::XATransactionId::toString ()
 const [virtual]

Returns a string containing the information for this **DataSet** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.879.4 Field Documentation

- 6.879.4.1 `std::vector<unsigned char> activemq::commands::XATransactionId::branchQualifier` [protected]
- 6.879.4.2 `int activemq::commands::XATransactionId::formatId` [protected]
- 6.879.4.3 `std::vector<unsigned char> activemq::commands::XATransactionId::globalTransactionId` [protected]
- 6.879.4.4 `const unsigned char activemq::commands::XATransactionId::ID_ - XATRANSACTIONID = 112` [static]

6.880 `activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller` Class Reference

Marshaling code for Open Wire Format for `XATransactionIdMarshaller` (p. 3769).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/XATransactionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller`:

Public Member Functions

- `XATransactionIdMarshaller ()`
- `virtual ~XATransactionIdMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.880.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3769). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.880.2 Constructor & Destructor Documentation

6.880.2.1 **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::XATransactionIdMarshaller** () [inline]

6.880.2.2 **virtual**
activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::~~XATransactionIdMarshaller () [inline, virtual]

6.880.3 Member Function Documentation

6.880.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.880.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.880.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3592).

6.880.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3592).

6.880.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3593).

6.880.3.6 virtual void `activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::tightMarshal2`
(`OpenWireFormat` * *wireFormat*, `commands::DataStructure`
* *dataStructure*, `decaf::io::DataOutputStream` * *dataOut*,
`utils::BooleanStream` * *bs*) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3593).

6.880.3.7 virtual void `activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::tightUnmarshal`
(`OpenWireFormat` * *wireFormat*, `commands::DataStructure`
* *dataStructure*, `decaf::io::DataInputStream` * *dataIn*,
`utils::BooleanStream` * *bs*) throw (`decaf::io::IOException`) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller** (p. 3594).

The documentation for this class was generated from the following file:

6.881.3 Member Function Documentation

6.881.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.881.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

```

6.881.3.3 virtual void ac-
tivismq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3581).

```

6.881.3.4 virtual void ac-
tivismq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3581).

```

6.881.3.5 virtual int ac-
tivismq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3582).

```
6.881.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3582).

```
6.881.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3583).

The documentation for this class was generated from the following file:

6.882.3 Member Function Documentation

6.882.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.882.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.882.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller` (p. 3588).

6.882.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller` (p. 3589).

6.882.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller` (p. 3589).

```
6.882.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller` (p. 3590).

```
6.882.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3590).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.883.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3577).

6.883.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3578).

6.883.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3578).

```
6.883.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3579).

```
6.883.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

6.885.3 Member Function Documentation

6.885.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.885.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.885.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3574).

6.885.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3574).

6.885.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3575).

```
6.885.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3575).

```
6.885.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3576).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/XATransactionIdMarshaller.h`

6.886 decaf::util::logging::XMLFormatter Class Reference

Format a **LogRecord** (p. 2261) into a standard XML format.

```
#include <src/main/decaf/util/logging/XMLFormatter.h>
```

Inheritance diagram for `decaf::util::logging::XMLFormatter`:

Public Member Functions

- **XMLFormatter** ()
- virtual **~XMLFormatter** ()
- virtual `std::string format` (const **LogRecord** &record) const
*Converts a **LogRecord** (p. 2261) into an XML string.*
- virtual `std::string getHead` (const **Handler** *handler)
Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.
- virtual `std::string getTail` (const **Handler** *handler)
Returns the tail string for a set of log records formatted as XML strings.

6.886.1 Detailed Description

Format a **LogRecord** (p. 2261) into a standard XML format. TODO - Currently only outputs UTF-8 The **XMLFormatter** (p. 3793) can be used with arbitrary character encodings, but it is recommended that it normally be used with UTF-8. The character encoding can be set on the output **Handler** (p. 1852).

Since

1.0

6.886.2 Constructor & Destructor Documentation

6.886.2.1 `decaf::util::logging::XMLFormatter::XMLFormatter ()`

6.886.2.2 `virtual decaf::util::logging::XMLFormatter::~~XMLFormatter ()`
[virtual]

6.886.3 Member Function Documentation

6.886.3.1 `virtual std::string decaf::util::logging::XMLFormatter::format (const LogRecord & record) const` [virtual]

Converts a **LogRecord** (p. 2261) into an XML string.

Parameters

record The log record to be formatted.

Returns

the log record formatted as an XML string.

Implements **decaf::util::logging::Formatter** (p. 1839).

6.886.3.2 `virtual std::string decaf::util::logging::XMLFormatter::getHead (const Handler * handler)` [virtual]

Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.

Parameters

handler The output handler, may be NULL.

Returns

the header string for log records formatted as XML strings.

6.886.3.3 `virtual std::string decaf::util::logging::XMLFormatter::getTail (const Handler * handler)` [virtual]

Returns the tail string for a set of log records formatted as XML strings.

Parameters

handler The output handler, may be NULL.

Returns

the tail string for log records formatted as XML strings.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/XMLFormatter.h`

6.888 decaf::util::zip::ZipException Class Reference

```
#include <src/main/decaf/util/zip/ZipException.h>
```

Inheritance diagram for `decaf::util::zip::ZipException`:

Public Member Functions

- **ZipException** () throw ()
Default Constructor.
- **ZipException** (const **lang::Exception** &ex) throw ()
Copy Constructor.
- **ZipException** (const **ZipException** &ex) throw ()
Copy Constructor.
- **ZipException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ZipException** (const std::exception *cause) throw ()
Constructor.
- **ZipException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **ZipException** * clone () const
Clones this exception.
- virtual ~**ZipException** () throw ()

6.888.1 Constructor & Destructor Documentation

6.888.1.1 decaf::util::zip::ZipException::ZipException () throw () [inline]

Default Constructor.

6.888.1.2 decaf::util::zip::ZipException::ZipException (const lang::Exception &ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.888.1.3 `decaf::util::zip::ZipException::ZipException (const ZipException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.888.1.4 `decaf::util::zip::ZipException::ZipException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.888.1.5 `decaf::util::zip::ZipException::ZipException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.888.1.6 `decaf::util::zip::ZipException::ZipException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.888.1.7 virtual decaf::util::zip::ZipException::~ZipException () throw ()
[inline, virtual]

6.888.2 Member Function Documentation

6.888.2.1 virtual ZipException* decaf::util::zip::ZipException::clone () const
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 2005).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**ZipException.h**

Defines

- **#define AMQ_CATCH_RETHROW(type)**
Macro for catching and re-throwing an exception of a given type.
- **#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)**
Macro for catching an exception of one type and then re-throwing as another type.
- **#define AMQ_CATCHALL_THROW(type)**
A catch-all that throws a known exception.
- **#define AMQ_CATCHALL_NOTHROW()**
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

- `#define AMQ_CATCH_NOTHROW(type)`
Macro for catching and re-throwing an exception of a given type.

7.104.1 Define Documentation

7.104.1.1 `#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.104.1.2 `#define AMQ_CATCH_NOTHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. `ActiveMQException`).

7.104.1.3 `#define AMQ_CATCH_RETHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. `ActiveMQException`).

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.104.1.4 #define AMQ_CATCHALL_NOTHROW()**Value:**

```
catch( ... ){ \
    activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.104.1.5 #define AMQ_CATCHALL_THROW(type)**Value:**

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters

type the type of exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.105 src/main/decaf/lang/exceptions/ExceptionDefines.h

File Reference

Defines

- **#define DECAF_CATCH_RETHROW(type)**
Macro for catching and rethrowing an exception of a given type.
- **#define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)**
Macro for catching an exception of one type and then rethrowing as another type.
- **#define DECAF_CATCHALL_THROW(type)**

A catch-all that throws a known exception.

- `#define DECAF_CATCHALL_NOTHROW()`
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- `#define DECAF_CATCH_NOTHROW(type)`
Macro for catching and rethrowing an exception of a given type.

7.105.1 Define Documentation

7.105.1.1 `#define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( &ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by `decaf::util::PriorityQueue< E >::add()`.

7.105.1.2 `#define DECAF_CATCH_NOTHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. Exception).

7.105.1.3 `#define DECAF_CATCH_RETHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. `Exception`).

Referenced by `decaf::util::PriorityQueue< E >::add()`.

7.105.1.4 `#define DECAF_CATCHALL_NOTHROW()`

Value:

```
catch( ... ){ \
    lang::Exception ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.105.1.5 `#define DECAF_CATCHALL_THROW(type)`

Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters

type the type of exception to be thrown.

Referenced by `decaf::util::PriorityQueue< E >::add()`.

7.580 src/main/cms/MessageEnumeration.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEnumeration**

Defines an object that enumerates a collection of Messages.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.581 src/main/cms/MessageEOFException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 3415) or **BytesMessage** (p. 979) is being read.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.582 src/main/cms/MessageFormatException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class `cms::MessageFormatException`

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace `cms`

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.583 `src/main/cms/MessageListener.h` File Reference

```
#include <cms/Config.h>
```

Data Structures

- class `cms::MessageListener`

A `MessageListener` (p. 2522) object is used to receive asynchronously delivered messages.

Namespaces

- namespace `cms`

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.584 `src/main/cms/MessageNotReadableException.h` File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class `cms::MessageNotReadableException`

This exception must be thrown when a CMS client attempts to read a write-only message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.585 src/main/cms/MessageNotWriteableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotWriteableException**

This exception must be thrown when a CMS client attempts to write to a read-only message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.586 src/main/cms/MessageProducer.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/Destination.h>
#include <cms/Closeable.h>
#include <cms/CMSException.h>
#include <cms/InvalidDestinationException.h>
#include <cms/MessageFormatException.h>
#include <cms/UnsupportedOperationException.h>
#include <cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

*A client uses a **MessageProducer** (p. 2550) object to send messages to a **Destination** (p. 1610).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.587 src/main/cms/ObjectMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
```

Data Structures

- class **cms::ObjectMessage**

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.588 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**

An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.589 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::util::Queue< E >**
A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**

7.590 src/main/cms/QueueBrowser.h File Reference

```
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageEnumeration.h>
```

Data Structures

- class **cms::QueueBrowser**
*This class implements in interface for browsing the messages in a **Queue** (p. 2947) without removing them.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.591 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Message.h>
#include <cms/TextMessage.h>
#include <cms/BytesMessage.h>
#include <cms/MapMessage.h>
#include <cms/StreamMessage.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <cms/Topic.h>
#include <cms/Queue.h>
#include <cms/QueueBrowser.h>
#include <cms/TemporaryTopic.h>
#include <cms/TemporaryQueue.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Session**

*A **Session** (p. 3148) object is a single-threaded context for producing and consuming messages.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.592 src/main/cms/Startable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Startable**

Interface for a class that implements the start method.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.593 src/main/cms/Stopable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Stoppable**

Interface for a class that implements the stop method.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.594 src/main/cms/StreamMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWritableException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageEOFException.h>
```

Data Structures

- class **cms::StreamMessage**

*Interface for a **StreamMessage** (p. 3415).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.595 src/main/cms/TemporaryQueue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryQueue**

*Defines a Temporary **Queue** (p. 2947) based **Destination** (p. 1610).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.596 src/main/cms/TemporaryTopic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryTopic**

*Defines a Temporary **Topic** (p. 3568) based **Destination** (p. 1610).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.597 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::TextMessage**
Interface for a text message.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.598 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**
An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.599 src/main/cms/UnsupportedOperationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::UnsupportedOperationException**

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.600 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::UnsupportedOperationException**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.601 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h>
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**

Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**

7.602 src/main/decaf/internal/DecafRuntime.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/Runtime.h>
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::DecafRuntime**

Handles APR initialization and termination.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**

7.603 src/main/decaf/internal/io/StandardErrorOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
```

Data Structures

- class **decaf::internal::io::StandardErrorOutputStream**

Wrapper Around the Standard error Output facility on the current platform.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::io**

7.604 src/main/decaf/internal/io/StandardInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/InputStream.h>
```

Data Structures

- class **decaf::internal::io::StandardInputStream**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::io**

7.605 src/main/decaf/internal/io/StandardOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
```

Data Structures

- class **decaf::internal::io::StandardOutputStream**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::io**

7.606 src/main/decaf/internal/net/DefaultServerSocketFactory.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/net/ServerSocketFactory.h>
```

Data Structures

- class **decaf::internal::net::DefaultServerSocketFactory**

Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::net**

7.607 src/main/decaf/internal/net/DefaultSocketFactory.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/net/SocketFactory.h>
```

Data Structures

- class **decaf::internal::net::DefaultSocketFactory**

SocketFactory implementation that is used to create Sockets.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::net**

7.608 src/main/decaf/internal/net/Network.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/concurrent/Mutex.h>
#include <decaf/internal/util/Resource.h>
#include <decaf/internal/util/GenericResource.h>
```

Data Structures

- class **decaf::internal::net::Network**

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::net**

7.609 src/main/decaf/internal/net/SocketFileDescriptor.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FileDescriptor.h>
```

Data Structures

- class **decaf::internal::net::SocketFileDescriptor**

File Descriptor type used internally by Decaf Socket objects.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::net**

7.610 src/main/decaf/internal/net/ssl/DefaultSSLContext.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/net/ssl/SSLContext.h>
```

Data Structures

- class **decaf::internal::net::ssl::DefaultSSLContext**

Default SSL Context manager for the Decaf library.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::net**

- local const int `base_length` [LENGTH_CODES]
- local const int `base_dist` [D_CODES]

7.660.1 Variable Documentation

7.660.1.1 const `uch ZLIB_INTERNAL_dist_code`[DIST_CODE_LEN]

Initial value:

```
7.660.1.2  const uch ZLIB_INTERNAL _length_code[MAX_MATCH-MIN_
MATCH+1]
```

7.660.1.3 local const int base dist[D CODES]

$$\{ \begin{array}{cccccccccccc} 0, & 1, & 2, & 3, & 4, & 6, & 8, & 12, & 16, & 24, \\ 32, & 48, & 64, & 96, & 128, & 192, & 256, & 384, & 512, & 768, \\ 1024, & 1536, & 2048, & 3072, & 4096, & 6144, & 8192, & 12288, & 16384, & 24576 \end{array} \}$$

7.660.1.4 local const int base__length[LENGTH_CODES]**Initial value:**

```
{
0, 1, 2, 3, 4, 5, 6, 7, 8, 10, 12, 14, 16, 20, 24, 28, 32, 40, 48, 56,
64, 80, 96, 112, 128, 160, 192, 224, 0
}
```

7.660.1.5 local const ct_data static_dtree[D_CODES]**Initial value:**

```
{
{{ 0},{ 5}}, {{16},{ 5}}, {{ 8},{ 5}}, {{24},{ 5}}, {{ 4},{ 5}},
{{20},{ 5}}, {{12},{ 5}}, {{28},{ 5}}, {{ 2},{ 5}}, {{18},{ 5}},
{{10},{ 5}}, {{26},{ 5}}, {{ 6},{ 5}}, {{22},{ 5}}, {{14},{ 5}},
{{30},{ 5}}, {{ 1},{ 5}}, {{17},{ 5}}, {{ 9},{ 5}}, {{25},{ 5}},
{{ 5},{ 5}}, {{21},{ 5}}, {{13},{ 5}}, {{29},{ 5}}, {{ 3},{ 5}},
{{19},{ 5}}, {{11},{ 5}}, {{27},{ 5}}, {{ 7},{ 5}}, {{23},{ 5}}
}
```

7.660.1.6 local const ct_data static_ltree[L_CODES+2]**7.661 src/main/decaf/internal/util/zip/zconf.h File Reference**

```
#include <decaf/util/Config.h>
```

```

```
#include <decaf/io/FilterInputStream.h>
```

```
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedInputStream**

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.666 src/main/decaf/io/BufferedOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
```

```
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedOutputStream**

Wrapper around another output stream that buffers output before writing to the target output stream.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.667 src/main/decaf/io/ByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/util/concurrent/Mutex.h>
#include <vector>
```

Data Structures

- class **decaf::io::ByteArrayInputStream**

*A **ByteArrayInputStream** (p. 944) contains an internal buffer that contains bytes that may be read from the stream.*

Namespaces

- namespace **decaf**

7.674 src/main/decaf/io/FileDescriptor.h File Reference

```
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::io::FileDescriptor**

This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.675 src/main/decaf/io/FilterInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::FilterInputStream**

*A **FilterInputStream** (p. 1771) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.676 src/main/decaf/io/FilterOutputStream.h File Reference

```
#include <decaf/io/OutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::FilterOutputStream**

This class is the superclass of all classes that filter output streams.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.677 src/main/decaf/io/Flushable.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::Flushable**

*A **Flushable** (p. 1811) is a destination of data that can be flushed.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.678 src/main/decaf/io/InputStream.h File Reference

```
#include <decaf/io/IOException.h>

#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::OutputStream**

Base interface for any class that wants to represent an output stream of bytes.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.683 src/main/decaf/io/OutputStreamWriter.h File Reference

```
#include <decaf/util/Config.h>
```

```
#include <decaf/io/Writer.h>
```

Data Structures

- class **decaf::io::OutputStreamWriter**
A class for turning a character stream into a byte stream.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.684 src/main/decaf/io/PushbackInputStream.h File Reference

```
#include <decaf/util/Config.h>
```

```
#include <decaf/io/InputStream.h>
```

```
#include <decaf/io/FilterInputStream.h>
```

Data Structures

- class **decaf::io::PushbackInputStream**
*A **PushbackInputStream** (p. 2940) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.*

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.685 src/main/decaf/io/Reader.h File Reference

- namespace **decaf::io**

7.686 src/main/decaf/io/UnsupportedEncodingException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::UnsupportedEncodingException**

Thrown when the the Character Encoding is not supported.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.687 src/main/decaf/io/UTFDataFormatException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::UTFDataFormatException**

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.688 src/main/decaf/io/Writer.h File Reference

```
#include <string>

#include <decaf/io/Flushable.h>
#include <decaf/lang/Appendable.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::Writer**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.689 src/main/decaf/lang/Appendable.h File Reference

```
#include <decaf/lang/Exception.h>
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::lang::Appendable**
An object to which char sequences and values can be appended.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::lang**

7.690 src/main/decaf/lang/ArrayPointer.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/System.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <decaf/util/concurrent/atomic/AtomicRefCounter.h>
#include <decaf/util/Comparator.h>
#include <memory>
#include <typeinfo>
#include <algorithm>
```

Data Structures

- class **decaf::lang::ArrayPointer< T, REFCOUNTER >**
*Decaf's implementation of a Smart **Pointer** (p. 2756) that is a template on a Type and is **Thread** (p. 3520) Safe if the default Reference Counter is used.*
- struct **decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayData**
- class **decaf::lang::ArrayPointerComparator< T, R >**
*This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 669).*

- struct **std::less< decaf::lang::ArrayPointer< T > >**

An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang**

Defines

- `#define WAIT_INFINITE 0xFFFFFFFF`

The synchronized macro defines a mechanism for synchronizing a section of code.

- `#define synchronized(W)`

7.810.1 Define Documentation

7.810.1.1 `#define synchronized(W)`

Value:

```
if(false){}
else
    for( decaf::util::concurrent::Lock lock_W(W);
        lock_W.isLocked(); lock_W.unlock() )
```

7.810.1.2 `#define WAIT_INFINITE 0xFFFFFFFF`

The synchronized macro defines a mechanism for synchronizing a section of code.

The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compilers restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

```
somefunction() { synchronized(X) (p. 4287) { // Do something that needs synchronizing. } }
```

7.811 src/main/decaf/util/concurrent/ConcurrentMap.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Map.h>
#include <decaf/lang/exceptions/UnsupportedOperationException.h>

#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/ListIterator.h>
#include <decaf/util/List.h>
```

Data Structures

- class **decaf::util::StlList< E >**
List (p. 2190) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.
- class **decaf::util::StlList< E >::StlListIterator**
- class **decaf::util::StlList< E >::ConstStlListIterator**

Namespaces

```
#include <map>
#include <vector>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/util/concurrent/Synchronizable.h>
#include <decaf/util/concurrent/Mutex.h>
#include <decaf/util/Map.h>
```

Data Structures

- class **decaf::util::StlMap**< K, V, COMPARATOR >
Map (p. 2305) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::util::Timer**
A facility for threads to schedule tasks for future execution in a background thread.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**

7.872 src/main/decaf/util/TimerTask.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/Runnable.h>
#include <decaf/util/concurrent/Mutex.h>
```

Data Structures

- class **decaf::util::TimerTask**
*A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 3543).*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
