Inheritance diagram for `activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller`:

Public Member Functions

- **FlushCommandMarshaller** ()
- virtual **~FlushCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.372.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p.1826). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.372.2 Constructor & Destructor Documentation

6.372.2.1 `activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::FlushCommandM`
`() [inline]`

6.372.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::~~FlushCommand`
`() [inline, virtual]`

6.372.3 Member Function Documentation

6.372.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.372.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.372.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.372.3.4 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 710).

6.372.3.5 virtual int activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 711).

6.372.3.6 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.372.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 713).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.373.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.373.3.4 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 717).

6.373.3.5 virtual int activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 718).

6.373.3.6 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

```
6.373.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 720).

6.374.3 Member Function Documentation

6.374.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.374.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.374.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

6.374.3.4 virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 723).

6.374.3.5 virtual int activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 724).

6.374.3.6 virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 726).

```
6.374.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/FlushCommandMarshaller.h`

6.375 decaf::util::logging::Formatter Class Reference

A **Formatter** (p. 1838) provides support for formatting LogRecords.

```
#include <src/main/decaf/util/logging/Formatter.h>
```

Inheritance diagram for decaf::util::logging::Formatter:

Public Member Functions

- virtual `~Formatter` ()
- virtual `std::string format` (const **LogRecord** &record) const =0
Format the given log record and return the formatted string.
- virtual `std::string formatMessage` (const **LogRecord** &record) const
Format the message string from a log record.
- virtual `std::string getHead` (const **Handler** *handler DECAF_UNUSED)
Return the header string for a set of formatted records.
- virtual `std::string getTail` (const **Handler** *handler DECAF_UNUSED)
Return the tail string for a set of formatted records.

6.375.1 Detailed Description

A **Formatter** (p. 1838) provides support for formatting LogRecords. Typically each logging **Handler** (p. 1852) will have a **Formatter** (p. 1838) associated with it. The **Formatter** (p. 1838) takes a **LogRecord** (p. 2261) and converts it to a string.

Some formatters (such as the **XMLFormatter** (p. 3793)) need to wrap head and tail strings around a set of formatted records. The `getHeader` and `getTail` methods can be used to obtain these strings.

6.375.2 Constructor & Destructor Documentation

6.375.2.1 virtual `decaf::util::logging::Formatter::~~Formatter` () [inline, virtual]

6.375.3 Member Function Documentation

6.375.3.1 virtual `std::string decaf::util::logging::Formatter::format` (const **LogRecord** & *record*) const [pure virtual]

Format the given log record and return the formatted string.

Parameters

record The Log Record to Format

Returns

the formatted record.

Implemented in `decaf::util::logging::SimpleFormatter` (p. 3279), and `decaf::util::logging::XMLFormatter` (p. 3794).

6.375.3.2 `virtual std::string decaf::util::logging::Formatter::formatMessage (const LogRecord & record) const` [virtual]

Format the message string from a log record.

Parameters

record The Log Record to Format

Returns

the formatted message

6.375.3.3 `virtual std::string decaf::util::logging::Formatter::getHead (const Handler *handler DECAF_UNUSED)` [inline, virtual]

Return the header string for a set of formatted records.

In the default implementation this method should return empty string.

Parameters

handler The target handler, can be NULL.

Returns

the head string.

6.375.3.4 `virtual std::string decaf::util::logging::Formatter::getTail (const Handler *handler DECAF_UNUSED)` [inline, virtual]

Return the tail string for a set of formatted records.

In the default implementation this method should return empty string

Parameters

handler the target handler, can be null

Returns

the tail string

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/Formatter.h`

6.376 `decaf::util::concurrent::Future< V >` Class Template Reference

A **Future** (p. 1840) represents the result of an asynchronous computation.

`#include <src/main/decaf/util/concurrent/Future.h>`

Public Member Functions

- virtual **~Future** ()
- bool **cancel** (bool mayInterruptIfRunning)=0
Attempts to cancel execution of this task.
- bool **isCancelled** () const =0
Returns true if this task was canceled before it completed normally.
- bool **isDone** () const =0
Returns true if this task completed.
- V **get** ()=0 throw (CancellationException, InterruptedException, ExecutionException)
Waits if necessary for the computation to complete, and then retrieves its result.
- V **get** (long long timeout, **TimeUnit** unit)=0 throw (InterruptedException, ExecutionException, TimeoutException)
Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

6.376.1 Detailed Description

`template<typename V> class decaf::util::concurrent::Future< V >`

A **Future** (p.1840) represents the result of an asynchronous computation. Methods are provided to check if the computation is complete, to wait for its completion, and to retrieve the result of the computation. The result can only be retrieved using method `get` when the computation has completed, blocking if necessary until it is ready. Cancellation is performed by the `cancel` method. Additional methods are provided to determine if the task completed normally or was canceled. Once a computation has completed, the computation cannot be canceled. If you would like to use a **Future** (p.1840) for the sake of cancellability but not provide a usable result, you can declare types of the form `Future<void*>` and return null as a result of the underlying task.

6.376.2 Constructor & Destructor Documentation

6.376.2.1 `template<typename V > virtual decaf::util::concurrent::Future< V >::~~Future () [inline, virtual]`

6.376.3 Member Function Documentation

6.376.3.1 `template<typename V > bool decaf::util::concurrent::Future< V >::cancel (bool mayInterruptIfRunning) [pure virtual]`

Attempts to cancel execution of this task.

This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when `cancel` is called, this task should never run. If the task has already started, then the `mayInterruptIfRunning` parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to **isDone()** (p. 1843) will always return true. Subsequent calls to **isCancelled()** (p. 1843) will always return true if this method returned true.

Parameters

mayInterruptIfRunning - true if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns

false if the task could not be canceled, typically because it has already completed normally;
true otherwise

6.376.3.2 `template<typename V> V decaf::util::concurrent::Future< V >::get (long long timeout, TimeUnit unit) throw (InterruptedException, ExecutionException, TimeoutException) [pure virtual]`

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters

timeout - the maximum time to wait

unit - the time unit of the timeout argument

Returns

the computed result

Exceptions

CancellationException (p. 1004) - if the computation was canceled

ExecutionException (p. 1746) - if the computation threw an exception

InterruptedException - if the current thread was interrupted while waiting

TimeoutException (p. 3541) - if the wait timed out

6.376.3.3 `template<typename V> V decaf::util::concurrent::Future< V >::get () throw (CancellationException, InterruptedException, ExecutionException) [pure virtual]`

Waits if necessary for the computation to complete, and then retrieves its result.

Returns

the computed result.

Exceptions

CancellationException (p. 1004) - if the computation was canceled

ExecutionException (p. 1746) - if the computation threw an exception

InterruptedException - if the current thread was interrupted while waiting

6.376.3.4 `template<typename V> bool decaf::util::concurrent::Future< V>::isCancelled () const [pure virtual]`

Returns true if this task was canceled before it completed normally.

Returns

true if this task was canceled before it completed

6.376.3.5 `template<typename V> bool decaf::util::concurrent::Future< V>::isDone () const [pure virtual]`

Returns true if this task completed.

Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns

true if this task completed

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Future.h`

6.377 activemq::transport::correlator::FutureResponse Class Reference

A container that holds a response object.

```
#include <src/main/activemq/transport/correlator/FutureResponse.h>
```

Public Member Functions

- `FutureResponse ()`
- `virtual ~FutureResponse ()`
- `virtual const Pointer< Response > & getResponse () const`
Getters for the response property.
- `virtual Pointer< Response > & getResponse ()`
- `virtual const Pointer< Response > & getResponse (unsigned int timeout) const`
Getters for the response property.
- `virtual Pointer< Response > & getResponse (unsigned int timeout)`
- `virtual void setResponse (const Pointer< Response > &response)`
Setter for the response property.

6.377.1 Detailed Description

A container that holds a response object. Callers of the `getResponse` method will block until a response has been received unless they call the `getRepsonse` that takes a timeout.

6.377.2 Constructor & Destructor Documentation

6.377.2.1 `activemq::transport::correlator::FutureResponse::FutureResponse ()`
[inline]

6.377.2.2 `virtual`
`activemq::transport::correlator::FutureResponse::~~FutureResponse ()`
[inline, virtual]

6.377.3 Member Function Documentation

6.377.3.1 `virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse () const`
[inline, virtual]

Getters for the response property.

Infinite Wait.

Returns

the response object for the request

6.377.3.2 `virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse ()`
[inline, virtual]

6.377.3.3 `virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int timeout)` [inline, virtual]

6.377.3.4 `virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int timeout) const` [inline, virtual]

Getters for the response property.

Timed Wait.

Parameters

timeout - time to wait in milliseconds

Returns

the response object for the request

6.377.3.5 `virtual void activemq::transport::correlator::FutureResponse::setResponse (const Pointer< Response > & response)` [inline, virtual]

Setter for the response property.

Parameters

response the response object for the request.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/correlator/FutureResponse.h`

6.378 decaf::security::GeneralSecurityException Class Reference

```
#include <src/main/decaf/security/GeneralSecurityException.h>
```

Inheritance diagram for decaf::security::GeneralSecurityException:

Public Member Functions

- **GeneralSecurityException** () throw ()
Default Constructor.
- **GeneralSecurityException** (const decaf::lang::Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **GeneralSecurityException** (const GeneralSecurityException &ex) throw ()
Copy Constructor.

Constructor - Initializes the file name and line number where this message occurred.
- **GeneralSecurityException** (const std::exception *cause) throw ()
Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **GeneralSecurityException** * clone () const
Clones this exception.
- virtual ~**GeneralSecurityException** () throw ()

6.378.1 Constructor & Destructor Documentation

6.378.1.1 decaf::security::GeneralSecurityException::GeneralSecurityException () throw () [inline]

Default Constructor.

6.378.1.2 `decaf::security::GeneralSecurityException::GeneralSecurityException (const decaf::lang::Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.378.1.3 `decaf::security::GeneralSecurityException::GeneralSecurityException (const GeneralSecurityException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.378.1.4 `decaf::security::GeneralSecurityException::GeneralSecurityException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.378.1.5 `decaf::security::GeneralSecurityException::GeneralSecurityException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.378.1.6 `decaf::security::GeneralSecurityException::GeneralSecurityException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs
lineNumber line number where the exception occurred.
msg message to report
... list of primitives that are formatted into the message

6.378.1.7 virtual
decaf::security::GeneralSecurityException::~~GeneralSecurityException (
) throw () [inline, virtual]

6.378.2 Member Function Documentation

6.378.2.1 virtual GeneralSecurityException* de-
caf::security::GeneralSecurityException::clone () const
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::lang::Exception** (p. 1715).

Reimplemented in **decaf::security::cert::CertificateEncodingException**
(p. 1011), **decaf::security::cert::CertificateException** (p. 1013), **de-**
caf::security::cert::CertificateExpiredException (p. 1015), **de-**

Protected Member Functions

- void **reportError** (const std::string &message, **decaf::lang::Exception** *ex, int code)
*Protected convenience method to report an error to this Handler's **ErrorManager** (p. 1710).*

6.382.1 Detailed Description

A **Handler** (p. 1852) object takes log messages from a **Logger** (p. 2237) and exports them. It might for example, write them to a console or write them to a file, or send them to a network logging service, or forward them to an OS log, or whatever.

A **Handler** (p. 1852) can be disabled by doing a **setLevel(Level.OFF** (p. 2190)) and can be re-enabled by doing a **setLevel** with an appropriate level.

Handler (p. 1852) classes typically use **LogManager** (p. 2254) properties to set default values for the Handler's **Filter** (p. 1770), **Formatter** (p. 1838), and **Level** (p. 2185). See the specific documentation for each concrete **Handler** (p. 1852) class.

6.382.2 Constructor & Destructor Documentation

6.382.2.1 **decaf::util::logging::Handler::Handler** ()

6.382.2.2 **virtual decaf::util::logging::Handler::~~Handler** () [virtual]

6.382.3 Member Function Documentation

6.382.3.1 **virtual void decaf::util::logging::Handler::flush** () [pure virtual]

Flush the Handler's output, clears any buffers.

Implemented in **decaf::util::logging::StreamHandler** (p. 3414).

6.382.3.2 **virtual ErrorManager* decaf::util::logging::Handler::getErrorManager** () [inline, virtual]

Gets the **ErrorManager** (p. 1710) used by this **Handler** (p. 1852).

Returns

ErrorManager (p. 1710) derived pointer or NULL.

6.382.3.3 **virtual Filter* decaf::util::logging::Handler::getFilter** () [inline, virtual]

Gets the **Filter** (p. 1770) that this **Handler** (p. 1852) uses to filter Log Records.

Returns

Filter (p. 1770) derived instance

6.382.3.4 `virtual Formatter* decaf::util::logging::Handler::getFormatter ()`
`[inline, virtual]`

Gets the `Formatter` (p. 1838) used by this `Handler` (p. 1852).

Returns

`Filter` (p. 1770) derived instance

6.382.3.5 `virtual Level decaf::util::logging::Handler::getLevel ()` `[inline, virtual]`

Get the log level specifying which message levels will be logged by this `Handler` (p. 1852).

Returns

`Level` (p. 2185) enumeration value

6.382.3.6 `virtual bool decaf::util::logging::Handler::isLoggable (const LogRecord & record) const` `[virtual]`

Check if this `Handler` (p. 1852) would actually log a given `LogRecord` (p. 2261).

This method checks if the `LogRecord` (p. 2261) has an appropriate `Level` (p. 2185) and whether it satisfies any `Filter` (p. 1770). It also may make other `Handler` (p. 1852) specific checks that might prevent a handler from logging the `LogRecord` (p. 2261).

Parameters

record `LogRecord` (p. 2261) to check

Reimplemented in `decaf::util::logging::StreamHandler` (p. 3414).

6.382.3.7 `virtual void decaf::util::logging::Handler::publish (const LogRecord & record)` `[pure virtual]`

Publish the Log Record to this `Handler` (p. 1852).

Parameters

record The Log Record to Publish

Implemented in `decaf::util::logging::ConsoleHandler` (p. 1302), and `decaf::util::logging::StreamHandler` (p. 3415).

6.382.3.8 `void decaf::util::logging::Handler::reportError (const std::string & message, decaf::lang::Exception * ex, int code)` `[protected]`

Protected convenience method to report an error to this Handler's `ErrorManager` (p. 1710).

Parameters

message - a descriptive string (may be empty)

ex - an exception (may be NULL)

code - an error code defined in **ErrorManager** (p. 1710)

6.382.3.9 virtual void decaf::util::logging::Handler::setErrorHandler (**ErrorManager** * *errorManager*) [virtual]

Sets the **Formatter** (p. 1838) used by this **Handler** (p. 1852).

The **ErrorManager**'s "error" method will be invoked if any errors occur while using this **Handler** (p. 1852).

Parameters

errorManager **ErrorManager** (p. 1710) derived instance

6.382.3.10 virtual void decaf::util::logging::Handler::setFilter (**Filter** * *filter*) [inline, virtual]

Sets the **Filter** (p. 1770) that this **Handler** (p. 1852) uses to filter Log Records.

For each call of publish the **Handler** (p. 1852) will call this **Filter** (p. 1770) (if it is non-null) to check if the **LogRecord** (p. 2261) should be published or discarded.

Parameters

filter **Filter** (p. 1770) derived instance

6.382.3.11 virtual void decaf::util::logging::Handler::setFormatter (**Formatter** * *formatter*) [virtual]

Sets the **Formatter** (p. 1838) used by this **Handler** (p. 1852).

Some Handlers may not use Formatters, in which case the **Formatter** (p. 1838) will be remembered, but not used.

Parameters

formatter **Filter** (p. 1770) derived instance

6.382.3.12 virtual void decaf::util::logging::Handler::setLevel (const **Level** & *value*) [inline, virtual]

Set (p. 3220) the log level specifying which message levels will be logged by this **Handler** (p. 1852).

The intention is to allow developers to turn on voluminous logging, but to limit the messages that are sent to certain Handlers.

Parameters

value **Level** (p. 2185) enumeration value

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Handler.h**

6.383 decaf::internal::util::HexStringParser Class Reference

```
#include <src/main/decaf/internal/util/HexStringParser.h>
```

Public Member Functions

- **HexStringParser** (int exponentWidth, int mantissaWidth)
Create a new HexParser.
- virtual **~HexStringParser** ()
- long long **parse** (const std::string &hexString)
Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or double as needed.

Static Public Member Functions

- static double **parseDouble** (const std::string &hexString)
- static float **parseFloat** (const std::string &hexString)

6.383.1 Constructor & Destructor Documentation

6.383.1.1 decaf::internal::util::HexStringParser::HexStringParser (int exponentWidth, int mantissaWidth)

Create a new HexParser.

Parameters

exponentWidth - Width of the exponent for the type to parse
mantissaWidth - Width of the mantissa for the type to parse

6.383.1.2 virtual decaf::internal::util::HexStringParser::~~HexStringParser () [inline, virtual]

6.383.2 Member Function Documentation

6.383.2.1 long long decaf::internal::util::HexStringParser::parse (const std::string & hexString)

Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or double as needed.

Parameters

hexString - string to parse

Returns

the bits parsed from the string

6.383.2.2 static double decaf::internal::util::HexStringParser::parseDouble (const std::string & *hexString*) [static]

6.383.2.3 static float decaf::internal::util::HexStringParser::parseFloat (const std::string & *hexString*) [static]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**HexStringParser.h**

6.384 activemq::wireformat::openwire::utils::HexTable Class Reference

The **HexTable** (p. 1857) class maps hexadecimal strings to the value of an index into the table, i.e.

```
#include <src/main/activemq/wireformat/openwire/utils/HexTable.h>
```

Public Member Functions

- **HexTable** ()
- virtual ~**HexTable** ()
- virtual const std::string & **operator[]** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

- virtual const std::string & **operator[]** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual std::size_t **size** () const

Returns the max size of this Table.

6.384.1 Detailed Description

The **HexTable** (p. 1857) class maps hexadecimal strings to the value of an index into the table, i.e. the class will return "FF" for the index 255 in the table.

6.384.2 Constructor & Destructor Documentation

6.384.2.1 `activemq::wireformat::openwire::utils::HexTable::HexTable ()`

6.384.2.2 `virtual activemq::wireformat::openwire::utils::HexTable::~~HexTable ()`
[inline, virtual]

6.384.3 Member Function Documentation

6.384.3.1 `virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

Parameters

index The index of the value in the table to fetch.

Returns

string containing the hex value if the index

Exceptions

IndexOutOfBoundsException

6.384.3.2 `virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

6.384.3.3 `virtual std::size_t activemq::wireformat::openwire::utils::HexTable::size () const` [inline, virtual]

Returns the max size of this Table.

Returns

an integer size value

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/utils/HexTable.h`

6.385 decaf::net::HttpRetryException Class Reference

```
#include <src/main/decaf/net/HttpRetryException.h>
```

Inheritance diagram for decaf::net::HttpRetryException:

Public Member Functions

- **HttpRetryException** () throw ()
Default Constructor.
- **HttpRetryException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **HttpRetryException** (const **HttpRetryException** &ex) throw ()
Copy Constructor.
- **HttpRetryException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **HttpRetryException** (const std::exception *cause) throw ()
Constructor.
- **HttpRetryException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **HttpRetryException** * clone () const
Clones this exception.
- virtual ~**HttpRetryException** () throw ()

6.385.1 Constructor & Destructor Documentation

6.385.1.1 decaf::net::HttpRetryException::HttpRetryException () throw () [inline]

Default Constructor.

6.385.1.2 decaf::net::HttpRetryException::HttpRetryException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.385.1.3 decaf::net::HttpRetryException::HttpRetryException (const HttpRetryException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.385.1.4 `decaf::net::HttpRetryException::HttpRetryException (const char *
file, const int lineNumber, const std::exception * cause, const char *
msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.385.1.5 `decaf::net::HttpRetryException::HttpRetryException (const
std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.385.1.6 `decaf::net::HttpRetryException::HttpRetryException (const char * file,
const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.385.1.7 `virtual decaf::net::HttpRetryException::~~HttpRetryException ()
throw () [inline, virtual]`

6.385.2 Member Function Documentation

6.385.2.1 `virtual HttpRetryException* decaf::net::HttpRetryException::clone ()
const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 2005).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/HttpRetryException.h`

6.386 activemq::util::IdGenerator Class Reference

```
#include <src/main/activemq/util/IdGenerator.h>
```

Data Structures

- class **StaticData**

Public Member Functions

- **IdGenerator** ()
- **IdGenerator** (const std::string &prefix)
- virtual **~IdGenerator** ()
- std::string **generateId** () const

Static Public Member Functions

- static std::string **getHostname** ()
Since the initialization of this object results in the retrieval of the machine's host name we can quickly return it here.
- static std::string **getSeedFromId** (const std::string &id)
Gets the seed value from a Generated Id, the count portion is removed.
- static long long **getSequenceFromId** (const std::string &id)
Gets the count value from a Generated Id, the seed portion is removed.

- static int **compare** (const std::string &id1, const std::string &id2)
Compares two generated id values.

6.386.1 Constructor & Destructor Documentation

6.386.1.1 `activemq::util::IdGenerator::IdGenerator ()`

6.386.1.2 `activemq::util::IdGenerator::IdGenerator (const std::string & prefix)`

6.386.1.3 `virtual activemq::util::IdGenerator::~~IdGenerator ()` [virtual]

6.386.2 Member Function Documentation

6.386.2.1 `static int activemq::util::IdGenerator::compare (const std::string & id1, const std::string & id2)` [static]

Compares two generated id values.

Parameters

- id1* The first id to compare, or left hand side.
- id2* The second id to compare, or right hand side.

Returns

zero if ids are equal or positive if id1 > id2...

6.386.2.2 `std::string activemq::util::IdGenerator::generateId ()` const

Returns

a newly generated unique id.

6.386.2.3 `static std::string activemq::util::IdGenerator::getHostname ()` [static]

Since the initialization of this object results in the retrieval of the machine's host name we can quickly return it here.

Returns

the previously retrieved host name.

6.386.2.4 `static std::string activemq::util::IdGenerator::getSeedFromId (const std::string & id)` [static]

Gets the seed value from a Generated Id, the count portion is removed.

Returns

the seed portion of the Id, minus the count value.

6.386.2.5 static long long activemq::util::IdGenerator::getSequenceFromId (const std::string & id) [static]

Gets the count value from a Generated Id, the seed portion is removed.

Returns

the sequence count portion of the id, minus the seed value.

- virtual ~**IllegalArgumentException** () throw ()

6.387.1 Constructor & Destructor Documentation

6.387.1.1 `decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException
() throw () [inline]`

Default Constructor.

6.387.1.2 `decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException
(const Exception & ex) throw () [inline]`

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.387.1.3 `decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException
(const IllegalArgumentException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.387.1.4 `decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException
(const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.387.1.5 `decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException
(const char * file, const int lineNumber, const char * msg, ...)
throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.387.1.6 decaf::lang::exceptions::IllegalArgumentOutOfRangeException::IllegalArgumentOutOfRangeException
 (const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.387.1.7 virtual

6.388.1 Constructor & Destructor Documentation

6.388.1.1 `decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException () throw () [inline]`

Default Constructor.

6.388.1.2 `decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.388.1.3 `decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const IllegalMonitorStateException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.388.1.4 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
 (const char * *file*, const int *lineNumber*, const char * *msg*, ...)
 throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.388.1.5 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
 (const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.388.1.6 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
 (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.388.1.7 virtual
 decaf::lang::exceptions::IllegalMonitorStateException::~~IllegalMonitorStateException
 () throw () [inline, virtual]

6.388.2 Member Function Documentation

6.388.2.1 virtual IllegalMonitorStateException* de-
 caf::lang::exceptions::IllegalMonitorStateException::clone (
) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/IllegalMonitorStateException.h`

6.389 cms::IllegalStateException Class Reference

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

```
#include <src/main/cms/IllegalStateException.h>
```

Inheritance diagram for cms::IllegalStateException:

Public Member Functions

- **IllegalStateException** () throw ()
- **IllegalStateException** (const **IllegalStateException** &ex) throw ()
- **IllegalStateException** (const std::string &message, const std::exception *cause) throw ()
- **IllegalStateException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**IllegalStateException** () throw ()

6.389.1 Detailed Description

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation. For example, this exception must be thrown if **Session.commit** (p. 3152) is called on a non-transacted session.

6.390.1 Constructor & Destructor Documentation

6.390.1.1 `decaf::lang::exceptions::IllegalStateException::IllegalStateException ()
throw () [inline]`

Default Constructor.

6.390.1.2 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (
const Exception & ex) throw () [inline]`

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.390.1.3 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (
const IllegalStateException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.390.1.4 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (
const char * file, const int lineNumber, const char * msg, ...)
throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.390.1.5 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.390.1.6 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.390.1.7 `virtual decaf::lang::exceptions::IllegalStateException::~~IllegalStateException () throw () [inline, virtual]`

6.390.2 Member Function Documentation

6.390.2.1 `virtual IllegalStateException* decaf::lang::exceptions::IllegalStateException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

Reimplemented in **decaf::nio::InvalidMarkException** (p. 1999).

The documentation for this class was generated from the following file:

- 6.392.2.6** `virtual void activemq::transport::inactivity::InactivityMonitor::onCommand (const Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

Parameters

command - the received command object.

Reimplemented from `activemq::transport::TransportFilter` (p. 3640).

- 6.392.2.7** `virtual void activemq::transport::inactivity::InactivityMonitor::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from `activemq::transport::TransportFilter` (p. 3640).

- 6.392.2.8** `virtual void activemq::transport::inactivity::InactivityMonitor::onException (const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

ex The exception to handle.

Reimplemented from `activemq::transport::TransportFilter` (p. 3641).

- 6.392.2.9** `void activemq::transport::inactivity::InactivityMonitor::setInitialDelayTime (long long value) const`
- 6.392.2.10** `void activemq::transport::inactivity::InactivityMonitor::setKeepAliveResponseRequired (bool value)`
- 6.392.2.11** `void activemq::transport::inactivity::InactivityMonitor::setReadCheckTime (long long value)`

6.393.1 Constructor & Destructor Documentation

6.393.1.1 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException () throw () [inline]

Default Constructor.

6.393.1.2 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.393.1.3 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const IndexOutOfBoundsException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.393.1.4 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException
 (const char * *file*, const int *lineNumber*, const char * *msg*, ...)
 throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.393.1.5 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException
 (const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.393.1.6 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException
 (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.393.1.7 virtual
 decaf::lang::exceptions::IndexOutOfBoundsException::~~IndexOutOfBoundsException
 () throw () [inline, virtual]

6.394.1 Constructor & Destructor Documentation

6.394.1.1 decaf::net::Inet4Address::Inet4Address () [protected]

6.394.1.2 decaf::net::Inet4Address::Inet4Address (const unsigned char * *ipAddress*, int *numBytes*) [protected]

6.394.1.3 decaf::net::Inet4Address::Inet4Address (const std::string & *hostname*, const unsigned char * *ipAddress*, int *numBytes*) [protected]

6.394.1.4 virtual decaf::net::Inet4Address::~~Inet4Address () [virtual]

6.394.2 Member Function Documentation

6.394.2.1 virtual bool decaf::net::Inet4Address::isAnyLocalAddress () const [virtual]

Check if this **InetAddress** (p. 1884) is a valid wildcard address.

Returns

true if the address is a wildcard address.

Reimplemented from **decaf::net::InetAddress** (p. 1889).

6.394.2.2 virtual bool decaf::net::Inet4Address::isLinkLocalAddress () const [virtual]

Check if this **InetAddress** (p. 1884) is a valid link local address.

Returns

true if the address is a link local address.

Reimplemented from **decaf::net::InetAddress** (p. 1889).

6.394.2.3 `virtual bool decaf::net::Inet4Address::isLoopbackAddress () const`
[virtual]

Check if this **InetAddress** (p. 1884) is a valid loopback address.

Returns

true if the address is a loopback address.

Reimplemented from **decaf::net::InetAddress** (p. 1889).

6.394.2.4 `virtual bool decaf::net::Inet4Address::isMCGlobal () const` [virtual]

Check if this **InetAddress** (p. 1884) is Multicast and has Global scope.

Returns

true if the address is Multicast and has Global scope.

Reimplemented from **decaf::net::InetAddress** (p. 1889).

6.394.2.5 `virtual bool decaf::net::Inet4Address::isMCLinkLocal () const`
[virtual]

Check if this **InetAddress** (p. 1884) is Multicast and has Link Local scope.

Returns

true if the address is Multicast and has Link Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1889).

6.394.2.6 `virtual bool decaf::net::Inet4Address::isMCNodeLocal () const`
[virtual]

Check if this **InetAddress** (p. 1884) is Multicast and has Node Local scope.

Returns

true if the address is Multicast and has Node Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1890).

6.394.2.7 `virtual bool decaf::net::Inet4Address::isMCOrgLocal () const`
[virtual]

Check if this **InetAddress** (p. 1884) is Multicast and has Organization scope.

Returns

true if the address is Multicast and has Organization scope.

Reimplemented from **decaf::net::InetAddress** (p. 1890).

6.394.2.8 `virtual bool decaf::net::Inet4Address::isMCSiteLocal () const`
[virtual]

Check if this **InetAddress** (p. 1884) is Multicast and has Site Local scope.

Returns

true if the address is Multicast and has Site Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1890).

6.394.2.9 `virtual bool decaf::net::Inet4Address::isMulticastAddress () const`
[virtual]

Check if this **InetAddress** (p. 1884) is a valid Multicast address.

Returns

true if the address is a Multicast address.

Reimplemented from **decaf::net::InetAddress** (p. 1890).

6.394.2.10 `virtual bool decaf::net::Inet4Address::isSiteLocalAddress () const`
[virtual]

Check if this **InetAddress** (p. 1884) is a valid site local address.

Returns

true if the address is a site local address.

Reimplemented from **decaf::net::InetAddress** (p. 1890).

1.0

6.396.2 Constructor & Destructor Documentation

6.396.2.1 `decaf::net::InetAddress::InetAddress ()` [protected]

6.396.2.2 `decaf::net::InetAddress::InetAddress (const unsigned char * ipAddress, int numBytes)` [protected]

6.396.2.3 `decaf::net::InetAddress::InetAddress (const std::string & hostname, const unsigned char * ipAddress, int numBytes)` [protected]

6.396.2.4 `virtual decaf::net::InetAddress::~~InetAddress ()` [virtual]

6.396.3 Member Function Documentation

6.396.3.1 `static unsigned int decaf::net::InetAddress::bytesToInt (const unsigned char * bytes, int start)` [static, protected]

Converts the bytes in an address array to an int starting from the value start treating the start value as the high order byte.

Parameters

bytes The array of bytes to convert to an int.

start The index in the array to treat as the high order byte.

Returns

an unsigned int that represents the address value.

6.396.3.2 `virtual decaf::lang::ArrayPointer<unsigned char> decaf::net::InetAddress::getAddress () const` [virtual]

Returns the Raw IP address in Network byte order.

The returned address is a copy of the bytes contained in this **InetAddress** (p.1884).

Returns

and ArrayPointer containing the raw bytes of the network address.

6.396.3.3 `static InetAddress decaf::net::InetAddress::getByAddress (const std::string & hostname, const unsigned char * bytes, int numBytes)` [static]

Given a host name and IPAddress return a new **InetAddress** (p.1884).

There is no name service checking or address validation done on the provided host name. The host name can either be machine name or the text based representation of the IP Address.

An IPV4 address must be only four bytes in length and an IPV6 address must be 16 bytes in length.

Returns

a copy of an **InetAddress** (p.1884) that represents the given byte array address.

Exceptions

UnknownHostException (p. 3649) if the address array length is invalid.

6.396.3.4 `static InetAddress decaf::net::InetAddress::getByAddress (const unsigned char * bytes, int numBytes) [static]`

Given a raw IP Address in byte array form, create and return a new **InetAddress** (p.1884) instance.

An IPV4 address must be only four bytes in length and an IPV6 address must be 16 bytes in length.

Returns

a copy of an **InetAddress** (p.1884) that represents the given byte array address.

Exceptions

UnknownHostException (p. 3649) if the address array length is invalid.

6.396.3.5 `virtual std::string decaf::net::InetAddress::getHostAddress () const [virtual]`

Returns a textual representation of the IP Address.

Returns

the string form of the IP Address.

6.396.3.6 `virtual std::string decaf::net::InetAddress::getHostName () const [virtual]`

Get the host name associated with this **InetAddress** (p.1884) instance.

If a host name was set upon construction then that value is returned, otherwise a reverse name lookup will be performed to attempt to get the host name associated with the set IP Address. If the host name cannot be resolved the textual representation of the IP Address is returned instead.

Returns

the name of the host associated with this set IP Address.

6.396.3.7 `static InetAddress decaf::net::InetAddress::getLocalHost () [static]`

Gets an **InetAddress** (p.1884) that is the local host address.

If the localhost value cannot be resolved then the **InetAddress** (p.1884) for Loopback is returned.

Returns

a new **InetAddress** (p.1884) object that contains the local host address.

Exceptions

UnknownHostException (p. 3649) if the address for local host is not found.

6.396.3.8 `virtual bool decaf::net::InetAddress::isAnyLocalAddress () const`
[inline, virtual]

Check if this **InetAddress** (p. 1884) is a valid wildcard address.

Returns

true if the address is a wildcard address.

Reimplemented in **decaf::net::Inet4Address** (p. 1881).

6.396.3.9 `virtual bool decaf::net::InetAddress::isLinkLocalAddress () const`
[inline, virtual]

Check if this **InetAddress** (p. 1884) is a valid link local address.

Returns

true if the address is a link local address.

Reimplemented in **decaf::net::Inet4Address** (p. 1881).

6.396.3.10 `virtual bool decaf::net::InetAddress::isLoopbackAddress () const`
[inline, virtual]

Check if this **InetAddress** (p. 1884) is a valid loopback address.

Returns

true if the address is a loopback address.

Reimplemented in **decaf::net::Inet4Address** (p. 1882).

6.396.3.11 `virtual bool decaf::net::InetAddress::isMCGlobal () const` [inline, virtual]

Check if this **InetAddress** (p. 1884) is Multicast and has Global scope.

Returns

true if the address is Multicast and has Global scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1882).

6.396.3.12 `virtual bool decaf::net::InetAddress::isMCLinkLocal () const`
[inline, virtual]

Check if this **InetAddress** (p.1884) is Multicast and has Link Local scope.

Returns

true if the address is Multicast and has Link Local scope.

Reimplemented in **decaf::net::Inet4Address** (p.1882).

6.396.3.13 `virtual bool decaf::net::InetAddress::isMCNodeLocal () const`
[inline, virtual]

Check if this **InetAddress** (p.1884) is Multicast and has Node Local scope.

Returns

true if the address is Multicast and has Node Local scope.

Reimplemented in **decaf::net::Inet4Address** (p.1882).

6.396.3.14 `virtual bool decaf::net::InetAddress::isMCOrgLocal () const` [inline, virtual]

Check if this **InetAddress** (p.1884) is Multicast and has Organization scope.

Returns

true if the address is Multicast and has Organization scope.

Reimplemented in **decaf::net::Inet4Address** (p.1882).

6.396.3.15 `virtual bool decaf::net::InetAddress::isMCSiteLocal () const`
[inline, virtual]

Check if this **InetAddress** (p.1884) is Multicast and has Site Local scope.

Returns

true if the address is Multicast and has Site Local scope.

Reimplemented in **decaf::net::Inet4Address** (p.1883).

6.396.3.16 `virtual bool decaf::net::InetAddress::isMulticastAddress () const`
[inline, virtual]

Check if this **InetAddress** (p.1884) is a valid Multicast address.

Returns

true if the address is a Multicast address.

Reimplemented in **decaf::net::Inet4Address** (p.1883).

6.396.3.17 `virtual bool decaf::net::InetAddress::isSiteLocalAddress () const`
`[inline, virtual]`

Check if this **InetAddress** (p. 1884) is a valid site local address.

Returns

true if the address is a site local address.

Reimplemented in **decaf::net::Inet4Address** (p. 1883).

6.396.3.18 `virtual std::string decaf::net::InetAddress::toString () const`
`[virtual]`

Returns a string representation of the **InetAddress** (p. 1884) in the form 'hostname / ipaddress'.

If the hostname is not resolved than it appears as empty.

Returns

string value of this **InetAddress** (p. 1884).

6.399 decaf::util::zip::Inflater Class Reference

This class uncompresses data that was compressed using the *DEFLATE* algorithm (see specification).

```
#include <src/main/decaf/util/zip/Inflater.h>
```

Public Member Functions

- **Inflater** ()
Creates a new decompressor.
- **Inflater** (bool nowrap)
Creates a new decompressor.
- virtual **~Inflater** ()
- void **setInput** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Sets input data for decompression.
- void **setInput** (const std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalStateException)
Sets input data for decompression.
- void **setInput** (const std::vector< unsigned char > &buffer) throw (decaf::lang::exceptions::IllegalStateException)
Sets input data for decompression.
- int **getRemaining** () const
Returns the total number of bytes remaining in the input buffer.
- void **setDictionary** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Sets the preset dictionary to the given array of bytes.
- void **setDictionary** (const std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Sets the preset dictionary to the given array of bytes.
- void **setDictionary** (const std::vector< unsigned char > &buffer) throw (decaf::lang::exceptions::IllegalStateException, decaf::lang::exceptions::IllegalArgumentException)

Sets the preset dictionary to the given array of bytes.

- bool **needsInput** () const
- bool **needsDictionary** () const
- void **finish** ()

When called, indicates that decompression should end with the current contents of the input buffer.

- bool **finished** () const
- int **inflate** (unsigned char *buffer, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalStateException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::util::zip::DataFormatException)

Uncompresses bytes into specified buffer.

- int **inflate** (std::vector< unsigned char > &buffer, int offset, int length) throw (decaf::lang::exceptions::IllegalStateException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::util::zip::DataFormatException)

Uncompresses bytes into specified buffer.

- int **inflate** (std::vector< unsigned char > &buffer) throw (decaf::lang::exceptions::IllegalStateException, decaf::util::zip::DataFormatException)

Uncompresses bytes into specified buffer.

- long long **getAdler** () const throw (decaf::lang::exceptions::IllegalStateException)
- long long **getBytesRead** () const throw (decaf::lang::exceptions::IllegalStateException)
- long long **getBytesWritten** () const throw (decaf::lang::exceptions::IllegalStateException)
- void **reset** () throw (decaf::lang::exceptions::IllegalStateException)

Resets deflater so that a new set of input data can be processed.

- void **end** ()

Closes the decompressor and discards any unprocessed input.

6.399.1 Detailed Description

This class uncompresses data that was compressed using the *DEFLATE* algorithm (see [specification](#)). Basically this class is part of the API to the stream based ZLIB compression library and is used as such by **InflaterInputStream** (p. 1902) and its descendants.

The typical usage of a **Inflater** (p. 1894) outside this package consists of a specific call to one of its constructors before being passed to an instance of **InflaterInputStream** (p. 1902).

See also

InflaterInputStream (p. 1902)
Deflater (p. 1595)

Since

1.0

6.399.2 Constructor & Destructor Documentation

6.399.2.1 decaf::util::zip::Inflater::Inflater ()

Creates a new decompressor.

This constructor defaults the inflater to use the ZLIB header and checksum fields.

6.399.2.2 decaf::util::zip::Inflater::Inflater (bool nowrap)

Creates a new decompressor.

If the parameter 'nowrap' is true then the ZLIB header and checksum fields will not be used. This provides compatibility with the compression format used by both GZIP and PKZIP.

Note: When using the 'nowrap' option it is also necessary to provide an extra "dummy" byte as input. This is required by the ZLIB native library in order to support certain optimizations.

6.399.2.3 virtual decaf::util::zip::Inflater::~Inflater () [virtual]

6.399.3 Member Function Documentation

6.399.3.1 void decaf::util::zip::Inflater::end ()

Closes the decompressor and discards any unprocessed input.

This method should be called when the decompressor is no longer being used, but will also be called automatically by the destructor. Once this method is called, the behavior of the **Inflater** (p.1894) object is undefined.

6.399.3.2 void decaf::util::zip::Inflater::finish ()

When called, indicates that decompression should end with the current contents of the input buffer.

6.399.3.3 bool decaf::util::zip::Inflater::finished () const

Returns

true if the end of the compressed data output stream has been reached.

6.399.3.4 long long decaf::util::zip::Inflater::getAdler () const throw (decaf::lang::exceptions::IllegalStateException)

Returns

the ADLER-32 value of the uncompressed data.

Exceptions

IllegalStateException if in the end state.

6.399.3.5 `long long decaf::util::zip::Inflater::getBytesRead () const throw (decaf::lang::exceptions::IllegalStateException)`

Returns

the total number of compressed bytes input so far.

Exceptions

IllegalStateException if in the end state.

6.399.3.6 `long long decaf::util::zip::Inflater::getBytesWritten () const throw (decaf::lang::exceptions::IllegalStateException)`

Returns

the total number of decompressed bytes output so far.

Exceptions

IllegalStateException if in the end state.

6.399.3.7 `int decaf::util::zip::Inflater::getRemaining () const`

Returns the total number of bytes remaining in the input buffer.

This can be used to find out what bytes still remain in the input buffer after decompression has finished.

Returns

the total number of bytes remaining in the input buffer

6.399.3.8 `int decaf::util::zip::Inflater::inflate (std::vector< unsigned char > & buffer) throw (decaf::lang::exceptions::IllegalStateException, decaf::util::zip::DataFormatException)`

Uncompresses bytes into specified buffer.

Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p.1899) or **needsDictionary()** (p.1899) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p.1896) can be used to get the Adler-32 value of the dictionary required.

Parameters

buffer The Buffer to write the compressed data to.

Exceptions

IllegalStateException if in the end state.

DataFormatException (p. 1450) if the compressed data format is invalid.

```

6.399.3.9  int decaf::util::zip::Inflater::inflate ( std::vector<
            unsigned char > & buffer, int offset, int length )
            throw ( decaf::lang::exceptions::IllegalStateException,
                    decaf::lang::exceptions::IndexOutOfBoundsException,
                    decaf::util::zip::DataFormatException )

```

Uncompresses bytes into specified buffer.

Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p.1899) or **needsDictionary()** (p.1899) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p.1896) can be used to get the Adler-32 value of the dictionary required.

Parameters

buffer The Buffer to write the compressed data to.

offset The position in the Buffer to start writing at.

length The maximum number of byte of data to write.

Exceptions

IllegalStateException if in the end state.

IndexOutOfBoundsException if the offset + length > size of the buffer.

DataFormatException (p. 1450) if the compressed data format is invalid.

```

6.399.3.10 int decaf::util::zip::Inflater::inflate ( unsigned char
            * buffer, int size, int offset, int length )
            throw ( decaf::lang::exceptions::NullPointerException,
                    decaf::lang::exceptions::IllegalStateException,
                    decaf::lang::exceptions::IndexOutOfBoundsException,
                    decaf::util::zip::DataFormatException )

```

Uncompresses bytes into specified buffer.

Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p.1899) or **needsDictionary()** (p.1899) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p.1896) can be used to get the Adler-32 value of the dictionary required.

Parameters

buffer The Buffer to write the compressed data to.

size The size of the buffer passed in.

offset The position in the Buffer to start writing at.

length The maximum number of byte of data to write.

Exceptions

NullPointerException if buffer is NULL.

IllegalStateException if in the end state.

IndexOutOfBoundsException if the offset + length > size of the buffer.

DataFormatException (p. 1450) if the compressed data format is invalid.

6.399.3.11 `bool decaf::util::zip::Inflater::needsDictionary () const`**Returns**

true if a preset dictionary is needed for decompression.

6.399.3.12 `bool decaf::util::zip::Inflater::needsInput () const`**Returns**

true if the input data buffer is empty and **setInput()** (p. 1901) should be called in order to provide more input

6.399.3.13 `void decaf::util::zip::Inflater::reset () throw (decaf::lang::exceptions::IllegalStateException)`

Resets deflater so that a new set of input data can be processed.

Keeps current decompression level and strategy settings.

Exceptions

IllegalStateException if in the end state.

6.399.3.14 `void decaf::util::zip::Inflater::setDictionary (const std::vector< unsigned char > & buffer, int offset, int length) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Sets the preset dictionary to the given array of bytes.

Should be called when **inflate()** (p. 1898) returns 0 and **needsDictionary()** (p. 1899) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1896) can be used to get the Adler-32 value of the dictionary needed.

Parameters

buffer The Buffer to read in for decompression.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

IllegalArgumentException if the given dictionary doesn't match the required dictionaries checksum value.

6.399.3.15 void decaf::util::zip::Inflater::setDictionary (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Sets the preset dictionary to the given array of bytes.

Should be called when **inflate()** (p.1898) returns 0 and **needsDictionary()** (p.1899) returns true indicating that a preset dictionary is required. The method **getAdler()** (p.1896) can be used to get the Adler-32 value of the dictionary needed.

Parameters

buffer The Buffer to read in for decompression.

size The size of the buffer passed in.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

IllegalArgumentException if the given dictionary doesn't match the required dictionaries checksum value.

6.399.3.16 void decaf::util::zip::Inflater::setDictionary (const std::vector< unsigned char > & *buffer*) throw (decaf::lang::exceptions::IllegalStateException, decaf::lang::exceptions::IllegalArgumentException)

Sets the preset dictionary to the given array of bytes.

Should be called when **inflate()** (p.1898) returns 0 and **needsDictionary()** (p.1899) returns true indicating that a preset dictionary is required. The method **getAdler()** (p.1896) can be used to get the Adler-32 value of the dictionary needed.

Parameters

buffer The Buffer to read in for decompression.

Exceptions

IllegalStateException if in the end state.

IllegalArgumentException if the given dictionary doesn't match the required dictionaries checksum value.

```

6.399.3.17 void decaf::util::zip::Inflater::setInput ( const unsigned
char * buffer, int size, int offset, int length )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::IllegalStateException )

```

Sets input data for decompression.

This should be called whenever **needsInput()** (p. 1899) returns true indicating that more input data is required.

Parameters

buffer The Buffer to read in for decompression.

size The size of the buffer passed in.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

```

6.399.3.18 void decaf::util::zip::Inflater::setInput ( const std::vector<
unsigned char > & buffer, int offset, int length )
throw ( decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::IllegalStateException )

```

Sets input data for decompression.

This should be called whenever **needsInput()** (p. 1899) returns true indicating that more input data is required.

Parameters

buffer The Buffer to read in for decompression.

offset The position in the Buffer to start reading from.

length The number of bytes to read from the input buffer.

Exceptions

IndexOutOfBoundsException if the offset + length > size of the buffer.

IllegalStateException if in the end state.

```

6.399.3.19 void decaf::util::zip::Inflater::setInput ( const std::vector< unsigned
char > & buffer ) throw ( decaf::lang::exceptions::IllegalStateException
)

```

Sets input data for decompression.

This should be called whenever **needsInput()** (p. 1899) returns true indicating that more input data is required.

Parameters

buffer The Buffer to read in for decompression.

Exceptions

IllegalStateException if in the end state.

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**Inflater.h**

6.400 decaf::util::zip::InflaterInputStream Class Reference

A FilterInputStream that decompresses data read from the wrapped InputStream instance.

```
#include <src/main/decaf/util/zip/InflaterInputStream.h>
```

Inheritance diagram for decaf::util::zip::InflaterInputStream:

Public Member Functions

- **InflaterInputStream** (decaf::io::InputStream *inputStream, bool own=false)
Create an instance of this class with a default inflater and buffer size.
- **InflaterInputStream** (decaf::io::InputStream *inputStream, Inflater *inflater, bool own=false)
*Creates a new **InflaterInputStream** (p. 1902) with a user supplied **Inflater** (p. 1894) and a default buffer size.*
- **InflaterInputStream** (decaf::io::InputStream *inputStream, Inflater *inflater, int bufferSize, bool own=false)
*Creates a new DeflateOutputStream with a user supplied **Inflater** (p. 1894) and specified buffer size.*
- virtual ~**InflaterInputStream** ()
- virtual int **available** () const throw (decaf::io::IOException)
Indicates the number of bytes available.
The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.
The default implementation of this method returns zero.
Returns
the number of bytes available on this input stream.
Exceptions
IOException (p. 2003) if an I/O error occurs.
- virtual void **close** () throw (decaf::io::IOException)

*Closes the **InputStream** (p. 1909) freeing any resources that might have been acquired during the lifetime of this stream.*

The default implementation of this method does nothing.

- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Skips over and discards n bytes of data from this input stream.

*The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1909) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

***IOException** (p. 2003) if an I/O error occurs.*

***UnsupportedOperationException** if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit The max bytes read before marked position is invalid.

- virtual void **reset** () throw (decaf::io::IOException)

Repositions this stream to the position at the time the mark method was last called on this input stream.

*If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2003) might be thrown. * If such an **IOException** (p. 2003) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2003). * If an **IOException** (p. 2003) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

*The default implementation of this method throws an **IOException** (p. 2003).*

Exceptions

***IOException** (p. 2003) if an I/O error occurs.*

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Protected Member Functions

- virtual void **fill** () throw (decaf::io::IOException)
Fills the input buffer with the next chunk of data.
- virtual int **doReadByte** () throw (decaf::io::IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int **length**) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Protected Attributes

- **Inflater * inflater**
*The **Inflater** (p. 1894) instance to use.*
- std::vector< unsigned char > **buff**
The buffer to hold chunks of data read from the stream before inflation.
- int **length**
The amount of data currently stored in the input buffer.
- bool **ownInflater**
- bool **atEOF**

Static Protected Attributes

- static const int **DEFAULT_BUFFER_SIZE**

6.400.1 Detailed Description

A FilterInputStream that decompresses data read from the wrapped InputStream instance.

Since

1.0

6.400.2 Constructor & Destructor Documentation

- 6.400.2.1** decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream*, bool *own* = *false*)

Create an instance of this class with a default inflater and buffer size.

Parameters

inputStream The **InputStream** instance to wrap.

own Should this **Filter** take ownership of the **InputStream** pointer (defaults to false).

6.400.2.2 `decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * inputStream, Inflater * inflater, bool own = false)`

Creates a new **InflaterInputStream** (p.1902) with a user supplied **Inflater** (p.1894) and a default buffer size.

When the user supplied a **Inflater** (p.1894) instance the **InflaterInputStream** (p.1902) does not take ownership of the **Inflater** (p.1894) pointer, the caller is still responsible for deleting the **Inflater** (p.1894).

Parameters

inputStream The **InputStream** instance to wrap.

inflater The user supplied **Inflater** (p.1894) to use for decompression. (

own Should this filter take ownership of the **InputStream** pointer (default is false).

Exceptions

NullPointerException if the **Inflater** (p.1894) given is NULL.

6.400.2.3 `decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * inputStream, Inflater * inflater, int bufferSize, bool own = false)`

Creates a new **DeflateOutputStream** with a user supplied **Inflater** (p.1894) and specified buffer size.

When the user supplied a **Inflater** (p.1894) instance the **InflaterInputStream** (p.1902) does not take ownership of the **Inflater** (p.1894) pointer, the caller is still responsible for deleting the **Inflater** (p.1894).

Parameters

inputStream The **InputStream** instance to wrap.

inflater The user supplied **Inflater** (p.1894) to use for decompression.

bufferSize The size of the input buffer.

own Should this filter take ownership of the **InputStream** pointer (default is false).

Exceptions

NullPointerException if the **Inflater** (p.1894) given is NULL.

IllegalArgumentException if the *bufferSize* value is zero.

6.400.2.4 `virtual decaf::util::zip::InflaterInputStream::~~InflaterInputStream ()`
[virtual]

6.400.3 Member Function Documentation

6.400.3.1 `virtual int decaf::util::zip::InflaterInputStream::available () const`
`throw (decaf::io::IOException)` [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Until EOF this method always returns 1, thereafter it always returns 0.

Reimplemented from `decaf::io::FilterInputStream` (p.1773).

6.400.3.2 `virtual void decaf::util::zip::InflaterInputStream::close () throw (`
`decaf::io::IOException)` [virtual]

Closes the **InputStream** (p. 1909) freeing any resources that might have been aquired during the lifetime of this stream.

The default implementation of this method does nothing.

Closes any resources associated with this **InflaterInputStream** (p. 1902).

Reimplemented from `decaf::io::FilterInputStream` (p.1774).

6.400.3.3 `virtual int decaf::util::zip::InflaterInputStream::doReadArrayBounded`
`(unsigned char * buffer, int size, int offset,`
`int length) throw (decaf::io::IOException,`
`decaf::lang::exceptions::IndexOutOfBoundsException,`
`decaf::lang::exceptions::NullPointerException)` [protected, virtual]

Reimplemented from `decaf::io::FilterInputStream` (p.1774).

6.400.3.4 `virtual int decaf::util::zip::InflaterInputStream::doReadByte () throw`
`(decaf::io::IOException)` [protected, virtual]

Reimplemented from `decaf::io::FilterInputStream` (p.1774).

6.400.3.5 `virtual void decaf::util::zip::InflaterInputStream::fill () throw (decaf::io::IOException)` [protected, virtual]

Fills the input buffer with the next chunk of data.

Exceptions

IOException if an I/O error occurs.

6.400.3.6 `virtual void decaf::util::zip::InflaterInputStream::mark (int readLimit)` [virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit The max bytes read before marked position is invalid.

Does nothing.

Reimplemented from `decaf::io::FilterInputStream` (p.1775).

6.400.3.7 `virtual bool decaf::util::zip::InflaterInputStream::markSupported () const` [virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Always returns false.

Reimplemented from `decaf::io::FilterInputStream` (p.1775).

6.400.3.8 `virtual void decaf::util::zip::InflaterInputStream::reset () throw (decaf::io::IOException)` [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called

is larger than the argument to mark at that last call, then an **IOException** (p. 2003) might be thrown. * If such an **IOException** (p. 2003) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2003). * If an **IOException** (p. 2003) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 2003).

Exceptions

IOException (p. 2003) if an I/O error occurs.

Always throws an **IOException** when called.

Reimplemented from **decaf::io::FilterInputStream** (p. 1775).

6.400.3.9 virtual long long decaf::util::zip::InflaterInputStream::skip
 (long long *num*) throw (decaf::io::IOException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1909) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException (p. 2003) if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Skips the specified amount of uncompressed input data.

Reimplemented from **decaf::io::FilterInputStream** (p. 1776).

6.400.4 Field Documentation

6.400.4.1 `bool decaf::util::zip::InflaterInputStream::atEOF` [protected]

6.400.4.2 `std::vector<unsigned char> decaf::util::zip::InflaterInputStream::buff`
[protected]

The buffer to hold chunks of data read from the stream before inflation.

6.400.4.3 `const int decaf::util::zip::InflaterInputStream::DEFAULT_BUFFER_SIZE` [static, protected]

6.400.4.4 `Inflater* decaf::util::zip::InflaterInputStream::inflater` [protected]

The **Inflater** (p.1894) instance to use.

6.400.4.5 `int decaf::util::zip::InflaterInputStream::length` [protected]

The amount of data currently stored in the input buffer.

6.400.4.6 `bool decaf::util::zip::InflaterInputStream::ownInflater` [protected]

The documentation for this class was generated from the following file:

- `src/main/decaf/util/zip/InflaterInputStream.h`

6.401 decaf::io::InputStream Class Reference

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

```
#include <src/main/decaf/io/InputStream.h>
```

Inheritance diagram for decaf::io::InputStream:

Public Member Functions

- **InputStream** ()
- virtual **~InputStream** ()
- virtual void **close** () throw (decaf::io::IOException)
*Closes the **InputStream** (p.1909) freeing any resources that might have been aquired during the lifetime of this stream.*
- virtual void **mark** (int readLimit)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (decaf::io::IOException)

Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.
- virtual int **available** () const throw (decaf::io::IOException)
Indicates the number of bytes available.
- virtual int **read** () throw (decaf::io::IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Reads up to size bytes of data from the input stream into an array of bytes.
- virtual int **read** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)
Reads up to length bytes of data from the input stream into an array of bytes.
- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual std::string **toString** () const
Output a String representation of this object.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to `Notify`.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.401.1 Detailed Description

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

Since

1.0

6.401.2 Constructor & Destructor Documentation

6.401.2.1 decaf::io::InputStream::InputStream ()

6.401.2.2 virtual decaf::io::InputStream::~~InputStream () [virtual]

6.401.3 Member Function Documentation

6.401.3.1 virtual int decaf::io::InputStream::available () const throw (decaf::io::IOException) [inline, virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented in `decaf::internal::io::StandardInputStream` (p. 3353), `decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream` (p. 2697), `decaf::internal::net::tcp::TcpSocketInputStream` (p. 3507), `decaf::io::BlockingByteArrayInputStream` (p. 773), `decaf::io::BufferedInputStream` (p. 864), `decaf::io::ByteArrayInputStream` (p. 947), `decaf::io::FilterInputStream` (p. 1773), `decaf::io::PushbackInputStream` (p. 2943), and `decaf::util::zip::InflaterInputStream` (p. 1906).

6.401.3.2 virtual void decaf::io::InputStream::close () throw (decaf::io::IOException) [virtual]

Closes the **InputStream** (p. 1909) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented in `decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream` (p. 2697), `decaf::internal::net::tcp::TcpSocketInputStream` (p. 3508), `decaf::io::BlockingByteArrayInputStream` (p. 773), `decaf::io::BufferedInputStream` (p. 864), `decaf::io::FilterInputStream` (p. 1774), and `decaf::util::zip::InflaterInputStream` (p. 1906).

6.401.3.3 virtual int decaf::io::InputStream::doReadArray (unsigned char * *buffer*, int *size*) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [protected, virtual]

Reimplemented in `decaf::io::FilterInputStream` (p. 1774).

6.401.3.4 virtual int decaf::io::InputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [protected, virtual]

Reimplemented in `activemq::io::LoggingInputStream` (p. 2250), `decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream` (p. 2697), `decaf::internal::net::tcp::TcpSocketInputStream` (p. 3508), `decaf::io::BlockingByteArrayInputStream` (p. 773), `decaf::io::BufferedInputStream` (p. 865), `decaf::io::ByteArrayInputStream` (p. 948), `decaf::io::FilterInputStream` (p. 1774), `decaf::io::PushbackInputStream` (p. 2943), and `decaf::util::zip::CheckedInputStream` (p. 1057), and `decaf::util::zip::InflaterInputStream` (p. 1906).

6.401.3.5 virtual int decaf::io::InputStream::doReadByte () throw (decaf::io::IOException) [protected, pure virtual]

Implemented in `activemq::io::LoggingInputStream` (p. 2251), `decaf::internal::io::StandardInputStream` (p. 3353), `decaf::internal::net::ssl::openssl::OpenSSLSocketInput`

(p. 2698), `decaf::internal::net::tcp::TcpSocketInputStream` (p. 3508), `decaf::io::BlockingByteArrayInputStream` (p. 773), `decaf::io::BufferedInputStream` (p. 865), `decaf::io::ByteArrayInputStream` (p. 948), `decaf::io::FilterInputStream` (p. 1774), `decaf::io::PushbackInputStream` (p. 2943), `decaf::util::zip::CheckedInputStream` (p. 1057), and `decaf::util::zip::InflaterInputStream` (p. 1906).

6.401.3.6 `virtual void decaf::io::InputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3463).

6.401.3.7 `virtual void decaf::io::InputStream::mark (int readLimit) [virtual]`

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit The max bytes read before marked position is invalid.

Reimplemented in `decaf::io::BufferedInputStream` (p. 865), `decaf::io::ByteArrayInputStream` (p. 948), `decaf::io::FilterInputStream` (p. 1775), `decaf::io::PushbackInputStream` (p. 2944), and `decaf::util::zip::InflaterInputStream` (p. 1907).

6.401.3.8 `virtual bool decaf::io::InputStream::markSupported () const [inline, virtual]`

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented in `decaf::io::BufferedInputStream` (p. 865), `decaf::io::ByteArrayInputStream` (p. 948), `decaf::io::FilterInputStream` (p. 1775), `decaf::io::PushbackInputStream` (p. 2944), and `decaf::util::zip::InflaterInputStream` (p. 1907).

6.401.3.9 `virtual void decaf::io::InputStream::notify ()
 throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [inline,
 virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3464).

6.401.3.10 `virtual void decaf::io::InputStream::notifyAll ()
 throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [inline,
 virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3465).

6.401.3.11 `virtual int decaf::io::InputStream::read (unsigned char * buffer,
 int size, int offset, int length) throw (decaf::io::IOException,
 decaf::lang::exceptions::IndexOutOfBoundsException,
 decaf::lang::exceptions::NullPointerException) [virtual]`

Reads up to length bytes of data from the input stream into an array of bytes.

An attempt is made to read as many as length bytes, but a smaller number may be read. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If length is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into b.

The first byte read is stored into element b[off], the next one into b[off+1], and so on. The number of bytes read is, at most, equal to length. Let k be the number of bytes actually read; these bytes will be stored in elements b[off] through b[off+k-1], leaving elements b[offset+k] through b[offset+length-1] unaffected.

In every case, elements `b[0]` through `b[offset]` and elements `b[offset+length]` through `b[b.length-1]` are unaffected.

This method called the protected virtual method `doReadArrayBounded` which simply calls the method `doReadByte()` (p.1912) repeatedly. If the first such call results in an **IOException** (p.2003), that exception is returned. If any subsequent call to `doReadByte()` (p.1912) results in a **IOException** (p.2003), the exception is caught and treated as if it were end of file; the bytes read up to that point are stored into the buffer and the number of bytes read before the exception occurred is returned. The default implementation of this method blocks until the requested amount of input data has been read, end of file is detected, or an exception is thrown. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

- buffer* The target buffer to write the read in data to.
- size* The size in bytes of the target buffer.
- offset* The position in the buffer to start inserting the read in data.
- length* The maximum number of bytes that should be read into buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

- IOException** (p. 2003) if an I/O error occurs.
- NullPointerException** if buffer passed is NULL.
- IndexOutOfBoundsException** if `length > size - offset`.

6.401.3.12 `virtual int decaf::io::InputStream::read () throw (decaf::io::IOException)` [virtual]

Reads a single byte from the buffer.

The value byte is returned as an int in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown.

The default implementation of this method calls the internal virtual method `doReadByte` which is a pure virtual method and must be overridden by all subclasses.

Returns

The next byte or -1 if the end of stream is reached.

Exceptions

- IOException** (p. 2003) if an I/O error occurs.

6.401.3.13 `virtual int decaf::io::InputStream::read (unsigned char * buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)` [virtual]

Reads up to size bytes of data from the input stream into an array of bytes.

An attempt is made to read as many as size bytes, but a smaller number may be read. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If size is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into b.

This method called the protected virtual method doReadArray which by default is the same as calling read(buffer, size, 0, size). Subclasses can customize the behavior of this method by overriding the doReadArray method to provide a better performing read operation.

Parameters

buffer The target buffer to write the read in data to.

size The size in bytes of the target buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

IOException (p. 2003) if an I/O error occurs.

NullPointerException if buffer passed is NULL.

6.401.3.14 virtual void decaf::io::InputStream::reset () throw (decaf::io::IOException) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2003) might be thrown. * If such an **IOException** (p. 2003) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2003). * If an **IOException** (p. 2003) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 2003).

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented in **decaf::io::BufferedInputStream** (p. 865), **decaf::io::ByteArrayInputStream** (p. 949), **decaf::io::FilterInputStream** (p. 1775), **decaf::io::PushbackInputStream** (p. 2944), and **decaf::util::zip::InflaterInputStream** (p. 1907).

6.401.3.15 `virtual long long decaf::io::InputStream::skip (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1909) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException (p. 2003) if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 2698), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 3508), **decaf::io::BlockingByteArrayInputStream** (p. 774), **decaf::io::BufferedInputStream** (p. 866), **decaf::io::ByteArrayInputStream** (p. 950), **decaf::io::FilterInputStream** (p. 1776), **decaf::io::PushbackInputStream** (p. 2945), **decaf::util::zip::CheckedInputStream** (p. 1057), and **decaf::util::zip::InflaterInputStream** (p. 1908).

6.401.3.16 `virtual std::string decaf::io::InputStream::toString () const` [virtual]

Output a String representation of this object.

The default version of this method just prints the Class Name.

Returns

a string representation of the object.

6.401.3.17 `virtual bool decaf::io::InputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException)` [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3466).

6.401.3.18 virtual void decaf::io::InputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3467).

6.401.3.19 virtual void decaf::io::InputStream::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3470).

6.401.3.20 virtual void decaf::io::InputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3468).

```
6.401.3.21 virtual void decaf::io::InputStream::wait ( long long millisecs,
int nanos ) throw ( decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3471).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/InputStream.h`

6.402 decaf::io::InputStreamReader Class Reference

An **InputStreamReader** (p. 1919) is a bridge from byte streams to character streams.

```
#include <src/main/decaf/io/InputStreamReader.h>
```

Inheritance diagram for decaf::io::InputStreamReader:

Public Member Functions

- **InputStreamReader** (**InputStream** *stream, bool own=false)
Create a new *InputStreamReader* (p. 1919) that wraps the given *InputStream* (p. 1909).
- virtual ~**InputStreamReader** ()
- virtual void **close** () throw (decaf::io::IOException)

- virtual bool **ready** () const throw (decaf::io::IOException)

Tells whether this stream is ready to be read.

Protected Member Functions

- virtual int **doReadArrayBounded** (char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Override this method to customize the functionality of the method read(unsigned char buffer, int size, int offset, int length).*

- virtual void **checkClosed** () const throw (decaf::io::IOException)

6.402.1 Detailed Description

An **InputStreamReader** (p. 1919) is a bridge from byte streams to character streams. For top efficiency, consider wrapping an **InputStreamReader** (p. 1919) within a **BufferedReader**. For example:

```
BufferedReader* in = new BufferedReader( new InputStreamReader (p. 1919)( System.in, false ), true );
```

OutputStreamWriter (p. 2726)

Since

1.0

6.402.2 Constructor & Destructor Documentation

6.402.2.1 decaf::io::InputStreamReader::InputStreamReader (**InputStream** * stream, bool own = false)

Create a new **InputStreamReader** (p. 1919) that wraps the given **InputStream** (p. 1909).

Parameters

stream The **InputStream** (p. 1909) to read from. (cannot be null).

own Does this object own the passed **InputStream** (p. 1909) (defaults to false).

Exceptions

NullPointerException if the passed **InputStream** (p. 1909) is NULL.

6.402.2.2 `virtual decaf::io::InputStreamReader::~~InputStreamReader ()`
[virtual]

6.402.3 Member Function Documentation

6.402.3.1 `virtual void decaf::io::InputStreamReader::checkClosed () const throw (decaf::io::IOException)` [protected, virtual]

6.402.3.2 `virtual void decaf::io::InputStreamReader::close () throw (decaf::io::IOException)` [virtual]

6.402.3.3 `virtual int decaf::io::InputStreamReader::doReadArrayBounded (char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)` [protected, virtual]

Override this method to customize the functionality of the method `read(unsigned char* buffer, int size, int offset, int length)`.

All subclasses must override this method to provide the basic **Reader** (p. 2960) functionality.

Implements **decaf::io::Reader** (p. 2962).

6.402.3.4 `virtual bool decaf::io::InputStreamReader::ready () const throw (decaf::io::IOException)` [virtual]

Tells whether this stream is ready to be read.

Returns

True if the next `read()` (p. 2964) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented from **decaf::io::Reader** (p. 2965).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/InputStreamReader.h`

6.403 decaf::internal::nio::IntArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/IntArrayBuffer.h>
```

Inheritance diagram for `decaf::internal::nio::IntArrayBuffer`:

Public Member Functions

- **IntArrayBuffer** (int size, bool readOnly=false) throw (decaf::lang::exceptions::IllegalArgumentException)

*Creates a **IntArrayBuffer** (p. 1921) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **IntArrayBuffer** (int *array, int size, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

*Creates a **IntArrayBuffer** (p. 1921) object that wraps the given array.*

- **IntArrayBuffer** (const decaf::lang::Pointer< ByteArrayAdapter > &array, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **IntArrayBuffer** (const IntArrayBuffer &other)

*Create a **IntArrayBuffer** (p. 1921) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**IntArrayBuffer** ()
- virtual int * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

*the array that backs this **Buffer** (p. 855).*

Exceptions

***ReadOnlyBufferException** (p. 2966) if this **Buffer** (p. 855) is read only.
UnsupportedOperationException if the underlying store has no array.*

- virtual int **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

***ReadOnlyBufferException** (p. 2966) if this **Buffer** (p. 855) is read only.
UnsupportedOperationException if the underlying store has no array.*

- virtual IntBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

- virtual `IntBuffer & compact ()` throw (`decaf::nio::ReadOnlyBufferException`)

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **IntBuffer** (p. 1931)*

Exceptions

***ReadOnlyBufferException** (p. 2966) if this buffer is read-only.*

- virtual `IntBuffer * duplicate ()`

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new int **Buffer** (p. 855) which the caller owns.*

- virtual `int get ()` throw (`decaf::nio::BufferUnderflowException`)

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position.

Exceptions

***BufferUnderflowException** (p. 882) if there no more data to return.*

- virtual `int get (int index) const` throw (`lang::exceptions::IndexOutOfBoundsException`)

Absolute get method.

Reads the value at the given index.

Parameters

***index** The index in the **Buffer** (p. 855) where the int is to be read.*

Returns

the int that is located at the given index.

Exceptions

***IndexOutOfBoundsException** if index is not smaller than the buffer's limit, or index is negative.*

- virtual `bool hasArray () const`

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

- virtual IntBuffer & **put** (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters

value The integer value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException (p. 2966) if this buffer is read-only.

- virtual IntBuffer & **put** (int index, int value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given ints into this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data.
value The ints to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written, or the index is negative.
ReadOnlyBufferException (p. 2966) - If this buffer is read-only.

- virtual IntBuffer * **slice** () const

*Creates a new **IntBuffer** (p. 1931) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.*

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the newly create **IntBuffer** (p. 1931) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

*Sets this **IntArrayBuffer** (p. 1921) as Read-Only.*

6.403.1 Constructor & Destructor Documentation

6.403.1.1 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int size, bool readOnly = false) throw (decaf::lang::exceptions::IllegalArgumentException)`

Creates a **IntArrayBuffer** (p. 1921) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArgumentException if the capacity value is negative.

6.403.1.2 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int * array, int size, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a **IntArrayBuffer** (p. 1921) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.403.1.3 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & array, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **IntArrayBuffer** (p. 1921) will be that of the remaining capacity of the passed buffer.

Parameters

- array* The ByteArrayAdapter to wrap.
- offset* The position that is this buffers start position.
- length* The limit of how many bytes into the array this Buffer can write.
- readOnly* Boolean indicating if this buffer should be read-only, default as false.

Exceptions

- NullPointerException* if array is NULL
- IndexOutOfBoundsException* if offset + length is greater than array size.

6.403.1.4 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const IntArrayBuffer & other)

Create a **IntArrayBuffer** (p.1921) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.

Parameters

- other* The **IntArrayBuffer** (p.1921) this one is to mirror.

6.403.1.5 virtual decaf::internal::nio::IntArrayBuffer::~~IntArrayBuffer () [virtual]

6.403.2 Member Function Documentation

6.403.2.1 virtual int* decaf::internal::nio::IntArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

- the array that backs this **Buffer** (p. 855).

Exceptions

- ReadOnlyBufferException* (p. 2966) if this **Buffer** (p. 855) is read only.
- UnsupportedOperationException* if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p.1934).

6.403.2.2 `virtual int decaf::internal::nio::IntArrayBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1934).

6.403.2.3 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::asReadOnlyBuffer
() const [virtual]`

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

Implements **decaf::nio::IntBuffer** (p. 1934).

6.403.2.4 `virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 860) is copied to index zero, the byte at index `p + 1` is copied to index one, and so forth until the byte at index `limit()` (p. 859) - 1 is copied to index `n = limit()` (p. 859) - 1 - `p`. The buffer's position is then set to `n+1` and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **IntBuffer** (p. 1931)

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1935).

6.403.2.5 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::duplicate ()
[virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new int **Buffer** (p. 855) which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1935).

6.403.2.6 virtual int decaf::internal::nio::IntArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

Implements **decaf::nio::IntBuffer** (p. 1937).

6.403.2.7 virtual int decaf::internal::nio::IntArrayBuffer::get (int index) const
throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the int is to be read.

Returns

the int that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::IntBuffer** (p. 1936).

6.403.2.8 **virtual bool decaf::internal::nio::IntArrayBuffer::hasArray () const**
[inline, virtual]

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::IntBuffer** (p. 1937).

6.403.2.9 **virtual bool decaf::internal::nio::IntArrayBuffer::isReadOnly () const**
[inline, virtual]

6.403.2.10 **virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int *index*,
int *value*) throw (lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException)** [virtual]

Writes the given ints into this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data.

value The ints to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written, or the index is negative.

ReadOnlyBufferException (p. 2966) - If this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1938).

6.403.2.11 `virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put
 (int value) throw (decaf::nio::BufferOverflowException,
 decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters

value The integer value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1938).

6.403.2.12 `virtual void decaf::internal::nio::IntArrayBuffer::setReadOnly (bool
 value) [inline, protected, virtual]`

Sets this **IntArrayBuffer** (p. 1921) as Read-Only.

Parameters

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.403.2.13 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::slice () const
 [virtual]`

Creates a new **IntBuffer** (p. 1931) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **IntBuffer** (p. 1931) which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1940).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/IntArrayBuffer.h`

6.404 decaf::nio::IntBuffer Class Reference

This class defines four categories of operations upon int buffers:

```
#include <src/main/decaf/nio/IntBuffer.h>
```

Inheritance diagram for decaf::nio::IntBuffer:

Public Member Functions

- virtual **~IntBuffer** ()
- virtual std::string **toString** () const
- virtual int * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the int array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **IntBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only int buffer that shares this buffer's content.
- virtual **IntBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **IntBuffer** * **duplicate** ()=0
Creates a new int buffer that shares this buffer's content.
- virtual int **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual int **get** (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **IntBuffer** & **get** (std::vector< int > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **IntBuffer** & **get** (int *buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible int array.
- **IntBuffer** & **put** (**IntBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)

This method transfers the ints remaining in the given source buffer into this buffer.

- **IntBuffer** & **put** (const int *buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

This method transfers ints into this buffer from the given source array.

- **IntBuffer** & **put** (std::vector< int > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source ints array into this buffer.

- virtual **IntBuffer** & **put** (int value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given integer into this buffer at the current position, and then increments the position.

- virtual **IntBuffer** & **put** (int index, int value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given ints into this buffer at the given index.

- virtual **IntBuffer** * **slice** () const =0

*Creates a new **IntBuffer** (p. 1931) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **IntBuffer** &value) const

- virtual bool **equals** (const **IntBuffer** &value) const

- virtual bool **operator==** (const **IntBuffer** &value) const

- virtual bool **operator<** (const **IntBuffer** &value) const

Static Public Member Functions

- static **IntBuffer** * **allocate** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)

Allocates a new Double buffer.

- static **IntBuffer** * **wrap** (int *array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

*Wraps the passed buffer with a new **IntBuffer** (p. 1931).*

- static **IntBuffer** * **wrap** (std::vector< int > &buffer)

*Wraps the passed STL int Vector in a **IntBuffer** (p. 1931).*

Protected Member Functions

- **IntBuffer** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)

*Creates a **IntBuffer** (p. 1931) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.404.1 Detailed Description

This class defines four categories of operations upon int buffers: o Absolute and relative get and put methods that read and write single ints; o Relative bulk get methods that transfer contiguous sequences of ints from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of ints from a int array or some other int buffer into this buffer o Methods for compacting, duplicating, and slicing a int buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing int array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.404.2 Constructor & Destructor Documentation

6.404.2.1 decaf::nio::IntBuffer::IntBuffer (int *capacity*) throw (decaf::lang::exceptions::IllegalArgumentException) [protected]

Creates a **IntBuffer** (p. 1931) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity The size and limit of the **Buffer** (p. 855) in integers.

Exceptions

IllegalArgumentException if capacity is negative.

6.404.2.2 virtual decaf::nio::IntBuffer::~~IntBuffer () [inline, virtual]

6.404.3 Member Function Documentation

6.404.3.1 static IntBuffer* decaf::nio::IntBuffer::allocate (int *capacity*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity The size of the Double buffer in integers.

Returns

the **IntBuffer** (p. 1931) that was allocated, caller owns.

6.404.3.2 `virtual int* decaf::nio::IntBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 855).

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1926).

6.404.3.3 `virtual int decaf::nio::IntBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1927).

6.404.3.4 `virtual IntBuffer* decaf::nio::IntBuffer::asReadOnlyBuffer () const [pure virtual]`

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow

the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1927).

6.404.3.5 `virtual IntBuffer& decaf::nio::IntBuffer::compact () throw (ReadOnlyBufferException)` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 860) is copied to index zero, the byte at index `p + 1` is copied to index one, and so forth until the byte at index `limit()` (p. 859) - 1 is copied to index `n = limit()` (p. 859) - 1 - `p`. The buffer's position is then set to `n+1` and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this `IntBuffer` (p. 1931)

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1927).

6.404.3.6 `virtual int decaf::nio::IntBuffer::compareTo (const IntBuffer & value) const` [virtual]

6.404.3.7 `virtual IntBuffer* decaf::nio::IntBuffer::duplicate ()` [pure virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new int `Buffer` (p. 855) which the caller owns.

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1928).

6.404.3.8 `virtual bool decaf::nio::IntBuffer::equals (const IntBuffer & value)
const [virtual]`

6.404.3.9 `IntBuffer& decaf::nio::IntBuffer::get (std::vector< int > buffer) throw
(BufferUnderflowException)`

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 855).

Exceptions

BufferUnderflowException (p. 882) if there are fewer than length ints remaining in this buffer.

6.404.3.10 `virtual int decaf::nio::IntBuffer::get (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the int is to be read.

Returns

the int that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1928).

6.404.3.11 `IntBuffer& decaf::nio::IntBuffer::get (int * buffer, int size,
int offset, int length) throw (BufferUnderflowException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::NullPointerException)`

Relative bulk get method.

This method transfers ints from this buffer into the given destination array. If there are fewer ints remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 860), then no bytes are transferred and a **BufferUnderflowException** (p. 882) is thrown.

Otherwise, this method copies `length` ints from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters

buffer The pointer to an allocated buffer to fill.
size The size of the buffer that was passed in.
offset The position in the buffer to start filling.
length The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 855).

Exceptions

BufferUnderflowException (p. 882) if there are fewer than `length` ints remaining in this buffer.
NullPointerException if the passed buffer is null.
IndexOutOfBoundsException if the preconditions of `size`, `offset`, or `length` are not met.

6.404.3.12 `virtual int decaf::nio::IntBuffer::get () throw (BufferUnderflowException) [pure virtual]`

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1928).

6.404.3.13 `virtual bool decaf::nio::IntBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1929).

6.404.3.14 `virtual bool decaf::nio::IntBuffer::operator< (const IntBuffer & value) const` [virtual]

6.404.3.15 `virtual bool decaf::nio::IntBuffer::operator== (const IntBuffer & value) const` [virtual]

6.404.3.16 `virtual IntBuffer& decaf::nio::IntBuffer::put (int value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters

value The integer value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1930).

6.404.3.17 `virtual IntBuffer& decaf::nio::IntBuffer::put (int index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given ints into this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data.

value The ints to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written, or the index is negative.

ReadOnlyBufferException (p. 2966) - If this buffer is read-only.

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1929).

6.404.3.18 `IntBuffer& decaf::nio::IntBuffer::put (const int * buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)`

This method transfers ints into this buffer from the given source array.

If there are more ints to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 860), then no ints are transferred and a **BufferOverflowException** (p. 880) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

- buffer* The array from which integers are to be read.
- size* The size of the buffer passed.
- offset* The offset within the array of the first char to be read.
- length* The number of integers to be read from the given array.

Returns

a reference to this buffer.

Exceptions

- BufferOverflowException** (p. 880) if there is insufficient space in this buffer.
- ReadOnlyBufferException** (p. 2966) if this buffer is read-only.
- NullPointerException** if the passed buffer is null.
- IndexOutOfBoundsException** if the preconditions of size, offset, or length are not met.

6.404.3.19 `IntBuffer& decaf::nio::IntBuffer::put (std::vector< int > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)`

This method transfers the entire content of the given source ints array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`.

Parameters

- buffer* The buffer whose contents are copied to this **IntBuffer** (p. 1931).

Returns

a reference to this buffer.

Exceptions

- BufferOverflowException** (p. 880) if there is insufficient space in this buffer.
- ReadOnlyBufferException** (p. 2966) if this buffer is read-only.

6.404.3.20 `IntBuffer& decaf::nio::IntBuffer::put (IntBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IllegalArgumentException)`

This method transfers the ints remaining in the given source buffer into this buffer.

If there are more ints remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 860), then no ints are transferred and a **BufferOverflowException** (p. 880) is thrown.

Otherwise, this method copies `n = src.remaining()` ints from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src The buffer to take ints from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if there is insufficient space in this buffer for the remaining ints in the source buffer.

IllegalArgumentException if the source buffer is this buffer.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

6.404.3.21 virtual IntBuffer* decaf::nio::IntBuffer::slice () const [pure virtual]

Creates a new **IntBuffer** (p. 1931) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **IntBuffer** (p. 1931) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1930).

6.404.3.22 virtual std::string decaf::nio::IntBuffer::toString () const [virtual]

Returns

a `std::string` describing this object

6.404.3.23 static IntBuffer* decaf::nio::IntBuffer::wrap (int * array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]

Wraps the passed buffer with a new **IntBuffer** (p. 1931).

The new buffer will be backed by the given int array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

- array*** The array that will back the new buffer.
- size*** The size of the passed in array.
- offset*** The offset of the subarray to be used.
- length*** The length of the subarray to be used.

Returns

a new **IntBuffer** (p.1931) that is backed by `buffer`, caller owns.

Exceptions

- NullPointerException*** if the array pointer is NULL.
- IndexOutOfBoundsException*** if the preconditions of size, offset, or length are not met.

6.404.3.24 `static IntBuffer* decaf::nio::IntBuffer::wrap (std::vector< int > &
buffer) [static]`

Wraps the passed STL int Vector in a **IntBuffer** (p.1931).

The new buffer will be backed by the given int array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

- buffer*** The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns

a new **IntBuffer** (p.1931) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/IntBuffer.h`

6.405 decaf::lang::Integer Class Reference

```

```

Inheritance diagram for `decaf::lang::Integer`:

Public Member Functions

- **Integer** (int value)
- **Integer** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Integer** ()
- virtual int **compareTo** (const **Integer** &i) const
*Compares this **Integer** (p. 1941) instance with another.*
- bool **equals** (const **Integer** &i) const
- virtual bool **operator==** (const **Integer** &i) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Integer** &i) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const int &i) const
*Compares this **Integer** (p. 1941) instance with another.*
- bool **equals** (const int &i) const
- virtual bool **operator==** (const int &i) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const int &i) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static **Integer** **decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a **String** (p. 3427) into a **Integer** (p. 1941).*
- static int **reverseBytes** (int value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.
- static int **reverse** (int value)
Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.
- static int **parseInt** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed int in the radix specified by the second argument.
- static int **parseInt** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal int.
- static **Integer** **valueOf** (int value)
*Returns a **Integer** (p. 1941) instance representing the specified int value.*
- static **Integer** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Integer** (p. 1941) object holding the value given by the specified std::string.*
- static **Integer** **valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Integer** (p. 1941) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*
- static int **bitCount** (int value)
Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static std::string **toString** (int value)
*Converts the int to a **String** (p. 3427) representation.*
- static std::string **toString** (int value, int radix)
Returns a string representation of the first argument in the radix specified by the second argument.
- static std::string **toHexString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 8.
- static std::string **toBinaryString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 2.

- static int **highestOneBit** (int value)
Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.
- static int **lowestOneBit** (int value)
Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (int value)
Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.
- static int **numberOfTrailingZeros** (int value)
Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.
- static int **rotateLeft** (int value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.
- static int **rotateRight** (int value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.
- static int **signum** (int value)
Returns the signum function of the specified int value.

Static Public Attributes

- static const int **SIZE** = 32
The size in bits of the primitive int type.
- static const int **MAX_VALUE** = (int)0x7FFFFFFF
The maximum value that the primitive type can hold.
- static const int **MIN_VALUE** = (int)0x80000000
The minimum value that the primitive type can hold.

6.405.1 Constructor & Destructor Documentation

6.405.1.1 decaf::lang::Integer::Integer (int value)

Parameters

value The primitive value to wrap in an Integer (p. 1941) instance.

6.405.1.2 `decaf::lang::Integer::Integer (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters

value The base 10 encoded string to decode to an `Integer` (p.1941) and wrap.

Exceptions

NumberFormatException

6.405.1.3 `virtual decaf::lang::Integer::~~Integer () [inline, virtual]`

6.405.2 Member Function Documentation

6.405.2.1 `static int decaf::lang::Integer::bitCount (int value) [static]`

Returns the number of one-bits in the two's complement binary representation of the specified int value.

This function is sometimes referred to as the population count.

Parameters

value - the int to count

Returns

the number of one-bits in the two's complement binary representation of the specified int value.

6.405.2.2 `virtual unsigned char decaf::lang::Integer::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.405.2.3 `virtual int decaf::lang::Integer::compareTo (const int & i) const [virtual]`

Compares this `Integer` (p.1941) instance with another.

Parameters

i - the `Integer` (p.1941) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements `decaf::lang::Comparable< int >` (p.1126).

6.405.2.4 `virtual int decaf::lang::Integer::compareTo (const Integer & i) const`
[virtual]

Compares this **Integer** (p.1941) instance with another.

Parameters

i - the **Integer** (p.1941) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.405.2.5 `static Integer decaf::lang::Integer::decode (const std::string & value)`
`throw (exceptions::NumberFormatException)` [static]

Decodes a **String** (p.3427) into a **Integer** (p.1941).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInt method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p.3427) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value - The string to decode

Returns

a **Integer** (p.1941) object containing the decoded value

Exceptions

NumberFormatException if the string is not formatted correctly.

6.405.2.6 `virtual double decaf::lang::Integer::doubleValue () const` [inline,
virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.405.2.7 `bool decaf::lang::Integer::equals (const Integer & i) const` [inline]**Parameters**

i - the **Integer** (p.1941) object to compare against.

Returns

true if the two **Integer** (p.1941) Objects have the same value.

6.405.2.8 `bool decaf::lang::Integer::equals (const int & i) const [inline, virtual]`

Parameters

i - the **Integer** (p.1941) object to compare against.

Returns

true if the two **Integer** (p.1941) Objects have the same value.

Implements **decaf::lang::Comparable**< **int** > (p.1126).

6.405.2.9 `virtual float decaf::lang::Integer::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.405.2.10 `static int decaf::lang::Integer::highestOneBit (int value) [static]`

Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the int to be inspected

Returns

an int value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.405.2.11 `virtual int decaf::lang::Integer::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.405.2.12 `virtual long long decaf::lang::Integer::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.405.2.13 `static int decaf::lang::Integer::lowestOneBit (int value) [static]`

Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the int to be inspected

Returns

an int value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.405.2.14 `static int decaf::lang::Integer::numberOfLeadingZeros (int value) [static]`

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.

Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

$\ast \text{floor}(\log_2(x)) = 31 - \text{numberOfLeadingZeros}(x) \ast \text{ceil}(\log_2(x)) = 32 - \text{numberOfLeadingZeros}(x - 1)$

Parameters

value - the int to be inspected

Returns

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.405.2.15 `static int decaf::lang::Integer::numberOfTrailingZeros (int value) [static]`

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.

Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters

value - the int to be inspected

Returns

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.405.2.16 `virtual bool decaf::lang::Integer::operator< (const int & i) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< int >` (p.1127).

6.405.2.17 `virtual bool decaf::lang::Integer::operator< (const Integer & i) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.405.2.18 `virtual bool decaf::lang::Integer::operator== (const Integer & i)`
`const` [inline, virtual]

Compares equality between this object and the one passed.

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.405.2.19 `virtual bool decaf::lang::Integer::operator==(const int & i) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< int > (p.1127).

6.405.2.20 `static int decaf::lang::Integer::parseInt (const std::string & s, int`
radix) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed int in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p.1022) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type **NumberFormatException** is thrown if any of the following situations occurs:
* The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p.1026) or larger than **Character.MAX_RADIX** (p.1026). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type int.

Parameters

s - the **String** (p.3427) containing the int representation to be parsed

radix - the radix to be used while parsing *s*

Returns

the int represented by the string argument in the specified radix.

Exceptions

NumberFormatException - If **String** (p.3427) does not contain a parsable int.

6.405.2.21 `static int decaf::lang::Integer::parseInt (const std::string & s) throw`
(exceptions::NumberFormatException) [static]

Parses the string argument as a signed decimal int.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting int value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseInt(const std::string, int)` method.

Parameters

s - **String** (p. 3427) to convert to a int

Returns

the converted int value

Exceptions

NumberFormatException if the string is not a int.

6.405.2.22 static int decaf::lang::Integer::reverse (int *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

Parameters

value - the value whose bits are to be reversed

Returns

the reversed bits int.

6.405.2.23 static int decaf::lang::Integer::reverseBytes (int *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

Parameters

value - the int whose bytes we are to reverse

Returns

the reversed int.

6.405.2.24 static int decaf::lang::Integer::rotateLeft (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

(Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters

value - the int to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

6.405.2.25 `static int decaf::lang::Integer::rotateRight (int value, int distance)`
[static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

(Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: `rotateRight(val, -distance) == rotateLeft(val, distance)`. Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: `rotateRight(val, distance) == rotateRight(val, distance & 0x1F)`.

Parameters

value - the int to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

6.405.2.26 `virtual short decaf::lang::Integer::shortValue () const` [inline, virtual]

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.405.2.27 `static int decaf::lang::Integer::signum (int value)` [static]

Returns the signum function of the specified int value.

(The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters

value - the int to be inspected

Returns

the signum function of the specified int value.

6.405.2.28 `static std::string decaf::lang::Integer::toBinaryString (int value)`
[static]

Returns a string representation of the integer argument as an unsigned integer in base 2.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character.

The characters '0' and '1' are used as binary digits.

Parameters

value - the int to be translated to a binary string

Returns

the unsigned int value as a binary string

6.405.2.29 `static std::string decaf::lang::Integer::toHexString (int value)`
[static]

Returns a string representation of the integer argument as an unsigned integer in base 16.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters

value - the int to be translated to an Octal string

Returns

the unsigned int value as a Octal string

6.405.2.30 `static std::string decaf::lang::Integer::toOctalString (int value)`
[static]

Returns a string representation of the integer argument as an unsigned integer in base 8.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters

value - the int to be translated to an Octal string

Returns

the unsigned int value as a Octal string

6.405.2.31 `std::string decaf::lang::Integer::toString () const`**Returns**

this Integer (p. 1941) Object as a **String** (p. 3427) Representation

6.405.2.32 `static std::string decaf::lang::Integer::toString (int value, int radix) [static]`

Returns a string representation of the first argument in the radix specified by the second argument.

If the radix is smaller than **Character.MIN_RADIX** (p. 1026) or larger than **Character.MAX_RADIX** (p. 1026), then the radix 10 is used instead.

If the first argument is negative, the first element of the result is the ASCII minus character '-'. If the first argument is not negative, no sign character appears in the result.

The remaining characters of the result represent the magnitude of the first argument. If the magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the magnitude will not be the zero character. The following ASCII characters are used as digits:

0123456789abcdefghijklmnopqrstuvwxyz

Parameters

value - the int to convert to a string

radix - the radix to format the string in

Returns

an int formatted to the string value of the radix given.

6.405.2.33 `static std::string decaf::lang::Integer::toString (int value) [static]`

Converts the int to a **String** (p. 3427) representation.

Parameters

value The int to convert to a `std::string` instance.

Returns

string representation

6.405.2.34 `static Integer decaf::lang::Integer::valueOf (const std::string & value,
int radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Integer** (p. 1941) object holding the value extracted from the specified `std::string` when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed int in the radix specified by the second argument, exactly as if the argument were given to the `parseInt(std::string, int)` method. The result is a **Integer** (p. 1941) object that represents the int value specified by the string.

Parameters

value - `std::string` to parse as base (*radix*)

radix - base of the string to parse.

Returns

new **Integer** (p. 1941) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a valid int.

6.405.2.35 `static Integer decaf::lang::Integer::valueOf (int value) [inline,
static]`

Returns a **Integer** (p. 1941) instance representing the specified int value.

Parameters

value - the int to wrap

Returns

the new **Integer** (p. 1941) object wrapping value.

6.405.2.36 `static Integer decaf::lang::Integer::valueOf (const std::string & value
) throw (exceptions::NumberFormatException) [static]`

Returns a **Integer** (p. 1941) object holding the value given by the specified `std::string`.

The argument is interpreted as representing a signed decimal int, exactly as if the argument were given to the `parseInt(std::string)` method. The result is a **Integer** (p. 1941) object that represents the int value specified by the string.

Parameters

value - `std::string` to parse as base 10

Returns

new **Integer** (p. 1941) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a decimal int.

6.405.3 Field Documentation

6.405.3.1 `const int decaf::lang::Integer::MAX_VALUE = (int)0x7FFFFFFF` [static]

The maximum value that the primitive type can hold.

6.405.3.2 `const int decaf::lang::Integer::MIN_VALUE = (int)0x80000000` [static]

The minimum value that the primitive type can hold.

6.405.3.3 `const int decaf::lang::Integer::SIZE = 32` [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Integer.h`

6.406 activemq::commands::IntegerResponse Class Reference

```
#include <src/main/activemq/commands/IntegerResponse.h>
```

Inheritance diagram for `activemq::commands::IntegerResponse`:

Public Member Functions

- `IntegerResponse ()`
- `virtual ~IntegerResponse ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual IntegerResponse * cloneDataStructure () const`
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- `virtual void copyDataStructure (const DataStructure *src)`
Copy the contents of the passed object into this object's members, overwriting any existing data.
- `virtual std::string toString () const`
Returns a string containing the information for this DataStructure (p. 1553) such as its type and value of its elements.
- `virtual bool equals (const DataStructure *value) const`
Compares the DataStructure (p. 1553) passed in to this one, and returns if they are equivalent.
- `virtual int getResult () const`
- `virtual void setResult (int result)`

Static Public Attributes

- static const unsigned char **ID_INTEGERRESPONSE** = 34

Protected Attributes

- int **result**

6.406.1 Constructor & Destructor Documentation

6.406.1.1 `activemq::commands::IntegerResponse::IntegerResponse ()`

6.406.1.2 `virtual activemq::commands::IntegerResponse::~~IntegerResponse ()`
[virtual]

6.406.2 Member Function Documentation

6.406.2.1 `virtual IntegerResponse* activemq::commands::IntegerResponse::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p.3077).

6.406.2.2 `virtual void activemq::commands::IntegerResponse::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::Response` (p.3078).

6.406.2.3 `virtual bool activemq::commands::IntegerResponse::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p.1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p.3078).

6.406.2.4 `virtual unsigned char activemq::commands::IntegerResponse::getDataStructureType () const`
 [virtual]

Get the unique identifier that this object and its own Marshaller share.

Returns

new **DataSet** (p. 1553) type copy.

Reimplemented from **activemq::commands::Response** (p. 3078).

6.406.2.5 `virtual int activemq::commands::IntegerResponse::getResult () const`
 [virtual]

6.406.2.6 `virtual void activemq::commands::IntegerResponse::setResult (int result)` [virtual]

6.406.2.7 `virtual std::string activemq::commands::IntegerResponse::toString () const` [virtual]

Returns a string containing the information for this **DataSet** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 3079).

6.406.3 Field Documentation

6.406.3.1 `const unsigned char activemq::commands::IntegerResponse::ID _ - INTEGERRESPONSE = 34` [static]

6.406.3.2 `int activemq::commands::IntegerResponse::result` [protected]

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.407.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1958). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.407.2 Constructor & Destructor Documentation

6.407.2.1 `activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.407.2.2 `virtual activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.407.3 Member Function Documentation

6.407.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3108).

6.407.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3109).

6.407.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3109).

6.407.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3109).

6.407.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::ResponseMarshaller` (p. 3110).

6.407.3.6 virtual void activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3110).

6.407.3.7 virtual void activemq::wireformat::openwire::marshal::v6::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::ResponseMarshaller** (p. 3111).

The documentation for this class was generated from the following file:

6.408.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1962). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.408.2 Constructor & Destructor Documentation

6.408.2.1 `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.408.2.2 `virtual activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.408.3 Member Function Documentation

6.408.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3090).

6.408.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3091).

6.408.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3091).

6.408.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3091).

6.408.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 3092).

6.408.3.6 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3092).

6.408.3.7 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 3093).

6.409.3 Member Function Documentation

6.409.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 3099).

6.409.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 3100).

6.409.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 3100).

6.409.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 3100).

6.409.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 3101).

6.409.3.6 virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3101).

6.409.3.7 virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 3102).

6.410.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1970). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.410.2 Constructor & Destructor Documentation

6.410.2.1 `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.410.2.2 `virtual activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.410.3 Member Function Documentation

6.410.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 3086).

6.410.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 3086).

6.410.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 3086).

6.410.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 3087).

6.410.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 3087).

6.410.3.6 virtual void activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3088).

6.410.3.7 virtual void activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 3088).

Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.411.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1974). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.411.2 Constructor & Destructor Documentation

6.411.2.1 `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::IntegerResponseMarshaller() [inline]`

6.411.2.2 `virtual activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::~~IntegerResponseMarshaller() [inline, virtual]`

6.411.3 Member Function Documentation

6.411.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::createObject() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3104).

6.411.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3104).

6.411.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3104).

6.411.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3105).

6.411.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 3105).

6.411.3.6 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3106).

6.411.3.7 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 3106).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**IntegerResponseMarshaller.h**

6.412 activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller Class Reference

Write a object instance to data output stream.

6.412.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1978). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.412.2 Constructor & Destructor Documentation

6.412.2.1 `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.412.2.2 `virtual activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.412.3 Member Function Documentation

6.412.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3095).

6.412.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3095).

6.412.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3095).

6.412.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3096).

6.412.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3096).

6.412.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3097).

6.412.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 3097).

6.414 activemq::transport::mock::InternalCommandListener Class Reference

Listens for Commands sent from the **MockTransport** (p. 2592).

```
#include <src/main/activemq/transport/mock/InternalCommandListener.h>
```

Inheritance diagram for `activemq::transport::mock::InternalCommandListener`:

Public Member Functions

- **InternalCommandListener** ()
- virtual **~InternalCommandListener** ()
- void **setTransport** (**MockTransport** *transport)
- void **setResponseBuilder** (const **Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
- void **run** ()

Default implementation of the run method - does nothing.

6.414.1 Detailed Description

Listens for Commands sent from the **MockTransport** (p. 2592). This class processes all outbound commands and sends responses that are constructed by calling the Protocol provided **ResponseBuilder** (p. 3079) and getting a set of Commands to send back into the **MockTransport** (p. 2592) as incoming Commands and Responses.

6.414.2 Constructor & Destructor Documentation

- 6.414.2.1 `activemq::transport::mock::InternalCommandListener::InternalCommandListener ()`
- 6.414.2.2 `virtual activemq::transport::mock::InternalCommandListener::~~InternalCommandListener () [virtual]`

6.414.3 Member Function Documentation

- 6.414.3.1 `virtual void activemq::transport::mock::InternalCommandListener::onCommand (const Pointer< Command > & command) [virtual]`
- 6.414.3.2 `void activemq::transport::mock::InternalCommandListener::run () [virtual]`

Default implementation of the run method - does nothing.

Reimplemented from `decaf::lang::Thread` (p. 3527).

- 6.414.3.3 `void activemq::transport::mock::InternalCommandListener::setResponseBuilder (const Pointer< ResponseBuilder > & responseBuilder) [inline]`
- 6.414.3.4 `void activemq::transport::mock::InternalCommandListener::setTransport (MockTransport * transport) [inline]`

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/InternalCommandListener.h`

6.415 decaf::lang::exceptions::InterruptedException Class Reference

```
#include <src/main/decaf/lang/exceptions/InterruptedException.h>
```

Inheritance diagram for `decaf::lang::exceptions::InterruptedException`:

Public Member Functions

- `InterruptedException () throw ()`
Default Constructor.
- `InterruptedException (const Exception &ex) throw ()`
*Conversion Constructor from some other **Exception** (p. 1712).*
- `InterruptedException (const InterruptedException &ex) throw ()`

Copy Constructor.

- **InterruptedException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- **InterruptedException** (const std::exception *cause) throw ()

Constructor.

- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **InterruptedException** * clone () const

Clones this exception.

- virtual ~**InterruptedException** () throw ()

6.415.1 Constructor & Destructor Documentation

6.415.1.1 decaf::lang::exceptions::InterruptedException::InterruptedException () throw () [inline]

Default Constructor.

6.415.1.2 decaf::lang::exceptions::InterruptedException::InterruptedException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.415.1.3 decaf::lang::exceptions::InterruptedException::InterruptedException (const InterruptedException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.415.1.4 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.415.1.5 `decaf::lang::exceptions::InterruptedException::InterruptedException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.415.1.6 `decaf::lang::exceptions::InterruptedException::InterruptedException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.415.1.7 `virtual decaf::lang::exceptions::InterruptedException::~InterruptedException () throw () [inline, virtual]`

6.415.2 Member Function Documentation

6.415.2.1 `virtual InterruptedException* decaf::lang::exceptions::InterruptedException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/InterruptedException.h`

6.416 decaf::io::InterruptedException Class Reference

```
#include <src/main/decaf/io/InterruptedException.h>
```

Inheritance diagram for `decaf::io::InterruptedException`:

Public Member Functions

- **InterruptedException** () throw ()
Default Constructor.
- **InterruptedException** (const **lang::Exception** &ex) throw ()
Copy Constructor.
- **InterruptedException** (const **InterruptedException** &ex) throw ()
Copy Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedException** (const std::exception *cause) throw ()
Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **InterruptedException** * clone () const
Clones this exception.
- virtual ~**InterruptedException** () throw ()

6.416.1 Constructor & Destructor Documentation

6.416.1.1 `decaf::io::InterruptedException::InterruptedException () throw () [inline]`

Default Constructor.

6.416.1.2 `decaf::io::InterruptedIOException::InterruptedIOException (const lang::Exception & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy

6.416.1.3 `decaf::io::InterruptedIOException::InterruptedIOException (const InterruptedIOException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.416.1.4 `decaf::io::InterruptedIOException::InterruptedIOException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.416.1.5 `decaf::io::InterruptedIOException::InterruptedIOException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.416.1.6 `decaf::io::InterruptedIOException::InterruptedIOException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.416.1.7 virtual decaf::io::InterruptedIOException::~InterruptedIOException () throw () [inline, virtual]

6.416.2 Member Function Documentation

6.416.2.1 virtual InterruptedIOException* decaf::io::InterruptedIOException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

- a new exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 2005).

Reimplemented in **decaf::net::SocketTimeoutException** (p. 3321).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InterruptedIOException.h**

6.417 cms::InvalidClientIdException Class Reference

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

```

- `InvalidDestinationException (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()`
- `virtual ~InvalidDestinationException () throw ()`

6.418.1 Detailed Description

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Since

1.3

6.418.2 Constructor & Destructor Documentation

```
6.418.2.1 cms::InvalidDestinationException::InvalidDestinationException ( )
throw ()
```

```
6.418.2.2 cms::InvalidDestinationException::InvalidDestinationException ( const
InvalidDestinationException & ex ) throw ()
```

```
6.418.2.3 cms::InvalidDestinationException::InvalidDestinationException ( const
std::string & message, const std::exception * cause ) throw ()
```

```
6.418.2.4 cms::InvalidDestinationException::InvalidDestinationException ( const
std::string & message, const std::exception * cause, const std::vector<
std::pair< std::string, int > > & stackTrace ) throw ()
```

```
6.418.2.5 virtual cms::InvalidDestinationException::~InvalidDestinationException
( ) throw () [virtual]
```

The documentation for this class was generated from the following file:

6.419 decaf::security::InvalidKeyException Class Reference

```
#include <src/main/decaf/security/InvalidKeyException.h>
```

Inheritance diagram for decaf::security::InvalidKeyException:

Public Member Functions

- **InvalidKeyException** () throw ()
Default Constructor.
- **InvalidKeyException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **InvalidKeyException** (const **InvalidKeyException** &ex) throw ()
Copy Constructor.

- **InvalidKeyException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InvalidKeyException** (const std::exception *cause) throw ()
Constructor.
- **InvalidKeyException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **InvalidKeyException * clone** () const
Clones this exception.
- virtual **~InvalidKeyException** () throw ()

6.419.1 Constructor & Destructor Documentation

6.419.1.1 `decaf::security::InvalidKeyException::InvalidKeyException () throw ()` [inline]

Default Constructor.

6.419.1.2 `decaf::security::InvalidKeyException::InvalidKeyException (const Exception & ex) throw ()` [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.419.1.3 `decaf::security::InvalidKeyException::InvalidKeyException (const InvalidKeyException & ex) throw ()` [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.419.1.4 `decaf::security::InvalidKeyException::InvalidKeyException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.419.1.5 `decaf::security::InvalidKeyException::InvalidKeyException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.419.1.6 `decaf::security::InvalidKeyException::InvalidKeyException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs
lineNumber line number where the exception occurred.
msg message to report
... list of primitives that are formatted into the message

6.419.1.7 `virtual decaf::security::InvalidKeyException::~~InvalidKeyException () throw () [inline, virtual]`

6.419.2 Member Function Documentation

6.419.2.1 `virtual InvalidKeyException* decaf::security::InvalidKeyException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 2153).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/InvalidKeyException.h`

6.420 decaf::nio::InvalidMarkException Class Reference

```
#include <src/main/decaf/nio/InvalidMarkException.h>
```

Inheritance diagram for `decaf::nio::InvalidMarkException`:

Public Member Functions

- **InvalidMarkException** () throw ()
Default Constructor.

Conversion Constructor from some other Exception.
- **InvalidMarkException** (const **InvalidMarkException** &ex) throw ()
Copy Constructor.
- **InvalidMarkException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InvalidMarkException** (const std::exception *cause) throw ()
Constructor.
- **InvalidMarkException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **InvalidMarkException** * clone () const
Clones this exception.
- virtual ~**InvalidMarkException** () throw ()

6.420.1 Constructor & Destructor Documentation

6.420.1.1 decaf::nio::InvalidMarkException::InvalidMarkException () throw ()
[inline]

Default Constructor.

6.420.1.2 decaf::nio::InvalidMarkException::InvalidMarkException (const lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex The Exception whose state data is to be copied into this Exception.

6.420.1.3 decaf::nio::InvalidMarkException::InvalidMarkException (const InvalidMarkException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex The Exception whose state data is to be copied into this Exception.

6.420.1.4 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.420.1.5 decaf::nio::InvalidMarkException::InvalidMarkException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.420.1.6 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.420.1.7 `virtual decaf::nio::InvalidMarkException::~InvalidMarkException ()
throw () [inline, virtual]`

6.420.2 Member Function Documentation

6.420.2.1 `virtual InvalidMarkException* decaf::nio::InvalidMarkException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new Exception instance that is a copy of this Exception.

Reimplemented from `decaf::lang::exceptions::IllegalStateException` (p. 1871).

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/InvalidMarkException.h`

6.421 cms::InvalidSelectorException Class Reference

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

```

Clones this exception.
- virtual **~InvalidStateException** () throw ()

6.422.1 Constructor & Destructor Documentation

6.422.1.1 decaf::lang::exceptions::InvalidStateException::InvalidStateException () throw () [inline]

Default Constructor.

6.422.1.2 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.422.1.3 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const InvalidStateException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.422.1.4 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.422.1.5 `decaf::lang::exceptions::InvalidStateException::InvalidStateException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.422.1.6 `decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.422.1.7 `virtual decaf::lang::exceptions::InvalidStateException::~~InvalidStateException () throw () [inline, virtual]`

6.422.2 Member Function Documentation

6.422.2.1 `virtual InvalidStateException* decaf::lang::exceptions::InvalidStateException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/InvalidStateException.h`

Constructor - Initializes the file name and line number where this message occurred.
- **IOException** (const std::exception *cause) throw ()
Constructor.
- **IOException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **IOException** * clone () const
Clones this exception.
- virtual ~**IOException** () throw ()

6.423.1 Constructor & Destructor Documentation

6.423.1.1 decaf::io::IOException::IOException () throw () [inline]

Default Constructor.

6.423.1.2 `decaf::io::IOException::IOException (const lang::Exception & ex)
throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy

6.423.1.3 `decaf::io::IOException::IOException (const IOException & ex) throw
() [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.423.1.4 `decaf::io::IOException::IOException (const char * file, const int
lineNumber, const std::exception * cause, const char * msg, ...)
throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.423.1.5 `decaf::io::IOException::IOException (const std::exception * cause)
throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.423.1.6 `decaf::io::IOException::IOException (const char * file, const int
lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.423.1.7 `virtual decaf::io::IOException::~~IOException () throw () [inline, virtual]`

6.423.2 Member Function Documentation

6.423.2.1 `virtual IOException* decaf::io::IOException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

- a new instance of an Exception that is a copy of this instance.

Reimplemented from `decaf::lang::Exception` (p. 1715).

Reimplemented in `decaf::internal::net::ssl::openssl::OpenSSLSocketException` (p. 2689), `decaf::io::EOFException` (p. 1709), `decaf::io::InterruptedIOException` (p. 1992), `decaf::io::UnsupportedEncodingException` (p. 3656), `decaf::io::UTFDataFormatException` (p. 3705), `decaf::net::BindException` (p. 770), `decaf::net::ConnectException` (p. 1167), `decaf::net::HttpRetryException` (p. 1861), `decaf::net::MalformedURLException` (p. 2305), `decaf::net::NoRouteToHostException` (p. 2642), `decaf::net::PortUnreachableException` (p. 2783), `decaf::net::ProtocolException` (p. 2939), `decaf::net::SocketException` (p. 3300), `decaf::net::SocketTimeoutException` (p. 3321), `decaf::net::UnknownHostException` (p. 3651), `decaf::net::UnknownServiceException` (p. 3654), and `decaf::util::zip::ZipException` (p. 3798).

*Is the **Transport** (p. 3629) Connected to its Broker.*

- virtual bool **isClosed** () const

*Has the **Transport** (p. 3629) been shutdown and no longer usable.*

- virtual std::string **getRemoteAddress** () const

- virtual void **reconnect** (const decaf::net::URI &uri AMQCPP_UNUSED) throw (decaf::io::IOException)

reconnect to another location

6.424.1 Detailed Description

Implementation of the **Transport** (p. 3629) interface that performs marshaling of commands to IO streams. This class does not implement the request method, it only handles oneway messages. A thread polls on the input stream for in-coming commands. When a command is received, the command listener is notified. The polling thread is not started until the start method is called. The close method will close the associated streams. Close can be called explicitly by the user, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

6.424.2 Constructor & Destructor Documentation

6.424.2.1 activemq::transport::IOTransport::IOTransport ()

Default Constructor.

6.424.2.2 activemq::transport::IOTransport::IOTransport (const Pointer< wireformat::WireFormat > & wireFormat)

Create an instance of this **Transport** (p. 3629) and assign its WireFormat instance at creation time.

Parameters

wireFormat Data encoder / decoder to use when reading and writing.

6.424.2.3 virtual `activemq::transport::IOTransport::~~IOTransport ()` [virtual]

6.424.3 Member Function Documentation

6.424.3.1 virtual void `activemq::transport::IOTransport::close ()` throw (`decaf::io::IOException`) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

6.424.3.2 virtual `std::string activemq::transport::IOTransport::getRemoteAddress ()` const [inline, virtual]

Returns

the remote address for this connection

6.424.3.3 virtual `TransportListener* activemq::transport::IOTransport::getTransportListener ()` const [inline, virtual]

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

6.424.3.4 virtual `bool activemq::transport::IOTransport::isClosed ()` const [inline, virtual]

Has the **Transport** (p. 3629) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3629)

6.424.3.5 virtual `bool activemq::transport::IOTransport::isConnected ()` const [inline, virtual]

Is the **Transport** (p. 3629) Connected to its Broker.

Returns

true if a connection has been made.

6.424.3.6 `virtual bool activemq::transport::IOTransport::isFaultTolerant () const`
[inline, virtual]

Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3629) is fault tolerant.

6.424.3.7 `virtual Transport* activemq::transport::IOTransport::narrow (const`
`std::type_info & typeId)` [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3629) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

6.424.3.8 `virtual void activemq::transport::IOTransport::oneway (const`
`Pointer< Command > & command) throw (decaf::io::IOException,`
`decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

6.424.3.9 `virtual void activemq::transport::IOTransport::reconnect (`
`const decaf::net::URI &uri AMQCPP_UNUSED) throw (`
`decaf::io::IOException)` [inline, virtual]

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.424.3.10 `virtual Pointer<Response> activemq::transport::IOTransport::request
 (const Pointer< Command > & command
) throw (decaf::io::IOException, de-
 cafe::lang::exceptions::UnsupportedOperationException)
 [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command to be sent.

Returns

the response to the command sent.

Exceptions

UnsupportedOperationException.

6.424.3.11 `virtual Pointer<Response> activemq::transport::IOTransport::request
 (const Pointer< Command > & command, unsigned
 int timeout) throw (decaf::io::IOException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command to be sent.

timeout the time to wait for a response.

Returns

the response to the command sent.

Exceptions

UnsupportedOperationException.

6.424.3.12 `virtual void activemq::transport::IOTransport::run () [virtual]`

Runs the polling thread.

Implements `decaf::lang::Runnable` (p. 3112).

6.424.3.13 `virtual void activemq::transport::IOTransport::setInputStream (
 decaf::io::DataInputStream * is) [inline, virtual]`

Sets the input stream for in-coming commands.

Parameters

is The input stream.

6.424.3.14 `virtual void activemq::transport::IOTransport::setOutputStream (decaf::io::DataOutputStream * os) [inline, virtual]`

Sets the output stream for out-going commands.

Parameters

os The output stream.

6.424.3.15 `virtual void activemq::transport::IOTransport::setTransportListener (TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

Parameters

listener the listener of transport events.

6.424.3.16 `virtual void activemq::transport::IOTransport::setWireFormat (const Pointer< wireformat::WireFormat > & wireFormat) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.424.3.17 `virtual void activemq::transport::IOTransport::start () throw (decaf::io::IOException) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

CMSEException if an error occurs or if this transport has already been closed.

6.424.3.18 `virtual void activemq::transport::IOTransport::stop () throw (decaf::io::IOException) [virtual]`

Stops the **Transport** (p. 3629), terminating any threads and stopping all read and write operations.

Exceptions

IOException if an error occurs while stopping the **Transport** (p. 3629).

The documentation for this class was generated from the following file:

6.425.3.1 `template<typename E> virtual decaf::util::Iterator<E>* decaf::lang::Iterable< E >::iterator () [pure virtual]`

Returns

an iterator over a set of elements of type T.

Referenced by `decaf::util::AbstractCollection< cms::Connection * >::clear()`, `decaf::util::AbstractCollection< cms::Connection * >::contains()`, `decaf::util::AbstractCollection< cms::Connection * >::copy()`, `decaf::util::AbstractCollection< cms::Connection * >::operator=()`, `decaf::util::AbstractCollection< cms::Connection * >::remove()`, `decaf::util::AbstractSet< ActiveMQSession * >::removeAll()`, `decaf::util::AbstractCollection< cms::Connection * >::removeAll()`, `decaf::util::AbstractCollection< cms::Connection * >::retainAll()`, and `decaf::util::AbstractCollection< cms::Connection * >::toArray()`.

6.425.3.2 `template<typename E> virtual decaf::util::Iterator<E>* decaf::lang::Iterable< E >::iterator () const [pure virtual]`

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Iterable.h`

6.426 decaf::util::Iterator< T > Class Template Reference

Defines an object that can be used to iterate over the elements of a collection.

```
#include <src/main/decaf/util/Iterator.h>
```

Inheritance diagram for decaf::util::Iterator< T >:

Public Member Functions

- virtual **~Iterator** ()
- virtual T **next** ()=0 throw (lang::exceptions::NoSuchElementException)
Returns the next element in the iteration.
- virtual bool **hasNext** () const =0
Returns true if the iteration has more elements.
- virtual void **remove** ()=0 throw (lang::exceptions::IllegalStateException, lang::exceptions::UnsupportedOperationException)
Removes from the underlying collection the last element returned by the iterator (optional operation).

6.426.1 Detailed Description

```
template<typename T> class decaf::util::Iterator< T >
```

Defines an object that can be used to iterate over the elements of a collection. The iterator provides a way to access and remove elements with well defined semantics.

6.426.2 Constructor & Destructor Documentation

6.426.2.1 `template<typename T> virtual decaf::util::Iterator< T >::~~Iterator ()`
`[inline, virtual]`

6.426.3 Member Function Documentation

6.426.3.1 `template<typename T> virtual bool decaf::util::Iterator< T >::hasNext () const` `[pure virtual]`

Returns true if the iteration has more elements.

Returns false if the next call to next would result in an NoSuchElementException to be thrown.

6.426.3.2 `template<typename T> virtual T decaf::util::Iterator< T >::next ()`
`throw (lang::exceptions::NoSuchElementException)` `[pure virtual]`

Returns the next element in the iteration.

Calling this method repeatedly until the **hasNext()** (p. 2013) method returns false will return each element in the underlying collection exactly once.

Returns

next element in the iteration of elements

Exceptions

NoSuchElementException - iteration has no more elements.

6.426.3.3 `template<typename T> virtual void decaf::util::Iterator< T
>::remove () throw (lang::exceptions::IllegalStateException,
lang::exceptions::UnsupportedOperationException) [pure virtual]`

Removes from the underlying collection the last element returned by the iterator (optional operation).

This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions

UnsupportedOperationException - if the remove operation is not supported by this **Iterator** (p. 2012).

IllegalStateException - if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Iterator.h`

6.427 activemq::commands::JournalQueueAck Class Reference

```
#include <src/main/activemq/commands/JournalQueueAck.h>
```

Inheritance diagram for `activemq::commands::JournalQueueAck`:

Public Member Functions

- **JournalQueueAck** ()
- virtual **~JournalQueueAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **JournalQueueAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const **Pointer**< **MessageAck** > & **getMessageAck** () const
- virtual **Pointer**< **MessageAck** > & **getMessageAck** ()
- virtual void **setMessageAck** (const **Pointer**< **MessageAck** > &messageAck)

Static Public Attributes

- static const unsigned char **ID_JOURNALQUEUEACK** = 52

Protected Attributes

- **Pointer**< **ActiveMQDestination** > destination
- **Pointer**< **MessageAck** > messageAck

6.427.1 Constructor & Destructor Documentation

6.427.1.1 **activemq::commands::JournalQueueAck::JournalQueueAck** ()

6.427.1.2 **virtual activemq::commands::JournalQueueAck::~~JournalQueueAck** ()
[virtual]

6.427.2 Member Function Documentation

6.427.2.1 **virtual JournalQueueAck* activemq::commands::JournalQueueAck::cloneDataStructure**
() const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.427.2.2 `virtual void activemq::commands::JournalQueueAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1555).

6.427.2.3 `virtual bool activemq::commands::JournalQueueAck::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1556).

6.427.2.4 `virtual unsigned char activemq::commands::JournalQueueAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.427.2.5 `virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination () const` [virtual]
- 6.427.2.6 `virtual Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination ()` [virtual]
- 6.427.2.7 `virtual const Pointer<MessageAck>& activemq::commands::JournalQueueAck::getMessageAck () const` [virtual]
- 6.427.2.8 `virtual Pointer<MessageAck>& activemq::commands::JournalQueueAck::getMessageAck ()` [virtual]
- 6.427.2.9 `virtual void activemq::commands::JournalQueueAck::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.427.2.10 `virtual void activemq::commands::JournalQueueAck::setMessageAck (const Pointer< MessageAck > & messageAck)` [virtual]
- 6.427.2.11 `virtual std::string activemq::commands::JournalQueueAck::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.767).

6.427.3 Field Documentation

- 6.427.3.1 `Pointer<ActiveMQDestination> activemq::commands::JournalQueueAck::destination` [protected]
- 6.427.3.2 `const unsigned char activemq::commands::JournalQueueAck::ID_-JOURNALQUEUEACK = 52` [static]
- 6.427.3.3 `Pointer<MessageAck> activemq::commands::JournalQueueAck::messageAck` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/JournalQueueAck.h`

6.428 activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller Class Reference

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 2017).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/JournalQueueAckMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller:

Public Member Functions

- **JournalQueueAckMarshaller** ()
- virtual **~JournalQueueAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.428.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 2017). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.428.2 Constructor & Destructor Documentation

6.428.2.1 `activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.428.2.2 `virtual activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.428.3 Member Function Documentation

6.428.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.428.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.428.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.428.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.428.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.428.3.6 virtual void activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.428.3.7 virtual void activemq::wireformat::openwire::marshal::v6::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

6.429.2.1 `activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.429.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.429.3 Member Function Documentation

6.429.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.429.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.429.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.429.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.429.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.429.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.429.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.430.3 Member Function Documentation

6.430.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.430.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.430.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.430.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.430.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.430.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.430.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.431.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p.2028). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.431.2 Constructor & Destructor Documentation

6.431.2.1 `activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.431.2.2 `virtual activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.431.3 Member Function Documentation

6.431.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.431.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.431.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.431.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.431.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.431.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.431.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/JournalQueueAckMarshaller.h`

6.432 **activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller** Class Reference

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 2032).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/JournalQueueAckMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller**:

Public Member Functions

- **JournalQueueAckMarshaller** ()

Write a object instance to data output stream.

6.432.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 2032). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.432.2 Constructor & Destructor Documentation

6.432.2.1 `activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.432.2.2 `virtual activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.432.3 Member Function Documentation

6.432.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.432.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.432.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.432.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.432.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.432.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.432.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.433.2.1 `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.433.2.2 `virtual activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.433.3 Member Function Documentation

6.433.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.433.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.433.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.433.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.433.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.433.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

```
6.433.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

- virtual const std::string & **getClientId** () const
- virtual std::string & **getClientId** ()
- virtual void **setClientId** (const std::string &clientId)
- virtual const **Pointer**< **TransactionId** > & **getTransactionId** () const
- virtual **Pointer**< **TransactionId** > & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

Static Public Attributes

- static const unsigned char **ID_JOURNALTOPICACK** = 50

Protected Attributes

- **Pointer**< **ActiveMQDestination** > destination
- **Pointer**< **MessageId** > messageId
- long long messageSequenceId
- std::string subscriptionName
- std::string clientId
- **Pointer**< **TransactionId** > transactionId

6.434.1 Constructor & Destructor Documentation

6.434.1.1 `activemq::commands::JournalTopicAck::JournalTopicAck ()`

6.434.1.2 `virtual activemq::commands::JournalTopicAck::~~JournalTopicAck ()`
[virtual]

6.434.2 Member Function Documentation

6.434.2.1 `virtual JournalTopicAck* activemq::commands::JournalTopicAck::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.434.2.2 `virtual void activemq::commands::JournalTopicAck::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1555).

6.434.2.3 `virtual bool activemq::commands::JournalTopicAck::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1556).

6.434.2.4 `virtual const std::string& activemq::commands::JournalTopicAck::getClientId () const [virtual]`

6.434.2.5 `virtual std::string& activemq::commands::JournalTopicAck::getClientId () [virtual]`

6.434.2.6 `virtual unsigned char activemq::commands::JournalTopicAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSetructure** (p. 1553) type copy.

Implements **activemq::commands::DataSetructure** (p. 1557).

-
- 6.434.2.7 `virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination () const` [virtual]

 - 6.434.2.10 `virtual Pointer<MessageId>& activemq::commands::JournalTopicAck::getMessageId ()` [virtual]
 - 6.434.2.11 `virtual long long activemq::commands::JournalTopicAck::getMessageSequenceId () const` [virtual]
 - 6.434.2.12 `virtual std::string& activemq::commands::JournalTopicAck::getSubscriptionName ()` [virtual]
 - 6.434.2.13 `virtual const std::string& activemq::commands::JournalTopicAck::getSubscriptionName () const` [virtual]
 - 6.434.2.14 `virtual const Pointer<TransactionId>& activemq::commands::JournalTopicAck::getTransactionId () const` [virtual]
 - 6.434.2.15 `virtual Pointer<TransactionId>& activemq::commands::JournalTopicAck::getTransactionId ()` [virtual]
 - 6.434.2.16 `virtual void activemq::commands::JournalTopicAck::setClientId (const std::string & clientId)` [virtual]
 - 6.434.2.17 `virtual void activemq::commands::JournalTopicAck::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
 - 6.434.2.18 `virtual void activemq::commands::JournalTopicAck::setMessageId (const Pointer< MessageId > & messageId)` [virtual]
 - 6.434.2.19 `virtual void activemq::commands::JournalTopicAck::setMessageSequenceId (long long messageSequenceId)` [virtual]
 - 6.434.2.20 `virtual void activemq::commands::JournalTopicAck::setSubscriptionName (const std::string & subscriptionName)` [virtual]
 - 6.434.2.21 `virtual void activemq::commands::JournalTopicAck::setTransactionId (const Pointer< TransactionId > & transactionId)` [virtual]
 - 6.434.2.22 `virtual std::string activemq::commands::JournalTopicAck::toString () const` [virtual]
-

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 767).

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.2045). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.435.2 Constructor & Destructor Documentation

6.435.2.1 `activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::JournalTopicAckMarshaller () [inline]`

6.435.2.2 `virtual
activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller () [inline, virtual]`

6.435.3 Member Function Documentation

6.435.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.435.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.435.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.435.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.435.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.435.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.435.3.7 virtual void ac-
 tivemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataInputStream * *dataIn*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/JournalTopicAckMarshaller.h

6.436 activemq::wireformat::openwire::marshal::v2::JournalTopicAckMa Class Reference

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p. 2049).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTopicAckMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller:

Public Member Functions

- **JournalTopicAckMarshaller** ()
- virtual **~JournalTopicAckMarshaller** ()

6.436.2.2 `virtual
activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller () [inline, virtual]`

6.436.3 Member Function Documentation

6.436.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.436.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.436.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.436.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.436.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.436.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.436.3.7 virtual void ac-
 tivemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataInputStream * *dataIn*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.437.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.437.3.7 virtual void ac-
 tivemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataInputStream * *dataIn*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.438.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.438.3.7 virtual void activemq::wireformat::openwire::marshal::v6::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.439.2.2 `virtual activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller()` [inline, virtual]

6.439.3 Member Function Documentation

6.439.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.439.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.439.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.439.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.439.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.439.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.439.3.7 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/JournalTopicAckMarshaller.h

6.440 activemq::wireformat::openwire::marshal::v1::JournalTopicAckMa Class Reference

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p. 2065).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/JournalTopicAckMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller:

Public Member Functions

- **JournalTopicAckMarshaller** ()
- virtual **~JournalTopicAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.440.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.2065). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.440.2 Constructor & Destructor Documentation

6.440.2.1 `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::JournalTopicAckMarshaller()` [inline]

6.440.2.2 `virtual activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller()` [inline, virtual]

6.440.3 Member Function Documentation

6.440.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.440.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.440.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.440.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.440.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.440.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.440.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**JournalTopicAckMarshaller.h**

6.441 activemq::commands::JournalTrace Class Reference

```
#include <src/main/activemq/commands/JournalTrace.h>
```

Inheritance diagram for **activemq::commands::JournalTrace**:

Public Member Functions

- **JournalTrace ()**
- virtual **~JournalTrace ()**
- virtual unsigned char **getDataStructureType ()** const

Get the unique identifier that this object and its own Marshaler share.

- virtual **JournalTrace** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getMessage** () const
- virtual std::string & **getMessage** ()
- virtual void **setMessage** (const std::string &message)

Static Public Attributes

- static const unsigned char **ID_JOURNALTRACE** = 53

Protected Attributes

- std::string **message**

6.441.1 Constructor & Destructor Documentation

6.441.1.1 **activemq::commands::JournalTrace::JournalTrace** ()

6.441.1.2 **virtual activemq::commands::JournalTrace::~~JournalTrace** ()
 [virtual]

6.441.2 Member Function Documentation

6.441.2.1 **virtual JournalTrace* activemq::commands::JournalTrace::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.441.2.2 virtual void activemq::commands::JournalTrace::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1555).

6.441.2.3 virtual bool activemq::commands::JournalTrace::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1556).

6.441.2.4 virtual unsigned char activemq::commands::JournalTrace::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

6.441.2.5 virtual std::string& activemq::commands::JournalTrace::getMessage () [virtual]**6.441.2.6 virtual const std::string& activemq::commands::JournalTrace::getMessage () const [virtual]****6.441.2.7 virtual void activemq::commands::JournalTrace::setMessage (const std::string & *message*) [virtual]****6.441.2.8 virtual std::string activemq::commands::JournalTrace::toString () const [virtual]**

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 767).

6.441.3 Field Documentation

6.441.3.1 `const unsigned char activemq::commands::JournalTrace::ID_-
JOURNALTRACE = 53` [static]

6.441.3.2 `std::string activemq::commands::JournalTrace::message` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/JournalTrace.h`

6.442 `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller` Class Reference

Marshaling code for Open Wire Format for `JournalTraceMarshaller` (p. 2072).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTraceMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller`:

Public Member Functions

- `JournalTraceMarshaller ()`
- `virtual ~JournalTraceMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaller.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.442.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.2072). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.442.2 Constructor & Destructor Documentation

6.442.2.1 activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::JournalTraceMarshaller () [inline]

6.442.2.2 virtual activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]

6.442.3 Member Function Documentation

6.442.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.442.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.442.3.3 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.442.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.442.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.442.3.6 virtual void **activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.442.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::~~JournalTraceMarshaller
() [inline, virtual]

6.443.3 Member Function Documentation

6.443.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.443.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.443.3.3 **virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::looseMarshal**
(**OpenWireFormat * wireFormat**, **commands::DataStructure * dataStructure**, **decaf::io::DataOutputStream * dataOut**) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

```
6.443.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

```
6.443.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.443.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.443.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

The documentation for this class was generated from the following file:

6.444.3 Member Function Documentation

6.444.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.444.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.444.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.444.3.4 virtual void activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.444.3.5 virtual int activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.444.3.6 virtual void activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.444.3.7 virtual void **activemq::wireformat::openwire::marshal::v6::JournalTraceMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/JournalTraceMarshaller.h`

6.445 activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller Class Reference

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 2083).

```

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.445.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.2083). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.445.2 Constructor & Destructor Documentation

6.445.2.1 `activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::JournalTraceMarshaller()` [inline]

6.445.2.2 `virtual activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::~~JournalTraceMarshaller()` [inline, virtual]

6.445.3 Member Function Documentation

6.445.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.445.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.445.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.445.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.445.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.445.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.445.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.446.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.2087). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.446.2 Constructor & Destructor Documentation

6.446.2.1 `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::JournalTraceMarshaller () [inline]`

6.446.2.2 `virtual activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]`

6.446.3 Member Function Documentation

6.446.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.446.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.446.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.446.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.446.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.446.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.446.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.447.2.2 `virtual activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]`

6.447.3 Member Function Documentation

6.447.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.447.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.447.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.447.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.447.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.447.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

```
6.447.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

- unsigned char type
- bool wasPrepared

6.448.1 Constructor & Destructor Documentation

6.448.1.1 **activemq::commands::JournalTransaction::JournalTransaction** ()

6.448.1.2 **virtual activemq::commands::JournalTransaction::~~JournalTransaction** () [virtual]

6.448.2 Member Function Documentation

6.448.2.1 **virtual JournalTransaction* activemq::commands::JournalTransaction::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.448.2.2 `virtual void activemq::commands::JournalTransaction::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1555).

6.448.2.3 `virtual bool activemq::commands::JournalTransaction::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1556).

6.448.2.4 `virtual unsigned char activemq::commands::JournalTransaction::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.448.2.5 `virtual const Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () const [virtual]`
- 6.448.2.6 `virtual Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () [virtual]`
- 6.448.2.7 `virtual unsigned char activemq::commands::JournalTransaction::getType () const [virtual]`
- 6.448.2.8 `virtual bool activemq::commands::JournalTransaction::getWasPrepared () const [virtual]`
- 6.448.2.9 `virtual void activemq::commands::JournalTransaction::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`
- 6.448.2.10 `virtual void activemq::commands::JournalTransaction::setType (unsigned char type) [virtual]`
- 6.448.2.11 `virtual void activemq::commands::JournalTransaction::setWasPrepared (bool wasPrepared) [virtual]`
- 6.448.2.12 `virtual std::string activemq::commands::JournalTransaction::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.767).

6.448.3 Field Documentation

- 6.448.3.1 `const unsigned char activemq::commands::JournalTransaction::ID_ - JOURNALTRANSACTION = 54 [static]`

Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.449.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.2099). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.449.2 Constructor & Destructor Documentation

6.449.2.1 `activemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::JournalTrans`
() [inline]

6.449.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::~~JournalTran`
() [inline, virtual]

6.449.3 Member Function Documentation

6.449.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::createObject`
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1505).

6.449.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::getDataStructur`
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1511).

6.449.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::looseMarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataOutputStream * dataOut`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.449.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.449.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.449.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.449.3.7 `virtual void activemq::wireformat::openwire::marshal::v6::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/JournalTransactionMarshaller.h`

6.450 `activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller` Class Reference

Marshaling code for Open Wire Format for `JournalTransactionMarshaller` (p. 2102).

#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTransactionMarshaller.h>

6.450.2.1 `activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::JournalTransactionMarshaller () [inline]`

6.450.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::~~JournalTransactionMarshaller () [inline, virtual]`

6.450.3 Member Function Documentation

6.450.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.450.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.450.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.450.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.450.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.450.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.450.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.452.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.452.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.452.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.452.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.453.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.453.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.453.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.453.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.453.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.453.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.453.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/JournalTransactionMarshaller.h`

6.454 **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller** Class Reference

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p. 2118).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/JournalTransactionMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller**:

Public Member Functions

- **JournalTransactionMarshaller** ()
- virtual **~JournalTransactionMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.454.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.2118). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.454.2 Constructor & Destructor Documentation

6.454.2.1 `activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::JournalTrans`
`() [inline]`

6.454.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::~~JournalTran`
`() [inline, virtual]`

6.454.3 Member Function Documentation

6.454.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.454.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.454.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.454.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.454.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.454.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.454.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/JournalTransactionMarshaller.h`

6.455 activemq::commands::KeepAliveInfo Class Reference

```
#include <src/main/activemq/commands/KeepAliveInfo.h>
```

Inheritance diagram for **activemq::commands::KeepAliveInfo**:

Public Member Functions

- **KeepAliveInfo** ()
- virtual **~KeepAliveInfo** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **KeepAliveInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual bool **isKeepAliveInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_KEEPAALIVEINFO** = 10

6.455.1 Constructor & Destructor Documentation

6.455.1.1 **activemq::commands::KeepAliveInfo::KeepAliveInfo** ()

6.455.1.2 **virtual activemq::commands::KeepAliveInfo::~~KeepAliveInfo** ()
 [virtual]

6.455.2 Member Function Documentation

6.455.2.1 **virtual KeepAliveInfo* activemq::commands::KeepAliveInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.455.2.2 `virtual void activemq::commands::KeepAliveInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.455.2.3 `virtual bool activemq::commands::KeepAliveInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.455.2.4 `virtual unsigned char activemq::commands::KeepAliveInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new `DataStructure` (p. 1553) type copy.

Implements `activemq::commands::DataStructure` (p. 1557).

6.455.2.5 `virtual bool activemq::commands::KeepAliveInfo::isKeepAliveInfo () const [inline, virtual]`

Returns

an answer of true to the `isKeepAliveInfo()` (p. 2124) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 698).

6.455.2.6 `virtual std::string activemq::commands::KeepAliveInfo::toString () const [virtual]`

Returns a string containing the information for this `DataStructure` (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

6.455.2.7 `virtual Pointer<Command> activemq::commands::KeepAliveInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1112).

6.455.3 Field Documentation

6.455.3.1 `const unsigned char activemq::commands::KeepAliveInfo::ID_ - KEEPALIVEINFO = 10` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/KeepAliveInfo.h`

6.456 **activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 2125).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/KeepAliveInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller**:

Public Member Functions

- **KeepAliveInfoMarshaller** ()
- virtual **~KeepAliveInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.456.1 Detailed Description

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 2125). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.456.2 Constructor & Destructor Documentation

6.456.2.1 **activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::KeepAliveInfoMar**
() [inline]

6.456.2.2 virtual
activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::~~KeepAliveInfoM
() [inline, virtual]

6.456.3 Member Function Documentation

6.456.3.1 virtual **commands::DataStructure*** **activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.456.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.456.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.456.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

6.456.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

6.456.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

6.456.3.7 `virtual void activemq::wireformat::openwire::marshal::v6::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/KeepAliveInfoMarshaller.h`

6.457 **activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 2129).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/KeepAliveInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller**:

Public Member Functions

- **KeepAliveInfoMarshaller** ()
- virtual **~KeepAliveInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.

() [inline, virtual]

6.457.3 Member Function Documentation

6.457.3.1 **virtual commands::DataStructure* ac-**
tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.457.3.2 **virtual unsigned char ac-**
tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::getDataStructureTy
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.457.3.3 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 736).

6.457.3.4 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 737).

6.457.3.5 virtual int activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

```
6.457.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

```
6.457.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 740).

The documentation for this class was generated from the following file:

() [inline, virtual]

6.458.3 Member Function Documentation

6.458.3.1 virtual commands::DataStructure* ac-
tivismq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.458.3.2 virtual unsigned char ac-
tivismq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::getDataStructureTy
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.458.3.3 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.458.3.4 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.458.3.5 virtual int activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.458.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.458.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 707).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.459.3.3 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 709).

6.459.3.4 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 710).

6.459.3.5 virtual int activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```
6.459.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.459.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 713).

tivemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/KeepAliveInfoMarshaller.h`

6.462 decaf::security::Key Class Reference

The **Key** (p. 2149) interface is the top-level interface for all keys.

```
#include <src/main/decaf/security/Key.h>
```

Inheritance diagram for `decaf::security::Key`:

Public Member Functions

- virtual **~Key** ()
- virtual `std::string` **getAlgorithm** () const =0
Returns the standard algorithm name for this key.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0
Provides the key in its primary encoding format, or nothing if this key does not support encoding.
- virtual `std::string` **getFormat** () const =0
Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

6.462.1 Detailed Description

The **Key** (p. 2149) interface is the top-level interface for all keys. It defines the functionality shared by all key objects. All keys have three characteristics:

An Algorithm

This is the key algorithm for that key. The key algorithm is usually an encryption or asymmetric operation algorithm (such as DSA or RSA), which will work with those algorithms and with related algorithms (such as MD5 with RSA, SHA-1 with RSA, Raw DSA, etc.) The name of the algorithm of a key is obtained using the `getAlgorithm` method.

An Encoded Form

This is an external encoded form for the key used when a standard representation of the key is needed outside the application, as when transmitting the key to some other party. The key is encoded according to a standard format (such as X.509 `SubjectPublicKeyInfo` or PKCS#8), and is returned using the `getEncoded` method. Note: The syntax of the ASN.1 type `SubjectPublicKeyInfo` is defined as follows:

SubjectPublicKeyInfo ::= SEQUENCE {

algorithm AlgorithmIdentifier,

subjectPublicKey BIT STRING }

AlgorithmIdentifier ::= SEQUENCE {

algorithm OBJECT IDENTIFIER,

parameters ANY DEFINED BY algorithm OPTIONAL }

For more information, see RFC 2459: Internet X.509 Public **Key** (p.2149) Infrastructure Certificate and CRL Profile.

A Format

This is the name of the format of the encoded key. It is returned by the `getFormat` method.

6.462.2 Constructor & Destructor Documentation

6.462.2.1 `virtual decaf::security::Key::~~Key () [inline, virtual]`

6.462.3 Member Function Documentation

6.462.3.1 `virtual std::string decaf::security::Key::getAlgorithm () const [pure virtual]`

Returns the standard algorithm name for this key.

For example, "DSA" would indicate that this key is a DSA key.

Returns

the name of the algorithm associated with this key.

6.462.3.2 `virtual void decaf::security::Key::getEncoded (std::vector< unsigned char > & output) const [pure virtual]`

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

Parameters

output Receives the encoded key, or nothing if the key does not support encoding.

6.462.3.3 `virtual std::string decaf::security::Key::getFormat () const [pure virtual]`

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

The primary encoding format is named in terms of the appropriate ASN.1 data format, if an ASN.1 specification for this key exists. For example, the name of the ASN.1 data format for public keys is SubjectPublicKeyInfo, as defined by the X.509 standard; in this case, the returned format is "X.509". Similarly, the name of the ASN.1 data format for private keys is PrivateKeyInfo, as defined by the PKCS #8 standard; in this case, the returned format is "PKCS#8".

Returns

the primary encoding format of the key.

Clones this exception.
- virtual ~**KeyException** () throw ()

6.463.1 Constructor & Destructor Documentation**6.463.1.1 decaf::security::KeyException::KeyException () throw () [inline]**

Default Constructor.

6.463.1.2 `decaf::security::KeyException::KeyException (const
decaf::lang::Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.463.1.3 `decaf::security::KeyException::KeyException (const KeyException &
ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.463.1.4 `decaf::security::KeyException::KeyException (const char * file, const
int lineNumber, const std::exception * cause, const char * msg, ...
) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.463.1.5 `decaf::security::KeyException::KeyException (const std::exception *
cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.463.1.6 `decaf::security::KeyException::KeyException (const char * file, const
int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* name where exception occurs
- lineNumber* line number where the exception occurred.
- msg* message to report
- ... list of primitives that are formatted into the message

6.463.1.7 virtual decaf::security::KeyException::~~KeyException () throw ()
[inline, virtual]

6.463.2 Member Function Documentation

6.463.2.1 virtual KeyException* decaf::security::KeyException::clone () const
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from decaf::security::GeneralSecurityException (p. 1847).

Reimplemented in decaf::security::InvalidKeyException (p. 1996), and decaf::security::KeyManagementException (p. 2155).

The documentation for this class was generated from the following file:

- src/main/decaf/security/KeyException.h

6.464 decaf::security::KeyManagementException Class Reference

```
#include <src/main/decaf/security/KeyManagementException.h>
```

Inheritance diagram for decaf::security::KeyManagementException:

Public Member Functions

- **KeyManagementException** () throw ()
Default Constructor.
- **KeyManagementException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **KeyManagementException** (const KeyManagementException &ex) throw ()

Copy Constructor.

- **KeyManagementException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- **KeyManagementException** (const std::exception *cause) throw ()

Constructor.

- **KeyManagementException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **KeyManagementException** * clone () const

Clones this exception.

- virtual ~**KeyManagementException** () throw ()

6.464.1 Constructor & Destructor Documentation

6.464.1.1 decaf::security::KeyManagementException::KeyManagementException () throw () [inline]

Default Constructor.

6.464.1.2 decaf::security::KeyManagementException::KeyManagementException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.464.1.3 decaf::security::KeyManagementException::KeyManagementException (const KeyManagementException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.464.1.4 decaf::security::KeyManagementException::KeyManagementException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.464.1.5 `decaf::security::KeyManagementException::KeyManagementException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.464.1.6 `decaf::security::KeyManagementException::KeyManagementException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs
lineNumber line number where the exception occurred.
msg message to report
... list of primitives that are formatted into the message

6.464.1.7 `virtual decaf::security::KeyManagementException::~KeyManagementException () throw () [inline, virtual]`

6.464.2 Member Function Documentation

6.464.2.1 `virtual KeyManagementException* decaf::security::KeyManagementException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 2153).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/KeyManagementException.h`

6.465 **activemq::commands::LastPartialCommand** Class Reference

```
#include <src/main/activemq/commands/LastPartialCommand.h>
```

Inheritance diagram for **activemq::commands::LastPartialCommand**:

Public Member Functions

- **LastPartialCommand** ()
- virtual **~LastPartialCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **LastPartialCommand * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*

Static Public Attributes

- static const unsigned char **ID_LASTPARTIALCOMMAND** = 61

6.465.1 Constructor & Destructor Documentation

6.465.1.1 `activemq::commands::LastPartialCommand::LastPartialCommand ()`

6.465.1.2 `virtual
activemq::commands::LastPartialCommand::~~LastPartialCommand ()
[virtual]`

6.465.2 Member Function Documentation

6.465.2.1 `virtual LastPartialCommand* ac-
tivemq::commands::LastPartialCommand::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::PartialCommand` (p. 2729).

6.465.2.2 `virtual void ac-
tivemq::commands::LastPartialCommand::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::PartialCommand` (p. 2729).

6.465.2.3 `virtual bool activemq::commands::LastPartialCommand::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::PartialCommand` (p. 2729).

6.465.2.4 `virtual unsigned char ac-
tivemq::commands::LastPartialCommand::getDataStructureType ()
const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1553) type copy.

Reimplemented from **activemq::commands::PartialCommand** (p. 2730).

6.465.2.5 `virtual std::string activemq::commands::LastPartialCommand::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::PartialCommand** (p. 2730).

6.465.3 Field Documentation

6.465.3.1 `const unsigned char activemq::commands::LastPartialCommand::ID_ - LASTPARTIALCOMMAND = 61 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/LastPartialCommand.h`

6.466 **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** Class Reference

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 2158).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/LastPartialCommandMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller**:

Public Member Functions

- **LastPartialCommandMarshaller** ()
- virtual **~LastPartialCommandMarshaller** ()
- virtual **commands::DataSet * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataSetType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.466.1 Detailed Description

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p.2158).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.466.2 Constructor & Destructor Documentation

- 6.466.2.1 **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::LastPartialCommandMarshaller** () [inline]
- 6.466.2.2 **virtual activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::~LastPartialCommandMarshaller** () [inline, virtual]

6.466.3 Member Function Documentation

- 6.466.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller` (p. 2732).

6.466.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaller.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller` (p. 2732).

6.466.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller` (p. 2733).

6.466.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller` (p. 2733).

6.466.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller` (p. 2734).

6.466.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller` (p. 2734).

```

6.466.3.7 virtual void activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller** (p. 2735).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/LastPartialCommandMarshaller.h`

6.467 activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 2162).

```

activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::~~LastPartialCommandMarshaller () [inline, virtual]

6.467.3 Member Function Documentation

6.467.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2745).

6.467.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::getDataStructureType() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2745).

6.467.3.3 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::looseMarshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2745).

6.467.3.4 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::looseUnmarshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2746).

6.467.3.5 virtual int activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2746).

6.467.3.6 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2747).

6.467.3.7 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2747).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/LastPartialCommandMarshaller.h`

6.468.3 Member Function Documentation

6.468.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2736).

6.468.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2737).

6.468.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2737).

6.468.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2737).

6.468.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2738).

6.468.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2738).

6.468.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2739).

The documentation for this class was generated from the following file:

6.469.2 Constructor & Destructor Documentation

6.469.2.1 `activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` [inline]

6.469.2.2 `virtual activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::~LastPartialCommandMarshaller()` [inline, virtual]

6.469.3 Member Function Documentation

6.469.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2741).

6.469.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2741).

6.469.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2741).

6.469.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2742).

6.469.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2742).

6.469.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2743).

6.469.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2743).

The documentation for this class was generated from the following file:

6.470.2 Constructor & Destructor Documentation

6.470.2.1 `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` [inline]

6.470.2.2 `virtual activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::~LastPartialCommandMarshaller()` [inline, virtual]

6.470.3 Member Function Documentation

6.470.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller** (p. 2749).

6.470.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2749).

6.470.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2750).

6.470.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2750).

6.470.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2750).

6.470.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2751).

6.470.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2751).

The documentation for this class was generated from the following file:

6.471.3 Member Function Documentation

6.471.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2753).

6.471.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2753).

6.471.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2754).

6.471.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2754).

6.471.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2755).

6.471.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2755).

6.471.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2756).

6.472 decaf::util::comparators::Less< E > Class Template Reference

Simple **Less** (p. 2182) **Comparator** (p. 1127) that compares to elements to determine if the first is less than the second.

```
#include <src/main/decaf/util/comparators/Less.h>
```

Inheritance diagram for decaf::util::comparators::Less< E >:

Public Member Functions

- **Less** ()
- virtual **~Less** ()
- virtual bool **operator**() (const E &left, const E &right) const
*Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1127) to be passed to an STL **Map** (p. 2305) for use as the sorting criteria.*
- virtual int **compare** (const E &o1, const E &o2) const
Compares its two arguments for order.

6.472.1 Detailed Description

```
template<typename E> class decaf::util::comparators::Less< E >
```

Simple **Less** (p. 2182) **Comparator** (p. 1127) that compares to elements to determine if the first is less than the second. This can be used in **Collection** (p. 1097) classes to sort elements according to their natural ordering. By design the Comparator's compare function return more information about comparison than the STL binary function's boolean compare operator. In this case the compare method will return

Since

1.0

6.472.2 Constructor & Destructor Documentation

6.472.2.1 `template<typename E > decaf::util::comparators::Less< E >::Less ()`
[inline]

6.472.2.2 `template<typename E > virtual decaf::util::comparators::Less< E >::~~Less ()` [inline, virtual]

6.472.3 Member Function Documentation

6.472.3.1 `template<typename E > virtual int decaf::util::comparators::Less< E >::compare (const E & o1, const E & o2) const` [inline, virtual]

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that `sgn(compare(x, y)) == -sgn(compare(y, x))` for all x and y. (This implies that `compare(x, y)` must throw an exception if and only if `compare(y, x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `((compare(x, y)>0) && (compare(y, z)>0))` implies `compare(x, z)>0`.

Finally, the implementer must ensure that `compare(x, y)==0` implies that `sgn(compare(x, z))==sgn(compare(y, z))` for all z.

It is generally the case, but not strictly required that `(compare(x, y)==0) == (x == y)`. Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

o1 - the first object to be compared

o2 - the second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implements `decaf::util::Comparator< E >` (p.1128).

6.472.3.2 `template<typename E > virtual bool decaf::util::comparators::Less< E >::operator() (const E & left, const E & right) const` [inline, virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p.1127) to be passed to an STL **Map** (p.2305) for use as the sorting criteria.

Parameters

left - the Left hand side operand.

right - the Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implements **decaf::util::Comparator**< E > (p. 1129).

- static const **Level** **FINEST**
FINEST indicates a highly detailed tracing message.
- static const **Level** **ALL**
ALL indicates that all messages should be logged.

Protected Member Functions

- **Level** (const std::string &name, int value)

*Create a named **Level** (p. 2185) with a given integer value.*

6.475.1 Detailed Description

The **Level** (p. 2185) class defines a set of standard logging levels that can be used to control logging output. The logging **Level** (p. 2185) objects are ordered and are specified by ordered integers. Enabling logging at a given level also enables logging at all higher levels.

Clients should normally use the predefined **Level** (p. 2185) constants such as **Level.SEVERE** (p. 2190).

The levels in descending order are:

* SEVERE (highest value) * WARNING * INFO * DEBUG * CONFIG * FINE * FINER * FINEST (lowest value)

In addition there is a level OFF that can be used to turn off logging, and a level ALL that can be used to enable logging of all messages.

It is possible for third parties to define additional logging levels by subclassing **Level** (p. 2185). In such cases subclasses should take care to chose unique integer level values.

Since

1.0

6.475.2 Constructor & Destructor Documentation

6.475.2.1 decaf::util::logging::Level::Level (const std::string & name, int value) [protected]

Create a named **Level** (p. 2185) with a given integer value.

Parameters

name Name of the level, e.g. SEVERE

value Unique integer value of this level, e.g. 100

6.475.2.2 `virtual decaf::util::logging::Level::~~Level () [virtual]`

6.475.3 Member Function Documentation

6.475.3.1 `virtual int decaf::util::logging::Level::compareTo (const Level & value) const [virtual]`

6.475.3.2 `virtual bool decaf::util::logging::Level::equals (const Level & value) const [virtual]`

6.475.3.3 `std::string decaf::util::logging::Level::getName () const [inline]`

Returns

the name of this **Level** (p.2185) instance.

6.475.3.4 `int decaf::util::logging::Level::intValue () const [inline]`

Returns

the integer value of this level instance.

6.475.3.5 `virtual bool decaf::util::logging::Level::operator< (const Level & value) const [virtual]`

6.475.3.6 `virtual bool decaf::util::logging::Level::operator== (const Level & value) const [virtual]`

6.475.3.7 `static Level decaf::util::logging::Level::parse (const std::string & name) throw (decaf::lang::exceptions::IllegalArgumentException) [static]`

Parse a level name string into a **Level** (p.2185).

The argument string may consist of either a level name or an integer value.

For example:

```
* "SEVERE" * "1000"
```

Parameters

name - The name or int value of the desired **Level** (p.2185)

Returns

the parsed **Level** (p.2185) value, passing in a level name that is an int value that is not one of the known **Level** (p.2185) values will result in a new **Level** (p.2185) that has been initialized with that int value and name as the string form of the int.

Exceptions

IllegalArgumentException if the value is not valid, validity means that the string is either a valid int (between `Integer::MIN_VALUE` and `Integer::MAX_VALUE` or is one of the known level names.

6.475.3.8 `std::string decaf::util::logging::Level::toString () const` [inline]**Returns**

the string value of this **Level** (p. 2185), e.g. "SEVERE".

6.475.4 **Field Documentation****6.475.4.1** `const Level decaf::util::logging::Level::ALL` [static]

ALL indicates that all messages should be logged.

This level is initialized to Integer::MIN_VALUE.

6.475.4.2 `const Level decaf::util::logging::Level::CONFIG` [static]

CONFIG is a message level for static configuration messages.

CONFIG messages are intended to provide a variety of static configuration information, to assist in debugging problems that may be associated with particular configurations. For example, CONFIG message might include the CPU type, the System properties, etc. This level is initialized to 600.

6.475.4.3 `const Level decaf::util::logging::Level::DEBUG` [static]

DEBUG is a level for more verbose informative messages.

DEBUG messages are intended to provide a more detailed message intended for use by developers in tracking the behavior of a client. DEBUG messages typically contain more implementation specific information that might not be significant to end users or system admins. This level is initialized to 700.

6.475.4.4 `const Level decaf::util::logging::Level::FINE` [static]

FINE is a message level providing tracing information.

All of FINE, FINER, and FINEST are intended for relatively detailed tracing. The exact meaning of the three levels will vary between subsystems, but in general, FINEST should be used for the most detailed output, FINER for somewhat less detailed output, and FINE for the lowest volume (and most important) messages.

In general the FINE level should be used for information that will be broadly interesting to developers who do not have a specialized interest in the specific subsystem.

FINE messages might include things like minor (recoverable) failures. Issues indicating potential performance problems are also worth logging as FINE. This level is initialized to 500.

6.475.4.5 `const Level decaf::util::logging::Level::FINER` [static]

FINER indicates a fairly detailed tracing message.

By default logging calls for entering, returning, or throwing an exception are traced at this level. This level is initialized to 400.

6.475.4.6 const Level decaf::util::logging::Level::FINEST [static]

FINEST indicates a highly detailed tracing message.

This level is initialized to 300.

6.475.4.7 const Level decaf::util::logging::Level::INFO [static]

INFO is a message level for informational messages.

Typically INFO messages will be written to the console or its equivalent. So the INFO level should only be used for reasonably significant messages that will make sense to end users and system admins. This level is initialized to 800.

6.475.4.8 const Level decaf::util::logging::Level::INHERIT [static]

NULL is a special level that indicates that the **Logger** (p. 2237) should get its **Level** (p. 2185) from its parent **Logger** (p. 2237), the value is initialized as zero.

6.475.4.9 const Level decaf::util::logging::Level::OFF [static]

OFF is a special level that can be used to turn off logging.

This level is initialized to Integer::MAX_VALUE

6.475.4.10 const Level decaf::util::logging::Level::SEVERE [static]

SEVERE is a message level indicating a serious failure.

In general SEVERE messages should describe events that are of considerable importance and which will prevent normal program execution. They should be reasonably intelligible to end users and to system administrators. This level is initialized to 1000.

6.475.4.11 const Level decaf::util::logging::Level::WARNING [static]

WARNING is a message level indicating a potential problem.

In general WARNING messages should describe events that will be of interest to end users or system managers, or which indicate potential problems. This level is initialized to 900.

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
- virtual E **remove** (std::size_t index)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)
Removes the element at the specified position in this list.

6.476.1 Detailed Description

template<typename E> class decaf::util::List< E >

An ordered collection (also known as a sequence). The user of this interface has precise control over where in the list each element is inserted. The user can access elements by their integer index (position in the list), and search for elements in the list.

Unlike sets, lists typically allow duplicate elements. More formally, lists typically allow pairs of elements `e1` and `e2` such that `e1.equals(e2)`, and they typically allow multiple null elements if they allow null elements at all. It is not inconceivable that someone might wish to implement a list that prohibits duplicates, by throwing runtime exceptions when the user attempts to insert them, but we expect this usage to be rare.

6.476.2 Constructor & Destructor Documentation

6.476.2.1 `template<typename E> decaf::util::List< E >::List () [inline]`

6.476.2.2 `template<typename E> virtual decaf::util::List< E >::~~List () [inline, virtual]`

6.476.3 Member Function Documentation

6.476.3.1 `template<typename E> virtual void decaf::util::List< E >::add (std::size_t index, const E & element) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in `decaf::util::StlList< E >` (p. 3363), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3363), `decaf::util::StlList< CompositeTask * >` (p. 3363), `decaf::util::StlList< URI >` (p. 3363), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3363), `decaf::util::StlList< PrimitiveValueNode >` (p. 3363), `decaf::util::StlList< Pointer< Command > >` (p. 3363), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3363), `decaf::util::StlList< cms::MessageProducer * >` (p. 3363), `decaf::util::StlList< cms::Destination * >` (p. 3363), `decaf::util::StlList< cms::Session * >` (p. 3363), and `decaf::util::StlList< cms::Connection * >` (p. 3363).

6.476.3.2 `template<typename E> virtual bool decaf::util::List< E >::addAll (std::size_t index, const Collection< E > & source) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are

returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index The index at which to insert the first element from the specified collection
source The **Collection** (p. 1097) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException - if the index is greater than size
UnsupportedOperationException - If the collection is non-modifiable.

Implemented in `decaf::util::StlList< E >` (p. 3364), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3364), `decaf::util::StlList< CompositeTask * >` (p. 3364), `decaf::util::StlList< URI >` (p. 3364), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3364), `decaf::util::StlList< PrimitiveValueNode >` (p. 3364), `decaf::util::StlList< Pointer< Command > >` (p. 3364), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3364), `decaf::util::StlList< cms::MessageProducer * >` (p. 3364), `decaf::util::StlList< cms::Destination * >` (p. 3364), `decaf::util::StlList< cms::Session * >` (p. 3364), and `decaf::util::StlList< cms::Connection * >` (p. 3364).

6.476.3.3 `template<typename E> virtual E decaf::util::List< E >::get (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Gets the element contained at position passed.

Parameters

index - position to get

Returns

value at index

Implemented in `decaf::util::StlList< E >` (p. 3365), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3365), `decaf::util::StlList< CompositeTask * >` (p. 3365), `decaf::util::StlList< URI >` (p. 3365), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3365), `decaf::util::StlList< PrimitiveValueNode >` (p. 3365), `decaf::util::StlList< Pointer< Command > >` (p. 3365), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3365), `decaf::util::StlList< cms::MessageProducer * >` (p. 3365), `decaf::util::StlList< cms::Destination * >` (p. 3365), `decaf::util::StlList< cms::Session * >` (p. 3365), and `decaf::util::StlList< cms::Connection * >` (p. 3365).

6.476.3.4 `template<typename E> virtual std::size_t decaf::util::List< E >::indexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NoSuchElementException if value is not in the list

Implemented in `decaf::util::StlList< E >` (p. 3366), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3366), `decaf::util::StlList< CompositeTask * >` (p. 3366), `decaf::util::StlList< URI >` (p. 3366), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3366), `decaf::util::StlList< PrimitiveValueNode >` (p. 3366), `decaf::util::StlList< Pointer< Command > >` (p. 3366), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3366), `decaf::util::StlList< cms::MessageProducer * >` (p. 3366), `decaf::util::StlList< cms::Destination * >` (p. 3366), `decaf::util::StlList< cms::Session * >` (p. 3366), and `decaf::util::StlList< cms::Connection * >` (p. 3366).

6.476.3.5 `template<typename E> virtual size_t decaf::util::List< E >::lastIndexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index *i* such that `get(i) == value` or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NoSuchElementException if value is not in the list

Implemented in `decaf::util::StlList< E >` (p. 3366), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3366), `decaf::util::StlList< CompositeTask * >` (p. 3366), `decaf::util::StlList< URI >` (p. 3366), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3366), `decaf::util::StlList< PrimitiveValueNode >` (p. 3366), `decaf::util::StlList< Pointer< Command > >` (p. 3366), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3366), `decaf::util::StlList< cms::MessageProducer * >` (p. 3366), `decaf::util::StlList< cms::Destination * >` (p. 3366), `decaf::util::StlList< cms::Session * >` (p. 3366), and `decaf::util::StlList< cms::Connection * >` (p. 3366).

6.476.3.6 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator ()` [pure virtual]

Returns

a list iterator over the elements in this list (in proper sequence).

Implemented in `decaf::util::StlList< E >` (p. 3367), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3367), `decaf::util::StlList< CompositeTask * >` (p. 3367), `decaf::util::StlList< URI >` (p. 3367), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3367), `decaf::util::StlList< PrimitiveValueNode >` (p. 3367), `decaf::util::StlList< Pointer< Command > >` (p. 3367), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3367), `decaf::util::StlList< cms::MessageProducer * >` (p. 3367), `decaf::util::StlList< cms::Destination * >` (p. 3367), `decaf::util::StlList< cms::Session * >` (p. 3367), and `decaf::util::StlList< cms::Connection * >` (p. 3367).

6.476.3.7 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t index) const` throw (`decaf::lang::exceptions::IndexOutOfBoundsException`) [pure virtual]

Implemented in `decaf::util::StlList< E >` (p. 3367), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3367), `decaf::util::StlList< CompositeTask * >` (p. 3367), `decaf::util::StlList< URI >` (p. 3367), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3367), `decaf::util::StlList< PrimitiveValueNode >` (p. 3367), `decaf::util::StlList< Pointer< Command > >` (p. 3367), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3367), `decaf::util::StlList< cms::MessageProducer * >` (p. 3367), `decaf::util::StlList< cms::Destination * >` (p. 3367), `decaf::util::StlList< cms::Session * >` (p. 3367), and `decaf::util::StlList< cms::Connection * >` (p. 3367).

6.476.3.8 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () const` [pure virtual]

Implemented in `decaf::util::StlList< E >` (p. 3367), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3367), `decaf::util::StlList< CompositeTask * >` (p. 3367), `decaf::util::StlList< URI >` (p. 3367), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3367), `decaf::util::StlList< PrimitiveValueNode >` (p. 3367), `decaf::util::StlList< Pointer< Command > >` (p. 3367), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3367), `decaf::util::StlList< cms::MessageProducer * >` (p. 3367), `decaf::util::StlList< cms::Destination * >` (p. 3367), `decaf::util::StlList< cms::Session * >` (p. 3367), and `decaf::util::StlList< cms::Connection * >` (p. 3367).

6.476.3.9 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t index)` throw (`decaf::lang::exceptions::IndexOutOfBoundsException`) [pure virtual]

Parameters

index index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial

call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBoundsException if the index is out of range (`index < 0 || index > size()` (p. 1106))

Implemented in `decaf::util::StlList< E >` (p. 3367), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3367), `decaf::util::StlList< CompositeTask * >` (p. 3367), `decaf::util::StlList< URI >` (p. 3367), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3367), `decaf::util::StlList< PrimitiveValueNode >` (p. 3367), `decaf::util::StlList< Pointer< Command > >` (p. 3367), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3367), `decaf::util::StlList< cms::MessageProducer * >` (p. 3367), `decaf::util::StlList< cms::Destination * >` (p. 3367), `decaf::util::StlList< cms::Session * >` (p. 3367), and `decaf::util::StlList< cms::Connection * >` (p. 3367).

```
6.476.3.10  template<typename E> virtual E decaf::util::List<
              E >::remove ( std::size_t index ) throw (
              decaf::lang::exceptions::UnsupportedOperationException,
              decaf::lang::exceptions::IndexOutOfBoundsException ) [pure virtual]
```

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index - the index of the element to be removed

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in `decaf::util::StlList< E >` (p. 3368), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3368), `decaf::util::StlList< CompositeTask * >` (p. 3368), `decaf::util::StlList< URI >` (p. 3368), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3368), `decaf::util::StlList< PrimitiveValueNode >` (p. 3368), `decaf::util::StlList< Pointer< Command > >` (p. 3368), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3368), `decaf::util::StlList< cms::MessageProducer * >` (p. 3368), `decaf::util::StlList< cms::Destination * >` (p. 3368), `decaf::util::StlList< cms::Session * >` (p. 3368), and `decaf::util::StlList< cms::Connection * >` (p. 3368).

```
6.476.3.11  template<typename E> virtual E decaf::util::List< E >::set
              ( std::size_t index, const E & element ) throw (
              decaf::lang::exceptions::IndexOutOfBoundsException ) [pure virtual]
```

Replaces the element at the specified position in this list with the specified element.

Parameters

index - index of the element to replace

element - element to be stored at the specified position

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

Implemented in `decaf::util::StlList< E >` (p. 3369), `decaf::util::StlList< cms::MessageConsumer * >` (p. 3369), `decaf::util::StlList< CompositeTask * >` (p. 3369), `decaf::util::StlList< URI >` (p. 3369), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 3369), `decaf::util::StlList< PrimitiveValueNode >` (p. 3369), `decaf::util::StlList< Pointer< Command > >` (p. 3369), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 3369), `decaf::util::StlList< cms::MessageProducer * >` (p. 3369), `decaf::util::StlList< cms::Destination * >` (p. 3369), `decaf::util::StlList< cms::Session * >` (p. 3369), and `decaf::util::StlList< cms::Connection * >` (p. 3369).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/List.h`

6.477 decaf::util::ListIterator< E > Class Template Reference

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

```
#include <src/main/decaf/util/ListIterator.h>
```

Inheritance diagram for `decaf::util::ListIterator< E >`:

Public Member Functions

- virtual `~ListIterator ()`
- virtual void `add (const E &e)=0` throw (`decaf::lang::exceptions::UnsupportedOperationException`, `decaf::lang::exceptions::IllegalArgumentException`)
Inserts the specified element into the list (optional operation).
- virtual void `set (const E &e)=0` throw (`decaf::lang::exceptions::UnsupportedOperationException`, `decaf::lang::exceptions::IllegalArgumentException`, `decaf::lang::exceptions::IllegalStateException`)
Replaces the last element returned by next or previous with the specified element (optional operation).
- virtual bool `hasPrevious ()` const =0
Returns true if this list iterator has more elements when traversing the list in the reverse direction.

- virtual E **previous** ()=0
Returns the previous element in the list.
- virtual int **nextIndex** () const =0
Returns the index of the element that would be returned by a subsequent call to next.
- virtual int **previousIndex** () const =0
Returns the index of the element that would be returned by a subsequent call to previous.

6.477.1 Detailed Description

template<typename E> class decaf::util::ListIterator< E >

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list. Note that the **remove()** (p. 2014) and **set(Object)** methods are not defined in terms of the cursor position; they are defined to operate on the last element returned by a call to **next()** (p. 2013) or **previous()** (p. 2199).

6.477.2 Constructor & Destructor Documentation

6.477.2.1 template<typename E > virtual decaf::util::ListIterator< E >::~ListIterator () [inline, virtual]

6.477.3 Member Function Documentation

6.477.3.1 template<typename E > virtual void decaf::util::ListIterator< E >::add (const E & e) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]

Inserts the specified element into the list (optional operation).

The element is inserted immediately before the next element that would be returned by next, if any, and after the next element that would be returned by previous, if any. (If the list contains no elements, the new element becomes the sole element on the list.) The new element is inserted before the implicit cursor: a subsequent call to next would be unaffected, and a subsequent call to previous would return the new element. (This call increases by one the value that would be returned by a call to nextIndex or previousIndex.)

Parameters

e - the element to insert.

Exceptions

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

6.477.3.2 `template<typename E > virtual bool decaf::util::ListIterator< E >::hasPrevious () const [pure virtual]`

Returns true if this list iterator has more elements when traversing the list in the reverse direction. (In other words, returns true if previous would return an element rather than throwing an exception.)

Returns

true if the list iterator has more elements when traversing the list in the reverse direction.

6.477.3.3 `template<typename E > virtual int decaf::util::ListIterator< E >::nextIndex () const [pure virtual]`

Returns the index of the element that would be returned by a subsequent call to next. (Returns list size if the list iterator is at the end of the list.)

Returns

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

6.477.3.4 `template<typename E > virtual E decaf::util::ListIterator< E >::previous () [pure virtual]`

Returns the previous element in the list.

This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns

the previous element in the list.

Exceptions

NoSuchElementException - if the iteration has no previous element.

6.477.3.5 `template<typename E > virtual int decaf::util::ListIterator< E >::previousIndex () const [pure virtual]`

Returns the index of the element that would be returned by a subsequent call to previous. (Returns -1 if the list iterator is at the beginning of the list.)

Returns

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

```

6.477.3.6  template<typename E > virtual void decaf::util::ListIterator<
             E >::set (  const E &  e  ) throw ( de-
             caf::lang::exceptions::UnsupportedOperationException,
             decaf::lang::exceptions::IllegalArgumentException,
             decaf::lang::exceptions::IllegalStateException ) [pure virtual]

```

Replaces the last element returned by next or previous with the specified element (optional operation).

This call can be made only if neither **ListIterator.remove** (p. 2014) nor **ListIterator.add** (p. 2198) have been called after the last call to next or previous.

Parameters

e - the element with which to replace the last element returned by next or previous.

Exceptions

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

IllegalStateException - if neither next nor previous have been called, or remove or add have been called after the last call to next or previous.

6.478 activemq::commands::LocalTransactionId Class Reference

```
#include <src/main/activemq/commands/LocalTransactionId.h>
```

Inheritance diagram for activemq::commands::LocalTransactionId:

Public Types

- typedef decaf::lang::PointerComparator< LocalTransactionId > COMPARATOR

Public Member Functions

- LocalTransactionId ()
- LocalTransactionId (const LocalTransactionId &other)
- virtual ~LocalTransactionId ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual LocalTransactionId * **cloneDataStructure** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*

- virtual long long **getValue** () const

- virtual void **setValue** (long long value)

- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const

- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()

- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)

- virtual int **compareTo** (const **LocalTransactionId** &value) const

- virtual bool **equals** (const **LocalTransactionId** &value) const

- virtual bool **operator==** (const **LocalTransactionId** &value) const

- virtual bool **operator<** (const **LocalTransactionId** &value) const

- **LocalTransactionId** & **operator=** (const **LocalTransactionId** &other)

Static Public Attributes

- static const unsigned char **ID_LOCALTRANSACTIONID** = 111

Protected Attributes

- long long value
- **Pointer**< **ConnectionId** > connectionId

6.478.1 Member Typedef Documentation

6.478.1.1 `typedef decaf::lang::PointerComparator<LocalTransactionId>
activemq::commands::LocalTransactionId::COMPARATOR`

6.478.2 Constructor & Destructor Documentation

6.478.2.1 `activemq::commands::LocalTransactionId::LocalTransactionId ()`

6.478.2.2 `activemq::commands::LocalTransactionId::LocalTransactionId (const
LocalTransactionId & other)`

6.478.2.3 `virtual activemq::commands::LocalTransactionId::~~LocalTransactionId ()
[virtual]`

6.478.3 Member Function Documentation

6.478.3.1 `virtual LocalTransactionId* ac-
tivemq::commands::LocalTransactionId::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.478.3.2 `virtual int activemq::commands::LocalTransactionId::compareTo (const
LocalTransactionId & value) const [virtual]`

6.478.3.3 `virtual void activemq::commands::LocalTransactionId::copyDataStructure
(const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.478.3.4 `virtual bool activemq::commands::LocalTransactionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.478.3.5 virtual bool activemq::commands::LocalTransactionId::equals (const LocalTransactionId & *value*) const [virtual]

6.478.3.6 virtual const Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () const [virtual]

6.478.3.7 virtual Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () [virtual]

6.478.3.8 virtual unsigned char activemq::commands::LocalTransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

6.478.3.9 virtual long long activemq::commands::LocalTransactionId::getValue () const [virtual]

6.478.3.10 virtual bool activemq::commands::LocalTransactionId::operator< (const LocalTransactionId & *value*) const [virtual]

6.478.3.11 LocalTransactionId& activemq::commands::LocalTransactionId::operator= (const LocalTransactionId & *other*)

6.478.3.12 virtual bool activemq::commands::LocalTransactionId::operator== (const LocalTransactionId & *value*) const [virtual]

6.478.3.13 virtual void activemq::commands::LocalTransactionId::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.478.3.14 virtual void activemq::commands::LocalTransactionId::setValue (long long *value*) [virtual]

6.478.3.15 virtual std::string activemq::commands::LocalTransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.478.4 Field Documentation

- 6.478.4.1 `Pointer<ConnectionId> activemq::commands::LocalTransactionId::connectionId`
[protected]
- 6.478.4.2 `const unsigned char activemq::commands::LocalTransactionId::ID - LOCALTRANSACTIONID = 111` [static]
- 6.478.4.3 `long long activemq::commands::LocalTransactionId::value` [protected]

The documentation for this class was generated from the following file:

6.479 `activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller` Class Reference

Marshaling code for Open Wire Format for `LocalTransactionIdMarshaller` (p. 2204).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/LocalTransactionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller`:

Public Member Functions

- `LocalTransactionIdMarshaller ()`
- `virtual ~LocalTransactionIdMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.479.1 Detailed Description

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p.2204). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.479.2 Constructor & Destructor Documentation

6.479.2.1 activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller () [inline]

6.479.2.2 virtual activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::~~LocalTransactionIdMarshaller () [inline, virtual]

6.479.3 Member Function Documentation

6.479.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.479.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.479.3.3 virtual void activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3592).

6.479.3.4 virtual void activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3592).

6.479.3.5 virtual int activemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3593).

```
6.479.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller` (p. 3593).

```
6.479.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller** (p. 3594).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/LocalTransactionIdMarshaller.h`

6.480 activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 2208).

```

6.480.2 Constructor & Destructor Documentation

6.480.2.1 activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller () [inline]

6.480.2.2 virtual activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::~LocalTransactionIdMarshaller () [inline, virtual]

6.480.3 Member Function Documentation

6.480.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.480.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.480.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3581).

6.480.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3581).

6.480.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3582).

```
6.480.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3582).

```
6.480.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3583).

6.481.3 Member Function Documentation

6.481.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.481.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.481.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3585).

6.481.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3585).

6.481.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3586).

6.481.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3586).

6.481.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3587).

The documentation for this class was generated from the following file:

6.482.2 Constructor & Destructor Documentation

6.482.2.1 activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller () [inline]

6.482.2.2 virtual
 activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::~LocalTransactionIdMarshaller () [inline, virtual]

6.482.3 Member Function Documentation

6.482.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.482.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.482.3.3 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3574).

6.482.3.4 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3574).

6.482.3.5 virtual int activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3575).

```
6.482.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3575).

```
6.482.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3576).

6.485 decaf::util::concurrent::Lock Class Reference

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

```
#include <src/main/decaf/util/concurrent/Lock.h>
```

Public Member Functions

- **Lock** (**Synchronizable** *object, const bool initiallyLocked=true)
Constructor - initializes the object member and locks the object if desired.
- virtual **~Lock** ()
Destructor - Unlocks the object if it is locked.
- void **lock** ()
Locks the object.
- void **unlock** ()
Unlocks the object if it is already locked, otherwise a call to this method has no effect.
- bool **isLocked** () const
Indicates whether or not the object is locked.

6.485.1 Detailed Description

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

Since

1.0

6.485.2 Constructor & Destructor Documentation

6.485.2.1 decaf::util::concurrent::Lock::Lock (Synchronizable * object, const bool initiallyLocked = true)

Constructor - initializes the object member and locks the object if desired.

Parameters

object The sync object to control

initiallyLocked If true, the object will automatically be locked.

6.485.2.2 virtual decaf::util::concurrent::Lock::~~Lock () [virtual]

Destructor - Unlocks the object if it is locked.

6.485.3 Member Function Documentation**6.485.3.1 bool decaf::util::concurrent::Lock::isLocked () const [inline]**

Indicates whether or not the object is locked.

Returns

true if the object is locked, otherwise false.

6.485.3.2 void decaf::util::concurrent::Lock::lock ()

Locks the object.

6.485.3.3 void decaf::util::concurrent::Lock::unlock ()

Unlocks the object if it is already locked, otherwise a call to this method has no effect.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Lock.h**

6.486 decaf::util::concurrent::locks::Lock Class Reference

Lock (p. 2229) implementations provide more extensive locking operations than can be obtained using synchronized statements.

```
#include <src/main/decaf/util/concurrent/locks/Lock.h>
```

Inheritance diagram for decaf::util::concurrent::locks::Lock:

Public Member Functions

- virtual **~Lock** ()
- virtual void **lock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock.
- virtual void **lockInterruptibly** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)

Acquires the lock unless the current thread is interrupted.

- virtual bool **tryLock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock only if it is free at the time of invocation.
- virtual bool **tryLock** (long long time, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Releases the lock.
- virtual **Condition** * **newCondition** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException)
*Returns a new **Condition** (p. 1156) instance that is bound to this **Lock** (p. 2229) instance.*

6.486.1 Detailed Description

Lock (p. 2229) implementations provide more extensive locking operations than can be obtained using synchronized statements. They allow more flexible structuring, may have quite different properties, and may support multiple associated **Condition** (p. 1156) objects.

A lock is a tool for controlling access to a shared resource by multiple threads. Commonly, a lock provides exclusive access to a shared resource: only one thread at a time can acquire the lock and all access to the shared resource requires that the lock be acquired first. However, some locks may allow concurrent access to a shared resource, such as the read lock of a **ReadWriteLock** (p. 2968).

While the scoping mechanism for synchronized statements makes it much easier to program with monitor locks, and helps avoid many common programming errors involving locks, there are occasions where you need to work with locks in a more flexible way. For example, some algorithms for traversing concurrently accessed data structures require the use of "hand-over-hand" or "chain locking": you acquire the lock of node A, then node B, then release A and acquire C, then release B and acquire D and so on. Implementations of the **Lock** (p. 2229) interface enable the use of such techniques by allowing a lock to be acquired and released in different scopes, and allowing multiple locks to be acquired and released in any order.

With this increased flexibility comes additional responsibility. The absence of block-structured locking removes the automatic release of locks that occurs with synchronized statements. In most cases, the following idiom should be used:

```
Lock (p. 2229) l = ...; l.lock(); try { // access the resource protected by this lock } catch(...) { l.unlock(); }
```

When locking and unlocking occur in different scopes, care must be taken to ensure that all code that is executed while the lock is held is protected by try-catch ensure that the lock is released when necessary.

Lock (p. 2229) implementations provide additional functionality over the use of synchronized methods and statements by providing a non-blocking attempt to acquire a lock (**tryLock**() (p. 2234)), an attempt to acquire the lock that can be interrupted (**lockInterruptibly**() (p. 2231), and an attempt to acquire the lock that can timeout (**tryLock(long, TimeUnit)**).

Note that **Lock** (p. 2229) instances are just normal objects and can themselves be used as the target in a synchronized statement.

The three forms of lock acquisition (interruptible, non-interruptible, and timed) may differ in their performance characteristics, ordering guarantees, or other implementation qualities. Further, the ability to interrupt the ongoing acquisition of a lock may not be available in a given **Lock** (p. 2229) class. Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of lock acquisition, nor is it required to support interruption of an ongoing lock acquisition. An implementation is required to clearly document the semantics and guarantees provided by each of the locking methods. It must also obey the interruption semantics as defined in this interface, to the extent that interruption of lock acquisition is supported: which is either totally, or only on method entry.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since

1.0

6.486.2 Constructor & Destructor Documentation

6.486.2.1 `virtual decaf::util::concurrent::locks::Lock::~~Lock () [inline, virtual]`

6.486.3 Member Function Documentation

6.486.3.1 `virtual void decaf::util::concurrent::locks::Lock::lock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]`

Acquires the lock.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired.

Implementation Considerations

A **Lock** (p. 2229) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 2229) implementation.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2980).

6.486.3.2 `virtual void decaf::util::concurrent::locks::Lock::lockInterruptibly () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [pure virtual]`

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is available and returns immediately.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread, and interruption of lock acquisition is supported.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return.

A **Lock** (p.2229) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p.2229) implementation.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implemented in `decaf::util::concurrent::locks::ReentrantLock` (p.2981).

6.486.3.3 virtual Condition* `decaf::util::concurrent::locks::Lock::newCondition`
 () throw (`decaf::lang::exceptions::RuntimeException`,
`decaf::lang::exceptions::UnsupportedOperationException`) [pure
 virtual]

Returns a new **Condition** (p.1156) instance that is bound to this **Lock** (p.2229) instance.

Before waiting on the condition the lock must be held by the current thread. A call to **Condition.await()** (p.1158) will atomically release the lock before waiting and re-acquire the lock before the wait returns.

Implementation Considerations

The exact operation of the **Condition** (p.1156) instance depends on the **Lock** (p.2229) implementation and must be documented by that implementation.

Returns

A new **Condition** (p.1156) instance for this **Lock** (p.2229) instance the caller must delete the returned **Condition** (p.1156) object when done with it.

Exceptions

RuntimeException if an error occurs while creating the **Condition** (p.1156).

UnsupportedOperationException if this **Lock** (p.2229) implementation does not support conditions

Implemented in `decaf::util::concurrent::locks::ReentrantLock` (p.2981).

6.486.3.4 `virtual bool decaf::util::concurrent::locks::Lock::tryLock`
(`long long time`, `const TimeUnit & unit`)
`throw (decaf::lang::exceptions::RuntimeException,`
`decaf::lang::exceptions::InterruptedException)` [pure virtual]

Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.

If the lock is available this method returns immediately with the value true. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread, and interruption of lock acquisition is supported; or * The specified waiting time elapses

If the lock is acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return, or reporting a timeout.

A **Lock** (p.2229) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p.2229) implementation.

Parameters

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p.2982).

6.486.3.5 `virtual bool decaf::util::concurrent::locks::Lock::tryLock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]`

Acquires the lock only if it is free at the time of invocation.

Acquires the lock if it is available and returns immediately with the value true. If the lock is not available then this method will return immediately with the value false.

A typical usage idiom for this method would be:

```
Lock (p. 2229) lock = ...; if (lock.tryLock()) { try { // manipulate protected state } catch(...) { lock.unlock(); } } else { // perform alternative actions }
```

This usage ensures that the lock is unlocked if it was acquired, and doesn't try to unlock if the lock was not acquired.

Returns

true if the lock was acquired and false otherwise

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implemented in `decaf::util::concurrent::locks::ReentrantLock` (p. 2983).

6.486.3.6 `virtual void decaf::util::concurrent::locks::Lock::unlock () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]`

Releases the lock.

Implementation Considerations

A **Lock** (p. 2229) implementation will usually impose restrictions on which thread can release a lock (typically only the holder of the lock can release it) and may throw an exception if the restriction is violated. Any restrictions and the exception type must be documented by that **Lock** (p. 2229) implementation.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

IllegalMonitorStateException if the current thread is not the owner of the lock.

Implemented in `decaf::util::concurrent::locks::ReentrantLock` (p. 2984).

```

Public Member Functions

- `~LockSupport ()`

Static Public Member Functions

- static void **unpark** (`decaf::lang::Thread *thread`) throw ()
Makes available the permit for the given thread, if it was not already available.
- static void **park** () throw ()
Disables the current thread for thread scheduling purposes unless the permit is available.
- static void **parkNanos** (long long nanos) throw ()
Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.
- static void **parkUntil** (long long deadline) throw ()
Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

6.487.1 Detailed Description

Basic thread blocking primitives for creating locks and other synchronization classes. This class associates, with each thread that uses it, a permit (in the sense of the **Semaphore** (p. 3126) class). A call to `park` will return immediately if the permit is available, consuming it in the process; otherwise it may block. A call to `unpark` makes the permit available, if it was not already available. (Unlike with Semaphores though, permits do not accumulate. There is at most one.)

Methods `park` and `unpark` provide efficient means of blocking and unblocking threads. Races between one thread invoking `park` and another thread trying to `unpark` it will preserve liveness, due to the permit. Additionally, `park` will return if the caller's thread was interrupted, and timeout versions are supported. The `park` method may also return at any other time, for "no reason", so in general must be invoked within a loop that rechecks conditions upon return. In this sense `park` serves as an optimization of a "busy wait" that does not waste as much time spinning, but must be paired with an `unpark` to be effective.

These methods are designed to be used as tools for creating higher-level synchronization utilities, and are not in themselves useful for most concurrency control applications. The `park` method is designed for use only in constructions of the form:

```
while (!canProceed()) { ... LockSupport.park(this); }
```

where neither `canProceed` nor any other actions prior to the call to `park` entail locking or blocking. Because only one permit is associated with each thread, any intermediary uses of `park` could interfere with its intended effects.

Sample Usage. Here is a sketch of a first-in-first-out non-reentrant lock class:

```
class FIFOMutex { private:  
    AtomicBoolean locked; ConcurrentLinkedQueue<Thread*> waiters;  
public:  
    void lock() {
```

```

bool wasInterrupted = false; Thread* current = Thread::currentThread(); waiters.add( current );
// Block while not first in queue or cannot acquire lock while( waiters.peek() != current ||
!locked.compareAndSet( false, true ) ) {
LockSupport.park(this); if( Thread::interrupted() ) // ignore interrupts while waiting wasInter-
rupted = true; }
waiters.remove(); if( wasInterrupted ) // reassert interrupt status on exit current.interrupt(); }
void unlock() { locked.set( false ); LockSupport.unpark (p. 2237)( waiters.peek() ); } };

```

6.487.2 Constructor & Destructor Documentation

6.487.2.1 `decaf::util::concurrent::locks::LockSupport::~~LockSupport ()`

6.487.3 Member Function Documentation

6.487.3.1 `static void decaf::util::concurrent::locks::LockSupport::park () throw () [static]`

Disables the current thread for thread scheduling purposes unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * Some other thread invokes unpark with the current thread as the target; or
- * Some other thread interrupts the current thread; or
- * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread upon return.

6.487.3.2 `static void decaf::util::concurrent::locks::LockSupport::parkNanos (long long nanos) throw () [static]`

Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- * Some other thread invokes unpark with the current thread as the target; or
- * Some other thread interrupts the current thread; or
- * The specified waiting time elapses; or
- * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the elapsed time upon return.

Parameters

nanos the maximum number of nanoseconds to wait

6.487.3.3 static void decaf::util::concurrent::locks::LockSupport::parkUntil (long long *deadline*) throw () [static]

Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes unpark with the current thread as the target; or * Some other thread interrupts the current thread; or * The specified deadline passes; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the current time upon return.

Parameters

deadline the absolute time, in milliseconds from the Epoch, to wait until

6.487.3.4 static void decaf::util::concurrent::locks::LockSupport::unpark (decaf::lang::Thread * *thread*) throw () [static]

Makes available the permit for the given thread, if it was not already available.

If the thread was blocked on park then it will unblock. Otherwise, its next call to park is guaranteed not to block. This operation is not guaranteed to have any effect at all if the given thread has not been started.

Parameters

thread the thread to unport, or NULL in which case the method has no effect.

The documentation for this class was generated from the following file:

Logs an Block Exit message.
- virtual void **severe** (const std::string &file, const int line, const std::string functionName, const std::string &message)
*Log a SEVERE **Level** (p. 2185) Log.*
- virtual void **warning** (const std::string &file, const int line, const std::string functionName, const std::string &message)
*Log a WARN **Level** (p. 2185) Log.*
- virtual void **info** (const std::string &file, const int line, const std::string functionName, const std::string &message)

Log a INFO Level (p. 2185) Log.

- virtual void **debug** (const std::string &file, const int line, const std::string functionName, const std::string &message)

Log a DEBUG Level (p. 2185) Log.

- virtual void **config** (const std::string &file, const int line, const std::string functionName, const std::string &message)

Log a CONFIG Level (p. 2185) Log.

- virtual void **fine** (const std::string &file, const int line, const std::string functionName, const std::string &message)

Log a FINE Level (p. 2185) Log.

- virtual void **finer** (const std::string &file, const int line, const std::string functionName, const std::string &message)

Log a FINER Level (p. 2185) Log.

- virtual void **finest** (const std::string &file, const int line, const std::string functionName, const std::string &message)

Log a FINEST Level (p. 2185) Log.

- virtual void **throwing** (const std::string &file, const int line, const std::string functionName, const decaf::lang::Throwable &thrown)

Log throwing an exception.

- virtual bool **isLoggable** (const Level &level) const

Check if a message of the given level would actually be logged by this logger.

- virtual void **log** (LogRecord &record)

Log a LogRecord (p. 2261).

- virtual void **log** (const Level &level, const std::string &message)

Log a message, with no arguments.

- virtual void **log** (const Level &levels, const std::string &file, const int line, const std::string &message,...)

Log a message, with the list of params that is formatted into the message string.

- virtual void **log** (const Level &level, const std::string &file, const int line, const std::string &message, lang::Exception &ex)

Log a message, with associated Throwable information.

Static Public Member Functions

Find or create a logger for a named subsystem.

Protected Member Functions

- **Logger** (const std::string &name)

*Creates a new instance of the **Logger** (p. 2237) with the given name.*

6.488.1 Detailed Description

A **Logger** (p. 2237) object is used to log messages for a specific system or application component. Loggers are normally named, using a hierarchical dot-separated namespace. **Logger** (p. 2237) names can be arbitrary strings, but they should normally be based on the namespace or class name of the logged component, such as **decaf.net** (p. 130) or **org.apache.decaf**. In addition it is possible to create "anonymous" Loggers that are not stored in the **Logger** (p. 2237) namespace.

Logger (p. 2237) objects may be obtained by calls on one of the **getLogger** factory methods. These will either create a new **Logger** (p. 2237) or return a suitable existing **Logger** (p. 2237).

Logging messages will be forwarded to registered **Handler** (p. 1852) objects, which can forward the messages to a variety of destinations, including consoles, files, OS logs, etc.

Each **Logger** (p. 2237) keeps track of a "parent" **Logger** (p. 2237), which is its nearest existing ancestor in the **Logger** (p. 2237) namespace.

Each **Logger** (p. 2237) has a "Level" associated with it. This reflects a minimum **Level** (p. 2185) that this logger cares about. If a Logger's level is set to **Level::INHERIT** (p. 2190), then its effective level is inherited from its parent, which may in turn obtain it recursively from its parent, and so on up the tree.

The log level can be configured based on the properties from the logging configuration file, as described in the description of the **LogManager** (p. 2254) class. However it may also be dynamically changed by calls on the **Logger.setLevel** (p. 2247) method. If a logger's level is changed the change may also affect child loggers, since any child logger that has 'inherit' as its level will inherit its effective level from its parent.

On each logging call the **Logger** (p. 2237) initially performs a cheap check of the request level (e.g. SEVERE or FINE) against the effective log level of the logger. If the request level is lower than the log level, the logging call returns immediately.

After passing this initial (cheap) test, the **Logger** (p. 2237) will allocate a **LogRecord** (p. 2261) to describe the logging message. It will then call a **Filter** (p. 1770) (if present) to do a more detailed check on whether the record should be published. If that passes it will then publish the **LogRecord** (p. 2261) to its output Handlers. By default, loggers also publish to their parent's Handlers, recursively up the tree.

Formatting is the responsibility of the output **Handler** (p. 1852), which will typically call a **Formatter** (p. 1838).

Note that formatting need not occur synchronously. It may be delayed until a **LogRecord** (p. 2261) is actually written to an external sink.

All methods on **Logger** (p. 2237) are thread safe.

Since

1.0

6.488.2 Constructor & Destructor Documentation

6.488.2.1 decaf::util::logging::Logger::Logger (const std::string & *name*) [protected]

Creates a new instance of the **Logger** (p. 2237) with the given name.

The logger will be initially configured with a null **Level** (p. 2185) and with useParentHandlers true.

Parameters

name A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as **decaf.net** (p. 130) or org.apache.decaf. It may be empty for anonymous Loggers.

6.488.2.2 virtual decaf::util::logging::Logger::~Logger () [virtual]

6.488.3 Member Function Documentation

6.488.3.1 void decaf::util::logging::Logger::addHandler (Handler * *handler*) throw (lang::exceptions::NullPointerException)

Add a log **Handler** (p. 1852) to receive logging messages.

By default, Loggers also send their output to their parent logger. Typically the root **Logger** (p. 2237) is configured with a set of Handlers that essentially act as default handlers for all loggers.

The ownership of the given **Handler** (p. 1852) is passed to the **Logger** (p. 2237) and the **Handler** (p. 1852) will be deleted when this **Logger** (p. 2237) is destroyed unless the caller first calls removeHandler with the same pointer value as was originally given.

Parameters

handler A Logging **Handler** (p. 1852)

Exceptions

NullPointerException if the **Handler** (p. 1852) given is NULL.

6.488.3.2 virtual void decaf::util::logging::Logger::config (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a CONFIG **Level** (p. 2185) Log.

If the logger is currently enabled for the CONFIG message level then the given message is forwarded to all the registered output **Handler** (p. 1852) objects.

Parameters

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 2185).

6.488.3.3 `virtual void decaf::util::logging::Logger::debug (const std::string & file,
const int line, const std::string functionName, const std::string &
message) [virtual]`

Log a **DEBUG Level** (p. 2185) Log.

If the logger is currently enabled for the **DEBUG** message level then the given message is forwarded to all the registered output **Handler** (p. 1852) objects.

Parameters

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 2185).

6.488.3.4 `virtual void decaf::util::logging::Logger::entering (const std::string &
blockName, const std::string & file, const int line) [virtual]`

Logs an Block Enter message.

This is a convenience method that is used to tag a block enter, a log record with the given information is logged at the **Level::FINER** (p. 2189) log level.

Parameters

blockName The source block name, (usually `ClassName::MethodName`, or `MethodName`).

file The source file name where this method was called from.

line The source line number where this method was called from.

6.488.3.5 `virtual void decaf::util::logging::Logger::exiting (const std::string &
blockName, const std::string & file, const int line) [virtual]`

Logs an Block Exit message.

This is a convenience method that is used to tag a block enter, a log record with the given information is logged at the **Level::FINER** (p. 2189) log level.

Parameters

blockName The source block name, (usually `ClassName::MethodName`, or `MethodName`).

file The source file name where this method was called from.

line The source line number where this method was called from.

6.488.3.6 `virtual void decaf::util::logging::Logger::fine (const std::string & file,
const int line, const std::string functionName, const std::string &
message) [virtual]`

Log a **FINE Level** (p. 2185) Log.

If the logger is currently enabled for the **FINE** message level then the given message is forwarded to all the registered output **Handler** (p. 1852) objects.

Parameters

file The file name where the log was generated.
line The line number where the log was generated.
functionName The name of the function that logged this.
message The message to log at this **Level** (p.2185).

6.488.3.7 `virtual void decaf::util::logging::Logger::finer (const std::string & file,
const int line, const std::string functionName, const std::string &
message) [virtual]`

Log a FINER **Level** (p. 2185) Log.

If the logger is currently enabled for the FINER message level then the given message is forwarded to all the registered output **Handler** (p.1852) objects.

Parameters

file The file name where the log was generated.
line The line number where the log was generated.
functionName The name of the function that logged this.
message The message to log at this **Level** (p.2185).

6.488.3.8 `virtual void decaf::util::logging::Logger::finest (const std::string & file,
const int line, const std::string functionName, const std::string &
message) [virtual]`

Log a FINEST **Level** (p. 2185) Log.

If the logger is currently enabled for the FINEST message level then the given message is forwarded to all the registered output **Handler** (p.1852) objects.

Parameters

file The file name where the log was generated.
line The line number where the log was generated.
functionName The name of the function that logged this.
message The message to log at this **Level** (p.2185).

6.488.3.9 `static Logger* decaf::util::logging::Logger::getAnonymousLogger ()
[static]`

Creates an anonymous logger.

The newly created **Logger** (p.2237) is not registered in the **LogManager** (p.2254) namespace. There will be no access checks on updates to the logger. Even although the new logger is anonymous, it is configured to have the root logger ("") as its parent. This means that by default it inherits its effective level and handlers from the root logger.

The caller is responsible for destroying the returned logger.

Returns

Newly created anonymous logger

6.488.3.10 `const Filter* decaf::util::logging::Logger::getFilter () const [inline]`

Gets the **Filter** (p. 1770) object that this class is using.

Returns

the **Filter** (p. 1770) in use, (can be NULL).

6.488.3.11 `const std::list<Handler*>& decaf::util::logging::Logger::getHandlers () const`

Gets a vector containing all the handlers that this class has been assigned to use.

Returns

a list of handlers that are used by this logger

6.488.3.12 `Level decaf::util::logging::Logger::getLevel () const [inline]`

Get the log **Level** (p. 2185) that has been specified for this **Logger** (p. 2237).

The result may be the INHERIT level, which means that this logger's effective level will be inherited from its parent.

Returns

the level that is currently set

6.488.3.13 `static Logger* decaf::util::logging::Logger::getLogger (const std::string & name) [static]`

Find or create a logger for a named subsystem.

If a logger has already been created with the given name it is returned. Otherwise a new logger is created.

If a new logger is created its log level will be configured based on the **LogManager** (p. 2254) and it will be configured to also send logging output to its parent loggers Handlers. It will be registered in the **LogManager** (p. 2254) global namespace.

Parameters

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as `cms` or `activemq.core.ActiveMQConnection` (p. 233)

Returns

a suitable logger.

6.488.3.14 `const std::string& decaf::util::logging::Logger::getName () const`
[inline]

Gets the name of this **Logger** (p. 2237).

Returns

logger name

6.488.3.15 `Logger* decaf::util::logging::Logger::getParent () const` [inline]

Gets the parent of this **Logger** (p. 2237) which will be the nearest existing **Logger** (p. 2237) in this Loggers namespace.

If this is the Root **Logger** (p. 2237) than this method returns NULL.

Returns

Pointer to this Loggers nearest parent **Logger** (p. 2237).

6.488.3.16 `bool decaf::util::logging::Logger::getUseParentHandlers () const`
[inline]

Discover whether or not this logger is sending its output to its parent logger.

Returns

true if using Parent Handlers

6.488.3.17 `virtual void decaf::util::logging::Logger::info (const std::string & file,
const int line, const std::string functionName, const std::string &
message)` [virtual]

Log a INFO **Level** (p. 2185) Log.

If the logger is currently enabled for the INFO message level then the given message is forwarded to all the registered output **Handler** (p. 1852) objects.

Parameters

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 2185).

6.488.3.18 `virtual bool decaf::util::logging::Logger::isLoggable (const Level &
level) const` [virtual]

Check if a message of the given level would actually be logged by this logger.

This check is based on the Loggers effective level, which may be inherited from its parent.

Parameters

level - a message logging level

Returns

true if the given message level is currently being logged.

6.488.3.19 `virtual void decaf::util::logging::Logger::log (const Level & levels,
const std::string & file, const int line, const std::string & message,
...) [virtual]`

Log a message, with the list of params that is formatted into the message string.

If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p.1852) objects

Parameters

level the **Level** (p. 2185) to log at

file the message to log

line the line in the file

... variable length argument to format the message string.

6.488.3.20 `virtual void decaf::util::logging::Logger::log (LogRecord & record)
[virtual]`

Log a **LogRecord** (p. 2261).

All the other logging methods in this class call through this method to actually perform any logging. Subclasses can override this single method to capture all log activity.

Parameters

record - the **LogRecord** (p. 2261) to be published

6.488.3.21 `virtual void decaf::util::logging::Logger::log (const Level & level,
const std::string & message) [virtual]`

Log a message, with no arguments.

If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p.1852) objects

Parameters

level the **Level** (p. 2185) to log at

message the message to log

6.488.3.22 `virtual void decaf::util::logging::Logger::log (const Level & level,
const std::string & file, const int line, const std::string & message,
lang::Exception & ex) [virtual]`

Log a message, with associated Throwable information.

If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 2261) which is forwarded to all registered output handlers. Note that the thrown argument is stored in the **LogRecord** (p. 2261) thrown property, rather than the **LogRecord** (p. 2261) parameters property. Thus is it processed specially by output Formatters and is not treated as a formatting parameter to the **LogRecord** (p. 2261) message property.

Parameters

level the **Level** (p. 2185) to log at.

file File that the message was logged in.

line the line number where the message was logged at.

message the message to log.

ex the Exception to log

6.488.3.23 `void decaf::util::logging::Logger::removeHandler (Handler * handler)`

Removes the specified **Handler** (p. 1852) from this logger, ownership of the **Handler** (p. 1852) pointer is returned to the caller.

Returns silently if the given **Handler** (p. 1852) is not found.

Parameters

handler The **Handler** (p. 1852) to remove

6.488.3.24 `void decaf::util::logging::Logger::setFilter (Filter * filter)`

Set (p. 3220) a filter to control output on this **Logger** (p. 2237).

After passing the initial "level" check, the **Logger** (p. 2237) will call this **Filter** (p. 1770) to check if a log record should really be published.

The caller releases ownership of this filter to this logger

Parameters

filter The **Filter** (p. 1770) to use, (can be NULL).

6.488.3.25 `void decaf::util::logging::Logger::setLevel (const Level & level)
[inline]`

Set (p. 3220) the log level specifying which message levels will be logged by this logger.

Message levels lower than this value will be discarded. The level value **Level::OFF** (p. 2190) can be used to turn off logging.

If the new level is the **INHERIT Level** (p. 2185), it means that this node should inherit its level from its nearest ancestor with a specific (non-INHERIT) level value.

Parameters

level The new **Level** (p. 2185) value to use when logging.

6.488.3.26 `void decaf::util::logging::Logger::setParent (Logger * parent)`
[inline]

Set (p. 3220) the parent for this **Logger** (p. 2237).

This method is used by the **LogManager** (p. 2254) to update a **Logger** (p. 2237) when the namespace changes.

It should not be called from application code.

6.488.3.27 `void decaf::util::logging::Logger::setUseParentHandlers (bool value)`
[inline]

Specify whether or not this logger should send its output to it's parent **Logger** (p. 2237).

This means that any LogRecords will also be written to the parent's Handlers, and potentially to its parent, recursively up the namespace.

Parameters

value True is output is to be written to the parent

6.488.3.28 `virtual void decaf::util::logging::Logger::severe (const std::string & file, const int line, const std::string functionName, const std::string & message)` [virtual]

Log a SEVERE **Level** (p. 2185) Log.

If the logger is currently enabled for the SEVERE message level then the given message is forwarded to all the registered output **Handler** (p. 1852) objects.

Parameters

file The file name where the log was generated.

line The line number where the log was generated.

functionName The name of the function that logged this.

message The message to log at this **Level** (p. 2185).

6.488.3.29 `virtual void decaf::util::logging::Logger::throwing (const std::string & file, const int line, const std::string functionName, const decaf::lang::Throwable & thrown)` [virtual]

Log throwing an exception.

This is a convenience method to log that a method is terminating by throwing an exception. The logging is done using the FINER level.

If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 2261) which is forwarded to all registered output handlers. The LogRecord's message is set to "THROW".

Parameters

- file* The file name where the log was generated.
- line* The line number where the log was generated.
- functionName* The name of the function that logged this.
- thrown* The Throwable that will be thrown, will be cloned.

6.488.3.30 `virtual void decaf::util::logging::Logger::warning (const std::string & file, const int line, const std::string functionName, const std::string & message) [virtual]`

Log a **WARN Level** (p. 2185) Log.

If the logger is currently enabled for the **WARN** message level then the given message is forwarded to all the registered output **Handler** (p. 1852) objects.

Parameters

- file* The file name where the log was generated.
- line* The line number where the log was generated.
- functionName* The name of the function that logged this.
- message* The message to log at this **Level** (p. 2185).

6.491.3.1 virtual void `activemq::io::LoggingOutputStream::doWriteArrayBounded (const unsigned char * buffer, int size, int offset, int length)` throw (`decaf::io::IOException`, `decaf::lang::exceptions::NullPointerException`, `decaf::lang::exceptions::IndexOutOfBoundsException`) [protected, virtual]

Reimplemented from `decaf::io::FilterOutputStream` (p. 1779).

6.491.3.2 virtual void `activemq::io::LoggingOutputStream::doWriteByte (unsigned char c)` throw (`decaf::io::IOException`) [protected, virtual]

Reimplemented from `decaf::io::FilterOutputStream` (p. 1779).

The documentation for this class was generated from the following file:

- `src/main/activemq/io/LoggingOutputStream.h`

6.492 `activemq::transport::logging::LoggingTransport` Class Reference

A transport filter that logs commands as they are sent/received.

```
#include <src/main/activemq/transport/logging/LoggingTransport.h>
```

Inheritance diagram for `activemq::transport::logging::LoggingTransport`:

Public Member Functions

- **LoggingTransport** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual **~LoggingTransport** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (`decaf::io::IOException`, `decaf::lang::exceptions::UnsupportedOperationException`)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (`decaf::io::IOException`, `decaf::lang::exceptions::UnsupportedOperationException`)
Not supported by this class - throws an exception.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Not supported by this class - throws an exception.

6.492.1 Detailed Description

A transport filter that logs commands as they are sent/received.

6.492.2 Constructor & Destructor Documentation

6.492.2.1 **activemq::transport::logging::LoggingTransport::LoggingTransport** (const **Pointer**< **Transport** > & *next*)

Constructor.

Parameters

next - the next **Transport** (p. 3629) in the chain

6.492.2.2 virtual **activemq::transport::logging::LoggingTransport::~LoggingTransport** () [inline, virtual]

6.492.3 Member Function Documentation

6.492.3.1 virtual void **activemq::transport::logging::LoggingTransport::onCommand** (const **Pointer**< **Command** > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3640).

6.492.3.2 virtual void **activemq::transport::logging::LoggingTransport::oneway** (const **Pointer**< **Command** > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from `activemq::transport::TransportFilter` (p. 3640).

6.492.3.3 `virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command that is sent as a request

Exceptions

UnsupportedOperationException.

Reimplemented from `activemq::transport::TransportFilter` (p. 3642).

6.492.3.4 `virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command that is sent as a request

timeout the time to wait for a response.

Exceptions

UnsupportedOperationException.

Reimplemented from `activemq::transport::TransportFilter` (p. 3641).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/logging/LoggingTransport.h`

6.493 decaf::util::logging::LogManager Class Reference

There is a single global `LogManager` (p. 2254) object that is used to maintain a set of shared state about Loggers and log services.

6.493.1 Detailed Description

There is a single global **LogManager** (p. 2254) object that is used to maintain a set of shared state about Loggers and log services. This **LogManager** (p. 2254) object:

* Manages a hierarchical namespace of **Logger** (p. 2237) objects. All named Loggers are stored in this namespace. * Manages a set of logging control properties. These are simple key-value pairs that can be used by Handlers and other logging objects to configure themselves.

The global **LogManager** (p. 2254) object can be retrieved using **LogManager::getLogManager()** (p. 2259). The **LogManager** (p. 2254) object is created during class initialization and cannot subsequently be changed.

TODO By default, the **LogManager** (p. 2254) reads its initial configuration from a properties file "lib/logging.properties" in the JRE directory. If you edit that property file you can change the default logging configuration for all uses of that JRE.

In addition, the **LogManager** (p. 2254) uses two optional system properties that allow more control over reading the initial configuration:

* "decaf.logger.config.class" * "decaf.logger.config.file"

These two properties may be set via the Preferences API, or as command line property definitions to the "java" command, or as system property definitions passed to JNI_CreateJavaVM.

If the "java.util.logging.config.class" property is set, then the property value is treated as a class name. The given class will be loaded, an object will be instantiated, and that object's constructor is responsible for reading in the initial configuration. (That object may use other system properties to control its configuration.) The alternate configuration class can use readConfiguration(InputStream) to define properties in the **LogManager** (p. 2254).

If "decaf.util.logging.config.class" property is not set, then the "decaf.util.logging.config.file" system property can be used to specify a properties file (in **decaf.util.Properties** (p. 2927) format). The initial logging configuration will be read from this file.

If neither of these properties is defined then, as described above, the **LogManager** (p. 2254) will read its initial configuration from a properties file "lib/logging.properties" in the working directory.

The properties for loggers and Handlers will have names starting with the dot-separated name for the handler or logger. ***TODO***

The global logging properties may include:

* A property "handlers". This defines a whitespace separated list of class names for handler classes to load and register as handlers on the root **Logger** (p. 2237) (the **Logger** (p. 2237) named ""). Each class name must be for a **Handler** (p. 1852) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.handlers". This defines a whitespace or comma separated list of class names for handlers classes to load and register as handlers to the specified logger. Each class name must be for a **Handler** (p. 1852) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.useParentHandlers". This defines a boolean value. By default every logger calls its parent in addition to handling the logging message itself, this often result in messages being handled by the root logger as well. When setting this property to false a **Handler** (p. 1852) needs to be configured for this logger otherwise no logging messages are delivered. * A property "config". This property is intended to allow arbitrary configuration code to be run. The property defines a whitespace separated list of class names. A new instance will be created for each named class. The default constructor of each class may execute arbitrary code to update the logging configuration, such as setting logger levels, adding handlers, adding filters, etc.

Loggers are organized into a naming hierarchy based on their dot separated names. Thus "a.b.c" is a child of "a.b", but "a.b1" and "a.b2" are peers.

All properties whose names end with ".level" are assumed to define log levels for Loggers. Thus "foo.level" defines a log level for the logger called "foo" and (recursively) for any of its children in the naming hierarchy. Log Levels are applied in the order they are defined in the properties file. Thus level settings for child nodes in the tree should come after settings for their parents. The property name ".level" can be used to set the level for the root of the tree.

All methods on the **LogManager** (p. 2254) object are multi-thread safe.

Since

1.0

6.493.2 Constructor & Destructor Documentation

6.493.2.1 virtual decaf::util::logging::LogManager::~LogManager () [virtual]

6.493.2.2 decaf::util::logging::LogManager::LogManager () [protected]

Constructor, hidden to protect against direct instantiation.

6.493.2.3 decaf::util::logging::LogManager::LogManager (const LogManager & *manager*) [protected]

Copy Constructor.

Parameters

manager the Manager to copy

6.493.3 Member Function Documentation

6.493.3.1 `bool decaf::util::logging::LogManager::addLogger (Logger * logger) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)`

Add a named logger.

This does nothing and returns false if a logger with the same name is already registered.

The **Logger** (p. 2237) factory methods call this method to register each newly created **Logger** (p. 2237).

Parameters

logger The new **Logger** (p. 2237) instance to add to this **LogManager** (p. 2254).

Exceptions

NullPointerException if logger is NULL.

IllegalArgumentException if the logger has no name.

6.493.3.2 `void decaf::util::logging::LogManager::addPropertyChangeListener (PropertyChangeListener * listener)`

Adds a change listener for **LogManager** (p. 2254) **Properties** (p. 2927), adding the same instance of a change event listener does nothing.

Parameters

listener The **PropertyChangeListener** to add (can be NULL).

6.493.3.3 `Logger* decaf::util::logging::LogManager::getLogger (const std::string & name)`

Retrieves or creates a new **Logger** (p. 2237) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.

Parameters

name The name of the **Logger** (p. 2237).

6.493.3.4 `int decaf::util::logging::LogManager::getLoggerNames (const std::vector< std::string > & names)`

Gets a list of known **Logger** (p. 2237) Names from this Manager, new loggers added while this method is in progress are not guaranteed to be in the list.

Parameters

names STL Vector to hold string logger names.

Returns

names count of how many loggers were inserted.

6.493.3.5 `static LogManager& decaf::util::logging::LogManager::getLogManager () [static]`

Get the global **LogManager** (p. 2254) instance.

Returns

A reference to the global **LogManager** (p. 2254) instance.

6.493.3.6 `const util::Properties& decaf::util::logging::LogManager::getProperties () const [inline]`

Gets a reference to the Logging **Properties** (p. 2927) used by this logger.

Returns

The **Logger** (p. 2237) **Properties** (p. 2927) Pointer

6.493.3.7 `std::string decaf::util::logging::LogManager::getProperty (const std::string & name)`

Gets the value of a named property of this **LogManager** (p. 2254).

Parameters

name The name of the Property to retrieve.

Returns

the value of the property

6.493.3.8 `void decaf::util::logging::LogManager::operator= (const LogManager & manager) [protected]`

Assignment operator.

Parameters

manager the manager to assign from

6.493.3.9 `void decaf::util::logging::LogManager::readConfiguration () throw (decaf::io::IOException)`

Reinitialize the logging properties and reread the logging configuration.

The same rules are used for locating the configuration properties as are used at startup. So normally the logging properties will be re-read from the same file that was used at startup.

Any log level definitions in the new configuration file will be applied using **Logger.setLevel()** (p. 2247), if the target **Logger** (p. 2237) exists.

A **PropertyChangeEvent** will be fired after the properties are read.

Exceptions

IOException if an I/O error occurs.

6.493.3.10 `void decaf::util::logging::LogManager::readConfiguration (decaf::io::InputStream * stream) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)`

Reinitialize the logging properties and reread the logging configuration from the given stream, which should be in **decaf.util.Properties** (p. 2927) format.

A PropertyChangeEvent will be fired after the properties are read.

Any log level definitions in the new configuration file will be applied using **Logger.setLevel()** (p. 2247), if the target **Logger** (p. 2237) exists.

Parameters

stream The InputStream to read the **Properties** (p. 2927) from.

Exceptions

NullPointerException if stream is NULL.

IOException if an I/O error occurs.

6.493.3.11 `void decaf::util::logging::LogManager::removePropertyChangeListener (PropertyChangeListener * listener)`

Removes a properties change listener from the **LogManager** (p. 2254), if the listener is not found of the param is NULL this method returns silently.

Parameters

listener The PropertyChangeListener to remove from the listeners set.

6.493.3.12 `void decaf::util::logging::LogManager::reset ()`

Reset the logging configuration.

For all named loggers, the reset operation removes and closes all Handlers and (except for the root logger) sets the level to INHERIT. The root logger's level is set to **Level::INFO** (p. 2190).

6.493.3.13 `void decaf::util::logging::LogManager::setProperties (const util::Properties & properties)`

Sets the **Properties** (p. 2927) this **LogManager** (p. 2254) should use to configure its loggers.

Once set a properties change event is fired.

Parameters

properties Pointer to read the configuration from

6.493.4 Friends And Related Function Documentation

6.493.4.1 friend class decaf::lang::Runtime [friend]

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/LogManager.h`

6.494 decaf::util::logging::LogRecord Class Reference

LogRecord (p. 2261) objects are used to pass logging requests between the logging framework and individual log Handlers.

```
#include <src/main/decaf/util/logging/LogRecord.h>
```

Public Member Functions

- **LogRecord** ()
- virtual **~LogRecord** ()
- **Level** **getLevel** () const
*Get **Level** (p. 2185) of this log record.*
- void **setLevel** (**Level** value)
*Set (p. 3220) the **Level** (p. 2185) of this Log Record.*
- const std::string & **getLoggerName** () const
Gets the Source Logger's Name.
- void **setLoggerName** (const std::string &loggerName)
Sets the Source Logger's Name.
- const std::string & **getSourceFile** () const
Gets the Source Log File name.
- void **setSourceFile** (const std::string &sourceFile)
Sets the Source Log File Name.
- unsigned int **getSourceLine** () const
Gets the Source Log line number.
- void **setSourceLine** (unsigned int sourceLine)
Sets the Source Log line number.
- const std::string & **getMessage** () const
Gets the Message to be Logged.
- void **setMessage** (const std::string &message)
Sets the Message to be Logged.

- `const std::string & getSourceFunction () const`
Gets the name of the function where this log was logged.
- `void setSourceFunction (const std::string &functionName)`
Sets the name of the function where this log was logged.
- `long long getTimestamp () const`
Gets the time in mills that this message was logged.
- `void setTimestamp (long long timeStamp)`
Sets the time in mills that this message was logged.
- `long long getTreadId () const`
Gets the Thread Id where this Log was created.
- `void setTreadId (long long threadId)`
Sets the Thread Id where this Log was created.
- `decaf::lang::Throwable * getThrown () const`
*Gets any Throwable associated with this **LogRecord** (p. 2261).*
- `void setThrown (decaf::lang::Throwable *thrown)`
*Sets the Throwable associated with this **LogRecord** (p. 2261), the pointer becomes the property of this instance of the **LogRecord** (p. 2261) and will be deleted when the record is destroyed.*

6.494.1 Detailed Description

LogRecord (p. 2261) objects are used to pass logging requests between the logging framework and individual log Handlers. When a **LogRecord** (p. 2261) is passed into the logging framework it logically belongs to the framework and should no longer be used or updated by the client application.

Since

1.0

6.494.2 Constructor & Destructor Documentation

6.494.2.1 `decaf::util::logging::LogRecord::LogRecord ()`

6.494.2.2 `virtual decaf::util::logging::LogRecord::~~LogRecord () [virtual]`

6.494.3 Member Function Documentation

6.494.3.1 `Level decaf::util::logging::LogRecord::getLevel () const [inline]`

Get **Level** (p. 2185) of this log record.

Returns

Level (p. 2185) enumeration value.

6.494.3.2 `const std::string& decaf::util::logging::LogRecord::getLoggerName () const [inline]`

Gets the Source Logger's Name.

Returns

the source loggers name

6.494.3.3 `const std::string& decaf::util::logging::LogRecord::getMessage () const [inline]`

Gets the Message to be Logged.

Returns

the source logger's message

6.494.3.4 `const std::string& decaf::util::logging::LogRecord::getSourceFile () const [inline]`

Gets the Source Log File name.

Returns

the source loggers name

6.494.3.5 `const std::string& decaf::util::logging::LogRecord::getSourceFunction () const [inline]`

Gets the name of the function where this log was logged.

Returns

the source logger's message

6.494.3.6 `unsigned int decaf::util::logging::LogRecord::getSourceLine () const [inline]`

Gets the Source Log line number.

Returns

the source loggers line number

6.494.3.7 `decaf::lang::Throwable* decaf::util::logging::LogRecord::getThrown () const [inline]`

Gets any Throwable associated with this **LogRecord** (p. 2261).

Returns

point to a Throwable instance or Null.

6.494.3.8 `long long decaf::util::logging::LogRecord::getTimestamp () const`
 `[inline]`

Gets the time in mills that this message was logged.

Returns

UTC time in milliseconds

6.494.3.9 `long long decaf::util::logging::LogRecord::getTreadId () const` `[inline]`

Gets the Thread Id where this Log was created.

Returns

the source loggers line number

6.494.3.10 `void decaf::util::logging::LogRecord::setLevel (Level value)` `[inline]`

Set (p. 3220) the **Level** (p. 2185) of this Log Record.

Parameters

value **Level** (p. 2185) Enumeration Value

6.494.3.11 `void decaf::util::logging::LogRecord::setLoggerName (const std::string`
 `& loggerName)` `[inline]`

Sets the Source Logger's Name.

Parameters

loggerName the source loggers name

6.494.3.12 `void decaf::util::logging::LogRecord::setMessage (const std::string &`
 `message)` `[inline]`

Sets the Message to be Logged.

Parameters

message the source loggers message

6.494.3.13 `void decaf::util::logging::LogRecord::setSourceFile (const std::string &`
 `sourceFile)` `[inline]`

Sets the Source Log File Name.

Parameters

sourceFile the source loggers name

6.494.3.14 void decaf::util::logging::LogRecord::setSourceFunction (const std::string & *functionName*) [inline]

Sets the name of the function where this log was logged.

Parameters

functionName the source of the log

6.494.3.15 void decaf::util::logging::LogRecord::setSourceLine (unsigned int *sourceLine*) [inline]

Sets the Source Log line number.

Parameters

sourceLine the source logger's line number

6.494.3.16 void decaf::util::logging::LogRecord::setThrown (decaf::lang::Throwable * *thrown*) [inline]

Sets the Throwable associated with this **LogRecord** (p. 2261), the pointer becomes the property of this instance of the **LogRecord** (p. 2261) and will be deleted when the record is destroyed.

Parameters

thrown A pointer to a Throwable that will be associated with this record.

6.494.3.17 void decaf::util::logging::LogRecord::setTimestamp (long long *timeStamp*) [inline]

Sets the time in mills that this message was logged.

Parameters

timeStamp UTC Time in Milliseconds.

6.494.3.18 void decaf::util::logging::LogRecord::setTreadId (long long *threadId*) [inline]

Sets the Thread Id where this Log was created.

Parameters

threadId the source logger's line number

6.495 decaf::util::logging::LogWriter Class Reference

```
#include <src/main/decaf/util/logging/LogWriter.h>
```

Public Member Functions

- **LogWriter** ()
- virtual **~LogWriter** ()
- virtual void **log** (const std::string &file, const int line, const std::string &prefix, const std::string &message)
Writes a message to the output destination.
- virtual void **log** (const std::string &message)
Writes a message to the output destination.

Static Public Member Functions

- static **LogWriter** & **getInstance** ()
Get the singleton instance.
- static void **returnInstance** ()
Returns a Checked out instance of this Writer.
- static void **destroy** ()
*Forcefully Delete the Instance of this **LogWriter** (p. 2266) even if there are outstanding references.*

6.495.1 Constructor & Destructor Documentation

6.495.1.1 decaf::util::logging::LogWriter::LogWriter ()

6.495.1.2 virtual decaf::util::logging::LogWriter::~~LogWriter () [virtual]

6.495.2 Member Function Documentation

6.495.2.1 static void decaf::util::logging::LogWriter::destroy () [static]

Forcefully Delete the Instance of this **LogWriter** (p. 2266) even if there are outstanding references.

6.495.2.2 static **LogWriter**& decaf::util::logging::LogWriter::getInstance ()
[static]

Get the singleton instance.

6.495.2.3 virtual void decaf::util::logging::LogWriter::log (const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters

message

6.495.2.4 virtual void decaf::util::logging::LogWriter::log (const std::string & *file*, const int *line*, const std::string & *prefix*, const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters

file

line

prefix

message

6.495.2.5 static void decaf::util::logging::LogWriter::returnInstance () [static]

Returns a Checked out instance of this Writer.

```
#include <src/main/decaf/lang/Long.h>
```

Inheritance diagram for decaf::lang::Long:

Public Member Functions

- **Long** (long long value)
- **Long** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Long** ()
- virtual int **compareTo** (const **Long** &l) const
*Compares this **Long** (p. 2267) instance with another.*
- bool **equals** (const **Long** &l) const
- virtual bool **operator==** (const **Long** &l) const
Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Long** &l) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const long long &l) const
*Compares this **Long** (p. 2267) instance with another.*
- bool **equals** (const long long &l) const
- virtual bool **operator==** (const long long &l) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const long long &l) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static int **bitCount** (long long value)
Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static **Long decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a **String** (p. 3427) into a **Long** (p. 2267).*
- static long long **highestOneBit** (long long value)
Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

- static long long **lowestOneBit** (long long value)
Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (long long value)
Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.
- static int **numberOfTrailingZeros** (long long value)
Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.
- static long long **parseLong** (const std::string &value) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal long.
- static long long **parseLong** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Long** (p. 2267) object holding the value extracted from the specified string when parsed with the radix given by the second argument.*
- static long long **reverseBytes** (long long value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.
- static long long **reverse** (long long value)
Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.
- static long long **rotateLeft** (long long value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.
- static long long **rotateRight** (long long value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.
- static int **signum** (long long value)
Returns the signum function of the specified value.
- static std::string **toString** (long long value)
*Converts the long to a **String** (p. 3427) representation.*
- static std::string **toString** (long long value, int radix)
- static std::string **toHexString** (long long value)
Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (long long value)
Returns a string representation of the long long argument as an unsigned long long in base 8.
- static std::string **toBinaryString** (long long value)

Returns a string representation of the long long argument as an unsigned long long in base 2.

- static **Long** **valueOf** (long long value)

*Returns a **Long** (p. 2267) instance representing the specified int value.*

- static **Long** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

*Returns a **Long** (p. 2267) object holding the value given by the specified std::string.*

- static **Long** **valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)

*Returns a **Long** (p. 2267) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 64

The size in bits of the primitive long long type.

- static const long long **MAX_VALUE** = (long long)0x7FFFFFFFFFFFFFFFFLL

The maximum value that the primitive type can hold.

- static const long long **MIN_VALUE** = (long long)0x8000000000000000LL

The minimum value that the primitive type can hold.

6.496.1 Constructor & Destructor Documentation

6.496.1.1 decaf::lang::Long::Long (long long value)

Parameters

value - the primitive long long to wrap

6.496.1.2 decaf::lang::Long::Long (const std::string & value) throw (exceptions::NumberFormatException)

Parameters

value - the long long formatted string to wrap

Exceptions

NumberFormatException

6.496.1.3 virtual decaf::lang::Long::~~Long () [inline, virtual]

6.496.2 Member Function Documentation

6.496.2.1 static int decaf::lang::Long::bitCount (long long *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value.

This function is sometimes referred to as the population count.

Parameters

value - the long long to count

Returns

the number of one-bits in the two's complement binary representation of the specified long long value.

6.496.2.2 virtual unsigned char decaf::lang::Long::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.496.2.3 virtual int decaf::lang::Long::compareTo (const long long & *l*) const [virtual]

Compares this **Long** (p. 2267) instance with another.

Parameters

l - the **Integer** (p. 1941) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements decaf::lang::Comparable< long long > (p. 1126).

6.496.2.4 virtual int decaf::lang::Long::compareTo (const Long & *l*) const [virtual]

Compares this **Long** (p. 2267) instance with another.

Parameters

l - the **Long** (p. 2267) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.496.2.5 `static Long decaf::lang::Long::decode (const std::string & value)
throw (exceptions::NumberFormatException) [static]`

Decodes a **String** (p. 3427) into a **Long** (p. 2267).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInt method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 3427) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value - The string to decode

Returns

a **Long** (p. 2267) object containing the decoded value

Exceptions

NumberFormatException if the string is not formatted correctly.

6.496.2.6 `virtual double decaf::lang::Long::doubleValue () const [inline,
virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.496.2.7 `bool decaf::lang::Long::equals (const Long & l) const [inline]`

Parameters

l - the **Long** (p. 2267) object to compare against.

Returns

true if the two **Integer** (p. 1941) Objects have the same value.

6.496.2.8 `bool decaf::lang::Long::equals (const long long & l) const` [inline, virtual]

Parameters

l - the **Long** (p. 2267) object to compare against.

Returns

true if the two **Integer** (p. 1941) Objects have the same value.

Implements **decaf::lang::Comparable**< long long > (p. 1126).

6.496.2.9 `virtual float decaf::lang::Long::floatValue () const` [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.496.2.10 `static long long decaf::lang::Long::highestOneBit (long long value)` [static]

Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the long long to be inspected

Returns

an long long value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.496.2.11 `virtual int decaf::lang::Long::intValue () const` [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.496.2.12 `virtual long long decaf::lang::Long::longValue () const` [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.496.2.13 `static long long decaf::lang::Long::lowestOneBit (long long value)`
[static]

Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the long long to be inspected

Returns

an long long value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.496.2.14 `static int decaf::lang::Long::numberOfLeadingZeros (long long value)`
[static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.

Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

$\text{* floor(log2(x)) = 63 - numberOfLeadingZeros(x) * ceil(log2(x)) = 64 - numberOfLeadingZeros(x - 1)}$

Parameters

value - the long long to be inspected

Returns

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.496.2.15 `static int decaf::lang::Long::numberOfTrailingZeros (long long value)`
[static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.

Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters

value - the int to be inspected

Returns

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.496.2.16 `virtual bool decaf::lang::Long::operator< (const long long & l) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< long long >` (p. 1127).

6.496.2.17 `virtual bool decaf::lang::Long::operator< (const Long & l) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.496.2.18 `virtual bool decaf::lang::Long::operator== (const Long & l) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.496.2.19 `virtual bool decaf::lang::Long::operator== (const long long & l)
const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< long long >` (p. 1127).

6.496.2.20 `static long long decaf::lang::Long::parseLong (const std::string &
value) throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal long.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting long value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseLong(java.lang.String, int)` method.

Note that the characters LL or ULL are not permitted to appear at the end of this string as would normally be permitted in a C++ program.

Parameters

value - **String** (p. 3427) to parse

Returns

long long value

Exceptions

NumberFormatException on invalid string value

6.496.2.21 `static long long decaf::lang::Long::parseLong (const std::string &
value, int radix) throw (exceptions::NumberFormatException)
[static]`

Returns a **Long** (p. 2267) object holding the value extracted from the specified string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed long in the radix specified by the second argument, exactly as if the arguments were given to the `parseLong(std::string, int)` method. The result is a **Long** (p. 2267) object that represents the long long value specified by the string.

Parameters

value - **String** (p. 3427) to parse

radix - the base encoding of the string

Returns

long long value

Exceptions

NumberFormatException on invalid string value

6.496.2.22 static long long decaf::lang::Long::reverse (long long *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

Parameters

value - the value whose bits are to be reversed

Returns

the reversed bits long long.

6.496.2.23 static long long decaf::lang::Long::reverseBytes (long long *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

Parameters

value - the long long whose bytes we are to reverse

Returns

the reversed long long.

6.496.2.24 static long long decaf::lang::Long::rotateLeft (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

(Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters

value - the long long to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

6.496.2.25 `static long long decaf::lang::Long::rotateRight (long long value, int distance) [static]`

Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

(Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: `rotateRight(val, -distance) == rotateLeft(val, distance)`. Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: `rotateRight(val, distance) == rotateRight(val, distance & 0x1F)`.

Parameters

value - the long long to be inspected
distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

6.496.2.26 `virtual short decaf::lang::Long::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.496.2.27 `static int decaf::lang::Long::signum (long long value) [static]`

Returns the signum function of the specified value.

(The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters

value - the long long to be inspected

Returns

the signum function of the specified long long value.

6.496.2.28 `static std::string decaf::lang::Long::toBinaryString (long long value) [static]`

Returns a string representation of the long long argument as an unsigned long long in base 2.

The unsigned long long value is the argument plus 2^{32} if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with

no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The characters '0' and '1' are used as binary digits.

Parameters

value - the long long to be translated to a binary string

Returns

the unsigned long long value as a binary string

6.496.2.29 `static std::string decaf::lang::Long::toHexString (long long value)`
[static]

Returns a string representation of the integer argument as an unsigned integer in base 16.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters

value - the long long to be translated to an Octal string

Returns

the unsigned long long value as a Octal string

6.496.2.30 `static std::string decaf::lang::Long::toOctalString (long long value)`
[static]

Returns a string representation of the long long argument as an unsigned long long in base 8.

The unsigned long long value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters

value - the long long to be translated to an Octal string

Returns

the unsigned long long value as a Octal string

6.496.2.31 `static std::string decaf::lang::Long::toString (long long value)`
[static]

Converts the long to a **String** (p. 3427) representation.

Parameters

value The long to convert to a std::string.

Returns

string representation

6.496.2.32 `std::string decaf::lang::Long::toString () const`

Returns

this **Long** (p. 2267) Object as a **String** (p. 3427) Representation

6.496.2.33 `static std::string decaf::lang::Long::toString (long long value, int radix)` [static]

6.496.2.34 `static Long decaf::lang::Long::valueOf (long long value)` [inline, static]

Returns a **Long** (p. 2267) instance representing the specified int value.

Parameters

value - the long long to wrap

Returns

the new **Integer** (p. 1941) object wrapping value.

6.496.2.35 `static Long decaf::lang::Long::valueOf (const std::string & value, int radix) throw (exceptions::NumberFormatException)` [static]

Returns a **Long** (p. 2267) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed long long in the radix specified by the second argument, exactly as if the argument were given to the `parseLong(std::string, int)` method. The result is a **Long** (p. 2267) object that represents the long long value specified by the string.

Parameters

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns

new **Long** (p. 2267) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a valid long long.

6.496.2.36 `static Long decaf::lang::Long::valueOf (const std::string & value)
throw (exceptions::NumberFormatException) [static]`

Returns a **Long** (p. 2267) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal long long, exactly as if the argument were given to the `parseLong(std::string)` method. The result is a **Integer** (p. 1941) object that represents the long long value specified by the string.

Parameters

value - std::string to parse as base 10

Returns

new **Long** (p. 2267) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a decimal long long.

6.496.3 Field Documentation

6.496.3.1 `const long long decaf::lang::Long::MAX_VALUE = (long
long)0x7FFFFFFFFFFFFFFFLL [static]`

The maximum value that the primitive type can hold.

6.496.3.2 `const long long decaf::lang::Long::MIN_VALUE = (long
long)0x8000000000000000LL [static]`

The minimum value that the primitive type can hold.

6.496.3.3 `const int decaf::lang::Long::SIZE = 64 [static]`

The size in bits of the primitive long long type.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Long.h`

6.497 decaf::internal::nio::LongArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/LongArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::LongArrayBuffer:

Public Member Functions

- **LongArrayBuffer** (int size, bool readOnly=false) throw (decaf::lang::exceptions::IllegalArgumentException)

*Creates a **IntArrayBuffer** (p. 1921) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **LongArrayBuffer** (long long *array, int size, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

*Creates a **LongArrayBuffer** (p. 2281) object that wraps the given array.*

- **LongArrayBuffer** (const decaf::lang::Pointer< ByteArrayAdapter > &array, int offset, int length, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **LongArrayBuffer** (const LongArrayBuffer &other)

*Create a **LongArrayBuffer** (p. 2281) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ~**LongArrayBuffer** ()
- virtual long long * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

*the array that backs this **Buffer** (p. 855).*

Exceptions

***ReadOnlyBufferException** (p. 2966) if this **Buffer** (p. 855) is read only.
UnsupportedOperationException if the underlying store has no array.*

- virtual int **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset long longo the backing array where index zero starts.

Exceptions

***ReadOnlyBufferException** (p. 2966) if this **Buffer** (p. 855) is read only.
UnsupportedOperationException if the underlying store has no array.*

- virtual LongBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow

the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

- virtual LongBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n + 1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **LongBuffer** (p. 2291).*

Exceptions

***ReadOnlyBufferException** (p. 2966) if this buffer is read-only.*

- virtual LongBuffer * **duplicate** ()

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new long long **Buffer** (p. 855) which the caller owns.*

- virtual long long **get** () throw (decaf::nio::BufferUnderflowException)

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position.

Exceptions

***BufferUnderflowException** (p. 882) if there no more data to return.*

- virtual long long **get** (int index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

Reads the value at the given index.

Parameters

***index** The index in the **Buffer** (p. 855) where the long long is to be read.*

Returns

the long long that is located at the given index.

Exceptions

***IndexOutOfBoundsException** if index is not smaller than the buffer's limit, or index is negative.*

- virtual bool **hasArray** () const

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () const

- virtual LongBuffer & **put** (long long value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value The long longs value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2966) if this buffer is read-only

- virtual LongBuffer & **put** (int index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given long longs long longo this buffer at the given index.

Parameters

*index The position in the **Buffer** (p. 855) to write the data*
value The long longs to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2966) if this buffer is read-only

- virtual LongBuffer * **slice** () const

*Creates a new **LongBuffer** (p. 2291) whose content is a shared subsequence of this buffer's content.*

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the newly create **LongBuffer** (p. 2291) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **LongArrayBuffer** (p. 2281) as Read-Only.*

6.497.1 Constructor & Destructor Documentation

6.497.1.1 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (int size, bool readOnly = false) throw (decaf::lang::exceptions::IllegalArgumentException)`

Creates a **IntArrayBuffer** (p. 1921) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size The size of the array, this is the limit we read and write to.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArgumentException if the capacity value is negative.

6.497.1.2 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (long long * array, int size, int offset, int length, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a **LongArrayBuffer** (p. 2281) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array The actual array to wrap.

size The size of the given array.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException if buffer is NULL

IndexOutOfBoundsException if offset is greater than array capacity.

6.497.1.3 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer`
 (`const decaf::lang::Pointer< ByteArrayAdapter > &`
`array`, `int offset`, `int length`, `bool readOnly = false`
) `throw (decaf::lang::exceptions::NullPointerException,`
`decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed `ByteArrayAdapter` and start at the given offset.

The capacity and limit of the new **LongArrayBuffer** (p.2281) will be that of the remaining capacity of the passed buffer.

Parameters

array The `ByteArrayAdapter` to wrap.

offset The position that is this buffers start position.

length The limit of how many bytes into the array this Buffer can write.

readOnly Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException if array is NULL

IndexOutOfBoundsException if offset + length is greater than array size.

6.497.1.4 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const`
`LongArrayBuffer & other)`

Create a **LongArrayBuffer** (p.2281) that mirrors this one, meaning it shares a reference to this buffers `ByteArrayAdapter` and when changes are made to that data it is reflected in both.

Parameters

other The **LongArrayBuffer** (p.2281) this one is to mirror.

6.497.1.5 `virtual decaf::internal::nio::LongArrayBuffer::~~LongArrayBuffer ()`
`[virtual]`

6.497.2 Member Function Documentation

6.497.2.1 `virtual long long* decaf::internal::nio::LongArrayBuffer::array ()`
`throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p.855).

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 2294).

6.497.2.2 `virtual int decaf::internal::nio::LongArrayBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset long longo the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 2294).

6.497.2.3 `virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::asReadOnlyBuffer () const [virtual]`

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

Implements **decaf::nio::LongBuffer** (p. 2295).

6.497.2.4 `virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **LongBuffer** (p. 2291).

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implements **decaf::nio::LongBuffer** (p. 2295).

6.497.2.5 **virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::duplicate ()** [virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new long long **Buffer** (p. 855) which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 2296).

6.497.2.6 **virtual long long decaf::internal::nio::LongArrayBuffer::get () throw (decaf::nio::BufferUnderflowException)** [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

Implements **decaf::nio::LongBuffer** (p. 2297).

6.497.2.7 `virtual long long decaf::internal::nio::LongArrayBuffer::get (int index)
const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the long long is to be read.

Returns

the long long that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::LongBuffer** (p. 2296).

6.497.2.8 `virtual bool decaf::internal::nio::LongArrayBuffer::hasArray () const
[inline, virtual]`

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::LongBuffer** (p. 2298).

6.497.2.9 `virtual bool decaf::internal::nio::LongArrayBuffer::isReadOnly () const
[inline, virtual]`

6.497.2.10 `virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put
(int index, long long value) throw (
lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given long longs longo this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data

value The long longs to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2966) if this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 2298).

6.497.2.11 **virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (long long *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)** [virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value The long longs value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2966) if this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 2298).

6.497.2.12 **virtual void decaf::internal::nio::LongArrayBuffer::setReadOnly (bool *value*)** [inline, protected, virtual]

Sets this **LongArrayBuffer** (p. 2281) as Read-Only.

Parameters

value Boolean value, true if this buffer is to be read-only, false otherwise.

6.497.2.13 **virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::slice ()**
const [virtual]

Creates a new **LongBuffer** (p. 2291) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **LongBuffer** (p. 2291) which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 2300).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/LongArrayBuffer.h`

6.498 decaf::nio::LongBuffer Class Reference

This class defines four categories of operations upon long long buffers:

```
#include <src/main/decaf/nio/LongBuffer.h>
```

Inheritance diagram for decaf::nio::LongBuffer:

Public Member Functions

- virtual **~LongBuffer** ()
- virtual `std::string toString () const`
- virtual `long long * array ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the long long array that backs this buffer (optional operation).
- virtual `int arrayOffset ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **LongBuffer * asReadOnlyBuffer () const =0**
Creates a new, read-only long long buffer that shares this buffer's content.
- virtual **LongBuffer & compact ()=0 throw (ReadOnlyBufferException)**
Compacts this buffer.
- virtual **LongBuffer * duplicate ()=0**
Creates a new long long buffer that shares this buffer's content.
- virtual `long long get ()=0 throw (BufferUnderflowException)`
Relative get method.
- virtual `long long get (int index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
Absolute get method.
- **LongBuffer & get (std::vector< long long > buffer) throw (BufferUnderflowException)**
Relative bulk get method.

- **LongBuffer** & **get** (long long *buffer, int size, int offset, int length) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Relative bulk get method.

- virtual bool **hasArray** () const =0

Tells whether or not this buffer is backed by an accessible long long array.

- **LongBuffer** & **put** (**LongBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the long longs remaining in the given source buffer long longo this buffer.

- **LongBuffer** & **put** (const long long *buffer, int size, int offset, int length) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

This method transfers long longs long longo this buffer from the given source array.

- **LongBuffer** & **put** (std::vector< long long > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source long longs array long longo this buffer.

- virtual **LongBuffer** & **put** (long long value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given long longs long longo this buffer at the current position, and then increments the position.

- virtual **LongBuffer** & **put** (int index, long long value)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given long longs long longo this buffer at the given index.

- virtual **LongBuffer** * **slice** () const =0

*Creates a new **LongBuffer** (p. 2291) whose content is a shared subsequence of this buffer's content.*

- virtual bool **operator==** (const **LongBuffer** &value) const

- virtual bool **operator<** (const **LongBuffer** &value) const

Static Public Member Functions

- static **LongBuffer** * **allocate** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
Allocates a new Double buffer.
- static **LongBuffer** * **wrap** (long long *array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
*Wraps the passed buffer with a new **LongBuffer** (p. 2291).*
- static **LongBuffer** * **wrap** (std::vector< long long > &buffer)
*Wraps the passed STL long long Vector in a **LongBuffer** (p. 2291).*

Protected Member Functions

- **LongBuffer** (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **LongBuffer** (p. 2291) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.*

6.498.1 Detailed Description

This class defines four categories of operations upon long long buffers: o Absolute and relative get and put methods that read and write single long longs; o Relative bulk get methods that transfer contiguous sequences of long longs from this buffer long longo an array; and o Relative bulk put methods that transfer contiguous sequences of long longs from a long long array or some other long long buffer long longo this buffer o Methods for compacting, duplicating, and slicing a long long buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing long long array long longo a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.498.2 Constructor & Destructor Documentation

6.498.2.1 decaf::nio::LongBuffer::LongBuffer (int capacity) throw (decaf::lang::exceptions::IllegalArgumentException) [protected]

Creates a **LongBuffer** (p. 2291) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity The size and limit of the **Buffer** (p. 855) in long longs.

Exceptions

IllegalArgumentException if capacity is negative.

6.498.2.2 `virtual decaf::nio::LongBuffer::~~LongBuffer () [inline, virtual]`

6.498.3 Member Function Documentation

6.498.3.1 `static LongBuffer* decaf::nio::LongBuffer::allocate (int capacity)
throw (decaf::lang::exceptions::IllegalArgumentException) [static]`

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity The size of the Double buffer in long longs.

Returns

the **LongBuffer** (p. 2291) that was allocated, caller owns.

6.498.3.2 `virtual long long* decaf::nio::LongBuffer::array () throw
(decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]`

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 855).

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2286).

6.498.3.3 `virtual int decaf::nio::LongBuffer::arrayOffset () throw
(decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset long longo the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2966) if this **Buffer** (p. 855) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2287).

6.498.3.4 virtual LongBuffer* decaf::nio::LongBuffer::asReadOnlyBuffer () const
[pure virtual]

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2287).

6.498.3.5 virtual LongBuffer& decaf::nio::LongBuffer::compact () throw (
ReadOnlyBufferException) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 860) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 859) - 1 is copied to index $n = \text{limit}()$ (p. 859) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **LongBuffer** (p. 2291).

Exceptions

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2287).

6.498.3.6 `virtual int decaf::nio::LongBuffer::compareTo (const LongBuffer & value) const` [virtual]

6.498.3.7 `virtual LongBuffer* decaf::nio::LongBuffer::duplicate ()` [pure virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new long long **Buffer** (p. 855) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2288).

6.498.3.8 `virtual bool decaf::nio::LongBuffer::equals (const LongBuffer & value) const` [virtual]

6.498.3.9 `LongBuffer& decaf::nio::LongBuffer::get (std::vector< long long > buffer) throw (BufferUnderflowException)`

Relative bulk get method.

This method transfers values from this buffer long longo the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 855).

Exceptions

BufferUnderflowException (p. 882) if there are fewer than length long longs remaining in this buffer.

6.498.3.10 `virtual long long decaf::nio::LongBuffer::get (int index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index The index in the **Buffer** (p. 855) where the long long is to be read.

Returns

the long long that is located at the given index.

Exceptions

IndexOutOfBoundsException if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2289).

6.498.3.11 **LongBuffer& decaf::nio::LongBuffer::get (long long * *buffer*, int *size*, int *offset*, int *length*) throw (BufferUnderflowException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)**

Relative bulk get method.

This method transfers long longs from this buffer long longo the given destination array. If there are fewer long longs remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 860), then no bytes are transferred and a **BufferUnderflowException** (p. 882) is thrown.

Otherwise, this method copies length long longs from this buffer long longo the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer The pointer to an allocated long long buffer to fill.

size The size of the passed in buffer.

offset The position in the buffer to start filling.

length The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 855).

Exceptions

BufferUnderflowException (p. 882) if there are fewer than length long longs remaining in this buffer

NullPointerException longerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.498.3.12 **virtual long long decaf::nio::LongBuffer::get () throw (BufferUnderflowException) [pure virtual]**

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position.

Exceptions

BufferUnderflowException (p. 882) if there no more data to return.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2288).

6.498.3.13 `virtual bool decaf::nio::LongBuffer::hasArray () const` [pure virtual]

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in `decaf::internal::nio::LongArrayBuffer` (p. 2289).

6.498.3.14 `virtual bool decaf::nio::LongBuffer::operator< (const LongBuffer & value) const` [virtual]**6.498.3.15** `virtual bool decaf::nio::LongBuffer::operator== (const LongBuffer & value) const` [virtual]**6.498.3.16** `virtual LongBuffer& decaf::nio::LongBuffer::put (long long value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value The long longs value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2966) if this buffer is read-only

Implemented in `decaf::internal::nio::LongArrayBuffer` (p. 2290).

6.498.3.17 `virtual LongBuffer& decaf::nio::LongBuffer::put (int index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters

index The position in the **Buffer** (p. 855) to write the data

value The long longs to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException if index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2966) if this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2289).

6.498.3.18 **LongBuffer& decaf::nio::LongBuffer::put (const long long * *buffer*, int *size*, int *offset*, int *length*) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)**

This method transfers long longs long longo this buffer from the given source array.

If there are more long longs to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 860), then no long longs are transferred and a **BufferOverflowException** (p. 880) is thrown.

Otherwise, this method copies `length` bytes from the given array long longo this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

buffer The array from which long longs are to be read.

size The size of the buffer passed.

offset The offset within the array of the first char to be read.

length The number of long longs to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if there is insufficient space in this buffer

ReadOnlyBufferException (p. 2966) if this buffer is read-only

NullPolong longerException if the passed buffer is null.

IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.498.3.19 **LongBuffer& decaf::nio::LongBuffer::put (std::vector< long long > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)**

This method transfers the entire content of the given source long longs array long longo this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size())`.

Parameters

buffer The buffer whose contents are copied to this **LongBuffer** (p. 2291).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if there is insufficient space in this buffer.

ReadOnlyBufferException (p. 2966) if this buffer is read-only.

6.498.3.20 `LongBuffer& decaf::nio::LongBuffer::put (LongBuffer & src
) throw (BufferOverflowException, ReadOnlyBufferException,
lang::exceptions::IllegalArgumentException)`

This method transfers the long longs remaining in the given source buffer long longo this buffer.

If there are more long longs remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 860), then no long longs are transferred and a **BufferOverflowException** (p. 880) is thrown.

Otherwise, this method copies `n = src.remaining()` long longs from the given buffer long longo this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src The buffer to take long longs from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 880) if there is insufficient space in this buffer for the remaining long longs in the source buffer

IllegalArgumentException if the source buffer is this buffer

ReadOnlyBufferException (p. 2966) if this buffer is read-only

6.498.3.21 `virtual LongBuffer* decaf::nio::LongBuffer::slice () const [pure
virtual]`

Creates a new **LongBuffer** (p. 2291) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **LongBuffer** (p. 2291) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2290).

6.498.3.22 `virtual std::string decaf::nio::LongBuffer::toString () const [virtual]`**Returns**

a std::string describing this object

6.498.3.23 `static LongBuffer* decaf::nio::LongBuffer::wrap (long long * array, int size, int offset, int length) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [static]`

Wraps the passed buffer with a new **LongBuffer** (p. 2291).

The new buffer will be backed by the given long long array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array The array that will back the new buffer.
size The size of the passed in array.
offset The offset of the subarray to be used.
length The length of the subarray to be used.

Returns

a new **LongBuffer** (p. 2291) that is backed by buffer, caller owns.

Exceptions

NullPointerException if the array pointer is NULL.
IndexOutOfBoundsException if the preconditions of size, offset, or length are not met.

6.498.3.24 `static LongBuffer* decaf::nio::LongBuffer::wrap (std::vector< long long > & buffer) [static]`

Wraps the passed STL long long Vector in a **LongBuffer** (p. 2291).

The new buffer will be backed by the given long long array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **LongBuffer** (p. 2291) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/LongBuffer.h`

6.499 activemq::util::LongSequenceGenerator Class Reference

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

```
#include <src/main/activemq/util/LongSequenceGenerator.h>
```

Public Member Functions

- **LongSequenceGenerator** ()
- virtual **~LongSequenceGenerator** ()
- long long **getNextSequenceId** ()
- long long **getLastSequenceId** ()

6.499.1 Detailed Description

This class is used to generate a sequence of long long values that are incremented each time a new value is requested. This class is thread safe so the ids can be requested in different threads safely.

6.499.2 Constructor & Destructor Documentation

6.499.2.1 `activemq::util::LongSequenceGenerator::LongSequenceGenerator ()`

6.499.2.2 `virtual
activemq::util::LongSequenceGenerator::~~LongSequenceGenerator ()
[inline, virtual]`

6.499.3 Member Function Documentation

6.499.3.1 `long long activemq::util::LongSequenceGenerator::getLastSequenceId ()`

Returns

the last id that was generated.

6.499.3.2 `long long activemq::util::LongSequenceGenerator::getNextSequenceId ()`

Returns

the next id in the sequence.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/LongSequenceGenerator.h`

6.500 decaf::net::MalformedURLException Class Reference

```
#include <src/main/decaf/net/MalformedURLException.h>
```

Inheritance diagram for decaf::net::MalformedURLException:

Public Member Functions

- **MalformedURLException** () throw ()
Default Constructor.
- **MalformedURLException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **MalformedURLException** (const MalformedURLException &ex) throw ()
Copy Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **MalformedURLException** (const std::exception *cause) throw ()
Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **MalformedURLException * clone** () const
Clones this exception.
- virtual **~MalformedURLException** () throw ()

6.500.1 Constructor & Destructor Documentation

6.500.1.1 decaf::net::MalformedURLException::MalformedURLException () throw () [inline]

Default Constructor.

6.500.1.2 `decaf::net::MalformedURLException::MalformedURLException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.500.1.3 `decaf::net::MalformedURLException::MalformedURLException (const MalformedURLException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.500.1.4 `decaf::net::MalformedURLException::MalformedURLException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.500.1.5 `decaf::net::MalformedURLException::MalformedURLException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.500.1.6 `decaf::net::MalformedURLException::MalformedURLException (const char * file, const int lineNumber, const char * msg, ...) throw ()`
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.500.1.7 `virtual decaf::net::MalformedURLException::~~MalformedURLException () throw ()` [inline, virtual]

6.500.2 Member Function Documentation

6.500.2.1 `virtual MalformedURLException* decaf::net::MalformedURLException::clone () const`
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 2005).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/MalformedURLException.h`

6.501 decaf::util::Map< K, V, COMPARATOR > Class Template Reference

Map (p. 2305) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

`#include <src/main/decaf/util/Map.h>`

Inheritance diagram for `decaf::util::Map< K, V, COMPARATOR >`:

Data Structures

- class **Entry**

Public Member Functions

- **Map** ()
Default constructor - does nothing.
- virtual **~Map** ()
- virtual bool **equals** (const **Map** &source) const =0
Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (const **Map** &source)=0
Copies the content of the source map into this map.
- virtual void **clear** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
- virtual bool **containsKey** (const K &key) const =0
Indicates whether or this map contains a value for the given key.
- virtual bool **containsValue** (const V &value) const =0
Indicates whether or this map contains a value for the given value, i.e.
- virtual bool **isEmpty** () const =0
- virtual std::size_t **size** () const =0
- virtual V & **get** (const K &key)=0 throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 2305).*
- virtual const V & **get** (const K &key) const =0 throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 2305).*
- virtual void **put** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
Sets the value for the specified key.
- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
*Stores a copy of the Mappings contained in the other **Map** (p. 2305) in this one.*
- virtual V **remove** (const K &key)=0 throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)
Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.
- virtual std::vector< K > **keySet** () const =0
*Returns a **Set** (p. 3220) view of the mappings contained in this map.*
- virtual std::vector< V > **values** () const =0

6.501.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::Map< K, V, COMPARATOR >
```

Map (p. 2305) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

6.501.2 Constructor & Destructor Documentation

6.501.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::Map< K, V, COMPARATOR >::Map ()` [inline]

Default constructor - does nothing.

6.501.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::Map< K, V, COMPARATOR >::~~Map ()` [inline, virtual]

6.501.3 Member Function Documentation

6.501.3.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::clear ()` throw (`decaf::lang::exceptions::UnsupportedOperationException`) [pure virtual]

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1145), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3374), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1145), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1145), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1145), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1145), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1145), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1145), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3374), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3374), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3374), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3374),

decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3374), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3374), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3374), decaf::util::StlMap< std::string, TransportFactory * > (p. 3374), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3374), decaf::util::StlMap< int, Pointer< Command > > (p. 3374), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3374), decaf::util::StlMap< std::string, CachedProducer * > (p. 3374), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3374).

6.501.3.2 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR
>::containsKey (const K & key) const [pure virtual]`

Indicates whether or this map contains a value for the given key.

Parameters

key The key to look up.

Returns

true if this map contains the value, otherwise false.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1146), decaf::util::StlMap< K, V, COMPARATOR > (p. 3374), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1146), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1146), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1146), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1146), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1146), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1146), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 3374), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 3374), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3374), decaf::util::StlMap< std::string, cms::Queue * > (p. 3374), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3374), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3374), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3374), decaf::util::StlMap< std::string, TransportFactory * > (p. 3374), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3374), decaf::util::StlMap< int, Pointer< Command > > (p. 3374), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3374), decaf::util::StlMap< std::string, CachedProducer * > (p. 3374), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3374).

6.501.3.3 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR
>::containsValue (const V & value) const [pure virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1146), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3374), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1146), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1146), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1146), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1146), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1146), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1146), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3374), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3374), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3374), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3374), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 3374), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3374), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 3374), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3374), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3374), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3374), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 3374), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 3374), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 3374).

6.501.3.4 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR
>::copy (const Map< K, V, COMPARATOR > & source) [pure
virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source The source object to copy from.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1147), and `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3375).

```
6.501.3.5  template<typename K, typename V, typename COMPARATOR =
            std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR
            >::equals ( const Map< K, V, COMPARATOR > & source ) const
            [pure virtual]
```

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source - `Map` (p. 2305) to compare to this one.

Returns

true if the `Map` (p. 2305) passed is equal in value to this one.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1147), and `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3375).

```
6.501.3.6  template<typename K, typename V, typename COMPARATOR =
            std::less<K>> virtual V& decaf::util::Map< K, V, COMPARATOR >::get
            ( const K & key ) throw ( lang::exceptions::NoSuchElementException )
            [pure virtual]
```

Gets the value mapped to the specified key in the `Map` (p. 2305).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters

key The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the `Map` (p. 2305).

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1147), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3376), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1147), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1147), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR`

> (p. 1147), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1147), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1147), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1147), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 3376), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 3376), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3376), decaf::util::StlMap< std::string, cms::Queue * > (p. 3376), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3376), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3376), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3376), decaf::util::StlMap< std::string, TransportFactory * > (p. 3376), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3376), decaf::util::StlMap< int, Pointer< Command > > (p. 3376), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3376), decaf::util::StlMap< std::string, CachedProducer * > (p. 3376), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3376).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals().

6.501.3.7 template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual const V& decaf::util::Map< K, V,
COMPARATOR >::get (const K & *key*) const throw (
lang::exceptions::NoSuchElementException) [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 2305).

If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2305).

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1148), decaf::util::StlMap< K, V, COMPARATOR > (p. 3376), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1148), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1148), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR

> (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1148), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3376), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3376), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3376), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3376), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 3376), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3376), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 3376), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3376), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3376), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3376), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 3376), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 3376), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 3376).

6.501.3.8 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::isEmpty () const [pure virtual]`

Returns

if the `Map` (p. 2305) contains any element or not, `TRUE` or `FALSE`

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1148), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3377), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1148), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3377), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3377), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3377), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3377), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3377),

decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3377), decaf::util::StlMap< std::string, CachedProducer * > (p. 3377), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3377).

6.501.3.9 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual std::vector<K> decaf::util::Map< K, V,
COMPARATOR >::keySet () const [pure virtual]`

Returns a **Set** (p. 3220) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 2014), **Set.remove** (p. 151), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns

the entire set of keys in this map as a std::vector.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1148), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3377), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1148), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1148), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3377), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3377), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3377), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3377), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3377), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 3377), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 3377), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 3377).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals()`.

6.501.3.10 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::put (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1150), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3378), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1150), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1150), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3378), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3378), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3378), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3378), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 3378), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3378), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 3378), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3378), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3378), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3378), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 3378), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 3378), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 3378).

6.501.3.11 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 2305) in this one.

Parameters

other A **Map** (p. 2305) instance whose elements are to all be inserted in this **Map** (p. 2305).

Exceptions

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1150), decaf::util::StlMap< K, V, COMPARATOR > (p. 3379), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1150), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1150), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1150), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1150), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1150), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1150), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 3379), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 3379), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3379), decaf::util::StlMap< std::string, cms::Queue * > (p. 3379), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3379), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3379), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3379), decaf::util::StlMap< std::string, TransportFactory * > (p. 3379), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3379), decaf::util::StlMap< int, Pointer< Command > > (p. 3379), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3379), decaf::util::StlMap< std::string, CachedProducer * > (p. 3379), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3379).

```
6.501.3.12  template<typename K, typename V, typename COMPARATOR
            = std::less<K>> virtual V decaf::util::Map< K, V,
            COMPARATOR >::remove ( const K & key ) throw
            ( decaf::lang::exceptions::NoSuchElementException,
            decaf::lang::exceptions::UnsupportedOperationException ) [pure
            virtual]
```

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException if this key is not in the **Map** (p. 2305).

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1152), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3379), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1152), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1152), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1152), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1152), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1152), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1152), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 3379), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 3379), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 3379), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 3379), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 3379), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 3379), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 3379), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 3379), `decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >` (p. 3379), `decaf::util::StlMap< int, Pointer< Command > >` (p. 3379), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 3379), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 3379), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 3379).

```
6.501.3.13  template<typename K, typename V, typename COMPARATOR
              = std::less<K>> virtual std::size_t decaf::util::Map< K, V,
              COMPARATOR >::size ( ) const [pure virtual]
```

Returns

The number of elements (key/value pairs) in this map.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1153), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 3379), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1153), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1153), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1153), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1153), `decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >` (p. 1153),

decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1153), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 3379), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 3379), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3379), decaf::util::StlMap< std::string, cms::Queue * > (p. 3379), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3379), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3379), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3379), decaf::util::StlMap< std::string, TransportFactory * > (p. 3379), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3379), decaf::util::StlMap< int, Pointer< Command > > (p. 3379), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3379), decaf::util::StlMap< std::string, CachedProducer * > (p. 3379), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3379).

6.501.3.14 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual std::vector<V> decaf::util::Map< K, V,
COMPARATOR >::values () const [pure virtual]`

Returns

the entire set of values in this map as a std::vector.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1154), decaf::util::StlMap< K, V, COMPARATOR > (p. 3380), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1154), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1154), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1154), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1154), decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR > (p. 1154), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1154), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 3380), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 3380), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 3380), decaf::util::StlMap< std::string, cms::Queue * > (p. 3380), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 3380), decaf::util::StlMap< std::string, CachedConsumer * > (p. 3380), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 3380), decaf::util::StlMap< std::string, TransportFactory * > (p. 3380), decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR > (p. 3380), decaf::util::StlMap< int, Pointer< Command > > (p. 3380), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 3380), decaf::util::StlMap< std::string, CachedProducer * > (p. 3380), and decaf::util::StlMap< std::string, cms::Topic * > (p. 3380).

6.502 cms::MapMessage Class Reference

A **MapMessage** (p. 2318) object is used to send a set of name-value pairs.

```
#include <src/main/cms/MapMessage.h>
```

Inheritance diagram for cms::MapMessage:

Public Member Functions

- virtual `~MapMessage ()`
- virtual `std::vector< std::string > getMapNames () const =0 throw (CMSEException)`
*Returns an Enumeration of all the names in the **MapMessage** (p. 2318) object.*
- virtual `bool itemExists (const std::string &name) const =0 throw (CMSEException)`
*Indicates whether an item exists in this **MapMessage** (p. 2318) object.*
- virtual `bool getBoolean (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)`
Returns the Boolean value of the Specified name.
- virtual `void setBoolean (const std::string &name, bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)`
Sets a boolean value with the specified name into the Map.
- virtual `unsigned char getByte (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)`
Returns the Byte value of the Specified name.
- virtual `void setByte (const std::string &name, unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)`
Sets a Byte value with the specified name into the Map.
- virtual `std::vector< unsigned char > getBytes (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)`
Returns the Bytes value of the Specified name.
- virtual `void setBytes (const std::string &name, const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)`
Sets a Bytes value with the specified name into the Map.
- virtual `char getChar (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)`
Returns the Char value of the Specified name.

- virtual void **setChar** (const std::string &name, char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Char value with the specified name into the Map.
- virtual double **getDouble** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Double value of the Specified name.
- virtual void **setDouble** (const std::string &name, double value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Double value with the specified name into the Map.
- virtual float **getFloat** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Float value of the Specified name.
- virtual void **setFloat** (const std::string &name, float value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Float value with the specified name into the Map.
- virtual int **getInt** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Int value of the Specified name.
- virtual void **setInt** (const std::string &name, int value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Int value with the specified name into the Map.
- virtual long long **getLong** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Long value of the Specified name.
- virtual void **setLong** (const std::string &name, long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Long value with the specified name into the Map.
- virtual short **getShort** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Short value of the Specified name.
- virtual void **setShort** (const std::string &name, short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Short value with the specified name into the Map.
- virtual std::string **getString** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the String value of the Specified name.
- virtual void **setString** (const std::string &name, const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a String value with the specified name into the Map.

6.502.1 Detailed Description

A **MapMessage** (p.2318) object is used to send a set of name-value pairs. The names are String objects, and the values are primitive data types in the Java programming language. The names must have a value that is not null, and not an empty string. The entries can be accessed sequentially or randomly by name. The order of the entries is undefined. **MapMessage** (p.2318) inherits from the **Message** (p.2375) interface and adds a message body that contains a Map.

When a client receives a **MapMessage** (p.2318), it is in read-only mode. If a client attempts to write to the message at this point, a **MessageNotWriteableException** (p.2549) is thrown. To place the **MapMessage** (p.2318) back into a state where it can be read from and written to, call the `clearBody` method.

MapMessage (p.2318) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p.1074). The String-to-primitive conversions may throw a **MessageFormatException** (p.2493) if the primitive's `valueOf()` method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X
double								X		X
String	X	X	X		X	X	X	X	X	
byte[]										X

6.502.2 Constructor & Destructor Documentation

6.502.2.1 `virtual cms::MapMessage::~MapMessage () [inline, virtual]`

6.502.3 Member Function Documentation

6.502.3.1 `virtual bool cms::MapMessage::getBoolean (const std::string & name) const throw (cms::MessageFormatException, cms::CMSEException) [pure virtual]`

Returns the Boolean value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

6.502.3.2 virtual unsigned char cms::MapMessage::getByte (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSEException) [pure virtual]

Returns the Byte value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.502.3.3 virtual std::vector<unsigned char> cms::MapMessage::getBytes (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSEException) [pure virtual]

Returns the Bytes value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.502.3.4 virtual char cms::MapMessage::getChar (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSEException) [pure virtual]

Returns the Char value of the Specified name.

Parameters

name name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

```

6.502.3.5 virtual double cms::MapMessage::getDouble ( const std::string & name
) const throw ( cms::MessageFormatException, cms::CMSException )
[pure virtual]

```

Returns the Double value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

```

6.502.3.6 virtual float cms::MapMessage::getFloat ( const std::string & name
) const throw ( cms::MessageFormatException, cms::CMSException )
[pure virtual]

```

Returns the Float value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

```

6.502.3.7 virtual int cms::MapMessage::getInt ( const std::string & name ) const
throw ( cms::MessageFormatException, cms::CMSException ) [pure
virtual]

```

Returns the Int value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

```

6.502.3.8 virtual long long cms::MapMessage::getLong ( const std::string & name
) const throw ( cms::MessageFormatException, cms::CMSException )
[pure virtual]

```

Returns the Long value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.502.3.9 `virtual std::vector< std::string > cms::MapMessage::getMapNames ()
const throw (CMSEException) [pure virtual]`

Returns an Enumeration of all the names in the **MapMessage** (p. 2318) object.

Returns

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 2318)

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

6.502.3.10 `virtual short cms::MapMessage::getShort (const std::string & name)
const throw (cms::MessageFormatException, cms::CMSEException)
[pure virtual]`

Returns the Short value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.502.3.11 `virtual std::string cms::MapMessage::getString (const std::string
& name) const throw (cms::MessageFormatException,
cms::CMSEException) [pure virtual]`

Returns the String value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.502.3.12 `virtual bool cms::MapMessage::itemExists (const std::string & name) const throw (CMSEException) [pure virtual]`

Indicates whether an item exists in this **MapMessage** (p. 2318) object.

Parameters

name String name of the Object in question

Returns

boolean value indicating if the name is in the map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

6.502.3.13 `virtual void cms::MapMessage::setBoolean (const std::string & name, bool value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a boolean value with the specified name into the Map.

Parameters

name the name of the boolean

value the boolean value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.14 `virtual void cms::MapMessage::setByte (const std::string & name, unsigned char value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a Byte value with the specified name into the Map.

Parameters

name the name of the Byte

value the Byte value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.15 `virtual void cms::MapMessage::setBytes (const std::string & name, const std::vector< unsigned char > & value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a Bytes value with the specified name into the Map.

Parameters

name The name of the Bytes

value The Bytes value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.16 `virtual void cms::MapMessage::setChar (const std::string & name, char value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a Char value with the specified name into the Map.

Parameters

name the name of the Char

value the Char value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.17 `virtual void cms::MapMessage::setDouble (const std::string & name, double value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a Double value with the specified name into the Map.

Parameters

name The name of the Double

value The Double value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.18 `virtual void cms::MapMessage::setFloat (const std::string & name, float value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Sets a Float value with the specified name into the Map.

Parameters

name The name of the Float

value The Float value to set in the Map

Exceptions

CMSException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.19 `virtual void cms::MapMessage::setInt (const std::string & name, int value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Sets a Int value with the specified name into the Map.

Parameters

name The name of the Int

value The Int value to set in the Map

Exceptions

CMSException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.20 `virtual void cms::MapMessage::setLong (const std::string & name, long long value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Sets a Long value with the specified name into the Map.

Parameters

name The name of the Long

value The Long value to set in the Map

Exceptions

CMSException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.21 `virtual void cms::MapMessage::setShort (const std::string & name, short value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a Short value with the specified name into the Map.

Parameters

name The name of the Short

value The Short value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

6.502.3.22 `virtual void cms::MapMessage::setString (const std::string & name, const std::string & value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Sets a String value with the specified name into the Map.

Parameters

name The name of the String

value The String value to set in the Map

Exceptions

CMSEException (p. 1074) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2549) - if the **Message** (p. 2375) is in Read-only Mode.

The documentation for this class was generated from the following file:

- `src/main/cms/MapMessage.h`

6.503 decaf::util::logging::MarkBlockLogger Class Reference

Defines a class that can be used to mark the entry and exit from scoped blocks.

```
#include <src/main/decaf/util/logging/MarkBlockLogger.h>
```

Public Member Functions

- **MarkBlockLogger** (**Logger** *logger, const std::string &blockName)
Constructor - Marks Block entry.
- virtual **~MarkBlockLogger** ()

6.503.1 Detailed Description

Defines a class that can be used to mark the entry and exit from scoped blocks. Create an instance of this class at the start of a scoped block, passing it the logger to use and the name of the block. The block entry and exit will be marked using the scope name, logger to the logger at the MARKBLOCK log level.

6.503.2 Constructor & Destructor Documentation

6.503.2.1 `decaf::util::logging::MarkBlockLogger::MarkBlockLogger (Logger * logger, const std::string & blockName) [inline]`

Constructor - Marks Block entry.

Parameters

- logger* **Logger** (p.2237) to use
- blockName* Block name

6.503.2.2 `virtual decaf::util::logging::MarkBlockLogger::~MarkBlockLogger () [inline, virtual]`

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/MarkBlockLogger.h`

6.504 activemq::wireformat::MarshalAware Class Reference

```
#include <src/main/activemq/wireformat/MarshalAware.h>
```

Inheritance diagram for `activemq::wireformat::MarshalAware`:

Public Member Functions

- virtual `~MarshalAware ()`
- virtual bool `isMarshalAware () const =0`
Determine if the class implementing this interface is really wanting to be told about marshaling.
- virtual void `beforeMarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called before marshaling is started to prepare the object to be marshaled.
- virtual void `afterMarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called after marshaling is started to cleanup the object being marshaled.

- virtual void **beforeUnmarshal** (**WireFormat** *wireFormat)=0 throw (decaf::io::IOException)
Called before unmarshaling is started to prepare the object to be unmarshaled.
- virtual void **afterUnmarshal** (**WireFormat** *wireFormat)=0 throw (decaf::io::IOException)
Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual void **setMarshaledForm** (**WireFormat** *wireFormat, const std::vector< char > &data)=0
Called to set the data to this object that will contain the objects marshaled form.
- virtual std::vector< unsigned char > **getMarshaledForm** (**WireFormat** *wireFormat)=0
Called to get the data to this object that will contain the objects marshaled form.

6.504.1 Constructor & Destructor Documentation

- 6.504.1.1** virtual **activemq::wireformat::MarshalAware::~~MarshalAware** ()
 [inline, virtual]

6.504.2 Member Function Documentation

- 6.504.2.1** virtual void **activemq::wireformat::MarshalAware::afterMarshal** (**WireFormat** * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called after marshaling is started to cleanup the object being marshaled.

Parameters

wireFormat - the wireformat object to control marshaling

- 6.504.2.2** virtual void **activemq::wireformat::MarshalAware::afterUnmarshal** (**WireFormat** * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

- 6.504.2.3** virtual void **activemq::wireformat::MarshalAware::beforeMarshal** (**WireFormat** * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

wireFormat - the wireformat object to control marshaling

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 319), and `activemq::commands::ActiveMQTextMessage` (p. 606).

6.504.2.4 `virtual void activemq::wireformat::MarshalAware::beforeUnmarshal (WireFormat * wireFormat) throw (decaf::io::IOException)` [pure virtual]

Called before unmarshaling is started to prepare the object to be unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

6.504.2.5 `virtual std::vector<unsigned char> activemq::wireformat::MarshalAware::getMarshaledForm (WireFormat * wireFormat)` [pure virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters

wireFormat - the wireformat object to control unmarshaling

Returns

buffer that holds the objects data.

6.504.2.6 `virtual bool activemq::wireformat::MarshalAware::isMarshalAware () const` [pure virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 324), `activemq::commands::BaseDataStructure` (p. 767), `activemq::commands::Message` (p. 2368), and `activemq::commands::WireFormatInfo` (p. 3723).

6.504.2.7 `virtual void activemq::wireformat::MarshalAware::setMarshaledForm (WireFormat * wireFormat, const std::vector< char > & data)` [pure virtual]

Called to set the data to this object that will contain the objects marshaled form.

Parameters

- wireFormat* - the wireformat object to control unmarshaling
- data* - vector of object binary data

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/MarshalAware.h

6.505 activemq::wireformat::openwire::marshal::v6::MarshallerFactory Class Reference

Used to create marshallers for a specific version of the wire protocol.

Public Member Functions

- **MarshallingSupport** ()
- virtual **~MarshallingSupport** ()

Static Public Member Functions

- static void **writeString** (decaf::io::DataOutputStream &dataOut, const std::string &value) throw (decaf::io::IOException)
Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.
- static void **writeString16** (decaf::io::DataOutputStream &dataOut, const std::string &value) throw (decaf::io::IOException)
Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.
- static void **writeString32** (decaf::io::DataOutputStream &dataOut, const std::string &value) throw (decaf::io::IOException)
Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

- static std::string **readString16** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)

Reads an Openwire encoded string from the provided DataInputStream.

- static std::string **readString32** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)

Reads an Openwire encoded string from the provided DataInputStream.

- static std::string **asciiToModifiedUtf8** (const std::string &asciiString) throw (decaf::io::UTFDataFormatException)

Given an ASCII String with byte values [0..255] convert the string to a string containing the modified UTF-8 form of that same string.

- static std::string **modifiedUtf8ToAscii** (const std::string modifiedUtf8String) throw (decaf::io::UTFDataFormatException)

Given a string that contains bytes in the Java Modified UTF-8 format convert that string back into ASCII values from [0..255].

6.511.1 Constructor & Destructor Documentation

6.511.1.1 activemq::util::MarshallingSupport::MarshallingSupport ()

6.511.1.2 virtual activemq::util::MarshallingSupport::~~MarshallingSupport () [virtual]

6.511.2 Member Function Documentation

6.511.2.1 static std::string activemq::util::MarshallingSupport::asciiToModifiedUtf8 (const std::string & *asciiString*) throw (decaf::io::UTFDataFormatException) [static]

Given an ASCII String with byte values [0..255] convert the string to a string containing the modified UTF-8 form of that same string.

This allows an ASCII string containing values greater than 127 as well as embedded NULLs to be sent to a Java client.

Parameters

asciiString The ASCII string to encode as Modified UTF-8

Returns

a string containing the Modified UTF-8 encoded form of the provided string.

Exceptions

UTFDataFormatException if the length of the encoded string would exceed the size of an signed integer.

6.511.2.2 `static std::string activemq::util::MarshallingSupport::modifiedUtf8ToAscii (const std::string modifiedUtf8String) throw (decaf::io::UTFDataFormatException) [static]`

Given a string that contains bytes in the Java Modified UTF-8 format convert that string back into ASCII values from [0..255].

This will handle any string sent from a Java client which contains values within the [0..255] range or has embedded Nulls. Strings that have encoded values greater than 255 will cause an exception to be thrown.

Parameters

modifiedUtf8String The string to convert from Modified UTF-8 to ASCII.

Returns

the ASCII encoded version of the provided string.

Exceptions

UTFDataFormatException if the provided string contains invalid data or the character values encoded in the string exceed ASCII value 255.

6.511.2.3 `static std::string activemq::util::MarshallingSupport::readString16 (decaf::io::DataInputStream & dataIn) throw (decaf::io::IOException) [static]`

Reads an Openwire encoded string from the provided DataInputStream.

No string processing is performed by this method, clients that know the data contains UTF-8 encoded content must use one of the utility methods of this class to decode the UTF-8 data.

This version assumes a size prefix of 16bits.

Parameters

dataIn The DataInputStream to read the String data from.

Returns

the String value.

Exceptions

IOException if an I/O error occurs while writing the string.

6.511.2.4 `static std::string activemq::util::MarshallingSupport::readString32 (decaf::io::DataInputStream & dataIn) throw (decaf::io::IOException) [static]`

Reads an Openwire encoded string from the provided DataInputStream.

No string processing is performed by this method, clients that know the data contains UTF-8 encoded content must use one of the utility methods of this class to decode the UTF-8 data.

This version assumes a size prefix of 32bits.

Parameters

dataIn The DataInputStream to read the String data from.

Returns

the String value.

Exceptions

IOException if an I/O error occurs while writing the string.

```
6.511.2.5 static void activemq::util::MarshallingSupport::writeString (
    decaf::io::DataOutputStream & dataOut, const std::string & value )
    throw ( decaf::io::IOException ) [static]
```

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

User must encode to Modified UTF-8 as needed.

Parameters

dataOut The DataOutputStream to write the String data to.

value Thre String value to write in Openwire form.

Exceptions

IOException if an I/O error occurs while writing the string.

```
6.511.2.6 static void activemq::util::MarshallingSupport::writeString16 (
    decaf::io::DataOutputStream & dataOut, const std::string & value )
    throw ( decaf::io::IOException ) [static]
```

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

User must encode to Modified UTF-8 as needed. This method write out only the size as a short and the string data no Openwire Type tag is appended.

Parameters

dataOut The DataOutputStream to write the String data to.

value Thre String value to write in Openwire form.

Exceptions

IOException if an I/O error occurs while writing the string.

6.511.2.7 `static void activemq::util::MarshallingSupport::writeString32 (decaf::io::DataOutputStream & dataOut, const std::string & value) throw (decaf::io::IOException) [static]`

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

User must encode to Modified UTF-8 as needed. This method write out only the size as a int and the string data no Openwire Type tag is appended.

Parameters

dataOut The DataOutputStream to write the String data to.

value Thre String value to write in Openwire form.

Exceptions

IOException if an I/O error occurs while writing the string.

6.512 decaf::lang::Math Class Reference

The class `Math` (p. 2339) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

`#include <src/main/decaf/lang/Math.h>`

Public Member Functions

- `Math ()`
- `virtual ~Math ()`

Static Public Member Functions

- static int **abs** (int value)
Returns the absolute value of an int value.
- static long long **abs** (long long value)
Returns the absolute value of an long long value.
- static float **abs** (float value)
Returns the absolute value of a float value.
- static double **abs** (double value)
Returns the absolute value of a double value.
- static double **sqrt** (double value)
Returns the arc cosine of an angle, in the range of 0.0 through pi.

- static double **pow** (double base, double exp)
Returns the value of the first argument raised to the power of the second argument.
- static short **min** (short a, short b)
Returns the double value that is closest in value to the argument and is equal to a mathematical integer.
- static int **min** (int a, int b)
*Returns the smaller of two **int** values.*
- static unsigned int **min** (unsigned int a, unsigned int b)
*Returns the smaller of two **unsigned int** values.*
- static long long **min** (long long a, long long b)
*Returns the smaller of two **long long** values.*
- static float **min** (float a, float b)
Returns the smaller of two float values.
- static double **min** (double a, double b)
Returns the smaller of two double values.
- static short **max** (short a, short b)
*Returns the larger of two **short** values.*
- static int **max** (int a, int b)
*Returns the larger of two **int** values.*
- static long long **max** (long long a, long long b)
*Returns the larger of two **long long** values.*
- static float **max** (float a, float b)
Returns the greater of two float values.
- static double **max** (double a, double b)
Returns the greater of two double values.
- static double **ceil** (double value)
Returns the natural logarithm (base e) of a double value.
- static double **floor** (double value)
Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.
- static int **round** (float value)
Returns the closest int to the argument.
- static long long **round** (double value)
Returns the closest long long to the argument.

- static double **random** ()
Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.
- static float **signum** (float value)
Returns Euler's number e raised to the power of a double value.
- static double **signum** (double value)
Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.
- static double **toRadians** (double angdeg)
Returns the measure in radians of the supplied degree angle.
- static double **toDegrees** (double angrad)
Returns the measure in degrees of the supplied radian angle.

Static Public Attributes

- static const double **E**
- static const double **PI**

6.512.1 Detailed Description

The class `Math` (p. 2339) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

6.512.2 Constructor & Destructor Documentation

6.512.2.1 `decaf::lang::Math::Math ()` [inline]

6.512.2.2 `virtual decaf::lang::Math::~~Math ()` [inline, virtual]

6.512.3 Member Function Documentation

6.512.3.1 `static int decaf::lang::Math::abs (int value)` [inline, static]

Returns the absolute value of an int value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.512.3.2 `static long long decaf::lang::Math::abs (long long value) [inline, static]`

Returns the absolute value of an long long value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.512.3.3 `static double decaf::lang::Math::abs (double value) [static]`

Returns the absolute value of a double value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

- o If the argument is positive zero or negative zero, the result is positive zero.
- o If the argument is infinite, the result is positive infinity.
- o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: `Double::longBitsToDouble (p.1678)(0x7fffffffffffffffULL & Double::doubleToLongBits(value))`

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.512.3.4 `static float decaf::lang::Math::abs (float value) [static]`

Returns the absolute value of a float value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

- o If the argument is positive zero or negative zero, the result is positive zero.
- o If the argument is infinite, the result is positive infinity.
- o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: `Float::intBitsToFloat (p.1786)(0x7fffffff & Float::floatToIntBits(value))`

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.512.3.5 static double decaf::lang::Math::ceil (double *value*) [static]

Returns the natural logarithm (base e) of a double value.

Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity.

Parameters

value the value to compute the natural log of.

Returns

the natural log of value. Returns the base 10 logarithm of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity. o If the argument is equal to 10^n for integer n , then the result is n .

Parameters

value - the value to operate on

Returns

the long base 10 of value Returns the natural logarithm of the sum of the argument and 1. Note that for small values x , the result of $\log_{10}(x)$ is much closer to the true result of $\ln(1 + x)$ than the floating-point evaluation of $\log(1.0+x)$.

Special cases:

o If the argument is NaN or less than -1, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative one, then the result is negative infinity. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to operate on

Returns

the the value $\ln(x + 1)$, the natural log of $x + 1$ Returns the smallest (closest to negative infinity) double value that is greater than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument. o If the argument value is less than zero but greater than -1.0, then the result is negative zero.

Note that the value of $\text{Math.ceil}(x)$ is exactly the value of $-\text{Math.floor}(-x)$.

Parameters

value - the value to find the ceiling of

Returns

the smallest (closest to negative infinity) floating-point value that is greater than or equal to the argument and is equal to a mathematical integer.

6.512.3.6 static double decaf::lang::Math::floor (double *value*) [static]

Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.

Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters

value - the value to find the floor of

Returns

the largest (closest to positive infinity) floating-point value that less than or equal to the argument and is equal to a mathematical integer.

6.512.3.7 static float decaf::lang::Math::max (float *a*, float *b*) [static]

Returns the greater of two float values.

That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters

a - an argument.

b - another argument.

Returns

the larger of *a* and *b*.

6.512.3.8 static double decaf::lang::Math::max (double *a*, double *b*) [static]

Returns the greater of two double values.

That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the larger of *a* and *b*.

6.512.3.9 `static short decaf::lang::Math::max (short a, short b) [inline, static]`

Returns the larger of two `short` values.

That is, the result the argument closer to the value of `Short::MAX_VALUE` (p. 3229). If the arguments have the same value, the result is that same value.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the larger of *a* and *b*.

6.512.3.10 `static int decaf::lang::Math::max (int a, int b) [inline, static]`

Returns the larger of two `int` values.

That is, the result the argument closer to the value of `Integer::MAX_VALUE` (p. 1956). If the arguments have the same value, the result is that same value.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the larger of *a* and *b*.

6.512.3.11 `static long long decaf::lang::Math::max (long long a, long long b) [inline, static]`

Returns the larger of two `long long` values.

That is, the result the argument closer to the value of `Long::MAX_VALUE` (p. 2281). If the arguments have the same value, the result is that same value.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the larger of **a** and **b**.

6.512.3.12 `static int decaf::lang::Math::min (int a, int b) [inline, static]`

Returns the smaller of two `int` values.

That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p.1956). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the smaller of **a** and **b**.

6.512.3.13 `static unsigned int decaf::lang::Math::min (unsigned int a, unsigned int b) [inline, static]`

Returns the smaller of two `unsigned int` values.

That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p.1956). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the smaller of **a** and **b**.

6.512.3.14 `static long long decaf::lang::Math::min (long long a, long long b) [inline, static]`

Returns the smaller of two `long long` values.

That is, the result the argument closer to the value of `Long::MIN_VALUE` (p.2281). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the smaller of **a** and **b**.

6.512.3.15 static float decaf::lang::Math::min (float *a*, float *b*) [static]

Returns the smaller of two float values.

That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the smaller of *a* and *b*.

6.512.3.16 static double decaf::lang::Math::min (double *a*, double *b*) [static]

Returns the smaller of two double values.

That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the smaller of *a* and *b*.

6.512.3.17 static short decaf::lang::Math::min (short *a*, short *b*) [inline, static]

Returns the double value that is closest in value to the argument and is equal to a mathematical integer.

If two double values that are mathematical integers are equally close, the result is the integer value that is even. Special cases:

- o If the argument value is already equal to a mathematical integer, then the result is the same as the argument.
- o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters

- value* - the value to round to the nearest integer

Returns

the rounded value Returns the smaller of two short values. That is, the result is the argument closer to the value of `decaf.lang.Short::MIN_VALUE` (p. 3229). If the arguments have the same value, the result is that same value.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the smaller of *a* and *b*.

6.512.3.18 `static double decaf::lang::Math::pow (double base, double exp)`
[static]

Returns the value of the first argument raised to the power of the second argument.

Special cases:

- o If the second argument is positive or negative zero, then the result is 1.0.
- o If the second argument is 1.0, then the result is the same as the first argument.
- o If the second argument is NaN, then the result is NaN.
- o If the first argument is NaN and the second argument is nonzero, then the result is NaN.

Parameters

- base* - the base
- exp* - the exponent

Returns

the base raised to the power of *exp*.

6.512.3.19 `static double decaf::lang::Math::random ()` [static]

Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.

The remainder value is mathematically equal to $f1 - f2 \times n$, where *n* is the mathematical integer closest to the exact mathematical value of the quotient $f1/f2$, and if two mathematical integers are equally close to $f1/f2$, then *n* is the integer that is even. If the remainder is zero, its sign is the same as the sign of the first argument. Special cases:

- o If either argument is NaN, or the first argument is infinite, or the second argument is positive zero or negative zero, then the result is NaN.
- o If the first argument is finite and the second argument is infinite, then the result is the same as the first argument.

Parameters

- f1* - the dividend.
- f2* - the divisor

Returns

the IEEE remainder of value Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0. Returned values are chosen pseudorandomly with (approximately) uniform distribution from that range.

When this method is first called, it creates a single new pseudorandom-number generator; This new pseudorandom-number generator is used thereafter for all calls to this method and is used nowhere else.

This method is properly synchronized to allow correct use by more than one thread. However, if many threads need to generate pseudorandom numbers at a great rate, it may reduce contention for each thread to have its own pseudorandom-number generator.

Returns

a pseudorandom double greater than or equal to 0.0 and less than 1.0.

6.512.3.20 static long long decaf::lang::Math::round (double *value*) [static]

Returns the closest long long to the argument.

The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type long long. In other words, the result is equal to the value of the expression: (long long)**Math.floor** (p. 2344)(a + 0.5d)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Long::MIN_VALUE** (p. 2281), the result is equal to the value of **Long::MIN_VALUE** (p. 2281). o If the argument is positive infinity or any value greater than or equal to the value of **Long::MAX_VALUE** (p. 2281), the result is equal to the value of **Long::MAX_VALUE** (p. 2281).

Parameters

value - the value to round

Returns

the value of the argument rounded to the nearest integral value.

6.512.3.21 static int decaf::lang::Math::round (float *value*) [static]

Returns the closest int to the argument.

The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type int. In other words, the result is equal to the value of the expression: (int)**Math.floor** (p. 2344)(a + 0.5f)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Integer::MIN_VALUE** (p. 1956), the result is equal to the value of **Integer::MIN_VALUE** (p. 1956). o If the argument is positive infinity or any value greater than or equal to the value of **Integer::MAX_VALUE** (p. 1956), the result is equal to the value of **Integer::MAX_VALUE** (p. 1956).

Parameters

value - the value to round

Returns

the value of the argument rounded to the nearest integral value.

6.512.3.22 static double decaf::lang::Math::signum (double *value*) [static]

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters

value - the floating-point value whose signum is to be returned

Returns

the signum function of the argument

6.512.3.23 static float decaf::lang::Math::signum (float *value*) [static]

Returns Euler's number e raised to the power of a double value.

Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is positive zero.

Parameters

value - the exponent to raise e to

Returns

the value e^x , where e is the base of the natural logarithms. Returns $e^x - 1$. Note that for values of x near 0, the exact sum of $\expm1(x) + 1$ is much closer to the true result of e^x than $\exp(x)$. Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is -1.0. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to raise $e^x - 1$

Returns

the value $e^x - 1$. Returns $\sqrt{x^2 + y^2}$ without intermediate overflow or underflow. Special cases:

If either argument is infinite, then the result is positive infinity. If either argument is NaN and neither argument is infinite, then the result is NaN.

Parameters

x - an argument

y - another argument

Returns

the $\sqrt{x^2 + y^2}$ without intermediate overflow or underflow Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

- o If the argument is NaN, then the result is NaN.
- o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters

value - the floating-point value whose signum is to be returned

Returns

the signum function of the argument

6.512.3.24 static double decaf::lang::Math::sqrt (double *value*) [static]

Returns the arc cosine of an angle, in the range of 0.0 through pi.

Special case:

- o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.

Parameters

value - the value to return the arc cosine of.

Returns

arc cosine of value in radians. Returns the arc sine of an angle, in the range of -pi/2 through pi/2. Special cases:

- o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.
- o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to return the arc cosine of.

Returns

arc cosine of value in radians. Returns the arc tangent of an angle, in the range of -pi/2 through pi/2. Special cases:

- o If the argument is NaN, then the result is NaN.
- o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to return the arc cosine of.

Returns

arc tangent of value in radians. Converts rectangular coordinates (x, y) to polar (r, theta). This method computes the phase theta by computing an arc tangent of y/x in the range of -pi to pi. Special cases:

o If either argument is NaN, then the result is NaN. o If the first argument is positive zero and the second argument is positive, or the first argument is positive and finite and the second argument is positive infinity, then the result is positive zero. o If the first argument is negative zero and the second argument is positive, or the first argument is negative and finite and the second argument is positive infinity, then the result is negative zero. o If the first argument is positive zero and the second argument is negative, or the first argument is positive and finite and the second argument is negative infinity, then the result is the double value closest to pi. o If the first argument is negative zero and the second argument is negative, or the first argument is negative and finite and the second argument is negative infinity, then the result is the double value closest to -pi. o If the first argument is positive and the second argument is positive zero or negative zero, or the first argument is positive infinity and the second argument is finite, then the result is the double value closest to pi/2. o If the first argument is negative and the second argument is positive zero or negative zero, or the first argument is negative infinity and the second argument is finite, then the result is the double value closest to -pi/2. o If both arguments are positive infinity, then the result is the double value closest to pi/4. o If the first argument is positive infinity and the second argument is negative infinity, then the result is the double value closest to 3*pi/4. o If the first argument is negative infinity and the second argument is positive infinity, then the result is the double value closest to -pi/4. o If both arguments are negative infinity, then the result is the double value closest to -3*pi/4.

Parameters

y - the ordinate coordinate
x - the abscissa coordinate

Returns

the theta component of the point (r, theta) in polar coordinates that corresponds to the point (x, y) in Cartesian coordinates. Returns the cube root of a double value. For positive finite x, $\text{cbrt}(-x) == -\text{cbrt}(x)$; that is, the cube root of a negative value is the negative of the cube root of that value's magnitude. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the double to compute the cube root of

Returns

the cube root of value Returns the trigonometric cosine of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN.

Parameters

value - an value in radians

Returns

the cosine of the argument. Returns the hyperbolic cosine of a double value. The hyperbolic cosine of x is defined to be $(e^x + e^{-x})/2$ where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is positive infinity. o If the argument is zero, then the result is 1.0.

Parameters

value - the number whose hyperbolic cosine is to be found

Returns

the hyperbolic cosine of value Returns the trigonometric sine of an angle. Special case:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the number whose sin is to be found

Returns

the sine of value Returns the hyperbolic sine of a double value. The hyperbolic sine of x is defined to be $(e^x - e^{-x})/2$ where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the number whose hyperbolic sin is to be found

Returns

the hyperbolic sine of value Returns the trigonometric tangent of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the number whose tangent is to be found

Returns

the tangent of value Returns the hyperbolic tangent of a double value. The hyperbolic tangent of x is defined to be $(e^x - e^{-x})/(e^x + e^{-x})$, in other words, $\sinh(x)/\cosh(x)$. Note that the absolute value of the exact tanh is always less than 1. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument. o If the argument is positive infinity, then the result is +1.0. o If the argument is negative infinity, then the result is -1.0.

Parameters

value - the number whose hyperbolic tangent is to be found

Returns

the hyperbolic cosine of value Returns the correctly rounded positive square root of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Otherwise, the result is the double value closest to the true mathematical square root of the argument value.

Parameters

value - the value to find the square root of
the square root of the argument.

6.512.3.25 `static double decaf::lang::Math::toDegrees (double angrad)` [inline, static]

Returns the measure in degrees of the supplied radian angle.

Parameters

angrad - an angle in radians

Returns

the degree measure of the angle.

6.512.3.26 `static double decaf::lang::Math::toRadians (double angdeg)` [inline, static]

Returns the measure in radians of the supplied degree angle.

Parameters

angdeg - an angle in degrees

Returns

the radian measure of the angle.

6.512.4 Field Documentation

6.512.4.1 `const double decaf::lang::Math::E` [static]

6.512.4.2 `const double decaf::lang::Math::PI` [static]

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Math.h`

6.513 activemq::util::MemoryUsage Class Reference

```
#include <src/main/activemq/util/MemoryUsage.h>
```

Inheritance diagram for `activemq::util::MemoryUsage`:

Public Member Functions

- **MemoryUsage** ()
Default Constructor.
- **MemoryUsage** (unsigned long long limit)
*Creates an instance of an **Usage** (p. 3701) monitor with a set limit.*
- virtual **~MemoryUsage** ()
- virtual void **waitForSpace** ()
*Waits forever for more space to be returned to this **Usage** (p. 3701) Manager.*
- virtual void **waitForSpace** (unsigned int timeout)
*Waits for more space to be returned to this **Usage** (p. 3701) Manager, times out when the given time span in milliseconds elapses.*
- virtual void **enqueueUsage** (unsigned long long value)
Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void **increaseUsage** (unsigned long long value)
Increases the usage by the value amount.
- virtual void **decreaseUsage** (unsigned long long value)
Decreases the usage by the value amount.
- virtual bool **isFull** () const
*Returns true if this **Usage** (p. 3701) instance is full, i.e.*
- unsigned long long **getUsage** () const
Gets the current usage amount.
- void **setUsage** (unsigned long long usage)
Sets the current usage amount.
- unsigned long long **getLimit** () const
Gets the current limit amount.
- void **setLimit** (unsigned long long limit)
Sets the current limit amount.

6.513.1 Constructor & Destructor Documentation

6.513.1.1 activemq::util::MemoryUsage::MemoryUsage ()

Default Constructor.

6.513.1.2 `activemq::util::MemoryUsage::MemoryUsage (unsigned long long limit)`

Creates an instance of an **Usage** (p. 3701) monitor with a set limit.

Parameters

limit - amount of memory this manager allows.

6.513.1.3 `virtual activemq::util::MemoryUsage::~~MemoryUsage () [virtual]`

6.513.2 Member Function Documentation

6.513.2.1 `virtual void activemq::util::MemoryUsage::decreaseUsage (unsigned long long value) [virtual]`

Decreases the usage by the value amount.

Parameters

value Amount of space to return to the pool

Implements **activemq::util::Usage** (p. 3702).

6.513.2.2 `virtual void activemq::util::MemoryUsage::enqueueUsage (unsigned long long value) [inline, virtual]`

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters

value Amount of usage in bytes to add.

Implements **activemq::util::Usage** (p. 3702).

6.513.2.3 `unsigned long long activemq::util::MemoryUsage::getLimit () const [inline]`

Gets the current limit amount.

Returns

the amount that can be used before full.

6.513.2.4 `unsigned long long activemq::util::MemoryUsage::getUsage () const [inline]`

Gets the current usage amount.

Returns

the amount of bytes currently used.

6.513.2.5 `virtual void activemq::util::MemoryUsage::increaseUsage (unsigned long long value) [virtual]`

Increases the usage by the value amount.

Parameters

value Amount of usage to add.

Implements `activemq::util::Usage` (p. 3702).

6.513.2.6 `virtual bool activemq::util::MemoryUsage::isFull () const [virtual]`

Returns true if this `Usage` (p. 3701) instance is full, i.e.

`Usage` (p. 3701) $\geq 100\%$

Implements `activemq::util::Usage` (p. 3703).

6.513.2.7 `void activemq::util::MemoryUsage::setLimit (unsigned long long limit) [inline]`

Sets the current limit amount.

Parameters

limit - The amount that can be used before full.

6.513.2.8 `void activemq::util::MemoryUsage::setUsage (unsigned long long usage) [inline]`

Sets the current usage amount.

Parameters

usage - The amount to tag as used.

6.513.2.9 `virtual void activemq::util::MemoryUsage::waitForSpace () [virtual]`

Waits forever for more space to be returned to this `Usage` (p. 3701) Manager.

Implements `activemq::util::Usage` (p. 3703).

6.513.2.10 `virtual void activemq::util::MemoryUsage::waitForSpace (unsigned int timeout) [virtual]`

Waits for more space to be returned to this `Usage` (p. 3701) Manager, times out when the given time span in milliseconds elapses.

Parameters

timeout The time to wait for more space.

Implements **activemq::util::Usage** (p. 3703).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/MemoryUsage.h`

6.514 **activemq::commands::Message** Class Reference

```
#include <src/main/activemq/commands/Message.h>
```

Inheritance diagram for **activemq::commands::Message**:

Public Member Functions

- **Message** ()
- virtual **~Message** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **Message * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.
- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual void **setAckHandler** (const **Pointer**< **core::ActiveMQAckHandler** > &handler)

*Sets the Acknowledgment Handler that this **Message** (p. 2358) will use when the Acknowledge method is called.*

- virtual **Pointer**< **core::ActiveMQAckHandler** > **getAckHandler** () const
*Gets the Acknowledgment Handler that this **Message** (p. 2358) will use when the Acknowledge method is called.*
- void **setConnection** (**core::ActiveMQConnection** ***connection**)
*Sets the ActiveMQConnection instance that this **Command** (p. 1107) was created from when the session create methods are called to create a **Message** (p. 2358).*
- **core::ActiveMQConnection** * **getConnection** () const
*Gets the ActiveMQConnection instance that this **Command** (p. 1107) was created from when the session create methods are called to create a **Message** (p. 2358).*
- virtual unsigned int **getSize** () const
Returns the Size of this message in Bytes.
- virtual bool **isExpired** () const
Returns if this message has expired, meaning that its Expiration time has elapsed.
- virtual void **onSend** ()
*Allows derived **Message** (p. 2358) classes to perform tasks before a message is sent.*
- **util::PrimitiveMap** & **getMessageProperties** ()
Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.
- const **util::PrimitiveMap** & **getMessageProperties** () const
- bool **isReadOnlyProperties** () const
*Returns if the **Message** (p. 2358) Properties Are Read Only.*
- void **setReadOnlyProperties** (bool value)
*Set the Read Only State of the **Message** (p. 2358) Properties.*
- bool **isReadOnlyBody** () const
*Returns if the **Message** (p. 2358) Body is Read Only.*
- void **setReadOnlyBody** (bool value)
*Set the Read Only State of the **Message** (p. 2358) Content.*
- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()

6.514.1 Constructor & Destructor Documentation

6.514.1.1 `activemq::commands::Message::Message ()`

6.514.1.2 `virtual activemq::commands::Message::~Message ()` [virtual]

6.514.2 Member Function Documentation

6.514.2.1 `virtual void activemq::commands::Message::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)` [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

Reimplemented from `activemq::commands::BaseDataStructure` (p. 765).

6.514.2.2 `virtual void activemq::commands::Message::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)` [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

Parameters

wireFormat - the wireformat controller

Reimplemented from `activemq::commands::BaseDataStructure` (p. 765).

6.514.2.3 virtual Message* activemq::commands::Message::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 168), **activemq::commands::ActiveMQBytesMessage** (p. 198), **activemq::commands::ActiveMQMapMessage** (p. 320), **activemq::commands::ActiveMQMessage** (p. 354), **activemq::commands::ActiveMQObjectMessage** (p. 397), **activemq::commands::ActiveMQStreamMessage** (p. 489), and **activemq::commands::ActiveMQTextMessage** (p. 607).

6.514.2.4 virtual void activemq::commands::Message::copyDataStructure (const DataStructure * src) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 168), **activemq::commands::ActiveMQBytesMessage** (p. 198), **activemq::commands::ActiveMQMapMessage** (p. 320), **activemq::commands::ActiveMQMessage** (p. 354), **activemq::commands::ActiveMQObjectMessage** (p. 398), **activemq::commands::ActiveMQStreamMessage** (p. 489), and **activemq::commands::ActiveMQTextMessage** (p. 607).

6.514.2.5 virtual bool activemq::commands::Message::equals (const DataStructure * value) const [virtual]

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 168), **activemq::commands::ActiveMQBytesMessage** (p. 199), **activemq::commands::ActiveMQMapMessage** (p. 320), **activemq::commands::ActiveMQMessage** (p. 354), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 383), and **activemq::commands::ActiveMQObjectMessage**

(p. 398), `activemq::commands::ActiveMQStreamMessage` (p. 490), `activemq::commands::ActiveMQTextMessage` (p. 607), `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 383), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 383), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 383), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 383), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 383), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 383).

6.514.2.6 `virtual Pointer<core::ActiveMQAckHandler>
activemq::commands::Message::getAckHandler () const [inline,
virtual]`

Gets the Acknowledgment Handler that this **Message** (p. 2358) will use when the Acknowledge method is called.

Returns

handler `ActiveMQAckHandler` to call or `NULL` if not set

6.514.2.7 `virtual long long activemq::commands::Message::getArrival () const
[virtual]`

6.514.2.8 `virtual long long activemq::commands::Message::getBrokerInTime ()
const [virtual]`

6.514.2.9 `virtual long long activemq::commands::Message::getBrokerOutTime ()
const [virtual]`

6.514.2.10 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >&
activemq::commands::Message::getBrokerPath () const [virtual]`

6.514.2.11 `virtual std::vector< decaf::lang::Pointer<BrokerId> >&
activemq::commands::Message::getBrokerPath () [virtual]`

6.514.2.12 `virtual std::vector< decaf::lang::Pointer<BrokerId> >&
activemq::commands::Message::getCluster () [virtual]`

6.514.2.13 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >&
activemq::commands::Message::getCluster () const [virtual]`

6.514.2.14 `core::ActiveMQConnection* ac-
tivemq::commands::Message::getConnection () const
[inline]`

Gets the `ActiveMQConnection` instance that this **Command** (p. 1107) was created from when the session create methods are called to create a **Message** (p. 2358).

Returns

the `ActiveMQConnection` parent for this **Message** (p. 2358) or `NULL` if not set.

- 6.514.2.15 `virtual const std::vector<unsigned char>& activemq::commands::Message::getContent () const`
[virtual]
- 6.514.2.16 `virtual std::vector<unsigned char>& activemq::commands::Message::getContent ()`
[virtual]
- 6.514.2.17 `virtual const std::string& activemq::commands::Message::getCorrelationId () const` [virtual]
- 6.514.2.18 `virtual std::string& activemq::commands::Message::getCorrelationId ()` [virtual]
- 6.514.2.19 `virtual Pointer<DataStructure>& activemq::commands::Message::getDataStructure ()`
[virtual]
- 6.514.2.20 `virtual const Pointer<DataStructure>& activemq::commands::Message::getDataStructure () const`
[virtual]
- 6.514.2.21 `virtual unsigned char activemq::commands::Message::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 168), **activemq::commands::ActiveMQBytesMessage** (p. 200), **activemq::commands::ActiveMQMapMessage** (p. 322), **activemq::commands::ActiveMQMessage** (p. 354), **activemq::commands::ActiveMQObjectMessage** (p. 398), **activemq::commands::ActiveMQStreamMessage** (p. 490), and **activemq::commands::ActiveMQTextMessage** (p. 607).

- 6.514.2.22 `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () const [virtual]`
- 6.514.2.23 `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () [virtual]`
- 6.514.2.24 `virtual long long activemq::commands::Message::getExpiration () const [virtual]`
- 6.514.2.25 `virtual const std::string& activemq::commands::Message::getGroupID () const [virtual]`
- 6.514.2.26 `virtual std::string& activemq::commands::Message::getGroupID () [virtual]`
- 6.514.2.27 `virtual int activemq::commands::Message::getGroupSequence () const [virtual]`
- 6.514.2.28 `virtual const std::vector<unsigned char>& activemq::commands::Message::getMarshaledProperties () const [virtual]`
- 6.514.2.29 `virtual std::vector<unsigned char>& activemq::commands::Message::getMarshaledProperties () [virtual]`
- 6.514.2.30 `virtual const Pointer<MessageId>& activemq::commands::Message::getMessageId () const [virtual]`
- 6.514.2.31 `virtual Pointer<MessageId>& activemq::commands::Message::getMessageId () [virtual]`
- 6.514.2.32 `util::PrimitiveMap& activemq::commands::Message::getMessageProperties () [inline]`

Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

Returns

a reference to the Primitive Map that holds message properties.

- 6.514.2.33 `const util::PrimitiveMap& activemq::commands::Message::getMessageProperties ()`
`const [inline]`
- 6.514.2.34 `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination ()`
`[virtual]`
- 6.514.2.35 `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () const`
`[virtual]`
- 6.514.2.36 `virtual const Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () const`
`[virtual]`
- 6.514.2.37 `virtual Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId ()`
`[virtual]`
- 6.514.2.38 `virtual unsigned char activemq::commands::Message::getPriority ()`
`const [virtual]`
- 6.514.2.39 `virtual const Pointer<ProducerId>& activemq::commands::Message::getProducerId () const`
`[virtual]`
- 6.514.2.40 `virtual Pointer<ProducerId>& activemq::commands::Message::getProducerId ()`
`[virtual]`
- 6.514.2.41 `virtual int activemq::commands::Message::getRedeliveryCounter ()`
`const [virtual]`
- 6.514.2.42 `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () const` `[virtual]`
- 6.514.2.43 `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo ()` `[virtual]`
- 6.514.2.44 `virtual unsigned int activemq::commands::Message::getSize () const`
`[virtual]`

Returns the Size of this message in Bytes.

Returns

number of bytes this message equates to.

Reimplemented in `activemq::commands::ActiveMQTextMessage` (p. 608).

- 6.514.2.45 `virtual const Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () const [virtual]`
- 6.514.2.46 `virtual Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () [virtual]`
- 6.514.2.47 `virtual long long activemq::commands::Message::getTimestamp () const [virtual]`
- 6.514.2.48 `virtual const Pointer<TransactionId>& activemq::commands::Message::getTransactionId () const [virtual]`
- 6.514.2.49 `virtual Pointer<TransactionId>& activemq::commands::Message::getTransactionId () [virtual]`
- 6.514.2.50 `virtual const std::string& activemq::commands::Message::getType () const [virtual]`
- 6.514.2.51 `virtual std::string& activemq::commands::Message::getType () [virtual]`
- 6.514.2.52 `virtual const std::string& activemq::commands::Message::getUserID () const [virtual]`
- 6.514.2.53 `virtual std::string& activemq::commands::Message::getUserID () [virtual]`
- 6.514.2.54 `virtual bool activemq::commands::Message::isCompressed () const [virtual]`
- 6.514.2.55 `virtual bool activemq::commands::Message::isDroppable () const [virtual]`
- 6.514.2.56 `virtual bool activemq::commands::Message::isExpired () const [virtual]`

Returns if this message has expired, meaning that its Expiration time has elapsed.

Returns

true if message is expired.

- 6.514.2.57 `virtual bool activemq::commands::Message::isMarshalAware () const [inline, virtual]`

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from `activemq::commands::BaseDataStructure` (p. 767).

Reimplemented in `activemq::commands::ActiveMQMapMessage` (p. 324).

6.514.2.58 `virtual bool activemq::commands::Message::isMessage () const`
[inline, virtual]

Returns

an answer of true to the `isMessage()` (p. 2369) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 698).

6.514.2.59 `virtual bool activemq::commands::Message::isPersistent () const`
[virtual]

6.514.2.60 `bool activemq::commands::Message::isReadOnlyBody () const`
[inline]

Returns if the `Message` (p. 2358) Body is Read Only.

Returns

true if `Message` (p. 2358) Content is Read Only.

6.514.2.61 `bool activemq::commands::Message::isReadOnlyProperties () const`
[inline]

Returns if the `Message` (p. 2358) Properties Are Read Only.

Returns

true if `Message` (p. 2358) Properties are Read Only.

6.514.2.62 `virtual bool activemq::commands::Message::isRecievedByDFBridge () const` [virtual]

6.514.2.63 `virtual void activemq::commands::Message::onSend ()` [inline, virtual]

Allows derived `Message` (p. 2358) classes to perform tasks before a message is sent.

Reimplemented in `activemq::commands::ActiveMQBytesMessage` (p. 200),
`activemq::commands::ActiveMQMessageTemplate< T >` (p. 390),
`activemq::commands::ActiveMQStreamMessage` (p. 490),
`activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 390),
`activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >` (p. 390),
`activemq::commands::ActiveMQMessageTemplate< cms::Message >` (p. 390),
`activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 390),
`activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >` (p. 390), and
`activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >` (p. 390).

6.514.2.64 `virtual void activemq::commands::Message::setAckHandler (const
Pointer< core::ActiveMQAckHandler > & handler) [inline,
virtual]`

Sets the Acknowledgment Handler that this **Message** (p. 2358) will use when the Acknowledge method is called.

Parameters

handler ActiveMQAckHandler to call

6.514.2.65 `virtual void activemq::commands::Message::setArrival (long long
arrival) [virtual]`

6.514.2.66 `virtual void activemq::commands::Message::setBrokerInTime (long
long brokerInTime) [virtual]`

6.514.2.67 `virtual void activemq::commands::Message::setBrokerOutTime (long
long brokerOutTime) [virtual]`

6.514.2.68 `virtual void activemq::commands::Message::setBrokerPath (const
std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)
[virtual]`

6.514.2.69 `virtual void activemq::commands::Message::setCluster (const
std::vector< decaf::lang::Pointer< BrokerId > > & cluster) [virtual]`

6.514.2.70 `virtual void activemq::commands::Message::setCompressed (bool
compressed) [virtual]`

6.514.2.71 `void activemq::commands::Message::setConnection (const
core::ActiveMQConnection * connection) [inline]`

Sets the ActiveMQConnection instance that this **Command** (p. 1107) was created from when the session create methods are called to create a **Message** (p. 2358).

Parameters

handler ActiveMQConnection parent for this message

- 6.514.2.72 virtual void activemq::commands::Message::setContent (const std::vector< unsigned char > & *content*) [virtual]
- 6.514.2.73 virtual void activemq::commands::Message::setCorrelationId (const std::string & *correlationId*) [virtual]
- 6.514.2.74 virtual void activemq::commands::Message::setDataStructure (const Pointer< DataStructure > & *dataStructure*) [virtual]
- 6.514.2.75 virtual void activemq::commands::Message::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.514.2.76 virtual void activemq::commands::Message::setDroppable (bool *droppable*) [virtual]
- 6.514.2.77 virtual void activemq::commands::Message::setExpiration (long long *expiration*) [virtual]
- 6.514.2.78 virtual void activemq::commands::Message::setGroupID (const std::string & *groupID*) [virtual]
- 6.514.2.79 virtual void activemq::commands::Message::setGroupSequence (int *groupSequence*) [virtual]
- 6.514.2.80 virtual void activemq::commands::Message::setMarshaledProperties (const std::vector< unsigned char > & *marshalledProperties*) [virtual]
- 6.514.2.81 virtual void activemq::commands::Message::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]
- 6.514.2.82 virtual void activemq::commands::Message::setOriginalDestination (const Pointer< ActiveMQDestination > & *originalDestination*) [virtual]
- 6.514.2.83 virtual void activemq::commands::Message::setOriginalTransactionId (const Pointer< TransactionId > & *originalTransactionId*) [virtual]
- 6.514.2.84 virtual void activemq::commands::Message::setPersistent (bool *persistent*) [virtual]
- 6.514.2.85 virtual void activemq::commands::Message::setPriority (unsigned char *priority*) [virtual]
- 6.514.2.86 virtual void activemq::commands::Message::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]
- 6.514.2.87 void activemq::commands::Message::setReadOnlyBody (bool *value*) [inline]

Set the Read Only State of the **Message** (p. 2358) Content.

Parameters

value - true if Content should be read only.

6.514.2.88 `void activemq::commands::Message::setReadOnlyProperties (bool value) [inline]`

Set the Read Only State of the **Message** (p. 2358) Properties.

Parameters

value - true if Properties should be read only.

6.514.2.89 `virtual void activemq::commands::Message::setRecievedByDFBridge (bool recievedByDFBridge) [virtual]`

6.514.2.90 `virtual void activemq::commands::Message::setRedeliveryCounter (int redeliveryCounter) [virtual]`

6.514.2.91 `virtual void activemq::commands::Message::setReplyTo (const Pointer< ActiveMQDestination > & replyTo) [virtual]`

6.514.2.92 `virtual void activemq::commands::Message::setTargetConsumerId (const Pointer< ConsumerId > & targetConsumerId) [virtual]`

6.514.2.93 `virtual void activemq::commands::Message::setTimestamp (long long timestamp) [virtual]`

6.514.2.94 `virtual void activemq::commands::Message::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`

6.514.2.95 `virtual void activemq::commands::Message::setType (const std::string & type) [virtual]`

6.514.2.96 `virtual void activemq::commands::Message::setUserID (const std::string & userID) [virtual]`

6.514.2.97 `virtual std::string activemq::commands::Message::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 170), **activemq::commands::ActiveMQBytesMessage** (p. 205), **activemq::commands::ActiveMQMapMessage** (p. 328), **activemq::commands::ActiveMQMessage** (p. 355), **activemq::commands::ActiveMQObjectMessage**

(p. 398), `activemq::commands::ActiveMQStreamMessage` (p. 495), and `activemq::commands::ActiveMQTextMessage` (p. 609).

```
6.514.2.98 virtual Pointer<Command> activemq::commands::Message::visit  
          ( activemq::state::CommandVisitor * visitor ) throw (   
            exceptions::ActiveMQException ) [virtual]
```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 1112).

6.515 cms::Message Class Reference

Root of all messages.

```
#include <src/main/cms/Message.h>
```

Inheritance diagram for cms::Message:

Public Member Functions

- virtual **~Message** ()
- virtual **Message * clone** () const =0
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void **acknowledge** () const =0 throw (IllegalStateException, CMSException)
Acknowledges all consumed messages of the session of this consumed message.
- virtual void **clearBody** ()=0 throw (CMSException)
Clears out the body of the message.
- virtual void **clearProperties** ()=0 throw (CMSException)
Clears out the message body.
- virtual std::vector< std::string > **getPropertyNames** () const =0 throw (CMSException)
Retrieves the property names.
- virtual bool **propertyExists** (const std::string &name) const =0 throw (CMSException)
Indicates whether or not a given property exists.
- virtual bool **getBooleanProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)
Gets a boolean property.
- virtual unsigned char **getByteProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)
Gets a byte property.
- virtual double **getDoubleProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)
Gets a double property.
- virtual float **getFloatProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)
Gets a float property.

- virtual int **getIntProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a int property.
- virtual long long **getLongProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a string property.
- virtual std::string **getCMSCorrelationID** () const =0 throw (CMSEException)
Gets the correlation ID for the message.

- virtual void **setCMSCorrelationID** (const std::string &correlationId)=0 throw (CMSEception)
Sets the correlation ID for the message.
- virtual int **getCMSDeliveryMode** () const =0 throw (CMSEception)
*Gets the **DeliveryMode** (p. 1609) for this message.*
- virtual void **setCMSDeliveryMode** (int mode)=0 throw (CMSEception)
*Sets the **DeliveryMode** (p. 1609) for this message.*
- virtual const **Destination** * **getCMSDestination** () const =0 throw (CMSEception)
*Gets the **Destination** (p. 1610) object for this message.*
- virtual void **setCMSDestination** (const **Destination** *destination)=0 throw (CMSEception)
*Sets the **Destination** (p. 1610) object for this message.*
- virtual long long **getCMSExpiration** () const =0 throw (CMSEception)
Gets the message's expiration value.
- virtual void **setCMSExpiration** (long long expireTime)=0 throw (CMSEception)
Sets the message's expiration value.
- virtual std::string **getCMSMessageID** () const =0 throw (CMSEception)
The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.
- virtual void **setCMSMessageID** (const std::string &id)=0 throw (CMSEception)
Sets the message ID.
- virtual int **getCMSPriority** () const =0 throw (CMSEception)
Gets the message priority level.
- virtual void **setCMSPriority** (int priority)=0 throw (CMSEception)
Sets the Priority Value for this message.
- virtual bool **getCMSRedelivered** () const =0 throw (CMSEception)
Gets an indication of whether this message is being redelivered.
- virtual void **setCMSRedelivered** (bool redelivered)=0 throw (CMSEception)
Specifies whether this message is being redelivered.
- virtual const **cms::Destination** * **getCMSReplyTo** () const =0 throw (CMSEception)
*Gets the **Destination** (p. 1610) object to which a reply to this message should be sent.*
- virtual void **setCMSReplyTo** (const **cms::Destination** *destination)=0 throw (CMSEception)
*Sets the **Destination** (p. 1610) object to which a reply to this message should be sent.*

- virtual long long **getCMSTimestamp** () const =0 throw (CMSEException)
Gets the message timestamp.
- virtual void **setCMSTimestamp** (long long timeStamp)=0 throw (CMSEException)
Sets the message timestamp.
- virtual std::string **getCMSType** () const =0 throw (CMSEException)
Gets the message type identifier supplied by the client when the message was sent.
- virtual void **setCMSType** (const std::string &type)=0 throw (CMSEException)
Sets the message type.

6.515.1 Detailed Description

Root of all messages. As in JMS, a message is comprised of 3 parts: CMS-specific headers, user-defined properties, and the body.

Message (p. 2375) Bodies

The CMS API defines four types of message bodies, each type is contained within its own **Message** (p. 2375) Interface definition.

- Stream - A **StreamMessage** (p. 3415) object's message body contains a stream of primitive values in the C++ language. It is filled and read sequentially. Unlike the **BytesMessage** (p. 979) type the values written to a **StreamMessage** (p. 3415) retain information on their type and rules for type conversion are enforced when reading back the values from the **Message** (p. 2375) Body.
- Map - A **MapMessage** (p. 2318) object's message body contains a set of name-value pairs, where names are std::string objects, and values are C++ primitives. The entries can be accessed sequentially or randomly by name. The **MapMessage** (p. 2318) makes no guarantee on the order of the elements within the **Message** (p. 2375) body.
- Text - A **TextMessage** (p. 3519) object's message body contains a std::string object. This message type can be used to transport plain-text messages, and XML messages.
- Bytes - A **BytesMessage** (p. 979) object's message body contains a stream of uninterpreted bytes. This message type is for literally encoding a body to match an existing message format. In many cases, it is possible to use one of the other body types, which are easier to use.

Message (p. 2375) Properties

Message (p. 2375) properties support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p. 1074). The String-to-primitive conversions may throw a runtime exception if the primitive's valueOf method does not accept the String as a valid representation of the primitive.

A value written as the row type can be read as the column type.

		boolean	byte	short	int	long	float	double	String
boolean	X								X
byte		X	X	X	X				X

short				X	X	X			X
int					X	X			X
long						X			X
float							X	X	X
double								X	X
String		X	X	X	X	X	X	X	X

When a **Message** (p. 2375) is delivered its properties are considered to be in a read-only mode and cannot be changed. Attempting to change the value of a delivered Message's properties will result in a **CMSEException** (p. 1074) being thrown.

6.515.2 Constructor & Destructor Documentation

6.515.2.1 `virtual cms::Message::~Message () [inline, virtual]`

6.515.3 Member Function Documentation

6.515.3.1 `virtual void cms::Message::acknowledge () const throw (
 IllegalStateException, CMSEException) [pure virtual]`

Acknowledges all consumed messages of the session of this consumed message.

All consumed CMS messages support the acknowledge method for use when a client has specified that its CMS session's consumed messages are to be explicitly acknowledged. By invoking acknowledge on a consumed message, a client acknowledges all messages consumed by the session that the message was delivered to.

Calls to acknowledge are ignored for both transacted sessions and sessions specified to use implicit acknowledgment modes.

A client may individually acknowledge each message as it is consumed, or it may choose to acknowledge messages as an application-defined group (which is done by calling acknowledge on the last received message of the group, thereby acknowledging all messages consumed by the session.)

Messages that have been received but not acknowledged may be redelivered.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

IllegalStateException (p. 1868) - if this method is called on a closed session.

6.515.3.2 `virtual void cms::Message::clearBody () throw (CMSEException)
 [pure virtual]`

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.3 `virtual void cms::Message::clearProperties () throw (CMSEException)`
[pure virtual]

Clears out the message body.

Clearing a message's body does not clear its header values or property entries.

If this message body was read-only, calling this method leaves the message body in the same state as an empty body in a newly created message.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.4 `virtual Message* cms::Message::clone () const` [pure virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implemented in `cms::BytesMessage` (p. 982).

6.515.3.5 `virtual bool cms::Message::getBooleanProperty (const std::string & name) const throw (MessageFormatException, CMSEException)` [pure virtual]

Gets a boolean property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.6 `virtual unsigned char cms::Message::getByteProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a byte property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.7 `virtual std::string cms::Message::getCMSCorrelationID () const throw (CMSEException) [pure virtual]`

Gets the correlation ID for the message.

This method is used to return correlation ID values that are either provider-specific message IDs or application-specific String values.

Returns

string representation of the correlation Id

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.8 `virtual int cms::Message::getCMSDeliveryMode () const throw (CMSEException) [pure virtual]`

Gets the **DeliveryMode** (p. 1609) for this message.

Returns

DeliveryMode (p. 1609) enumerated value.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.9 `virtual const Destination* cms::Message::getCMSDestination () const throw (CMSEException) [pure virtual]`

Gets the **Destination** (p. 1610) object for this message.

The CMSDestination header field contains the destination to which the message is being sent.

When a message is sent, this field is ignored. After completion of the send or publish method, the field holds the destination specified by the method.

When a message is received, its CMSDestination value must be equivalent to the value assigned when it was sent.

Returns

Destination (p. 1610) object

Exceptions

CMSException (p. 1074) - if an internal error occurs.

6.515.3.10 `virtual long long cms::Message::getCMSExpiration () const throw (CMSException) [pure virtual]`

Gets the message's expiration value.

When a message is sent, the CMSExpiration header field is left unassigned. After completion of the send or publish method, it holds the expiration time of the message. This is the sum of the time-to-live value specified by the client and the GMT at the time of the send or publish.

If the time-to-live is specified as zero, CMSExpiration is set to zero to indicate that the message does not expire.

When a message's expiration time is reached, a provider should discard it. The CMS API does not define any form of notification of message expiration.

Clients should not receive messages that have expired; however, the CMS API does not guarantee that this will not happen.

Returns

the time the message expires, which is the sum of the time-to-live value specified by the client and the GMT at the time of the send

Exceptions

CMSException (p. 1074) - if an internal error occurs.

6.515.3.11 `virtual std::string cms::Message::getCMSMessageID () const throw (CMSException) [pure virtual]`

The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.

When a message is sent, CMSMessageID can be ignored. When the send or publish method returns, it contains a provider-assigned value.

A CMSMessageID is a String value that should function as a unique key for identifying messages in a historical repository. The exact scope of uniqueness is provider-defined. It should at least cover all messages for a specific installation of a provider, where an installation is some connected set of message routers.

All CMSMessageID values must start with the prefix 'ID:'. Uniqueness of message ID values across different providers is not required.

Since message IDs take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the message ID is not used by an application. By calling the **MessageProducer.setDisableMessageID** (p. 2556) method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value.

Returns

provider-assigned message id

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.12 `virtual int cms::Message::getCMSPriority () const throw (CMSEException) [pure virtual]`

Gets the message priority level.

The CMS API defines ten levels of priority value, with 0 as the lowest priority and 9 as the highest. In addition, clients should consider priorities 0-4 as gradations of normal priority and priorities 5-9 as gradations of expedited priority.

The CMS API does not require that a provider strictly implement priority ordering of messages; however, it should do its best to deliver expedited messages ahead of normal messages.

Returns

priority value

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.13 `virtual bool cms::Message::getCMSRedelivered () const throw (CMSEException) [pure virtual]`

Gets an indication of whether this message is being redelivered.

If a client receives a message with the CMSRedelivered field set, it is likely, but not guaranteed, that this message was delivered earlier but that its receipt was not acknowledged at that time.

Returns

true if this message is being redelivered

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.14 `virtual const cms::Destination* cms::Message::getCMSReplyTo () const throw (CMSEException) [pure virtual]`

Gets the **Destination** (p. 1610) object to which a reply to this message should be sent.

Returns

Destination (p. 1610) to which to send a response to this message

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.15 `virtual long long cms::Message::getCMSTimestamp () const throw (CMSEException) [pure virtual]`

Gets the message timestamp.

The CMSTimestamp header field contains the time a message was handed off to a provider to be sent. It is not the time the message was actually transmitted, because the actual send may occur later due to transactions or other client-side queuing of messages.

When a message is sent, CMSTimestamp is ignored. When the send or publish method returns, it contains a time value somewhere in the interval between the call and the return. The value is in the format of a normal millis time value in the Java programming language.

Since timestamps take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the timestamp is not used by an application. By calling the MessageProducer.setDisableMessageTimestamp method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value.

Returns

the message timestamp

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.16 `virtual std::string cms::Message::getCMSType () const throw (CMSEException) [pure virtual]`

Gets the message type identifier supplied by the client when the message was sent.

Returns

the message type

See also

setCMSType (p. 2391)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.17 `virtual double cms::Message::getDoubleProperty (const std::string & name) const throw (MessageFormatException, CMSEException) [pure virtual]`

Gets a double property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.18 `virtual float cms::Message::getFloatProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a float property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.19 `virtual int cms::Message::getIntProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a int property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.20 `virtual long long cms::Message::getLongProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a long property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.21 `virtual std::vector<std::string> cms::Message::getPropertyNames ()
const throw (CMSEException) [pure virtual]`

Retrieves the property names.

Returns

The complete set of property names currently in this message.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.22 `virtual short cms::Message::getShortProperty (const std::string &
name) const throw (MessageFormatException, CMSEException)
[pure virtual]`

Gets a short property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.23 `virtual std::string cms::Message::getStringProperty (const std::string
& name) const throw (MessageFormatException, CMSEException)
[pure virtual]`

Gets a string property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 1074) if the property does not exist.

MessageFormatException (p. 2493) - if this type conversion is invalid.

6.515.3.24 `virtual bool cms::Message::propertyExists (const std::string & name) const throw (CMSEException) [pure virtual]`

Indicates whether or not a given property exists.

Parameters

name The name of the property to look up.

Returns

True if the property exists in this message.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.25 `virtual void cms::Message::setBooleanProperty (const std::string & name, bool value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a boolean property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.26 `virtual void cms::Message::setByteProperty (const std::string & name, unsigned char value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a byte property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.27 `virtual void cms::Message::setCMSCorrelationID (const std::string & correlationId) throw (CMSEException) [pure virtual]`

Sets the correlation ID for the message.

A client can use the CMSCorrelationID header field to link one message with another. A typical use is to link a response message with its request message.

CMSCorrelationID can hold one of the following:

- A provider-specific message ID
- An application-specific String
- A provider-native byte[] value

Since each message sent by a CMS provider is assigned a message ID value, it is convenient to link messages via message ID. All message ID values must start with the 'ID:' prefix.

In some cases, an application (made up of several clients) needs to use an application-specific value for linking messages. For instance, an application may use CMSCorrelationID to hold a value referencing some external information. Application-specified values must not start with the 'ID:' prefix; this is reserved for provider-generated message ID values.

If a provider supports the native concept of correlation ID, a CMS client may need to assign specific CMSCorrelationID values to match those expected by clients that do not use the CMS API. A byte[] value is used for this purpose. CMS providers without native correlation ID values are not required to support byte[] values. The use of a byte[] value for CMSCorrelationID is non-portable.

Parameters

correlationId The message ID of a message being referred to.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.28 `virtual void cms::Message::setCMSDeliveryMode (int mode) throw (CMSEException) [pure virtual]`

Sets the **DeliveryMode** (p. 1609) for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

mode **DeliveryMode** (p. 1609) enumerated value.

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.29 `virtual void cms::Message::setCMSDestination (const Destination *
destination) throw (CMSEException) [pure virtual]`

Sets the **Destination** (p. 1610) object for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

destination **Destination** (p. 1610) Object

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.30 `virtual void cms::Message::setCMSExpiration (long long expireTime
) throw (CMSEException) [pure virtual]`

Sets the message's expiration value.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

expireTime the message's expiration time

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.31 `virtual void cms::Message::setCMSMessageID (const std::string & id
) throw (CMSEException) [pure virtual]`

Sets the message ID.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

id the ID of the message

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.32 `virtual void cms::Message::setCMSPriority (int priority) throw (CMSEException) [pure virtual]`

Sets the Priority Value for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

priority priority value for this message

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.33 `virtual void cms::Message::setCMSRedelivered (bool redelivered) throw (CMSEException) [pure virtual]`

Specifies whether this message is being redelivered.

This field is set at the time the message is delivered. This method can be used to change the value for a message that has been received.

Parameters

redelivered boolean redelivered value

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.34 `virtual void cms::Message::setCMSReplyTo (const cms::Destination * destination) throw (CMSEException) [pure virtual]`

Sets the **Destination** (p. 1610) object to which a reply to this message should be sent.

The CMSReplyTo header field contains the destination where a reply to the current message should be sent. If it is null, no reply is expected. The destination may be either a **Queue** (p. 2947) object or a **Topic** (p. 3568) object.

Messages sent with a null CMSReplyTo value may be a notification of some event, or they may just be some data the sender thinks is of interest.

Messages with a CMSReplyTo value typically expect a response. A response is optional; it is up to the client to decide. These messages are called requests. A message sent in response to a request is called a reply.

In some cases a client may wish to match a request it sent earlier with a reply it has just received. The client can use the CMSCorrelationID header field for this purpose.

Parameters

destination **Destination** (p. 1610) to which to send a response to this message

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

6.515.3.35 `virtual void cms::Message::setCMSTimestamp (long long timeStamp) throw (CMSException)` [pure virtual]

Sets the message timestamp.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

timeStamp integer time stamp value

Exceptions

CMSException (p. 1074) - if an internal error occurs.

6.515.3.36 `virtual void cms::Message::setCMSType (const std::string & type) throw (CMSException)` [pure virtual]

Sets the message type.

Some CMS providers use a message repository that contains the definitions of messages sent by applications. The CMSType header field may reference a message's definition in the provider's repository.

The CMS API does not define a standard message definition repository, nor does it define a naming policy for the definitions it contains.

Some messaging systems require that a message type definition for each application message be created and that each message specify its type. In order to work with such CMS providers, CMS clients should assign a value to CMSType, whether the application makes use of it or not. This ensures that the field is properly set for those providers that require it.

To ensure portability, CMS clients should use symbolic values for CMSType that can be configured at installation time to the values defined in the current provider's message repository. If string literals are used, they may not be valid type names for some CMS providers.

Parameters

type the message type

See also

`getCMSType` (p. 2384)

Exceptions

CMSException (p. 1074) - if an internal error occurs.

6.515.3.37 `virtual void cms::Message::setDoubleProperty (const std::string & name, double value) throw (MessageNotWriteableException, CMSException)` [pure virtual]

Sets a double property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.38 `virtual void cms::Message::setFloatProperty (const std::string & name, float value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a float property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.39 `virtual void cms::Message::setIntProperty (const std::string & name, int value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a int property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.40 `virtual void cms::Message::setLongProperty (const std::string & name, long long value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a long property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.41 `virtual void cms::Message::setShortProperty (const std::string & name, short value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a short property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.515.3.42 `virtual void cms::Message::setStringProperty (const std::string & name, const std::string & value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a string property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 1074) - if the name is an empty string.

MessageNotWriteableException (p. 2549) - if properties are read-only

6.516 activemq::commands::MessageAck Class Reference

```
#include <src/main/activemq/commands/MessageAck.h>
```

Inheritance diagram for `activemq::commands::MessageAck`:

Public Member Functions

- **MessageAck** ()
- virtual **~MessageAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **MessageAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

6.516.1.2 **virtual activemq::commands::MessageAck::~MessageAck** () [virtual]

6.516.2 Member Function Documentation

6.516.2.1 **virtual MessageAck* activemq::commands::MessageAck::cloneDataStructure** () **const** [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.516.2.2 **virtual void activemq::commands::MessageAck::copyDataStructure** (**const DataStructure * src**) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.516.2.3 **virtual bool activemq::commands::MessageAck::equals** (**const DataStructure * value**) **const** [virtual]

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

```

```
6.516.2.7 virtual unsigned char ac-
tivismq::commands::MessageAck::getDataStructureType (
) const [virtual]
```

Get the unique identifier that this object and its own Marshaller share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.516.2.8** virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () const [virtual]
- 6.516.2.9** virtual Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () [virtual]
- 6.516.2.10** virtual const Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () const [virtual]
- 6.516.2.11** virtual Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () [virtual]
- 6.516.2.12** virtual const Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () const [virtual]
- 6.516.2.13** virtual Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () [virtual]
- 6.516.2.14** virtual int activemq::commands::MessageAck::getMessageCount () const [virtual]
- 6.516.2.15** virtual const Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () const [virtual]
- 6.516.2.16** virtual Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () [virtual]
- 6.516.2.17** virtual bool activemq::commands::MessageAck::isMessageAck () const [inline, virtual]

Returns

an answer of true to the `isMessageAck()` (p. 2397) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 698).

- 6.516.2.18 `virtual void activemq::commands::MessageAck::setAckType (unsigned char ackType) [virtual]`
- 6.516.2.19 `virtual void activemq::commands::MessageAck::setConsumerId (const Pointer< ConsumerId > & consumerId) [virtual]`
- 6.516.2.20 `virtual void activemq::commands::MessageAck::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.516.2.21 `virtual void activemq::commands::MessageAck::setFirstMessageId (const Pointer< MessageId > & firstMessageId) [virtual]`
- 6.516.2.22 `virtual void activemq::commands::MessageAck::setLastMessageId (const Pointer< MessageId > & lastMessageId) [virtual]`
- 6.516.2.23 `virtual void activemq::commands::MessageAck::setMessageCount (int messageCount) [virtual]`
- 6.516.2.24 `virtual void activemq::commands::MessageAck::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`
- 6.516.2.25 `virtual std::string activemq::commands::MessageAck::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

- 6.516.2.26 `virtual Pointer<Command> activemq::commands::MessageAck::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.1112).

6.516.3 Field Documentation

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.517.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2399). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.517.2 Constructor & Destructor Documentation

6.517.2.1 activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::MessageAckMarshaller () [inline]

6.517.2.2 virtual
activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.517.3 Member Function Documentation

6.517.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.517.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::getDataSetType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.517.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 729).

6.517.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 730).

6.517.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

6.517.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

6.517.3.7 `virtual void activemq::wireformat::openwire::marshal::v6::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.518.3 Member Function Documentation

6.518.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.518.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.518.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 736).

6.518.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 737).

6.518.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

```
6.518.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

```
6.518.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

6.519.3 Member Function Documentation

6.519.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.519.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.519.3.3 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.519.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.519.3.5 virtual int activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.519.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.519.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

6.520.2.2 virtual
activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.520.3 Member Function Documentation

6.520.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.520.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.520.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.520.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

6.520.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```
6.520.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.520.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/MessageAckMarshaller.h`

6.521 activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2415).

```

6.521.2.2 virtual
activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.521.3 Member Function Documentation

6.521.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.521.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.521.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.521.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

6.521.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

```
6.521.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

```
6.521.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.522.3 Member Function Documentation

6.522.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.522.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.522.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 722).

6.522.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 723).

6.522.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```
6.522.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.522.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

6.523 cms::MessageConsumer Class Reference

A client uses a **MessageConsumer** (p. 2423) to received messages from a destination.

#include <src/main/cms/MessageConsumer.h>

Inheritance diagram for cms::MessageConsumer:

Public Member Functions

- virtual **~MessageConsumer** ()
- virtual **Message * receive** ()=0 throw (**CMSEException**)
*Synchronously Receive a **Message** (p. 2375).*
- virtual **Message * receive** (int millisecs)=0 throw (**CMSEException**)
*Synchronously Receive a **Message** (p. 2375), time out after defined interval.*
- virtual **Message * receiveNoWait** ()=0 throw (**CMSEException**)
*Receive a **Message** (p. 2375), does not wait if there isn't a new message to read, returns NULL if nothing read.*
- virtual void **setMessageListener** (**MessageListener** *listener)=0 throw (**CMSEException**)
*Sets the **MessageListener** (p. 2522) that this class will send notifs on.*
- virtual **MessageListener * getMessageListener** () const =0 throw (**CMSEException**)
*Gets the **MessageListener** (p. 2522) that this class will send new **Message** (p. 2375) notification events to.*
- virtual std::string **getMessageSelector** () const =0 throw (cms::CMSEException)
Gets this message consumer's message selector expression.

6.523.1 Detailed Description

A client uses a **MessageConsumer** (p. 2423) to received messages from a destination. A client may either synchronously receive a message consumer's messages or have the consumer asynchronously deliver them as they arrive.

For synchronous receipt, a client can request the next message from a message consumer using one of its **receive** methods. There are several variations of **receive** that allow a client to poll or wait for the next message.

For asynchronous delivery, a client can register a **MessageListener** (p. 2522) object with a message consumer. As messages arrive at the message consumer, it delivers them by calling the **MessageListener** (p. 2522)'s **onMessage** method.

When the **MessageConsumer**'s **close** method is called the method can block while an asynchronous message delivery is in progress or until a **receive** operation completes. A blocked consumer in a **receive** call will return a Null when the **close** method is called.

MessageListener (p. 2522)

Since

1.0

6.523.2 Constructor & Destructor Documentation

6.523.2.1 **virtual cms::MessageConsumer::~MessageConsumer ()** [inline, virtual]

6.523.3 Member Function Documentation

6.523.3.1 **virtual MessageListener* cms::MessageConsumer::getMessageListener ()** **const throw (CMSEException)** [pure virtual]

Gets the **MessageListener** (p. 2522) that this class will send new **Message** (p. 2375) notification events to.

Returns

The listener of messages received by this consumer

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 994).

6.523.3.2 **virtual std::string cms::MessageConsumer::getMessageSelector ()** **const throw (cms::CMSEException)** [pure virtual]

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 995).

6.523.3.3 `virtual Message* cms::MessageConsumer::receive (int millisecs)
throw (CMSEException) [pure virtual]`

Synchronously Receive a **Message** (p. 2375), time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 995).

6.523.3.4 `virtual Message* cms::MessageConsumer::receive () throw (CMSEException) [pure virtual]`

Synchronously Receive a **Message** (p. 2375).

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 995).

6.523.3.5 `virtual Message* cms::MessageConsumer::receiveNoWait () throw (CMSEException) [pure virtual]`

Receive a **Message** (p. 2375), does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 996).

6.523.3.6 `virtual void cms::MessageConsumer::setMessageListener (MessageListener * listener) throw (CMSEException) [pure virtual]`

Sets the **MessageListener** (p. 2522) that this class will send notifs on.

Parameters

listener The listener of messages received by this consumer.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 996).

The documentation for this class was generated from the following file:

- `src/main/cms/MessageConsumer.h`

6.524 activemq::cmsutil::MessageCreator Class Reference

Creates the user-defined message to be sent by the `CmsTemplate` (p. 1083).

6.525.1 Constructor & Destructor Documentation

6.525.1.1 `activemq::commands::MessageDispatch::MessageDispatch ()`

6.525.1.2 `virtual activemq::commands::MessageDispatch::~~MessageDispatch ()`
[virtual]

6.525.2 Member Function Documentation

6.525.2.1 `virtual MessageDispatch* activemq::commands::MessageDispatch::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.525.2.2 `virtual void activemq::commands::MessageDispatch::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.525.2.3 `virtual bool activemq::commands::MessageDispatch::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.525.2.4 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () const [virtual]

6.525.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () [virtual]

6.525.2.6 virtual unsigned char activemq::commands::MessageDispatch::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

6.525.2.7 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () const [virtual]

6.525.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () [virtual]

6.525.2.9 virtual const Pointer<Message>& activemq::commands::MessageDispatch::getMessage () const [virtual]

6.525.2.10 virtual Pointer<Message>& activemq::commands::MessageDispatch::getMessage () [virtual]

6.525.2.11 virtual int activemq::commands::MessageDispatch::getRedeliveryCounter () const [virtual]

6.525.2.12 virtual bool activemq::commands::MessageDispatch::isMessageDispatch () const [inline, virtual]

Returns

an answer of true to the **isMessageDispatch()** (p. 2429) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 698).

- 6.525.2.13** `virtual void activemq::commands::MessageDispatch::setConsumerId (const Pointer< ConsumerId > & consumerId) [virtual]`
- 6.525.2.14** `virtual void activemq::commands::MessageDispatch::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.525.2.15** `virtual void activemq::commands::MessageDispatch::setMessage (const Pointer< Message > & message) [virtual]`
- 6.525.2.16** `virtual void activemq::commands::MessageDispatch::setRedeliveryCounter (int redeliveryCounter) [virtual]`
- 6.525.2.17** `virtual std::string activemq::commands::MessageDispatch::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

- 6.525.2.18** `virtual Pointer<Command> activemq::commands::MessageDispatch::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.1112).

6.525.3 Field Documentation

6.526 activemq::core::MessageDispatchChannel Class Reference

```
#include <src/main/activemq/core/MessageDispatchChannel.h>
```

Inheritance diagram for `activemq::core::MessageDispatchChannel`:

Public Member Functions

- `MessageDispatchChannel ()`
- `virtual ~MessageDispatchChannel ()`
- `void enqueue (const Pointer< MessageDispatch > &message)`
Add a Message to the Channel behind all pending message.
- `void enqueueFirst (const Pointer< MessageDispatch > &message)`
Add a message to the front of the Channel.
- `bool isEmpty () const`
- `bool isClosed () const`
- `bool isRunning () const`
- `Pointer< MessageDispatch > dequeue (long long timeout) throw (exceptions::ActiveMQException)`
Used to get an enqueued message.
- `Pointer< MessageDispatch > dequeueNoWait ()`

Used to get an enqueued message if there is one queued right now.

- **Pointer< MessageDispatch > peek () const**
Peek in the Queue and return the first message in the Channel without removing it from the channel.
- **void start ()**
Starts dispatch of messages from the Channel.
- **void stop ()**
Stops dispatch of message from the Channel.
- **void close ()**
Close this channel no messages will be dispatched after this method is called.
- **void clear ()**
Clear the Channel, all pending messages are removed.
- **int size () const**
- **std::vector< Pointer< MessageDispatch > > removeAll ()**
Remove all messages that are currently in the Channel and return them as a list of Messages.
- **virtual void lock () throw (decaf::lang::exceptions::RuntimeException)**
Locks the object.
- **virtual bool tryLock () throw (decaf::lang::exceptions::RuntimeException)**
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- **virtual void unlock () throw (decaf::lang::exceptions::RuntimeException)**
Unlocks the object.
- **virtual void wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)**
Waits on a signal from this object, which is generated by a call to Notify.
- **virtual void wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)**
Waits on a signal from this object, which is generated by a call to Notify.
- **virtual void wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)**
Waits on a signal from this object, which is generated by a call to Notify.
- **virtual void notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)**
Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.526.1 Constructor & Destructor Documentation

6.526.1.1 `activemq::core::MessageDispatchChannel::MessageDispatchChannel ()`

6.526.1.2 `virtual
activemq::core::MessageDispatchChannel::~~MessageDispatchChannel () [virtual]`

6.526.2 Member Function Documentation

6.526.2.1 `void activemq::core::MessageDispatchChannel::clear ()`

Clear the Channel, all pending messages are removed.

6.526.2.2 `void activemq::core::MessageDispatchChannel::close ()`

Close this channel no messages will be dispatched after this method is called.

6.526.2.3 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeue (long long timeout) throw (exceptions::ActiveMQException)`

Used to get an enqueued message.

The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will be consumed by this method.

Returns

null if we timeout or if the consumer is closed.

Exceptions

ActiveMQException

6.526.2.4 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeueNoWait ()`

Used to get an enqueued message if there is one queued right now.

If there is no waiting message then this method returns Null.

Returns

a message if there is one in the queue.

6.526.2.5 `void activemq::core::MessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & message)`

Add a Message to the Channel behind all pending message.

Parameters

message - The message to add to the Channel.

6.526.2.6 `void activemq::core::MessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & message)`

Add a message to the front of the Channel.

Parameters

message - The Message to add to the front of the Channel.

6.526.2.7 `bool activemq::core::MessageDispatchChannel::isClosed () const [inline]`

Returns

has the Queue been closed.

6.526.2.8 `bool activemq::core::MessageDispatchChannel::isEmpty () const`

Returns

true if there are no messages in the Channel.

6.526.2.9 `bool activemq::core::MessageDispatchChannel::isRunning () const [inline]`

Returns

true if the Channel currently running and will dequeue message.

6.526.2.10 `virtual void activemq::core::MessageDispatchChannel::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3463).

6.526.2.11 `virtual void activemq::core::MessageDispatchChannel::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3464).

6.526.2.12 `virtual void activemq::core::MessageDispatchChannel::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3465).

6.526.2.13 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::peek () const`

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns

a message if there is one in the queue.

6.526.2.14 `std::vector< Pointer<MessageDispatch> > activemq::core::MessageDispatchChannel::removeAll ()`

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns

a list of Messages that was previously in the Channel.

6.526.2.15 `int activemq::core::MessageDispatchChannel::size () const`

Returns

the number of Messages currently in the Channel.

6.526.2.16 `void activemq::core::MessageDispatchChannel::start ()`

Starts dispatch of messages from the Channel.

6.526.2.17 `void activemq::core::MessageDispatchChannel::stop ()`

Stops dispatch of message from the Channel.

6.526.2.18 `virtual bool activemq::core::MessageDispatchChannel::tryLock ()
throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3466).

6.526.2.19 `virtual void activemq::core::MessageDispatchChannel::unlock ()
throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3467).

6.526.2.20 `virtual void activemq::core::MessageDispatchChannel::wait (long
long milliseconds) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3470).

```
6.526.2.21  virtual void activemq::core::MessageDispatchChannel::wait
            ( long long millisecs, int nanos ) throw
            ( decaf::lang::exceptions::RuntimeException,
              decaf::lang::exceptions::IllegalArgumentException,
              decaf::lang::exceptions::IllegalMonitorStateException,
              decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3471).

```
6.526.2.22  virtual void activemq::core::MessageDispatchChannel::wait
            ( ) throw ( decaf::lang::exceptions::RuntimeException,
              decaf::lang::exceptions::IllegalMonitorStateException,
              decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3468).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/MessageDispatchChannel.h`

6.527 activemq::wireformat::openwire::marshal::v2::MessageDispatchMa Class Reference

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2438).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageDispatchMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller`:

Public Member Functions

- **MessageDispatchMarshaller** ()
- virtual **~MessageDispatchMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.527.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2438). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.527.2 Constructor & Destructor Documentation

6.527.2.1 activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::MessageDispatchMarshaller () [inline]

6.527.2.2 virtual
activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::~~MessageDispatchMarshaller () [inline, virtual]

6.527.3 Member Function Documentation

6.527.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.527.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.527.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.527.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

6.527.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 738).

```
6.527.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 739).

```
6.527.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.528.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.2442). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.528.2 Constructor & Destructor Documentation

6.528.2.1 activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::MessageDispatchMarshaller () [inline]

6.528.2.2 virtual
activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::~MessageDispatchMarshaller () [inline, virtual]

6.528.3 Member Function Documentation

6.528.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.528.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.528.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.528.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.528.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.528.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.528.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

6.529.2.2 virtual
 activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::~MessageDispatchMarshaller () [inline, virtual]

6.529.3 Member Function Documentation

6.529.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.529.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.529.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

6.529.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

6.529.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```
6.529.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.529.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/MessageDispatchMarshaller.h`

6.530 activemq::wireformat::openwire::marshal::v4::MessageDispatchMa Class Reference

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2450).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/MessageDispatchMarshaller.h>
```

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.530.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.2450). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.530.2 Constructor & Destructor Documentation

6.530.2.1 activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::MessageDispatchMarshaller () [inline]

6.530.2.2 virtual
activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::~~MessageDispatchMarshaller () [inline, virtual]

6.530.3 Member Function Documentation

6.530.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.530.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.530.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.530.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

6.530.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 711).

```
6.530.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 712).

```
6.530.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

6.531.3 Member Function Documentation

6.531.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.531.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.531.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.531.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

6.531.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 718).

```
6.531.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

```
6.531.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.532.3 Member Function Documentation

6.532.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.532.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.532.3.3 virtual void activemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.532.3.4 virtual void activemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

6.532.3.5 virtual int activemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 731).

```
6.532.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 732).

```
6.532.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

6.533.1 Constructor & Destructor Documentation

6.533.1.1 **activemq::commands::MessageDispatchNotification::MessageDispatchNotification**
()

6.533.1.2 **virtual**
activemq::commands::MessageDispatchNotification::~~MessageDispatchNotification
() [virtual]

6.533.2 Member Function Documentation

6.533.2.1 **virtual MessageDispatchNotification* ac-**
tivemq::commands::MessageDispatchNotification::cloneDataStructure (
) const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p.1554).

6.533.2.2 **virtual void ac-**
tivemq::commands::MessageDispatchNotification::copyDataStructure (
const **DataStructure** * **src**) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.533.2.3 `virtual bool activemq::commands::MessageDispatchNotification::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 696).

6.533.2.4 `virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () const [virtual]`

6.533.2.5 `virtual Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () [virtual]`

6.533.2.6 `virtual unsigned char activemq::commands::MessageDispatchNotification::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.533.2.7 virtual long long activemq::commands::MessageDispatchNotification::getDeliverySequenceId () const [virtual]
- 6.533.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () const [virtual]
- 6.533.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () [virtual]
- 6.533.2.10 virtual Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId () [virtual]
- 6.533.2.11 virtual const Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId () const [virtual]
- 6.533.2.12 virtual bool activemq::commands::MessageDispatchNotification::isMessageDispatchNotification () const [inline, virtual]

Returns

an answer of true to the `isMessageDispatchNotification()` (p. 2465) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 699).

- 6.533.2.13 virtual void activemq::commands::MessageDispatchNotification::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]
- 6.533.2.14 virtual void activemq::commands::MessageDispatchNotification::setDeliverySequenceId (long long *deliverySequenceId*) [virtual]
- 6.533.2.15 virtual void activemq::commands::MessageDispatchNotification::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.533.2.16 virtual void activemq::commands::MessageDispatchNotification::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]
- 6.533.2.17 virtual std::string activemq::commands::MessageDispatchNotification::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 700).

6.533.2.18 `virtual Pointer<Command> activemq::commands::MessageDispatchNotification::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 1112).

6.533.3 Field Documentation

6.533.3.1 `Pointer<ConsumerId> activemq::commands::MessageDispatchNotification::consumerId [protected]`

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.534.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchNotificationMarshaller** (p. 2466). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.534.2 Constructor & Destructor Documentation

6.534.2.1 `activemq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::MessageDispatchNotificationMarshaller()` [inline]

6.534.2.2 `virtual activemq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::~MessageDispatchNotificationMarshaller()` [inline, virtual]

6.534.3 Member Function Documentation

6.534.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::createDataStructure()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.534.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.534.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::marshal(commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.534.3.4 `virtual void activismq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::looseM
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn) throw (
decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller`
(p. 730).

6.534.3.5 `virtual int activismq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::tightM
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs) throw (
decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller`
(p. 731).

6.534.3.6 `virtual void activismq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::tightM
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

```
6.534.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 733).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v6/MessageDispatchNotificationMarshaller.h`

6.535 `activemq::wireformat::openwire::marshal::v2::MessageDispatchNo` Class Reference

Marshaling code for Open Wire Format for `MessageDispatchNotificationMarshaller` (p. 2470).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageDispatchNotificationMarshaller
```

6.535.3.5 **virtual int ac-**
 tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller**
 (p. 738).

6.535.3.6 **virtual void ac-**
 tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 739).

```
6.535.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.538.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchNotificationMarshaller** (p.2482). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.538.2 Constructor & Destructor Documentation

6.538.2.1 `activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::MessageDispatchNotificationMarshaller () [inline]`

6.538.2.2 `virtual activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::~MessageDispatchNotificationMarshaller () [inline, virtual]`

6.538.3 Member Function Documentation

6.538.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::createDataStructure () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.538.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.538.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::marshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.538 ac-
 tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller
 Class Reference 2489

6.538.3.4 **virtual void ac-**
 tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::looseM
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*) throw (
 decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**
 (p. 717).

6.538.3.5 **virtual int ac-**
 tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**
 (p. 718).

6.538.3.6 **virtual void ac-**
 tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

```
6.538.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 726).

```
6.539.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/MessageDispatchNotificationMarshaller.h

6.540 cms::MessageEnumeration Class Reference

Defines an object that enumerates a collection of Messages.

```
#include <src/main/cms/MessageEnumeration.h>
```

Inheritance diagram for cms::MessageEnumeration:

Public Member Functions

- virtual `~MessageEnumeration ()`
- virtual bool `hasMoreMessages ()=0`
*Returns true if there are more **Message** (p. 2375) in the Browser that can be retrieved via the **nextMessage** method.*
- virtual `cms::Message * nextMessage ()=0 throw (cms::CMSEException)`
*Returns the Next **Message** (p. 2375) in the **Queue** (p. 2947) if one is present, if no more Message's are available then an Exception is thrown.*

6.540.1 Detailed Description

Defines an object that enumerates a collection of Messages. The client calls the `hasMoreMessages` method to determine if a **Message** (p. 2375) is available. If a **Message** (p. 2375) is available the client calls the `nextMessage` method to retrieve that **Message** (p. 2375), calling `nextMessage` when a **Message** (p. 2375) is not available results in an exception.

Since

2.1

6.540.2 Constructor & Destructor Documentation

- 6.540.2.1** virtual `cms::MessageEnumeration::~~MessageEnumeration ()` [inline, virtual]

6.540.3 Member Function Documentation

- 6.540.3.1** virtual bool `cms::MessageEnumeration::hasMoreMessages ()` [pure virtual]

Returns true if there are more **Message** (p. 2375) in the Browser that can be retrieved via the `nextMessage` method.

If this method returns false and the `nextMessage` method is called then an Exception will be thrown.

Returns

true if more Message's are available in the Browser.

Implemented in `activemq::core::ActiveMQQueueBrowser` (p. 440).

- 6.540.3.2** virtual `cms::Message* cms::MessageEnumeration::nextMessage ()`
`throw (cms::CMSEException)` [pure virtual]

Returns the Next **Message** (p. 2375) in the **Queue** (p. 2947) if one is present, if no more Message's are available then an Exception is thrown.

If a **Message** (p. 2375) object pointer is returned then that object becomes the property of the caller and must be deleted by the caller when finished.

Returns

The next **Message** (p. 2375) in the **Queue** (p. 2947).

Exceptions

CMSEException (p. 1074) if no more Message's currently in the **Queue** (p. 2947).

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 440).

The documentation for this class was generated from the following file:

- `src/main/cms/MessageEnumeration.h`

6.541 cms::MessageEOFException Class Reference

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 3415) or **BytesMessage** (p. 979) is being read.

```
#include <src/main/cms/MessageEOFException.h>
```

Inheritance diagram for cms::MessageEOFException:

Public Member Functions

- **MessageEOFException** () throw ()
- **MessageEOFException** (const **MessageEOFException** &ex) throw ()
- **MessageEOFException** (const std::string &message, const std::exception *cause) throw ()
- **MessageEOFException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**MessageEOFException** () throw ()

6.541.1 Detailed Description

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 3415) or **BytesMessage** (p. 979) is being read.

Since

1.3

6.541.2 Constructor & Destructor Documentation

The documentation for this class was generated from the following file:

- `src/main/cms/MessageEOFException.h`

6.542 cms::MessageFormatException Class Reference

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

```
#include <src/main/cms/MessageFormatException.h>
```

Inheritance diagram for cms::MessageFormatException:

Public Member Functions

- `MessageFormatException () throw ()`
- `MessageFormatException (const MessageFormatException &ex) throw ()`
- `MessageFormatException (const std::string &message, const std::exception *cause) throw ()`
- `MessageFormatException (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()`
- `virtual ~MessageFormatException () throw ()`

6.542.1 Detailed Description

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type. It must also be thrown when equivalent type errors are made with message property values. For example, this exception must be thrown if `StreamMessage.readShort` (p. 3422) is used to read a boolean value.

Since

1.3

6.542.2 Constructor & Destructor Documentation

activemq::commands::MessageId::COMPARATOR`

6.543.2 Constructor & Destructor Documentation

6.543.2.1 `activemq::commands::MessageId::MessageId ()`

6.543.2.2 `activemq::commands::MessageId::MessageId (const MessageId & other
)`

6.543.2.3 `activemq::commands::MessageId::MessageId (const std::string &
messageKey)`

6.543.2.4 `activemq::commands::MessageId::MessageId (const Pointer<
ProducerInfo > & producerInfo, long long producerSequenceId)`

6.543.2.5 `activemq::commands::MessageId::MessageId (const Pointer<
ProducerId > & producerId, long long producerSequenceId)`

6.543.2.6 `activemq::commands::MessageId::MessageId (const std::string &
producerId, long long producerSequenceId)`

6.543.2.7 `virtual activemq::commands::MessageId::~~MessageId () [virtual]`

6.543.3 Member Function Documentation

6.543.3.1 `virtual MessageId* activemq::commands::MessageId::cloneDataStructure
() const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.543.3.2 `virtual int activemq::commands::MessageId::compareTo (const
MessageId & value) const [virtual]`

6.543.3.3 `virtual void activemq::commands::MessageId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.543.3.4 `virtual bool activemq::commands::MessageId::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.543.3.5 `virtual bool activemq::commands::MessageId::equals (const MessageId & value) const [virtual]`

6.543.3.6 `virtual long long activemq::commands::MessageId::getBrokerSequenceId () const [virtual]`

6.543.3.7 `virtual unsigned char activemq::commands::MessageId::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

- 6.543.3.8 `virtual const Pointer<ProducerId>& activemq::commands::MessageId::getProducerId () const`
[virtual]
- 6.543.3.9 `virtual Pointer<ProducerId>& activemq::commands::MessageId::getProducerId ()`
[virtual]
- 6.543.3.10 `virtual long long activemq::commands::MessageId::getProducerSequenceId () const` [virtual]
- 6.543.3.11 `virtual bool activemq::commands::MessageId::operator< (const MessageId & value) const` [virtual]
- 6.543.3.12 `MessageId& activemq::commands::MessageId::operator= (const MessageId & other)`
- 6.543.3.13 `virtual bool activemq::commands::MessageId::operator== (const MessageId & value) const` [virtual]
- 6.543.3.14 `virtual void activemq::commands::MessageId::setBrokerSequenceId (long long brokerSequenceId)` [virtual]
- 6.543.3.15 `virtual void activemq::commands::MessageId::setProducerId (const Pointer< ProducerId > & producerId)` [virtual]
- 6.543.3.16 `virtual void activemq::commands::MessageId::setProducerSequenceId (long long producerSequenceId)` [virtual]
- 6.543.3.17 `void activemq::commands::MessageId::setTextView (const std::string & key)`
- 6.543.3.18 `void activemq::commands::MessageId::setValue (const std::string & key)`
- 6.543.3.19 `virtual std::string activemq::commands::MessageId::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.543.4 Field Documentation

- 6.543.4.1 `long long activemq::commands::MessageId::brokerSequenceId`
[protected]

6.544.2.2 **virtual** **activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::~~MessageIdMarshaller** () [inline, virtual]

6.544.3 Member Function Documentation

6.544.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.544.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.544.3.3 virtual void `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseMarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataOutputStream * dataOut`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.544.3.4 virtual void `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.544.3.5 virtual int `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

```
6.544.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

```
6.544.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException*** if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**MessageIdMarshaller.h**

6.545 activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 2503).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/MessageIdMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller**:

Public Member Functions

- **MessageIdMarshaller** ()

6.545.3 Member Function Documentation

6.545.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.545.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.545.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1518).

6.545.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.545.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

```
6.545.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

```
6.545.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.546.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p.2507). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.546.2 Constructor & Destructor Documentation

6.546.2.1 `activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::MessageIdMarshaller () [inline]`

6.546.2.2 `virtual activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::~~MessageIdMarshaller () [inline, virtual]`

6.546.3 Member Function Documentation

6.546.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

6.546.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1511).

6.546.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.546.3.4 virtual void `activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.546.3.5 virtual int `activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

```

6.546.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

```

6.546.3.7 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

6.547.3 Member Function Documentation

6.547.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.547.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.547.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.547.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.547.3.5 virtual int activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.547.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.547.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.548.2.1 `activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::MessageIdMarshaller () [inline]`

6.548.2.2 `virtual activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::~~MessageIdMarshaller () [inline, virtual]`

6.548.3 Member Function Documentation

6.548.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.548.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.548.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.548.3.4 virtual void activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.548.3.5 virtual int activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.548.3.6 virtual void activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.548.3.7 virtual void **activemq::wireformat::openwire::marshal::v6::MessageIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.549.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p.2518). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.549.2 Constructor & Destructor Documentation

6.549.2.1 `activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::MessageIdMarshaller () [inline]`

6.549.2.2 `virtual activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::~~MessageIdMarshaller () [inline, virtual]`

6.549.3 Member Function Documentation

6.549.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.549.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.549.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.549.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.549.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.549.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.549.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/MessageIdMarshaller.h`

6.550 cms::MessageListener Class Reference

A `MessageListener` (p. 2522) object is used to receive asynchronously delivered messages.

```
#include <src/main/cms/MessageListener.h>
```

Public Member Functions

- `virtual ~MessageListener ()`
- `virtual void onMessage (const Message *message)=0`

*Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 2375) types.*

6.550.1 Detailed Description

A `MessageListener` (p. 2522) object is used to receive asynchronously delivered messages.

Since

1.0

6.550.2 Constructor & Destructor Documentation

6.550.2.1 `virtual cms::MessageListener::~~MessageListener () [inline, virtual]`

6.550.3 Member Function Documentation

6.550.3.1 `virtual void cms::MessageListener::onMessage (const Message * message) [pure virtual]`

Called asynchronously when a new message is received, the message reference can be to any of the `Message` (p. 2375) types.

a dynamic cast is used to find out what type of message this is. The lifetime of this object is only guaranteed to be for life of the `onMessage` function after this call-back returns the message may no longer exists. Users should copy the data or clone the message if they wish to retain information that was contained in this `Message` (p. 2375).

It is considered a programming error for this method to throw an exception.

Parameters

message `Message` (p. 2375) object {const} pointer recipient does not own.

The documentation for this class was generated from the following file:

- `src/main/cms/MessageListener.h`

6.551 activemq::wireformat::openwire::marshal::v5::MessageMarshaller Class Reference

Marshaling code for Open Wire Format for `MessageMarshaller` (p. 2523).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/MessageMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v5::MessageMarshaller`:

Public Member Functions

- `MessageMarshaller ()`
- `virtual ~MessageMarshaller ()`
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.551.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 2523). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.551.2 Constructor & Destructor Documentation

6.551.2.1 activemq::wireformat::openwire::marshal::v5::MessageMarshaller::MessageMarshaller () [inline]

6.551.2.2 virtual activemq::wireformat::openwire::marshal::v5::MessageMarshaller::~~MessageMarshaller () [inline, virtual]

6.551.3 Member Function Documentation

6.551.3.1 virtual void activemq::wireformat::openwire::marshal::v5::MessageMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 223), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 342), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 369), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 413), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 513), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 623).

6.551.3.2 virtual void `activemq::wireformat::openwire::marshal::v5::MessageMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 189), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 224), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 343), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 369), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 413), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 514), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 623).

```

6.551.3.3 virtual int ac-
tivismq::wireformat::openwire::marshal::v5::MessageMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 189), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 224), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 343), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 369), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 413), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 514), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 623).

```

6.551.3.4 virtual void ac-
tivismq::wireformat::openwire::marshal::v5::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 189), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 224), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 343), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 370), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 414), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 514), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 624).

```
6.551.3.5  virtual void ac-
            tivemq::wireformat::openwire::marshal::v5::MessageMarshaller::tightUnmarshal
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataInputStream * dataIn,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 727).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 190), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 225), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 344), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 370), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 414), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 515), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 624).

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 2527). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.552.2 Constructor & Destructor Documentation

6.552.2.1 `activemq::wireformat::openwire::marshal::v3::MessageMarshaller::MessageMarshaller ()` [inline]

6.552.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessageMarshaller::~~MessageMarshaller ()` [inline, virtual]

6.552.3 Member Function Documentation

6.552.3.1 `virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 172), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 211), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 330), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 357), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 401), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 501), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 611).

6.552.3.2 `virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 173), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 212), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 331), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 357), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 401), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 502), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 611).

```
6.552.3.3 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 173), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 212), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 331), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 357), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 401), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 502), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 612).

```

6.552.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 174), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 213), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 331), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 358), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 402), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 502), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 612).

```

6.552.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 707).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 174), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 213), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 332), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 358), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 402), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 503), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 612).

- `virtual ~MessageMarshaller ()`
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.
- `virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`
Write a object instance to data output stream.

6.553.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 2532). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.553.2 Constructor & Destructor Documentation

6.553.2.1 `activemq::wireformat::openwire::marshal::v2::MessageMarshaller::MessageMarshaller ()` [inline]

6.553.2.2 `virtual activemq::wireformat::openwire::marshal::v2::MessageMarshaller::~~MessageMarshaller ()` [inline, virtual]

6.553.3 Member Function Documentation

6.553.3.1 `virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 231), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 346), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 373), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 417), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 517), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 631).

6.553.3.2 `virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 185), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 232), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 347), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 373), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 417), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 518), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 631).

```
6.553.3.3 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 185), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 232), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 347), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 373), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 417), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 518), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 631).

```

6.553.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 185), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 232), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 347), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 374), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 418), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 518), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 632).

```

6.553.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 740).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 186), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 233), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 348), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 374), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 418), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 519), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 632).

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 181), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 220), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 339), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 365), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 409), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 510), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 615).

```
6.554.3.3 virtual int ac-
tivemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 181), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 220), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 339), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 365), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 409), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 510), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 615).

```

6.554.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 181), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 220), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 339), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 366), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 410), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 510), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 616).

```

6.554.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

tivemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 177), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 216), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 335), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 361), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 405), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 506), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 619).

6.555.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 177), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 216), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 335), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 362), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 406), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 506), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 620).

6.555.3.5 virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

6.556.2.1 `activemq::wireformat::openwire::marshal::v6::MessageMarshaller::MessageMarshaller ()` [inline]

6.556.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v6::MessageMarshaller::~~MessageMarshaller ()` [inline, virtual]

6.556.3 Member Function Documentation

6.556.3.1 `virtual void` `activemq::wireformat::openwire::marshal::v6::MessageMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::ActiveMQBlobMessageMarshaller` (p. 192), `activemq::wireformat::openwire::marshal::v6::ActiveMQBytesMessageMarshaller` (p. 227), `activemq::wireformat::openwire::marshal::v6::ActiveMQMapMessageMarshaller` (p. 350), `activemq::wireformat::openwire::marshal::v6::ActiveMQMessageMarshaller` (p. 377), `activemq::wireformat::openwire::marshal::v6::ActiveMQObjectMessageMarshaller` (p. 421), `activemq::wireformat::openwire::marshal::v6::ActiveMQStreamMessageMarshaller` (p. 521), and `activemq::wireformat::openwire::marshal::v6::ActiveMQTextMessageMarshaller` (p. 627).

6.556.3.2 `virtual void` `activemq::wireformat::openwire::marshal::v6::MessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn)` throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::ActiveMQBlobMessageMarshaller` (p. 193), `activemq::wireformat::openwire::marshal::v6::ActiveMQBytesMessageMarshaller` (p. 228), `activemq::wireformat::openwire::marshal::v6::ActiveMQMapMessageMarshaller` (p. 351), `activemq::wireformat::openwire::marshal::v6::ActiveMQMessageMarshaller` (p. 377), `activemq::wireformat::openwire::marshal::v6::ActiveMQObjectMessageMarshaller` (p. 421), `activemq::wireformat::openwire::marshal::v6::ActiveMQStreamMessageMarshaller` (p. 522), and `activemq::wireformat::openwire::marshal::v6::ActiveMQTextMessageMarshaller` (p. 627).

```
6.556.3.3  virtual int ac-
            tivemq::wireformat::openwire::marshal::v6::MessageMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
              * dataStructure, utils::BooleanStream * bs ) throw (
              decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 731).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::ActiveMQBlobMessageMarshaller` (p. 193), `activemq::wireformat::openwire::marshal::v6::ActiveMQBytesMessageMarshaller` (p. 228), `activemq::wireformat::openwire::marshal::v6::ActiveMQMapMessageMarshaller` (p. 351), `activemq::wireformat::openwire::marshal::v6::ActiveMQMessageMarshaller` (p. 377), `activemq::wireformat::openwire::marshal::v6::ActiveMQObjectMessageMarshaller` (p. 421), `activemq::wireformat::openwire::marshal::v6::ActiveMQStreamMessageMarshaller` (p. 522), and `activemq::wireformat::openwire::marshal::v6::ActiveMQTextMessageMarshaller` (p. 627).

```

6.556.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 732).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::ActiveMQBlobMessageMarshaller** (p. 193), **activemq::wireformat::openwire::marshal::v6::ActiveMQBytesMessageMarshaller** (p. 228), **activemq::wireformat::openwire::marshal::v6::ActiveMQMapMessageMarshaller** (p. 351), **activemq::wireformat::openwire::marshal::v6::ActiveMQMessageMarshaller** (p. 378), **activemq::wireformat::openwire::marshal::v6::ActiveMQObjectMessageMarshaller** (p. 422), **activemq::wireformat::openwire::marshal::v6::ActiveMQStreamMessageMarshaller** (p. 522), and **activemq::wireformat::openwire::marshal::v6::ActiveMQTextMessageMarshaller** (p. 628).

```

6.556.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::MessageMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::ActiveMQBlobMessageMarshaller` (p. 194), `activemq::wireformat::openwire::marshal::v6::ActiveMQBytesMessageMarshaller` (p. 229), `activemq::wireformat::openwire::marshal::v6::ActiveMQMapMessageMarshaller` (p. 352), `activemq::wireformat::openwire::marshal::v6::ActiveMQMessageMarshaller` (p. 378), `activemq::wireformat::openwire::marshal::v6::ActiveMQObjectMessageMarshaller` (p. 422), `activemq::wireformat::openwire::marshal::v6::ActiveMQStreamMessageMarshaller` (p. 523), and `activemq::wireformat::openwire::marshal::v6::ActiveMQTextMessageMarshaller` (p. 628).

6.559 cms::MessageProducer Class Reference

A client uses a `MessageProducer` (p. 2550) object to send messages to a **Destination** (p. 1610).

```
#include <src/main/cms/MessageProducer.h>
```

Inheritance diagram for `cms::MessageProducer`:

Public Member Functions

- `virtual ~MessageProducer ()`
- `virtual void send (Message *message)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)`
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- `virtual void send (Message *message, int deliveryMode, int priority, long long timeToLive)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)`
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- `virtual void send (const Destination *destination, Message *message)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **Destination** *destination, **Message** *message, int deliveryMode, int priority, long long timeToLive)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)=0 throw (CMSEException)

Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const =0 throw (CMSEException)

Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)=0 throw (CMSEException)

*Sets if **Message** (p. 2375) Ids are disabled for this Producer.*

- virtual bool **getDisableMessageID** () const =0 throw (CMSEException)

*Gets if **Message** (p. 2375) Ids are disabled for this Producer.*

- virtual void **setDisableMessageTimeStamp** (bool value)=0 throw (CMSEException)

*Sets if **Message** (p. 2375) Time Stamps are disabled for this Producer.*

- virtual bool **getDisableMessageTimeStamp** () const =0 throw (CMSEException)

*Gets if **Message** (p. 2375) Time Stamps are disabled for this Producer.*

- virtual void **setPriority** (int priority)=0 throw (CMSEException)

Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const =0 throw (CMSEException)

Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)=0 throw (CMSEException)

Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const =0 throw (CMSEException)

Gets the Time to Live that this producer sends messages with.

6.559.1 Detailed Description

A client uses a **MessageProducer** (p. 2550) object to send messages to a **Destination** (p. 1610). A **MessageProducer** (p. 2550) object is created by passing a **Destination** (p. 1610) object to a message-producer creation method supplied by a session.

A client also has the option of creating a message producer without supplying a destination. In this case, a **Destination** (p. 1610) must be provided with every send operation. A typical use for this kind of message producer is to send replies to requests using the request's CMSReplyTo destination.

A client can specify a default delivery mode, priority, and time to live for messages sent by a message producer. It can also specify the delivery mode, priority, and time to live for an individual message.

A client can specify a time-to-live value in milliseconds for each message it sends. This value defines a message expiration time that is the sum of the message's time-to-live and the GMT when it is sent (for transacted sends, this is the time the client sends the message, not the time the transaction is committed).

Since

1.0

6.559.2 Constructor & Destructor Documentation

6.559.2.1 `virtual cms::MessageProducer::~MessageProducer () [inline, virtual]`

6.559.3 Member Function Documentation

6.559.3.1 `virtual int cms::MessageProducer::getDeliveryMode () const throw (CMSEException) [pure virtual]`

Gets the delivery mode for this Producer.

Returns

The **DeliveryMode** (p. 1609)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 998), and `activemq::core::ActiveMQProducer` (p. 425).

6.559.3.2 `virtual bool cms::MessageProducer::getDisableMessageID () const throw (CMSEException) [pure virtual]`

Gets if **Message** (p. 2375) Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 998), and `activemq::core::ActiveMQProducer` (p. 425).

6.559.3.3 `virtual bool cms::MessageProducer::getDisableMessageTimeStamp ()
const throw (CMSEException) [pure virtual]`

Gets if **Message** (p. 2375) Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 999), and **activemq::core::ActiveMQProducer** (p. 426).

6.559.3.4 `virtual int cms::MessageProducer::getPriority () const throw (CMSEException) [pure virtual]`

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 999), and **activemq::core::ActiveMQProducer** (p. 426).

6.559.3.5 `virtual long long cms::MessageProducer::getTimeToLive () const
throw (CMSEException) [pure virtual]`

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 999), and **activemq::core::ActiveMQProducer** (p. 427).

6.559.3.6 `virtual void cms::MessageProducer::send (Message * message,
int deliveryMode, int priority, long long timeToLive)
throw (cms::CMSEException, cms::MessageFormatException,
cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions

CMSEException (p. 1074) - if an internal error occurs while sending the message.

MessageFormatException (p. 2493) - if an Invalid **Message** (p. 2375) is given.

InvalidDestinationException (p. 1993) - if a client uses this method with a **MessageProducer** (p. 2550) with an invalid destination.

UnsupportedOperationException (p. 3659) - if a client uses this method with a **MessageProducer** (p. 2550) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1000), and **activemq::core::ActiveMQProducer** (p. 428).

6.559.3.7 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions

CMSEException (p. 1074) - if an internal error occurs while sending the message.

MessageFormatException (p. 2493) - if an Invalid **Message** (p. 2375) is given.

InvalidDestinationException (p. 1993) - if a client uses this method with a **MessageProducer** (p. 2550) with an invalid destination.

UnsupportedOperationException (p. 3659) - if a client uses this method with a **MessageProducer** (p. 2550) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1001), and **activemq::core::ActiveMQProducer** (p. 427).

6.559.3.8 virtual void cms::MessageProducer::send (Message * *message*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

message The message to be sent.

Exceptions

CMSException (p. 1074) - if an internal error occurs while sending the message.

MessageFormatException (p. 2493) - if an Invalid **Message** (p. 2375) is given.

InvalidDestinationException (p. 1993) - if a client uses this method with a **MessageProducer** (p. 2550) with an invalid destination.

UnsupportedOperationException (p. 3659) - if a client uses this method with a **MessageProducer** (p. 2550) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1001), and **activemq::core::ActiveMQProducer** (p. 428).

6.559.3.9 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

destination The destination on which to send the message

message the message to be sent.

Exceptions

CMSException (p. 1074) - if an internal error occurs while sending the message.

MessageFormatException (p. 2493) - if an Invalid **Message** (p. 2375) is given.

InvalidDestinationException (p. 1993) - if a client uses this method with a **MessageProducer** (p. 2550) with an invalid destination.

UnsupportedOperationException (p. 3659) - if a client uses this method with a **MessageProducer** (p. 2550) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1000), and **activemq::core::ActiveMQProducer** (p. 429).

6.559.3.10 `virtual void cms::MessageProducer::setDeliveryMode (int mode)
throw (CMSEException)` [pure virtual]

Sets the delivery mode for this Producer.

Parameters

mode The **DeliveryMode** (p. 1609)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1002), and **activemq::core::ActiveMQProducer** (p. 429).

6.559.3.11 `virtual void cms::MessageProducer::setDisableMessageID (bool value)
throw (CMSEException)` [pure virtual]

Sets if **Message** (p. 2375) Ids are disabled for this Producer.

Parameters

value boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1002), and **activemq::core::ActiveMQProducer** (p. 430).

6.559.3.12 `virtual void cms::MessageProducer::setDisableMessageTimeStamp (bool value)
throw (CMSEException)` [pure virtual]

Sets if **Message** (p. 2375) Time Stamps are disabled for this Producer.

Parameters

value - boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 1002), and **activemq::core::ActiveMQProducer** (p. 430).

6.559.3.13 `virtual void cms::MessageProducer::setPriority (int priority)
throw (CMSEException)` [pure virtual]

Sets the Priority that this Producers sends messages at.

Parameters

priority int value for Priority level

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 1002), and `activemq::core::ActiveMQProducer` (p. 430).

6.559.3.14 `virtual void cms::MessageProducer::setTimeToLive (long long time) throw (CMSEException)` [pure virtual]

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

time default time to live value in milliseconds

Exceptions

CMSEException (p. 1074) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 1003), and `activemq::core::ActiveMQProducer` (p. 430).

The documentation for this class was generated from the following file:

- `src/main/cms/MessageProducer.h`

6.560 activemq::wireformat::openwire::utils::MessagePropertyInterceptor Class Reference

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

```
#include <src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h>
```

Public Member Functions

- **MessagePropertyInterceptor** (`commands::Message *message`, `util::PrimitiveMap *properties`) throw (`decaf::lang::exceptions::NullPointerException`)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

- `virtual ~MessagePropertyInterceptor ()`
- `virtual bool getBooleanProperty (const std::string &name) const`

Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const
Gets a byte property.
- virtual double **getDoubleProperty** (const std::string &name) const
Gets a double property.
- virtual float **getFloatProperty** (const std::string &name) const
Gets a float property.
- virtual int **getIntProperty** (const std::string &name) const
Gets a int property.
- virtual long long **getLongProperty** (const std::string &name) const
Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const
Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const
Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value)
Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value)
Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value)
Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value)
Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value)
Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value)
Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value)
Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value)
Sets a string property.

6.560.1 Detailed Description

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties. Currently the only properties that are intercepted and handled are:

Name | Conversion Supported ----- JMSXDeliveryCount |
Int, Long, String JMSXGroupID | String JMSXGroupSeq | Int, Long, String

6.560.2 Constructor & Destructor Documentation

6.560.2.1 `activemq::wireformat::openwire::utils::MessagePropertyInterceptor::MessagePropertyInterceptor (commands::Message * message, util::PrimitiveMap * properties)`
`throw (decaf::lang::exceptions::NullPointerException)`

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

Parameters

message - The Message to store reserved property data in
properties - The PrimitiveMap to store the rest of the properties in.

Exceptions

NullPointerException if either param is NULL

6.560.2.2 `virtual`
`activemq::wireformat::openwire::utils::MessagePropertyInterceptor::~MessagePropertyInterceptor () [virtual]`

6.560.3 Member Function Documentation

6.560.3.1 `virtual bool` `activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getBooleanProperty (const std::string & name) const [virtual]`

Gets a boolean property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.2 `virtual unsigned char` `activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getByteProperty (const std::string & name) const [virtual]`

Gets a byte property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.3 `virtual double activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getDoubleProperty (const std::string & name) const [virtual]`

Gets a double property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.4 `virtual float activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getFloatProperty (const std::string & name) const [virtual]`

Gets a float property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.5 `virtual int activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getIntProperty (const std::string & name) const [virtual]`

Gets a int property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.6 `virtual long long ac-`
 `tivemq::wireformat::openwire::utils::MessagePropertyInterceptor::getLongProperty`
 `(const std::string & name) const [virtual]`

Gets a long property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.7 `virtual short ac-`
 `tivemq::wireformat::openwire::utils::MessagePropertyInterceptor::getShortProperty`
 `(const std::string & name) const [virtual]`

Gets a short property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.8 `virtual std::string ac-`
 `tivemq::wireformat::openwire::utils::MessagePropertyInterceptor::getStringProperty`
 `(const std::string & name) const [virtual]`

Gets a string property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.560.3.9 `virtual void ac-`
 `tivemq::wireformat::openwire::utils::MessagePropertyInterceptor::setBooleanProperty`
 `(const std::string & name, bool value) [virtual]`

Sets a boolean property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.10 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setByteProperty (const std::string & name, unsigned char value) [virtual]`

Sets a byte property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.11 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setDoubleProperty (const std::string & name, double value) [virtual]`

Sets a double property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.12 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setFloatProperty (const std::string & name, float value) [virtual]`

Sets a float property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.13 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setIntProperty (const std::string & name, int value) [virtual]`

Sets a int property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.14 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setLongProperty (const std::string & name, long long value) [virtual]`

Sets a long property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.15 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setShortProperty (const std::string & name, short value) [virtual]`

Sets a short property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.560.3.16 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setStringProperty (const std::string & name, const std::string & value) [virtual]`

Sets a string property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h`

6.561 activemq::commands::MessagePull Class Reference

```
#include <src/main/activemq/commands/MessagePull.h>
```

Inheritance diagram for `activemq::commands::MessagePull`:

Public Member Functions

- `MessagePull ()`
- `virtual ~MessagePull ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual MessagePull * cloneDataStructure () const`
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ConsumerId** > & **getConsumerId** () const
- virtual **Pointer**< **ConsumerId** > & **getConsumerId** ()
- virtual void **setConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual long long **getTimeout** () const
- virtual void **setTimeout** (long long timeout)
- virtual const std::string & **getCorrelationId** () const
- virtual std::string & **getCorrelationId** ()
- virtual void **setCorrelationId** (const std::string &correlationId)
- virtual const **Pointer**< **MessageId** > & **getMessageId** () const
- virtual **Pointer**< **MessageId** > & **getMessageId** ()
- virtual void **setMessageId** (const **Pointer**< **MessageId** > &messageId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_MESSAGEPULL** = 20

Protected Attributes

- **Pointer**< **ConsumerId** > **consumerId**
- **Pointer**< **ActiveMQDestination** > **destination**
- long long **timeout**
- std::string **correlationId**
- **Pointer**< **MessageId** > **messageId**

6.561.1 Constructor & Destructor Documentation

6.561.1.1 `activemq::commands::MessagePull::MessagePull ()`

6.561.1.2 `virtual activemq::commands::MessagePull::~~MessagePull () [virtual]`

6.561.2 Member Function Documentation

6.561.2.1 `virtual MessagePull* activemq::commands::MessagePull::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.561.2.2 `virtual void activemq::commands::MessagePull::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.561.2.3 `virtual bool activemq::commands::MessagePull::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

- 6.561.2.4** `virtual const Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () const [virtual]`
- 6.561.2.5** `virtual Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () [virtual]`
- 6.561.2.6** `virtual const std::string& activemq::commands::MessagePull::getCorrelationId () const [virtual]`
- 6.561.2.7** `virtual std::string& activemq::commands::MessagePull::getCorrelationId () [virtual]`
- 6.561.2.8** `virtual unsigned char activemq::commands::MessagePull::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.561.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () const [virtual]
- 6.561.2.10 virtual Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () [virtual]
- 6.561.2.11 virtual const Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () const [virtual]
- 6.561.2.12 virtual Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () [virtual]
- 6.561.2.13 virtual long long activemq::commands::MessagePull::getTimeout () const [virtual]
- 6.561.2.14 virtual void activemq::commands::MessagePull::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]
- 6.561.2.15 virtual void activemq::commands::MessagePull::setCorrelationId (const std::string & *correlationId*) [virtual]
- 6.561.2.16 virtual void activemq::commands::MessagePull::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.561.2.17 virtual void activemq::commands::MessagePull::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]
- 6.561.2.18 virtual void activemq::commands::MessagePull::setTimeout (long long *timeout*) [virtual]
- 6.561.2.19 virtual std::string activemq::commands::MessagePull::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

- 6.561.2.20 virtual Pointer<Command> activemq::commands::MessagePull::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1112).

6.561.3 Field Documentation

- 6.561.3.1** **Pointer<ConsumerId> activemq::commands::MessagePull::consumerId**
[protected]
- 6.561.3.2** **std::string activemq::commands::MessagePull::correlationId** [protected]
- 6.561.3.3** **Pointer<ActiveMQDestination> activemq::commands::MessagePull::destination** [protected]
- 6.561.3.4** **const unsigned char activemq::commands::MessagePull::ID _-MESSAGEPULL = 20** [static]
- 6.561.3.5** **Pointer<MessageId> activemq::commands::MessagePull::messageId**
[protected]
- 6.561.3.6** **long long activemq::commands::MessagePull::timeout** [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/MessagePull.h`

6.562 **activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller** Class Reference

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2568).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessagePullMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller**:

Public Member Functions

- **MessagePullMarshaller ()**
- **virtual ~MessagePullMarshaller ()**
- **virtual commands::DataStructure * createObject () const**
Creates a new instance of this marshalable type.
- **virtual unsigned char getDataStructureType () const**
Get the Data Structure Type that identifies this Marshaler.
- **virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)**

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.562.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2568). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.562.2 Constructor & Destructor Documentation

6.562.2.1 activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::MessagePullMarshaller () [inline]

6.562.2.2 virtual activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::~~MessagePullMarshaller () [inline, virtual]

6.562.3 Member Function Documentation

6.562.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.562.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.562.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.562.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

6.562.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 738).

6.562.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 739).

6.562.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

The documentation for this class was generated from the following file:

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.563.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2572). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.563.2 Constructor & Destructor Documentation

6.563.2.1 activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::MessagePullMarshaller () [inline]

6.563.2.2 virtual activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::~~MessagePullMarshaller () [inline, virtual]

6.563.3 Member Function Documentation

6.563.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.563.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.563.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

6.563.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 723).

6.563.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 724).

```
6.563.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.563.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 727).

The documentation for this class was generated from the following file:

6.564.2 Constructor & Destructor Documentation

6.564.2.1 `activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::MessagePullMarshaller ()` [inline]

6.564.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::~~MessagePullMarshaller ()` [inline, virtual]

6.564.3 Member Function Documentation

6.564.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::createObject () const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.564.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::getDataStructureType () const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.564.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.564.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

6.564.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 704).

```
6.564.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.564.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/MessagePullMarshaller.h`

6.565 activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller Class Reference

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2580).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/MessagePullMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller`:

Public Member Functions

- **MessagePullMarshaller** ()
- virtual **~MessagePullMarshaller** ()

Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.565.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2580). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.565.2 Constructor & Destructor Documentation

6.565.2.1 `activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::MessagePullMarshaller ()` [inline]

6.565.2.2 `virtual activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::~~MessagePullMarshaller ()` [inline, virtual]

6.565.3 Member Function Documentation

6.565.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::createObject () const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.565.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::getDataStructureType () const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.565.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.565.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

6.565.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 711).

```
6.565.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 712).

```
6.565.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

6.566.3 Member Function Documentation

6.566.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.566.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.566.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.566.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

6.566.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 718).

```
6.566.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 719).

```
6.566.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.568.1 Detailed Description

The **MockTransport** (p. 2592) defines a base level **Transport** (p. 3629) class that is intended to be used in place of an a regular protocol **Transport** (p. 3629) such as TCP. This **Transport** (p. 3629) assumes that it is the base **Transport** (p. 3629) in the Transports stack, and destroys any Transports that are passed to it in its constructor.

This **Transport** (p. 3629) defines an Interface **ResponseBuilder** (p. 3079) which must be implemented by any protocol for which the **Transport** (p. 3629) is used to Emulate. The **Transport** (p. 3629) hands off all outbound commands to the **ResponseBuilder** (p. 3079) for processing, it is up to the builder to create appropriate responses and schedule any asynchronous messages that might result from a message sent to the Broker.

6.568.2 Constructor & Destructor Documentation

6.568.2.1 `activemq::transport::mock::MockTransport::MockTransport (const Pointer< wireformat::WireFormat > & wireFormat, const Pointer< ResponseBuilder > & responseBuilder)`

6.568.2.2 `virtual activemq::transport::mock::MockTransport::~MockTransport () [inline, virtual]`

6.568.3 Member Function Documentation

6.568.3.1 `virtual void activemq::transport::mock::MockTransport::close () throw (decaf::io::IOException) [virtual]`

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 1066).

6.568.3.2 `virtual void activemq::transport::mock::MockTransport::fireCommand (const Pointer< Command > & command) [inline, virtual]`

Fires a Command back through this transport to its registered CommandListener if there is one.

Parameters

command - Command to send to the Listener.

6.568.3.3 `virtual void activemq::transport::mock::MockTransport::fireException (const exceptions::ActiveMQException & ex) [inline, virtual]`

Fires a Exception back through this transport to its registered ExceptionListener if there is one.

Parameters

ex The Exception that will be passed on the the **Transport** (p. 3629) listener.

- 6.568.3.4** `static MockTransport* activemq::transport::mock::MockTransport::getInstance () [inline, static]`
- 6.568.3.5** `int activemq::transport::mock::MockTransport::getNumReceivedMessageBeforeFail () const [inline]`
- 6.568.3.6** `int activemq::transport::mock::MockTransport::getNumReceivedMessages () const [inline]`
- 6.568.3.7** `int activemq::transport::mock::MockTransport::getNumSentKeepAlives () const [inline]`
- 6.568.3.8** `int activemq::transport::mock::MockTransport::getNumSentKeepAlivesBeforeFail () const [inline]`
- 6.568.3.9** `int activemq::transport::mock::MockTransport::getNumSentMessageBeforeFail () const [inline]`
- 6.568.3.10** `int activemq::transport::mock::MockTransport::getNumSentMessages () const [inline]`
- 6.568.3.11** `virtual std::string activemq::transport::mock::MockTransport::getRemoteAddress () const [inline, virtual]`

Returns

the remote address for this connection

Implements `activemq::transport::Transport` (p. 3630).

- 6.568.3.12** `virtual TransportListener* activemq::transport::mock::MockTransport::getTransportListener () const [inline, virtual]`

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

Implements `activemq::transport::Transport` (p. 3631).

- 6.568.3.13** `Pointer<wireformat::WireFormat> activemq::transport::mock::MockTransport::getWireFormat () const [inline]`

Gets the currently set WireFormat.

Returns

the current WireFormat object.

6.568.3.14 `virtual bool activemq::transport::mock::MockTransport::isClosed ()
const [inline, virtual]`

Has the **Transport** (p. 3629) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3629)

Implements **activemq::transport::Transport** (p. 3631).

6.568.3.15 `virtual bool activemq::transport::mock::MockTransport::isConnected ()
const [inline, virtual]`

Is the **Transport** (p. 3629) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3631).

6.568.3.16 `bool activemq::transport::mock::MockTransport::isFailOnClose ()
const [inline]`

6.568.3.17 `bool activemq::transport::mock::MockTransport::isFailOnKeepAliveSends ()
const [inline]`

6.568.3.18 `bool activemq::transport::mock::MockTransport::isFailOnReceiveMessage ()
const [inline]`

6.568.3.19 `bool activemq::transport::mock::MockTransport::isFailOnSendMessage ()
const [inline]`

6.568.3.20 `bool activemq::transport::mock::MockTransport::isFailOnStart ()
const [inline]`

6.568.3.21 `bool activemq::transport::mock::MockTransport::isFailOnStop ()
const [inline]`

6.568.3.22 `virtual bool activemq::transport::mock::MockTransport::isFaultTolerant ()
const [inline, virtual]`

Is this **Transport** (p. 3629) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3629) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3631).

6.568.3.23 `virtual Transport* activemq::transport::mock::MockTransport::narrow (const std::type_info & typeId) [inline, virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3629) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3631).

6.568.3.24 `virtual void activemq::transport::mock::MockTransport::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3632).

6.568.3.25 `virtual void activemq::transport::mock::MockTransport::reconnect (const decaf::net::URI &uri AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.568.3.26 `virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command - The command to be sent.

timeout - The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements `activemq::transport::Transport` (p. 3633).

6.568.3.27 `virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command the command to be sent.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements `activemq::transport::Transport` (p. 3632).

- 6.568.3.28 `void activemq::transport::mock::MockTransport::setFailOnClose (bool value) [inline]`
- 6.568.3.29 `void activemq::transport::mock::MockTransport::setFailOnKeepAliveSends (bool value) [inline]`
- 6.568.3.30 `void activemq::transport::mock::MockTransport::setFailOnReceiveMessage (bool value) [inline]`
- 6.568.3.31 `void activemq::transport::mock::MockTransport::setFailOnSendMessage (bool value) [inline]`
- 6.568.3.32 `void activemq::transport::mock::MockTransport::setFailOnStart (bool value) [inline]`
- 6.568.3.33 `void activemq::transport::mock::MockTransport::setFailOnStop (bool value) [inline]`
- 6.568.3.34 `void activemq::transport::mock::MockTransport::setNumReceivedMessageBeforeFail (int value) [inline]`
- 6.568.3.35 `void activemq::transport::mock::MockTransport::setNumReceivedMessages (int value) [inline]`
- 6.568.3.36 `void activemq::transport::mock::MockTransport::setNumSentKeepAlives (int value) [inline]`
- 6.568.3.37 `void activemq::transport::mock::MockTransport::setNumSentKeepAlivesBeforeFail (int value) [inline]`
- 6.568.3.38 `void activemq::transport::mock::MockTransport::setNumSentMessageBeforeFail (int value) [inline]`
- 6.568.3.39 `void activemq::transport::mock::MockTransport::setNumSentMessages (int value) [inline]`
- 6.568.3.40 `virtual void activemq::transport::mock::MockTransport::setOutgoingListener (TransportListener * listener) [inline, virtual]`

Sets a Listener that gets notified for every command that would have been sent by this transport to the Broker, this allows a client to verify that its messages are making it to the wire.

Parameters

listener - The CommandListener to notify for each message

6.568.3.41 `void activemq::transport::mock::MockTransport::setResponseBuilder (const Pointer< ResponseBuilder > & responseBuilder) [inline]`

Sets the **ResponseBuilder** (p. 3079) that this class uses to create Responses to Commands sent. These are either real Response Objects, or Commands that would have been sent Asynchronously be the Broker.

Parameters

responseBuilder - The **ResponseBuilder** (p. 3079) to use from now on.

6.568.3.42 `virtual void activemq::transport::mock::MockTransport::setTransportListener (TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

Parameters

listener the listener of transport events.

Implements **activemq::transport::Transport** (p. 3633).

6.568.3.43 `virtual void activemq::transport::mock::MockTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat AMQCPP_UNUSED) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat WireFormat the object used to encode / decode commands.

6.568.3.44 `virtual void activemq::transport::mock::MockTransport::start () throw (decaf::io::IOException) [virtual]`

Starts the **Transport** (p. 3629), the send methods of a **Transport** (p. 3629) will throw an exception if used before the **Transport** (p. 3629) is started.

Exceptions

IOException if and error occurs while starting the **Transport** (p. 3629).

Implements **activemq::transport::Transport** (p. 3634).

6.568.3.45 `virtual void activemq::transport::mock::MockTransport::stop () throw (decaf::io::IOException) [virtual]`

Stops the **Transport** (p. 3629).

Exceptions

IOException if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 3634).

6.569.1 Detailed Description

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

6.569.2 Constructor & Destructor Documentation

6.569.2.1 virtual
activemq::transport::mock::MockTransportFactory::~MockTransportFactory
() [inline, virtual]

6.569.3 Member Function Documentation

6.569.3.1 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::create
(const decaf::net::URI & *location*) throw (
exceptions::ActiveMQException) [virtual]

Creates a fully configured **Transport** (p.3629) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.3635).

6.569.3.2 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::createComposite
(const decaf::net::URI & *location*) throw (
exceptions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p.3629) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.3635).

6.569.3.3 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::doCreateComposite
(const decaf::net::URI & *location*, const Pointer<
wireformat::WireFormat> & *wireFormat*, const decaf::util::Properties
& *properties*) throw (exceptions::ActiveMQException) [protected,
virtual]

Creates a slimed down **Transport** (p.3629) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3629).

properties - Properties to apply to the transport.

Returns

Pointer to a new **Transport** (p. 3629) instance.

Exceptions

ActiveMQException if an error occurs

*Attempts to **Lock** (p. 2228) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.570.1 Detailed Description

Mutex (p.2604) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.

Since

1.0

6.570.2 Constructor & Destructor Documentation

6.570.2.1 decaf::util::concurrent::Mutex::Mutex ()

6.570.2.2 virtual decaf::util::concurrent::Mutex::~~Mutex () [virtual]

6.570.3 Member Function Documentation

6.570.3.1 virtual void decaf::util::concurrent::Mutex::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements decaf::util::concurrent::Synchronizable (p.3463).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::lock(), decaf::util::StlMap< std::string, cms::Topic * >::lock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::lock(), and decaf::util::AbstractCollection< cms::Connection * >::lock().

6.570.3.2 `virtual void decaf::util::concurrent::Mutex::notify ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3464).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notify()`, `decaf::util::StlMap< std::string, cms::Topic * >::notify()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notify()`, and `decaf::util::AbstractCollection< cms::Connection * >::notify()`.

6.570.3.3 `virtual void decaf::util::concurrent::Mutex::notifyAll
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3465).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notifyAll()`, `decaf::util::StlMap< std::string, cms::Topic * >::notifyAll()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notifyAll()`, and `decaf::util::AbstractCollection< cms::Connection * >::notifyAll()`.

6.570.3.4 `virtual bool decaf::util::concurrent::Mutex::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]`

Attempts to **Lock** (p. 2228) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3466).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::tryLock()`, `decaf::util::StlMap< std::string, cms::Topic * >::tryLock()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::tryLock()`, and `decaf::util::AbstractCollection< cms::Connection * >::tryLock()`.

6.570.3.5 virtual void decaf::util::concurrent::Mutex::unlock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3467).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::unlock()`, `decaf::util::StlMap< std::string, cms::Topic * >::unlock()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::unlock()`, and `decaf::util::AbstractCollection< cms::Connection * >::unlock()`.

6.570.3.6 virtual void decaf::util::concurrent::Mutex::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3468).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::wait()`, `decaf::util::StlMap< std::string, cms::Topic * >::wait()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::wait()`, and `decaf::util::AbstractCollection< cms::Connection * >::wait()`.

6.570.3.7 `virtual void decaf::util::concurrent::Mutex::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3470).

6.570.3.8 `virtual void decaf::util::concurrent::Mutex::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3461) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3471).

6.572 decaf::internal::util::concurrent::MutexImpl Class Reference

```
#include <src/main/decaf/internal/util/concurrent/MutexImpl.h>
```

Static Public Member Functions

- static **decaf::util::concurrent::MutexHandle * create** ()
Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.
- static void **destroy** (decaf::util::concurrent::MutexHandle *handle)
Destroy a previously create Mutex instance.
- static void **lock** (decaf::util::concurrent::MutexHandle *handle)
Locks the Mutex.
- static bool **trylock** (decaf::util::concurrent::MutexHandle *handle)
Tries to lock the Mutex.
- static void **unlock** (decaf::util::concurrent::MutexHandle *handle)
Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

6.572.1 Member Function Documentation

6.572.1.1 static decaf::util::concurrent::MutexHandle* decaf::internal::util::concurrent::MutexImpl::create () [static]

Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.

Returns

handle to a newly created Mutex.

6.572.1.2 static void decaf::internal::util::concurrent::MutexImpl::destroy (decaf::util::concurrent::MutexHandle * *handle*) [static]

Destroy a previously create Mutex instance.

Parameters

mutex The Mutex instance to be destroyed.

6.572.1.3 static void decaf::internal::util::concurrent::MutexImpl::lock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Locks the Mutex.

If the Mutex is already locked by another thread this method blocks until the Mutex becomes unlocked and this thread acquires the lock.

Parameters

handle the handle to the Mutex to Lock.

6.572.1.4 static bool decaf::internal::util::concurrent::MutexImpl::trylock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Tries to lock the Mutex.

If the Mutex is unlocked this Thread acquires the lock on the Mutex and this method returns true, if the Mutex is already locked then the lock is not acquired and this method returns false.

Parameters

handle the handle to the Mutex to attempt to Lock.

Returns

true if the lock was acquired false otherwise.

6.572.1.5 static void decaf::internal::util::concurrent::MutexImpl::unlock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

Parameters

handle the handle to the Mutex to attempt to Lock.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/MutexImpl.h

6.573 decaf::internal::net::Network Class Reference

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

```
#include <src/main/decaf/internal/net/Network.h>
```

Public Member Functions

- virtual ~**Network** ()
- decaf::util::concurrent::Mutex * getRuntimeLock ()
*Gets a pointer to the **Network** (p. 2611) Runtime's Lock object, this can be used by **Network** (p. 2611) layer APIs to synchronize around certain actions such as adding a resource to the **Network** (p. 2611) layer, etc.*
- void addNetworkResource (decaf::internal::util::Resource *value)
*Adds a Resource to the **Network** (p. 2611) Runtime, this resource will be held by the runtime until the Library shutdown method is called at which time all the Resources held by the **Network** (p. 2611) Runtime are destroyed.*
- template<typename T >
void addAsResource (T *value)

Static Public Member Functions

- static **Network** * **getNetworkRuntime** ()

*Gets the one and only instance of the **Network** (p. 2611) class, if this is called before the **Network** (p. 2611) layer has been initialized or after it has been shutdown then an *IllegalStateException* is thrown.*

- static void **initializeNetworking** ()

Initialize the Networking layer.

- static void **shutdownNetworking** ()

*Shutdown the **Network** (p. 2611) layer and free any associated resources, classes in the Decaf library that use the networking layer will now fail if used after calling the shutdown method.*

Protected Member Functions

- **Network** ()

6.573.1 Detailed Description

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

Since

1.0

6.573.2 Constructor & Destructor Documentation

6.573.2.1 `decaf::internal::net::Network::Network ()` [protected]

6.573.2.2 `virtual decaf::internal::net::Network::~~Network ()` [virtual]

6.573.3 Member Function Documentation

6.573.3.1 `template<typename T > void decaf::internal::net::Network::addAsResource (T * value)` [inline]

6.573.3.2 `void decaf::internal::net::Network::addNetworkResource (decaf::internal::util::Resource * value)`

Adds a Resource to the **Network** (p. 2611) Runtime, this resource will be held by the runtime until the Library shutdown method is called at which time all the Resources held by the **Network** (p. 2611) Runtime are destroyed.

Parameters

value The Resource to add to the **Network** (p. 2611) Runtime.

Exceptions

NullPointerException if the Resource value passed is null.

6.573.3.3 static Network* decaf::internal::net::Network::getNetworkRuntime () [static]

Gets the one and only instance of the **Network** (p. 2611) class, if this is called before the **Network** (p. 2611) layer has been initialized or after it has been shutdown then an `IllegalStateException` is thrown.

Returns

pointer to the **Network** (p. 2611) runtime for the Decaf library.

6.573.3.4 decaf::util::concurrent::Mutex* decaf::internal::net::Network::getRuntimeLock ()

Gets a pointer to the **Network** (p. 2611) Runtime's Lock object, this can be used by **Network** (p. 2611) layer APIs to synchronize around certain actions such as adding a resource to the **Network** (p. 2611) layer, etc.

The pointer returned is owned by the **Network** (p. 2611) runtime and should not be deleted or copied by the caller.

Returns

a pointer to the **Network** (p. 2611) Runtime's single Lock instance.

6.573.3.5 static void decaf::internal::net::Network::initializeNetworking () [static]

Initialize the Networking layer.

6.573.3.6 static void decaf::internal::net::Network::shutdownNetworking () [static]

Shutdown the **Network** (p. 2611) layer and free any associated resources, classes in the Decaf library that use the networking layer will now fail if used after calling the shutdown method.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/Network.h`

6.574 activemq::commands::NetworkBridgeFilter Class Reference

```
#include <src/main/activemq/commands/NetworkBridgeFilter.h>
```

Inheritance diagram for `activemq::commands::NetworkBridgeFilter`:

Public Member Functions

- **NetworkBridgeFilter** ()
- virtual **~NetworkBridgeFilter** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **NetworkBridgeFilter * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*
- virtual int **getNetworkTTL** () const
- virtual void **setNetworkTTL** (int networkTTL)
- virtual const **Pointer**< **BrokerId** > & **getNetworkBrokerId** () const
- virtual **Pointer**< **BrokerId** > & **getNetworkBrokerId** ()
- virtual void **setNetworkBrokerId** (const **Pointer**< **BrokerId** > &networkBrokerId)

Static Public Attributes

- static const unsigned char **ID_NETWORKBRIDGEFILTER** = 91

Protected Attributes

- int **networkTTL**
- **Pointer**< **BrokerId** > **networkBrokerId**

6.574.1 Constructor & Destructor Documentation

6.574.1.1 `activemq::commands::NetworkBridgeFilter::NetworkBridgeFilter ()`

6.574.1.2 `virtual
activemq::commands::NetworkBridgeFilter::~~NetworkBridgeFilter ()
[virtual]`

6.574.2 Member Function Documentation

6.574.2.1 `virtual NetworkBridgeFilter* ac-
tivemq::commands::NetworkBridgeFilter::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.574.2.2 `virtual void ac-
tivemq::commands::NetworkBridgeFilter::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1555).

6.574.2.3 `virtual bool activemq::commands::NetworkBridgeFilter::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1556).

6.574.2.4 `virtual unsigned char ac-
tivemq::commands::NetworkBridgeFilter::getDataStructureType ()
const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1553) type copy.

Implements **activemq::commands::DataSet** (p. 1557).

- 6.574.2.5** `virtual const Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () const [virtual]`
- 6.574.2.6** `virtual Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () [virtual]`
- 6.574.2.7** `virtual int activemq::commands::NetworkBridgeFilter::getNetworkTTL () const [virtual]`
- 6.574.2.8** `virtual void activemq::commands::NetworkBridgeFilter::setNetworkBrokerId (const Pointer< BrokerId > & networkBrokerId) [virtual]`
- 6.574.2.9** `virtual void activemq::commands::NetworkBridgeFilter::setNetworkTTL (int networkTTL) [virtual]`
- 6.574.2.10** `virtual std::string activemq::commands::NetworkBridgeFilter::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 767).

6.574.3 Field Documentation

- 6.574.3.1** `const unsigned char activemq::commands::NetworkBridgeFilter::ID_NETWORKBRIDGEFILTER = 91 [static]`
- 6.574.3.2** `Pointer<BrokerId> activemq::commands::NetworkBridgeFilter::networkBrokerId [protected]`
- 6.574.3.3** `int activemq::commands::NetworkBridgeFilter::networkTTL [protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/NetworkBridgeFilter.h`

6.575 activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller Class Reference

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2617).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/NetworkBridgeFilterMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller:

Public Member Functions

- **NetworkBridgeFilterMarshaller** ()
- virtual **~NetworkBridgeFilterMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.575.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p.2617).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.575.2 Constructor & Destructor Documentation

6.575.2.1 `activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.575.2.2 `virtual activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.575.3 Member Function Documentation

6.575.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1505).

6.575.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1511).

6.575.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1518).

6.575.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure** *
dataStructure, **decaf::io::DataInputStream** * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

6.575.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **utils::BooleanStream** * *bs*) throw (
decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.575.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal2`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, decaf::io::DataOutputStream * dataOut,`
`utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

6.575.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightUnmarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, decaf::io::DataInputStream * dataIn,`
`utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1546).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/NetworkBridgeFilterMarshaller.h`

6.576 `activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilter` Class Reference

Marshaling code for Open Wire Format for `NetworkBridgeFilterMarshaller` (p. 2620).

#include <src/main/activemq/wireformat/openwire/marshal/v6/NetworkBridgeFilterMarshaller.h>

Inheritance diagram for activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller:

Public Member Functions

6.576.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p.2620).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.576.2 Constructor & Destructor Documentation

6.576.2.1 `activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.576.2.2 `virtual activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.576.3 Member Function Documentation

6.576.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.576.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.576.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.576.3.4 virtual void activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.576.3.5 virtual int activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.576.3.6 virtual void activemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.576.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.577.2.1 `activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.577.2.2 `virtual activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.577.3 Member Function Documentation

6.577.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.577.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.577.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.577.3.4 virtual void activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.577.3.5 virtual int activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.577.3.6 virtual void activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.577.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.578.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p.2628).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.578.2 Constructor & Destructor Documentation

6.578.2.1 `activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.578.2.2 `virtual activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.578.3 Member Function Documentation

6.578.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.578.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.578.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.578.3.4 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.578.3.5 virtual int activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.578.3.6 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.578.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/NetworkBridgeFilterMarshaller.h

6.579 activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller Class Reference

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2632).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/NetworkBridgeFilterMarshaller.h>
```

Write a object instance to data output stream.

6.579.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2632).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.579.2 Constructor & Destructor Documentation

6.579.2.1 `activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.579.2.2 `virtual activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.579.3 Member Function Documentation

6.579.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.579.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.579.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.579.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.579.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.579.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.579.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.580.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2636).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.580.2 Constructor & Destructor Documentation

6.580.2.1 `activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.580.2.2 `virtual activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.580.3 Member Function Documentation

6.580.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.580.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.580.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.580.3.4 virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.580.3.5 virtual int activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.580.3.6 virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.580.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/NetworkBridgeFilterMarshaller.h

6.581 decaf::net::NoRouteToHostException Class Reference

```
#include <src/main/decaf/net/NoRouteToHostException.h>
```

Inheritance diagram for decaf::net::NoRouteToHostException:

Public Member Functions

- **NoRouteToHostException** () throw ()
Default Constructor.

- **NoRouteToHostException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **NoRouteToHostException** (const NoRouteToHostException &ex) throw ()
Copy Constructor.
- **NoRouteToHostException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoRouteToHostException** (const std::exception *cause) throw ()
Constructor.
- **NoRouteToHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoRouteToHostException * clone** () const
Clones this exception.
- virtual **~NoRouteToHostException** () throw ()

6.581.1 Constructor & Destructor Documentation

6.581.1.1 decaf::net::NoRouteToHostException::NoRouteToHostException () throw () [inline]

Default Constructor.

6.581.1.2 decaf::net::NoRouteToHostException::NoRouteToHostException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.581.1.3 decaf::net::NoRouteToHostException::NoRouteToHostException (const NoRouteToHostException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.581.1.4 `decaf::net::NoRouteToHostException::NoRouteToHostException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.581.1.5 `decaf::net::NoRouteToHostException::NoRouteToHostException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.581.1.6 `decaf::net::NoRouteToHostException::NoRouteToHostException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.581.1.7 `virtual decaf::net::NoRouteToHostException::~~NoRouteToHostException () throw () [inline, virtual]`

6.581.2 Member Function Documentation

6.581.2.1 `virtual NoRouteToHostException* decaf::net::NoRouteToHostException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 3300).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/NoRouteToHostException.h`

6.582 decaf::security::NoSuchAlgorithmException Class Reference

```
#include <src/main/decaf/security/NoSuchAlgorithmException.h>
```

Inheritance diagram for decaf::security::NoSuchAlgorithmException:

Public Member Functions

- **NoSuchAlgorithmException** () throw ()
Default Constructor.
- **NoSuchAlgorithmException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **NoSuchAlgorithmException** (const NoSuchAlgorithmException &ex) throw ()
Copy Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchAlgorithmException** (const std::exception *cause) throw ()
Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchAlgorithmException * clone** () const
Clones this exception.
- virtual **~NoSuchAlgorithmException** () throw ()

6.582.1 Constructor & Destructor Documentation

6.582.1.1 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException () throw () [inline]`

Default Constructor.

6.582.1.2 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.582.1.3 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const NoSuchAlgorithmException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.582.1.4 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.582.1.5 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.582.1.6 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException`
`(const char * file, const int lineNumber, const char * msg, ...)`
`throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.582.1.7 `virtual`
`decaf::security::NoSuchAlgorithmException::~~NoSuchAlgorithmException`
`() throw ()` [inline, virtual]

6.582.2 Member Function Documentation

6.582.2.1 `virtual NoSuchAlgorithmException* de-`
`caf::security::NoSuchAlgorithmException::clone ()`
`const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p.1847).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/NoSuchAlgorithmException.h`

6.583 decaf::lang::exceptions::NoSuchElementException Class Reference

Clones this exception.
- virtual ~**NoSuchElementException** () throw ()

6.583.1 Constructor & Destructor Documentation

6.583.1.1 **decaf::lang::exceptions::NoSuchElementException::NoSuchElementException**
() throw () [inline]

Default Constructor.

6.583.1.2 **decaf::lang::exceptions::NoSuchElementException::NoSuchElementException**
(const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.583.1.3 **decaf::lang::exceptions::NoSuchElementException::NoSuchElementException**
(const **NoSuchElementException** & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.583.1.4 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException
(const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.583.1.5 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException
(const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p.2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.583.1.6 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...)
throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.583.1.7 virtual
decaf::lang::exceptions::NoSuchElementException::~~NoSuchElementException
() throw () [inline, virtual]

6.583.2 Member Function Documentation

6.583.2.1 virtual NoSuchElementException* de-
caf::lang::exceptions::NoSuchElementException::clone (
) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p.1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p.1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/NoSuchElementException.h`

6.584 decaf::security::NoSuchProviderException Class Reference

```
#include <src/main/decaf/security/NoSuchProviderException.h>
```

Inheritance diagram for `decaf::security::NoSuchProviderException`:

Public Member Functions

- **NoSuchProviderException** () throw ()
Default Constructor.
- **NoSuchProviderException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **NoSuchProviderException** (const **NoSuchProviderException** &ex) throw ()
Copy Constructor.
- **NoSuchProviderException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchProviderException** (const std::exception *cause) throw ()
Constructor.
- **NoSuchProviderException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchProviderException** * clone () const
Clones this exception.
- virtual ~**NoSuchProviderException** () throw ()

6.584.1 Constructor & Destructor Documentation

6.584.1.1 decaf::security::NoSuchProviderException::NoSuchProviderException () throw () [inline]

Default Constructor.

6.584.1.2 decaf::security::NoSuchProviderException::NoSuchProviderException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.584.1.3 decaf::security::NoSuchProviderException::NoSuchProviderException (const NoSuchProviderException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.584.1.4 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.584.1.5 decaf::security::NoSuchProviderException::NoSuchProviderException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.584.1.6 `decaf::security::NoSuchProviderException::NoSuchProviderException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.584.1.7 `virtual decaf::security::NoSuchProviderException::~~NoSuchProviderException () throw ()` [inline, virtual]

6.584.2 Member Function Documentation

6.584.2.1 `virtual NoSuchProviderException* decaf::security::NoSuchProviderException::clone () const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p.1847).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/NoSuchProviderException.h`

6.585 decaf::lang::exceptions::NullPointerException Class Reference

```
#include <src/main/decaf/lang/exceptions/NullPointerException.h>
```

Inheritance diagram for `decaf::lang::exceptions::NullPointerException`:

Public Member Functions

- **NullPointerException** () throw ()
Default Constructor.
- **NullPointerException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1712).*
- **NullPointerException** (const **NullPointerException** &ex) throw ()
Copy Constructor.
- **NullPointerException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NullPointerException** (const std::exception *cause) throw ()
Constructor.
- **NullPointerException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NullPointerException** * **clone** () const
Clones this exception.
- virtual ~**NullPointerException** () throw ()

6.585.1 Constructor & Destructor Documentation

6.585.1.1 decaf::lang::exceptions::NullPointerException::NullPointerException () throw () [inline]

Default Constructor.

6.585.1.2 decaf::lang::exceptions::NullPointerException::NullPointerException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.585.1.3 decaf::lang::exceptions::NullPointerException::NullPointerException (const NullPointerException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.585.1.4 `decaf::lang::exceptions::NullPointerException::NullPointerException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.585.1.5 `decaf::lang::exceptions::NullPointerException::NullPointerException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p.2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.585.1.6 `decaf::lang::exceptions::NullPointerException::NullPointerException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.585.1.7 `virtual decaf::lang::exceptions::NullPointerException::~~NullPointerException () throw () [inline, virtual]`

6.585.2 Member Function Documentation

6.585.2.1 `virtual NullPointerException* decaf::lang::exceptions::NullPointerException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/NullPointerException.h`

6.586 decaf::lang::Number Class Reference

The abstract class **Number** (p. 2653) is the superclass of classes **Byte** (p. 884), **Double** (p. 1672), **Float** (p. 1780), **Integer** (p. 1941), **Long** (p. 2267), and **Short** (p. 3220).

```
#include <src/main/decaf/lang/Number.h>
```

Inheritance diagram for decaf::lang::Number:

Public Member Functions

- virtual `~Number ()`
- virtual unsigned char **byteValue ()** const
Answers the byte value which the receiver represents.
- virtual double **doubleValue ()** const =0
Answers the double value which the receiver represents.
- virtual float **floatValue ()** const =0
Answers the float value which the receiver represents.
- virtual int **intValue ()** const =0
Answers the int value which the receiver represents.
- virtual long long **longValue ()** const =0
Answers the long value which the receiver represents.
- virtual short **shortValue ()** const
Answers the short value which the receiver represents.

6.586.1 Detailed Description

The abstract class **Number** (p. 2653) is the superclass of classes **Byte** (p. 884), **Double** (p. 1672), **Float** (p. 1780), **Integer** (p. 1941), **Long** (p. 2267), and **Short** (p. 3220). Subclasses of **Number** (p. 2653) must provide methods to convert the represented numeric value to byte, double, float, int, long, and short.

6.586.2 Constructor & Destructor Documentation

6.586.2.1 `virtual decaf::lang::Number::~~Number () [inline, virtual]`

6.586.3 Member Function Documentation

6.586.3.1 `virtual unsigned char decaf::lang::Number::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

6.586.3.2 `virtual double decaf::lang::Number::doubleValue () const [pure virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 682).

6.586.3.3 `virtual float decaf::lang::Number::floatValue () const [pure virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 682).

6.586.3.4 `virtual int decaf::lang::Number::intValue () const [pure virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 684).

6.586.3.5 `virtual long long decaf::lang::Number::longValue () const [pure virtual]`

Answers the long value which the receiver represents.

Returns

long long the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 684).

6.586.3.6 virtual short decaf::lang::Number::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/NumberFormatException`

6.587 decaf::lang::exceptions::NumberFormatException Class Reference

```
#include <src/main/decaf/lang/exceptions/NumberFormatException.h>
```

Inheritance diagram for `decaf::lang::exceptions::NumberFormatException`:

Public Member Functions

- **NumberFormatException** ()
Default Constructor.
- **NumberFormatException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1712).*
- **NumberFormatException** (const **NumberFormatException** &ex) throw ()
Copy Constructor.
- **NumberFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NumberFormatException** (const std::exception *cause) throw ()
Constructor.
- **NumberFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.

- virtual **NumberFormatException** * **clone** () const
Clones this exception.
- virtual ~**NumberFormatException** () throw ()

6.587.1 Constructor & Destructor Documentation

6.587.1.1 `decaf::lang::exceptions::NumberFormatException::NumberFormatException () [inline]`

Default Constructor.

Referenced by clone().

6.587.1.2 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other **Exception** (p. 1712).

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.587.1.3 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const NumberFormatException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The **Exception** (p. 1712) whose data is to be copied into this one.

6.587.1.4 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.587.1.5 decaf::lang::exceptions::NumberFormatException::NumberFormatException
(const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

***cause* Pointer** (p. 2756) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.587.1.6 decaf::lang::exceptions::NumberFormatException::NumberFormatException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...)
throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.587.1.7 virtual
decaf::lang::exceptions::NumberFormatException::~~NumberFormatException
() throw () [inline, virtual]

6.587.2 Member Function Documentation

6.587.2.1 virtual NumberFormatException* decaf::lang::exceptions::NumberFormatException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1712) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1715).

References NumberFormatException().

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/NumberFormatException.h

6.588 cms::ObjectMessage Class Reference

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

```
#include <src/main/cms/ObjectMessage.h>
```

Inheritance diagram for cms::ObjectMessage:

Public Member Functions

- virtual `~ObjectMessage()`

6.588.1 Detailed Description

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object. serialized `ObjectMessage` (p. 2658)s.

Since

1.0

6.588.2 Constructor & Destructor Documentation

6.588.2.1 virtual `cms::ObjectMessage::~ObjectMessage()` [`inline`, `virtual`]

The documentation for this class was generated from the following file:

- `src/main/cms/ObjectMessage.h`

6.589 decaf::internal::net::ssl::openssl::OpenSSLContextSpi Class Reference

Provides an SSLContext that wraps the OpenSSL API.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLContextSpi.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLContextSpi:

Public Member Functions

- `OpenSSLContextSpi()`
- virtual `~OpenSSLContextSpi()`
- virtual void `providerInit(security::SecureRandom *random)`

Perform the initialization of this Context.

Parameters

random Pointer to an instance of a secure random number generator.

Exceptions

NullPointerException if the *SecureRandom* instance is *NULL*.
KeyManagementException if an error occurs while initializing the context.

- virtual **decaf::net::SocketFactory * providerGetSocketFactory ()**

Returns a **SocketFactory** (p. 3301) instance that can be used to create new **SSLSocket** (p. 3337) objects.

The **SocketFactory** (p. 3301) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 3301) instance that can be used to create new *SSLSockets*.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) object requires initialization but has not been initialized yet.

- virtual **decaf::net::ServerSocketFactory * providerGetServerSocketFactory ()**

Returns a **ServerSocketFactory** (p. 3145) instance that can be used to create new **SSLServerSocket** (p. 3329) objects.

The **ServerSocketFactory** (p. 3145) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 3301) instance that can be used to create new *SSLServerSockets*.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) object requires initialization but has not been initialized yet.

Friends

- class **OpenSSLSocket**
- class **OpenSSLSocketFactory**

6.589.1 Detailed Description

Provides an *SSLContext* that wraps the *OpenSSL* API.

Since

1.0

6.589.2 Constructor & Destructor Documentation

6.589.2.1 `decaf::internal::net::ssl::openssl::OpenSSLContextSpi::OpenSSLContextSpi
()`

6.589.2.2 `virtual
decaf::internal::net::ssl::openssl::OpenSSLContextSpi::~~OpenSSLContextSpi
() [virtual]`

6.589.3 Member Function Documentation

6.589.3.1 `virtual decaf::net::ServerSocketFactory* de-
caf::internal::net::ssl::openssl::OpenSSLContextSpi::providerGetServerSocketFactory
() [virtual]`

Returns a **ServerSocketFactory** (p. 3145) instance that can be used to create new **SSLServerSocket** (p. 3329) objects.

The **ServerSocketFactory** (p. 3145) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 3301) instance that can be used to create new SSLServerSockets.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) object requires initialization but has not been initialized yet.

Implements **decaf::net::ssl::SSLContextSpi** (p. 3325).

6.589.3.2 `virtual decaf::net::SocketFactory* de-
caf::internal::net::ssl::openssl::OpenSSLContextSpi::providerGetSocketFactory
() [virtual]`

Returns a **SocketFactory** (p. 3301) instance that can be used to create new **SSLSocket** (p. 3337) objects.

The **SocketFactory** (p. 3301) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 3301) instance that can be used to create new SSLSockets.

Exceptions

IllegalStateException if the **SSLContextSpi** (p. 3324) object requires initialization but has not been initialized yet.

Implements **decaf::net::ssl::SSLContextSpi** (p. 3325).

6.589.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerInit (security::SecureRandom * *random*) [virtual]

Perform the initialization of this Context.

Parameters

random Pointer to an instance of a secure random number generator.

Exceptions

NullPointerException if the SecureRandom instance is NULL.

KeyManagementException if an error occurs while initializing the context.

Implements decaf::net::ssl::SSLContextSpi (p. 3326).

6.591 decaf::internal::net::ssl::openssl::OpenSSLServerSocket Class Reference

SSLServerSocket based on OpenSSL library code.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocket.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLServerSocket:

Public Member Functions

- **OpenSSLServerSocket** (**OpenSSLParameters** *parameters)
- virtual **~OpenSSLServerSocket** ()
- virtual std::vector< std::string > **getSupportedCipherSuites** () const
*Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 3329).*
*Normally not all of these cipher suites will be enabled on the **Socket** (p. 3281).*
Returns
a vector containing the names of all the supported cipher suites.
- virtual std::vector< std::string > **getSupportedProtocols** () const
*Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 3329) instance.*
Returns
a vector containing the names of all the supported protocols.
- virtual std::vector< std::string > **getEnabledCipherSuites** () const
*Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 3329).*
Returns
vector of the names of all enabled Cipher Suites.
- virtual void **setEnabledCipherSuites** (const std::vector< std::string > &suites)
*Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 3329) connection. Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.*
Parameters
suites An Vector of names for all the Cipher Suites that are to be enabled.
Exceptions
***IllegalArgumentException** if the vector is empty or one of the names is invalid.*
- virtual std::vector< std::string > **getEnabledProtocols** () const
*Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 3329).*
Returns
vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)
*Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 3329) connection. Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.*
Parameters
protocols An Vector of names for all the Protocols that are to be enabled.
Exceptions
IllegalArgumentException if the vector is empty or one of the names is invalid.
- virtual bool **getWantClientAuth** () const
Returns
*true if the **Socket** (p. 3281) request client Authentication.*
- virtual void **setWantClientAuth** (bool value)
*Sets whether or not this **Socket** (p. 3281) will request Client Authentication. If set to true the **Socket** (p. 3281) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.*
Parameters
value Whether the server socket should request client authentication.
- virtual bool **getNeedClientAuth** () const
Returns
*true if the **Socket** (p. 3281) requires client Authentication.*
- virtual void **setNeedClientAuth** (bool value)
*Sets whether or not this **Socket** (p. 3281) will require Client Authentication. If set to true the **Socket** (p. 3281) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.*
Parameters
value Whether the server socket should require client authentication.
- virtual **decaf::net::Socket * accept** () throw (decaf::io::IOException)
*Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 3136), the caller blocks until a connection is made. If the *SO_TIMEOUT* option is set this method could throw a **SocketTimeoutException** (p. 3319) if the operation times out.*
Returns
*a new **Socket** (p. 3281) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.*
Exceptions
IOException if an I/O error occurs while binding the socket.
SocketException (p. 3298) if an error occurs while blocking on the accept call.
SocketTimeoutException (p. 3319) if the *SO_TIMEOUT* option was used and the accept timed out.

6.591.1 Detailed Description

SSLServerSocket based on OpenSSL library code.

Since

1.0

6.591.2 Constructor & Destructor Documentation

6.591.2.1 `decaf::internal::net::ssl::openssl::OpenSSLServerSocket::OpenSSLServerSocket (OpenSSLParameters * parameters)`

6.591.2.2 `virtual decaf::internal::net::ssl::openssl::OpenSSLServerSocket::~~OpenSSLServerSocket () [virtual]`

6.591.3 Member Function Documentation

6.591.3.1 `virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLServerSocket::accept () throw (decaf::io::IOException) [virtual]`

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 3136), the caller blocks until a connection is made.

If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 3319) if the operation times out.

Returns

a new **Socket** (p. 3281) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions

IOException if an I/O error occurs while binding the socket.

SocketException (p. 3298) if an error occurs while blocking on the accept call.

SocketTimeoutException (p. 3319) if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented from **decaf::net::ServerSocket** (p. 3141).

6.591.3.2 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getEnabledCipherSuites () const [virtual]`

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 3329).

Returns

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3332).

6.591.3.3 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getEnabledProtocols () const [virtual]`

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 3329).

Returns

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3332).

6.591.3.4 `virtual bool decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getNeedClientAuth () const [virtual]`

Returns

true if the **Socket** (p. 3281) requires client Authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3333).

6.591.3.5 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getSupportedCipherSuites () const [virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 3329).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3281).

Returns

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3333).

6.591.3.6 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getSupportedProtocols () const [virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 3329) instance.

Returns

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3333).

6.591.3.7 virtual bool decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getWantClientAuth () const [virtual]

Returns

true if the **Socket** (p. 3281) request client Authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3333).

6.591.3.8 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [virtual]

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 3329) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3333).

6.591.3.9 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [virtual]

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 3329) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3334).

6.591.3.10 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setNeedClientAuth (bool *value*) [virtual]

Sets whether or not this **Socket** (p. 3281) will require Client Authentication.

If set to true the **Socket** (p. 3281) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters

value Whether the server socket should require client authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3334).

6.591.3.11 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setWantClientAuth (bool *value*) [virtual]

Sets whether or not this **Socket** (p. 3281) will request Client Authentication.

If set to true the **Socket** (p. 3281) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

Parameters

value Whether the server socket should request client authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 3334).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLServerSocket.h**

6.592 decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory Class Reference

SSLServerSocketFactory that creates Server Sockets that use OpenSSL.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocketFactory.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory:

Public Member Functions

- **OpenSSLServerSocketFactory (OpenSSLContextSpi *parent)**
- **virtual ~OpenSSLServerSocketFactory ()**
- **virtual decaf::net::ServerSocket * createServerSocket ()**

*Create a new **ServerSocket** (p. 3136) that is unbound.*

*The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory.*

Returns

*new **ServerSocket** (p. 3136) pointer that is owned by the caller.*

Exceptions

***IOException** if the **ServerSocket** (p. 3136) cannot be created for some reason.*

- **virtual decaf::net::ServerSocket * createServerSocket (int port)**

*Create a new **ServerSocket** (p. 3136) that is bound to the given port.*

*The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory.*

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

- virtual **decaf::net::ServerSocket * createServerSocket** (int port, int backlog)

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3136) will use the specified connection backlog setting.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The number of pending connect request the **ServerSocket** (p. 3136) can queue.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

- virtual **decaf::net::ServerSocket * createServerSocket** (int port, int backlog, const **decaf::net::InetAddress *address**)

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3136) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is **NULL** than the **ServerSocket** (p. 3136) will listen on all interfaces.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The number of pending connect request the **ServerSocket** (p. 3136) can queue.

address The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

- virtual **std::vector< std::string > getDefaultCipherSuites** ()

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 3336)

- virtual **std::vector< std::string > getSupportedCipherSuites** ()

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

6.592.2.1 decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::OpenSSLServerSocketFactory (OpenSSLContextSpi * *parent*)

6.592.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::~OpenSSLServerSocketFactory () [virtual]

6.592.3 Member Function Documentation

6.592.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket () [virtual]

Create a new **ServerSocket** (p. 3136) that is unbound.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 3146).

6.592.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 3147).

6.592.3.3 `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int port, int backlog, const decaf::net::InetAddress * address) [virtual]`

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3136) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 3136) will listen on all interfaces.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The number of pending connect request the **ServerSocket** (p. 3136) can queue.

address The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 3147).

6.592.3.4 `virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int port, int backlog) [virtual]`

Create a new **ServerSocket** (p. 3136) that is bound to the given port.

The **ServerSocket** (p. 3136) will have been configured with the defaults from the factory. The **ServerSocket** (p. 3136) will use the specified connection backlog setting.

Parameters

port The port to bind the **ServerSocket** (p. 3136) to.

backlog The number of pending connect request the **ServerSocket** (p. 3136) can queue.

Returns

new **ServerSocket** (p. 3136) pointer that is owned by the caller.

Exceptions

IOException if the **ServerSocket** (p. 3136) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 3147).

6.592.3.5 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getDefaultCipherSuites () [virtual]`

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 3336)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 3336).

6.592.3.6 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getSupportedCipherSuites () [virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

getDefaultCipherSuites() (p. 3336)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 3336).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocketFactory.h`

6.593 decaf::internal::net::ssl::openssl::OpenSSLSocket Class Reference

Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocket.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocket:

Public Member Functions

- **OpenSSLSocket** (**OpenSSLParameters** *parameters)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const **decaf::net::InetAddress** *address, int port)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const **decaf::net::InetAddress** *address, int port, const **decaf::net::InetAddress** *localAddress, int localPort)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const std::string &host, int port)
- **OpenSSLSocket** (**OpenSSLParameters** *parameters, const std::string &host, int port, const **decaf::net::InetAddress** *localAddress, int localPort)
- virtual ~**OpenSSLSocket** ()
- virtual void **connect** (const std::string &host, int port, int timeout) throw (**decaf::io::IOException**, **decaf::lang::exceptions::IllegalArgumentException**)

Connects to the specified destination, with a specified timeout value.

*If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 3319) is thrown. A timeout value of zero is treated as an infinite timeout.*

Parameters

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

timeout The number of Milliseconds to wait before treating the connection as failed.

Exceptions

IOException Thrown if a failure occurred in the connect.

SocketTimeoutException (p. 3319) if the timeout for connection is exceeded.

IllegalArgumentException if the timeout value is negative or the endpoint is invalid.

- virtual void **close** () throw (**decaf::io::IOException**)

*Closes the **Socket** (p. 3281).*

*Once closed a **Socket** (p. 3281) cannot be connected or otherwise operated upon, a new **Socket** (p. 3281) instance must be created.*

Exceptions

IOException if an I/O error occurs while closing the **Socket** (p. 3281).

- virtual **decaf::io::InputStream** * **getInputStream** () throw (**decaf::io::IOException**)

*Gets the **InputStream** for this socket if its connected.*

*The pointer returned is the property of the associated **Socket** (p. 3281) and should not be deleted by the caller.*

*When the returned **InputStream** is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure. Closing the **InputStream** will also close the underlying **Socket** (p. 3281).*

Returns

*The **InputStream** for this socket.*

Exceptions

IOException if an error occurs during creation of the **InputStream**, also if the **Socket** (p. 3281) is not connected or the input has been shutdown previously.

- virtual **decaf::io::OutputStream * getOutputStream ()** throw (decaf::io::IOException)

Gets the OutputStream for this socket if it is connected.

*The pointer returned is the property of the **Socket** (p. 3281) instance and should not be deleted by the caller.*

*Closing the returned **Socket** (p. 3281) will also close the underlying **Socket** (p. 3281).*

Returns

the OutputStream for this socket.

Exceptions

IOException *if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 3281) is closed or the output has been shutdown previously.*

- virtual void **shutdownInput ()** throw (decaf::io::IOException)

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions

IOException *if an I/O error occurs while performing this operation.*

- virtual void **shutdownOutput ()** throw (decaf::io::IOException)

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OutputStream::write will throw an IOException.

Exceptions

IOException *if an I/O error occurs while performing this operation.*

- virtual void **setOOBInline** (bool value) throw (decaf::net::SocketException)

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException (p. 3298) *if an error is encountered while performing this operation.*

- virtual void **sendUrgentData** (int data) throw (decaf::io::IOException)

*Sends on byte of urgent data to the **Socket** (p. 3281).*

Parameters

data *The value to write as urgent data, only the lower eight bits are sent.*

Exceptions

IOException *if an I/O error occurs while performing this operation.*

- virtual std::vector< std::string > **getSupportedCipherSuites ()** const

*Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3337).*

*Normally not all of these cipher suites will be enabled on the **Socket** (p. 3281).*

Returns

a vector containing the names of all the supported cipher suites.

- virtual std::vector< std::string > **getSupportedProtocols ()** const

*Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3337) instance.*

Returns

a vector containing the names of all the supported protocols.

- virtual std::vector< std::string > **getEnabledCipherSuites** () const

*Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSL Socket** (p. 3281).*

Returns

vector of the names of all enabled Cipher Suites.

- virtual void **setEnabledCipherSuites** (const std::vector< std::string > &suites)

*Sets the Cipher Suites that are to be enabled on the **SSL Socket** (p. 3281) connection. Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.*

Parameters

***suites** An Vector of names for all the Cipher Suites that are to be enabled.*

Exceptions

***IllegalArgumentException** if the vector is empty or one of the names is invalid.*

- virtual std::vector< std::string > **getEnabledProtocols** () const

*Returns a vector containing the names of all the currently enabled Protocols for this **SSL Socket** (p. 3281).*

Returns

vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (const std::vector< std::string > &protocols)

*Sets the Protocols that are to be enabled on the **SSL Socket** (p. 3281) connection. Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.*

Parameters

***protocols** An Vector of names for all the Protocols that are to be enabled.*

Exceptions

***IllegalArgumentException** if the vector is empty or one of the names is invalid.*

- virtual void **startHandshake** ()

*Initiates a handshake for this **SSL Connection**, this can be necessary for several reasons such as using new encryption keys, or starting a new session.*

*When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an **IOException** to indicate an error.*

Exceptions

***IOException** if an I/O error occurs while performing the Handshake*

- virtual void **setUseClientMode** (bool value)

Determines the mode that the socket uses when a handshake is initiated, client or server.

*This method must be called prior to any handshake attempts on this **Socket** (p. 3281), once a handshake has been initiated this socket remains the the set mode; client or server, for the life of this object.*

Parameters

value The mode setting, true for client or false for server.

Exceptions

IllegalArgumentException if the handshake process has begun and mode is locked.

- virtual bool **getUseClientMode** () const

*Gets whether this **Socket** (p. 3281) is in Client or Server mode, true indicates that the mode is set to Client.*

Returns

*true if the **Socket** (p. 3281) is in Client mode, false otherwise.*

- virtual void **setNeedClientAuth** (bool value)

*Sets the **Socket** (p. 3281) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters

value The value indicating if a client is required to authenticate itself or not.

- virtual bool **getNeedClientAuth** () const

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

- virtual void **setWantClientAuth** (bool value)

*Sets the **Socket** (p. 3281) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters

value The value indicating if a client is requested to authenticate itself or not.

- virtual bool **getWantClientAuth** () const

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

- int **read** (unsigned char *buffer, int size, int offset, int length)

Reads the requested data from the Socket and write it into the passed in buffer.

- void **write** (const unsigned char *buffer, int size, int offset, int length)
Writes the specified data in the passed in buffer to the Socket.
- int **available** ()
Gets the number of bytes in the Socket buffer that can be read without blocking.

6.593.1 Detailed Description

Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

Since

1.0

6.593.2 Constructor & Destructor Documentation

- 6.593.2.1** `decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * parameters)`
- 6.593.2.2** `decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * parameters, const decaf::net::InetAddress * address, int port)`
- 6.593.2.3** `decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * parameters, const decaf::net::InetAddress * address, int port, const decaf::net::InetAddress * localAddress, int localPort)`
- 6.593.2.4** `decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * parameters, const std::string & host, int port)`
- 6.593.2.5** `decaf::internal::net::ssl::openssl::OpenSSLSocket::OpenSSLSocket (OpenSSLParameters * parameters, const std::string & host, int port, const decaf::net::InetAddress * localAddress, int localPort)`
- 6.593.2.6** `virtual decaf::internal::net::ssl::openssl::OpenSSLSocket::~~OpenSSLSocket () [virtual]`

6.593.3 Member Function Documentation

- 6.593.3.1** `int decaf::internal::net::ssl::openssl::OpenSSLSocket::available ()`

Gets the number of bytes in the Socket buffer that can be read without blocking.

Returns

the number of bytes that can be read from the Socket without blocking.

Exceptions

IOException if an I/O error occurs while performing this operation.

6.593.3.2 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::close ()
throw (decaf::io::IOException) [virtual]`

Closes the **Socket** (p. 3281).

Once closed a **Socket** (p. 3281) cannot be connected or otherwise operated upon, a new **Socket** (p. 3281) instance must be created.

Exceptions

IOException if an I/O error occurs while closing the **Socket** (p. 3281).

Reimplemented from **decaf::net::Socket** (p. 3287).

6.593.3.3 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::connect
(const std::string & host, int port, int timeout) throw (
decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException
) [virtual]`

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 3319) is thrown. A timeout value of zero is treated as an infinite timeout.

Parameters

host The host name or IP address of the remote host to connect to.

port The port on the remote host to connect to.

timeout The number of Milliseconds to wait before treating the connection as failed.

Exceptions

IOException Thrown if a failure occurred in the connect.

SocketTimeoutException (p. 3319) if the timeout for connection is exceeded.

IllegalArgumentException if the timeout value is negative or the endpoint is invalid.

Reimplemented from **decaf::net::Socket** (p. 3288).

6.593.3.4 `virtual std::vector<std::string> de-
caf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledCipherSuites (
) const [virtual]`

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSL Socket** (p. 3281).

Returns

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLSocket** (p. 3340).

6.593.3.5 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledProtocols () const [virtual]`

Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 3281).

Returns

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 3341).

6.593.3.6 `virtual decaf::io::InputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getInputStream () throw (decaf::io::IOException) [virtual]`

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 3281) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broken the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 3281).

Returns

The InputStream for this socket.

Exceptions

IOException if an error occurs during creation of the InputStream, also if the **Socket** (p. 3281) is not connected or the input has been shutdown previously.

Reimplemented from **decaf::net::Socket** (p. 3289).

6.593.3.7 `virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getNeedClientAuth () const [virtual]`

Returns if this socket is configured to require client authentication, true means that it has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 3341).

6.593.3.8 `virtual decaf::io::OutputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getOutputStream () throw (decaf::io::IOException) [virtual]`

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 3281) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 3281) will also close the underlying **Socket** (p. 3281).

Returns

the OutputStream for this socket.

Exceptions

IOException if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 3281) is closed or the output has been shutdown previously.

Reimplemented from **decaf::net::Socket** (p. 3290).

6.593.3.9 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedCipherSuites () const [virtual]`

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 3337).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 3281).

Returns

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLSocket** (p. 3341).

6.593.3.10 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedProtocols () const [virtual]`

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 3337) instance.

Returns

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 3342).

6.593.3.11 `virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getUseClientMode () const [virtual]`

Gets whether this **Socket** (p. 3281) is in Client or Server mode, true indicates that the mode is set to Client.

Returns

true if the **Socket** (p. 3281) is in Client mode, false otherwise.

Implements **decaf::net::ssl::SSLSocket** (p. 3342).

6.593.3.12 `virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getWantClientAuth () const [virtual]`

Returns if this socket is configured to request client authentication, true means that it has and that clients that failed to authenticate will be rejected but that clients that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 3342).

6.593.3.13 `int decaf::internal::net::ssl::openssl::OpenSSLSocket::read (unsigned char * buffer, int size, int offset, int length)`

Reads the requested data from the **Socket** and write it into the passed in buffer.

Parameters

buffer The buffer to read into

size The size of the specified buffer

offset The offset into the buffer where reading should start filling.

length The number of bytes past offset to fill with data.

Returns

the actual number of bytes read or -1 if at EOF.

Exceptions

IOException if an I/O error occurs during the read.

NullPointerException if buffer is Null.

IndexOutOfBoundsException if offset + length is greater than buffer size.

6.593.3.14 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::sendUrgentData (int data) throw (decaf::io::IOException) [virtual]`

Sends one byte of urgent data to the **Socket** (p. 3281).

Parameters

data The value to write as urgent data, only the lower eight bits are sent.

Exceptions

IOException if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 3293).

6.593.3.15 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledCipherSuites (const std::vector< std::string > & suites) [virtual]`

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 3281) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLSocket** (p. 3342).

6.593.3.16 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledProtocols (const std::vector< std::string > & protocols) [virtual]`

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 3281) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLSocket** (p. 3343).

6.593.3.17 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setNeedClientAuth (bool value) [virtual]`

Sets the **Socket** (p. 3281) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the `setWantClientAuth` method.

Parameters

value The value indicating if a client is required to authenticate itself or not.

Implements **decaf::net::ssl::SSLSocket** (p. 3343).

6.593.3.18 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setOOBInline (bool value) throw (decaf::net::SocketException) [virtual]`

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the Socket's InputStream, no notification is give.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException (p. 3298) if an error is encountered while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 3294).

6.593.3.19 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setUseClientMode (bool value) [virtual]`

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 3281), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.

Parameters

value The mode setting, true for client or false for server.

Exceptions

IllegalArgumentException if the handshake process has begun and mode is locked.

Implements **decaf::net::ssl::SSLSocket** (p. 3344).

6.593.3.20 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setWantClientAuth (bool value) [virtual]`

Sets the **Socket** (p. 3281) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters

value The value indicating if a client is requested to authenticate itself or not.

Implements **decaf::net::ssl::SSLSocket** (p. 3344).

6.593.3.21 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownInput ()
throw (decaf::io::IOException) [virtual]`

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions

IOException if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 3296).

6.593.3.22 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownOutput ()
throw (decaf::io::IOException) [virtual]`

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OutputStream::write will throw an IOException.

Exceptions

IOException if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 3297).

6.593.3.23 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::startHandshake ()
[virtual]`

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not required to support multiple handshakes and can throw an IOException to indicate an error.

Exceptions

IOException if an I/O error occurs while performing the Handshake

Implements **decaf::net::ssl::SSLSocket** (p. 3344).

6.593.3.24 `void decaf::internal::net::ssl::openssl::OpenSSLSocket::write (const
unsigned char * buffer, int size, int offset, int length)`

Writes the specified data in the passed in buffer to the Socket.

Parameters

- buffer* The buffer to write to the socket.
- size* The size of the specified buffer.
- offset* The offset into the buffer where the data to write starts at.
- length* The number of bytes past offset to write.

Exceptions

- IOException* if an I/O error occurs during the write.
- NullPointerException* if buffer is Null.
- IndexOutOfBoundsException* if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

Gets and formats an error message string from the OpenSSL error stack.

6.594.1 Detailed Description

Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

Since

1.0

6.594.2 Constructor & Destructor Documentation

6.594.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException () throw ()

Creates an new **OpenSSLSocketException** (p. 2686) with default values.

6.594.2.2 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const Exception & ex) throw ()

Conversion Constructor from some other Exception.

Parameters

ex An Exception object that should become this type of Exception.

6.594.2.3 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const OpenSSLSocketException & ex) throw ()

Copy Constructor.

Parameters

ex The **OpenSSLSocketException** (p. 2686) whose values should be copied to this instance.

6.594.2.4 `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()`

Create a new **OpenSSLSocketException** (p. 2686) and initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown (can be null).

msg The error message to report.

... The list of primitives that are formatted into the message.

6.594.2.5 `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const std::exception * cause) throw ()`

Creates a new **OpenSSLSocketException** (p. 2686) with the passed exception set as the cause of this exception.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.594.2.6 `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * file, const int lineNumber, const char * msg, ...) throw ()`

Create a new **OpenSSLSocketException** (p. 2686) and initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

Parameters

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

msg The error message to report.

... The list of primitives that are formatted into the message

6.594.2.7 `decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * file, const int lineNumber) throw ()`

Create a new **OpenSSLSocketException** (p. 2686) and initializes the file name and line number where this message occurred.

Sets the message to report by getting the complete set of error messages from the OpenSSL error stack and concatenating them into one string.

Parameters

- file* The file name where exception occurs.
- lineNumber* The line number where the exception occurred.

6.594.2.8 **virtual**
decaf::internal::net::ssl::openssl::OpenSSLSocketException::~~OpenSSLSocketException
() throw () [virtual]

6.594.3 Member Function Documentation

6.594.3.1 **virtual OpenSSLSocketException* de-**
caf::internal::net::ssl::openssl::OpenSSLSocketException::clone () const
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override this method.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 3300).

6.594.3.2 **std::string de-**
caf::internal::net::ssl::openssl::OpenSSLSocketException::getErrorString (
) const [protected]

Gets and formats an error message string from the OpenSSL error stack.

Returns

a string containing the complete OpenSSL error string.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketException.h`

6.595 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketFactory.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketFactory:

Public Member Functions

- **OpenSSLSocketFactory** (**OpenSSLContextSpi** *parent)
- virtual **~OpenSSLSocketFactory** ()
- virtual **decaf::net::Socket** * **createSocket** () throw (decaf::io::IOException)

*Creates an unconnected **Socket** (p. 3281) object.*

Returns

*a new **Socket** (p. 3281) object, caller must free this object when done.*

Exceptions

***IOException** if the **Socket** (p. 3281) cannot be created.*
- virtual **decaf::net::Socket** * **createSocket** (const **decaf::net::InetAddress** *host, int port) throw (decaf::io::IOException, decaf::net::UnknownHostException)

*Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).*

Parameters

host The host to connect the socket to.
port The port on the remote host to connect to.

Returns

*a new **Socket** (p. 3281) object, caller must free this object when done.*

Exceptions

***IOException** if an I/O error occurs while creating the **Socket** (p. 3281) object.
UnknownHostException (p. 3649) if the host name is not known.*
- virtual **decaf::net::Socket** * **createSocket** (const **decaf::net::InetAddress** *host, int port, const **decaf::net::InetAddress** *ifAddress, int localPort) throw (decaf::io::IOException, decaf::net::UnknownHostException)

*Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).*

*The **Socket** (p. 3281) will be bound to the specified local address and port.*

Parameters

host The host to connect the socket to.
port The port on the remote host to connect to.
ifAddress The address on the local machine to bind the **Socket** (p. 3281) to.
localPort The local port to bind the **Socket** (p. 3281) to.

Returns

*a new **Socket** (p. 3281) object, caller must free this object when done.*

Exceptions

***IOException** if an I/O error occurs while creating the **Socket** (p. 3281) object.
UnknownHostException (p. 3649) if the host name is not known.*
- virtual **decaf::net::Socket** * **createSocket** (const std::string &hostname, int port) throw (decaf::io::IOException, decaf::net::UnknownHostException)

*Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).*

Parameters

host The host name or IP address to connect the socket to.
port The port on the remote host to connect to.

Returns

*a new **Socket** (p. 3281) object, caller must free this object when done.*

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.
UnknownHostException (p. 3649) if the host name is not known.

- virtual **decaf::net::Socket * createSocket** (const std::string &name, int port, const **decaf::net::InetAddress *ifAddress**, int localPort) throw (**decaf::io::IOException**, **decaf::net::UnknownHostException**)

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

host The host name or IP address to connect the socket to.
port The port on the remote host to connect to.
ifAddress The address on the local machine to bind the **Socket** (p. 3281) to.
localPort The local port to bind the **Socket** (p. 3281) to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.
UnknownHostException (p. 3649) if the host name is not known.

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 3347)

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() (p. 3347)

- virtual **decaf::net::Socket * createSocket** (**decaf::net::Socket *socket**, std::string host, int port, bool autoClose)

Returns a socket layered over an existing socket connected to the named host, at the given port. This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

socket The existing socket to layer over.
host The server host the original **Socket** (p. 3281) is connected to.
port The server port the original **Socket** (p. 3281) is connected to.
autoClose Should the layered over **Socket** (p. 3281) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 3281) instance that wraps the given **Socket** (p. 3281).

Exceptions

IOException if an I/O exception occurs while performing this operation.
UnknownHostException (p. 3649) if the host is unknown.

6.595.1 Detailed Description

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

Since

1.0

6.595.2 Constructor & Destructor Documentation

6.595.2.1 `decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::OpenSSLSocketFactory (OpenSSLContextSpi * parent)`

6.595.2.2 `virtual decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::~~OpenSSLSocketFactory () [virtual]`

6.595.3 Member Function Documentation

6.595.3.1 `virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket () throw (decaf::io::IOException) [virtual]`

Creates an unconnected **Socket** (p. 3281) object.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if the **Socket** (p. 3281) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 3302).

6.595.3.2 `virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (decaf::net::Socket * socket, std::string host, int port, bool autoClose) [virtual]`

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

- socket* The existing socket to layer over.
- host* The server host the original **Socket** (p. 3281) is connected to.
- port* The server port the original **Socket** (p. 3281) is connected to.
- autoClose* Should the layered over **Socket** (p. 3281) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 3281) instance that wraps the given **Socket** (p. 3281).

Exceptions

- IOException* if an I/O exception occurs while performing this operation.
- UnknownHostException* (p. 3649) if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3346).

6.595.3.3 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host*, int *port*) throw (decaf::io::IOException, decaf::net::UnknownHostException) [virtual]

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

- host* The host to connect the socket to.
- port* The port on the remote host to connect to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

- IOException* if an I/O error occurs while creating the **Socket** (p. 3281) object.
- UnknownHostException* (p. 3649) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3302).

6.595.3.4 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const std::string & *hostname*, int *port*) throw (decaf::io::IOException, decaf::net::UnknownHostException) [virtual]

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

- host* The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3303).

```
6.595.3.5  virtual decaf::net::Socket* de-
            caf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (
            const std::string & name, int port, const decaf::net::InetAddress
            * ifAddress, int localPort ) throw ( decaf::io::IOException,
            decaf::net::UnknownHostException ) [virtual]
```

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

Parameters

host The host name or IP address to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 3281) to.

localPort The local port to bind the **Socket** (p. 3281) to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3303).

```
6.595.3.6  virtual decaf::net::Socket* de-
            caf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket
            ( const decaf::net::InetAddress * host, int port, const
            decaf::net::InetAddress * ifAddress, int localPort ) throw (
            decaf::io::IOException, decaf::net::UnknownHostException ) [virtual]
```

Creates a new **Socket** (p. 3281) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 3301).

The **Socket** (p. 3281) will be bound to the specified local address and port.

Parameters

host The host to connect the socket to.

port The port on the remote host to connect to.

ifAddress The address on the local machine to bind the **Socket** (p. 3281) to.

localPort The local port to bind the **Socket** (p. 3281) to.

Returns

a new **Socket** (p. 3281) object, caller must free this object when done.

Exceptions

IOException if an I/O error occurs while creating the **Socket** (p. 3281) object.

UnknownHostException (p. 3649) if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 3304).

6.595.3.7 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getDefaultCipherSuites() [virtual]`

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

`getSupportedCipherSuites()` (p. 3347)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3347).

6.595.3.8 `virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getSupportedCipherSuites() [virtual]`

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

`getDefaultCipherSuites()` (p. 3347)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 3347).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketFactory.h`

6.596 decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream Class Reference

An output stream for reading data from an OpenSSL Socket instance.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketInputStream.h>
```

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream:

Public Member Functions

- **OpenSSLSocketInputStream** (**OpenSSLSocket** *socket)
- virtual **~OpenSSLSocketInputStream** ()
- virtual int **available** () const throw (decaf::io::IOException)

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2003) if an I/O error occurs.

- virtual void **close** () throw (decaf::io::IOException)
- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Not supported.

Protected Member Functions

- virtual int **doReadByte** () throw (io::IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

6.596.1 Detailed Description

An output stream for reading data from an OpenSSL Socket instance.

Since

1.0

6.596.2 Constructor & Destructor Documentation

6.596.2.1 `decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::OpenSSLSocketInputStream (OpenSSLSocket * socket)`

6.596.2.2 `virtual decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::~~OpenSSLSocketInputStream () [virtual]`

6.596.3 Member Function Documentation

6.596.3.1 `virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::available () const throw (decaf::io::IOException) [virtual]`

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented from `decaf::io::InputStream` (p. 1911).

6.596.3.2 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::close () throw (decaf::io::IOException) [virtual]`

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1909) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Reimplemented from `decaf::io::InputStream` (p. 1912).

6.596.3.3 `virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadArrayBounded (unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [protected, virtual]`

Reimplemented from `decaf::io::InputStream` (p. 1912).

6.596.3.4 `virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadByte () throw (io::IOException)` [protected, virtual]

Implements `decaf::io::InputStream` (p. 1912).

6.596.3.5 `virtual long long decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::skip (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Not supported.

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of `InputStream` (p. 1909) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException (p. 2003) if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

Reimplemented from `decaf::io::InputStream` (p. 1917).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketInputStream.h`

6.597 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream Class Reference

OutputStream implementation used to write data to an `OpenSSLSocket` (p. 2673) instance.

```
#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketOutputStream.h>
```

Inheritance diagram for `decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream`:

Public Member Functions

- **OpenSSLSocketOutputStream** (**OpenSSLSocket** *socket)
- virtual **~OpenSSLSocketOutputStream** ()
- virtual void **close** () throw (decaf::io::IOException)

The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c) throw (decaf::io::IOException)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

6.597.1 Detailed Description

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 2673) instance.

Since

1.0

6.597.2 Constructor & Destructor Documentation

6.597.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::OpenSSLSocketOutputStream (**OpenSSLSocket** * *socket*)

6.597.2.2 virtual
decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::~~OpenSSLSocketOutputStream () [virtual]

6.597.3 Member Function Documentation

6.597.3.1 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::close ()
throw (decaf::io::IOException) [virtual]

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 2720).

6.597.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 2721).

6.597.3.3 `virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteByte (unsigned char c) throw (decaf::io::IOException)` [protected, virtual]

Implements `decaf::io::OutputStream` (p. 2721).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketOutputStream.h`

6.598 `activemq::wireformat::openwire::OpenWireFormat` Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h>`

Inheritance diagram for `activemq::wireformat::openwire::OpenWireFormat`:

Public Member Functions

- `OpenWireFormat (const decaf::util::Properties &properties)`
*Constructs a new **OpenWireFormat** (p. 2700) object.*
- `virtual ~OpenWireFormat ()`
- `virtual bool hasNegotiator () const`
*Returns true if this **WireFormat** (p. 3712) has a Negotiator that needs to wrap the Transport that uses it.*
- `virtual Pointer< transport::Transport > createNegotiator (const Pointer< transport::Transport > &transport) throw (decaf::lang::exceptions::UnsupportedOperationException)`
If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.
- `void addMarshaller (marshal::DataStreamMarshaller *marshaller)`
Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.
- `virtual void marshal (const Pointer< commands::Command > &command, const activemq::transport::Transport *transport, decaf::io::DataOutputStream *out) throw (decaf::io::IOException)`
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- `virtual Pointer< commands::Command > unmarshal (const activemq::transport::Transport *transport, decaf::io::DataInputStream *in) throw (decaf::io::IOException)`
Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.

- virtual int **tightMarshalNestedObject1** (commands::DataStructure *object, utils::BooleanStream *bs) throw (decaf::io::IOException)

Utility method for Tight Marshaling the given object to the boolean stream passed.

- void **tightMarshalNestedObject2** (commands::DataStructure *o, decaf::io::DataOutputStream *ds, utils::BooleanStream *bs) throw (decaf::io::IOException)

Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.

- commands::DataStructure * **tightUnmarshalNestedObject** (decaf::io::DataInputStream *dis, utils::BooleanStream *bs) throw (decaf::io::IOException)

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

- commands::DataStructure * **looseUnmarshalNestedObject** (decaf::io::DataInputStream *dis) throw (decaf::io::IOException)

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

- void **looseMarshalNestedObject** (commands::DataStructure *o, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Utility method to loosely Marshal an object that is derived from the DataStrucutre interface.

- void **renegotiateWireFormat** (const commands::WireFormatInfo &info) throw (decaf::lang::exceptions::IllegalStateException)

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

- virtual void **setPreferedWireFormatInfo** (const Pointer< commands::WireFormatInfo > &info) throw (decaf::lang::exceptions::IllegalStateException)

Configures this object using the provided WireformatInfo object.

- virtual const Pointer< commands::WireFormatInfo > & **getPreferedWireFormatInfo** () const

Gets the Preferred WireFormatInfo object that this class holds.

- bool **isStackTraceEnabled** () const

Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () const

Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

Sets if the tcpNoDelayEnabled flag is on.

- **int getVersion () const**
Get the current Wireformat Version.
- **void setVersion (int version) throw (decaf::lang::exceptions::IllegalArgumentException)**
Set the current Wireformat Version.
- **virtual bool inReceive () const**
Is there a Message being unmarshaled?
- **bool isCacheEnabled () const**
Checks if the cacheEnabled flag is on.
- **void setCacheEnabled (bool cacheEnabled)**
Sets if the cacheEnabled flag is on.
- **int getCacheSize () const**
Returns the currently set Cache size.
- **void setCacheSize (int value)**
Sets the current Cache size.
- **bool isTightEncodingEnabled () const**
Checks if the tightEncodingEnabled flag is on.
- **void setTightEncodingEnabled (bool tightEncodingEnabled)**
Sets if the tightEncodingEnabled flag is on.
- **bool isSizePrefixDisabled () const**
Checks if the sizePrefixDisabled flag is on.
- **void setSizePrefixDisabled (bool sizePrefixDisabled)**
Sets if the sizePrefixDisabled flag is on.
- **long long getMaxInactivityDuration () const**
Gets the MaxInactivityDuration setting.
- **void setMaxInactivityDuration (long long value)**
Sets the MaxInactivityDuration setting.
- **long long getMaxInactivityDurationInitialDelay () const**
Gets the MaxInactivityDurationInitialDelay setting.
- **void setMaxInactivityDurationInitialDelay (long long value)**
Sets the MaxInactivityDurationInitialDelay setting.

Protected Member Functions

- **commands::DataStructure * doUnmarshal** (decaf::io::DataInputStream *dis)
throw (decaf::io::IOException)
Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrcutre object once done, caller takes ownership of this object.
- **void destroyMarshallers** ()
Cleans up all registered Marshallers and empties the dataMarshallers vector.

Static Protected Attributes

- static const unsigned char **NULL__TYPE**
- static const int **DEFAULT__VERSION** = 1

6.598.1 Constructor & Destructor Documentation

6.598.1.1 **activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat** (const decaf::util::Properties & *properties*)

Constructs a new **OpenWireFormat** (p. 2700) object.

Parameters

properties - can contain optional config params.

6.598.1.2 **virtual** **activemq::wireformat::openwire::OpenWireFormat::~~OpenWireFormat** () [virtual]

6.598.2 Member Function Documentation

6.598.2.1 **void activemq::wireformat::openwire::OpenWireFormat::addMarshaller** (marsh::DataStreamMarshaller * *marshaller*)

Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.

Parameters

marshaller - the Marshaler to add to the collection.

6.598.2.2 **virtual Pointer<transport::Transport> ac-** **tivemq::wireformat::openwire::OpenWireFormat::createNegotiator** (const Pointer< transport::Transport > & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns

new instance of a **WireFormatNegotiator** (p. 3751).

Implements **activemq::wireformat::WireFormat** (p. 3714).

6.598.2.3 void ac-
tivemq::wireformat::openwire::OpenWireFormat::destroyMarshallers ()
 [protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector.

This should be called before a reconfiguration of the version marshallers, or on destruction of this object

6.598.2.4 commands::DataStructure* ac-
tivemq::wireformat::openwire::OpenWireFormat::doUnmarshal (
decaf::io::DataInputStream * *dis*) throw (decaf::io::IOException)
 [protected]

Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.

This method can return null if the type of the object to unmarshal is NULL, empty data.

Parameters

dis - DataInputStream to read from

Returns

new DataStructure* that the caller owns

Exceptions

IOException if an error occurs during the unmarshal

6.598.2.5 int activemq::wireformat::openwire::OpenWireFormat::getCacheSize ()
const [inline]

Returns the currently set Cache size.

Returns

the current value of the broker's cache size.

6.598.2.6 long long ac-
tivemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration
() const [inline]

Gets the MaxInactivityDuration setting.

Returns

maximum inactivity duration value in milliseconds.

6.598.2.7 `long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay () const [inline]`

Gets the MaxInactivityDurationInitialDelay setting.

Returns

maximum inactivity duration initial delay value in milliseconds.

6.598.2.8 `virtual const Pointer<commands::WireFormatInfo>& activemq::wireformat::openwire::OpenWireFormat::getPreferredWireFormatInfo () const [inline, virtual]`

Gets the Preferred WireFormatInfo object that this class holds.

Returns

pointer to a preferred WireFormatInfo object

6.598.2.9 `int activemq::wireformat::openwire::OpenWireFormat::getVersion () const [inline, virtual]`

Get the current Wireformat Version.

Returns

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 3714).

6.598.2.10 `virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator () const [inline, virtual]`

Returns true if this **WireFormat** (p. 3712) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 3712) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3714).

6.598.2.11 `virtual bool activemq::wireformat::openwire::OpenWireFormat::inReceive () const [inline, virtual]`

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3715).

6.598.2.12 `bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled () const [inline]`

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.598.2.13 `bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled () const [inline]`

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.598.2.14 `bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled () const [inline]`

Checks if the stackTraceEnabled flag is on.

Returns

true if the flag is on.

6.598.2.15 `bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled () const [inline]`

Checks if the tcpNoDelayEnabled flag is on.

Returns

true if the flag is on.

6.598.2.16 `bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled () const [inline]`

Checks if the tightEncodingEnabled flag is on.

Returns

true if the flag is on.

6.598.2.17 `void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject (commands::DataStructure * o, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`

Utility method to loosely Marshal an object that is derived from the DataStrucutre interface.

The marshaled data is written to the passed in DataOutputStream.

Parameters

o - DataStructure derived Object to Marshal
dataOut - DataOutputStream to write the data to

Exceptions

IOException if an error occurs.

6.598.2.18 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject (decaf::io::DataInputStream * dis) throw (decaf::io::IOException)`

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

Will read the Data and construct a new DataStructure based Object, the pointer to the Object returned is now owned by the caller.

Parameters

dis - the DataInputStream to read the data from

Returns

a new DataStructure derived Object pointer

Exceptions

IOException if an error occurs.

6.598.2.19 `virtual void activemq::wireformat::openwire::OpenWireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) throw (decaf::io::IOException) [virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command The Command to Marshal.
transport The Transport instance that called this method.
out The output stream to write the command to.

Exceptions

IOException

Implements `activemq::wireformat::WireFormat` (p. 3715).

6.598.2.20 `void activemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat (const commands::WireFormatInfo & info) throw (decaf::lang::exceptions::IllegalStateException)`

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

Parameters

info - The new Wireformat Info settings

Exceptions

IllegalStateException is wire format can't be negotiated.

6.598.2.21 `void activemq::wireformat::openwire::OpenWireFormat::setCacheEnabled (bool cacheEnabled) [inline]`

Sets if the cacheEnabled flag is on.

Parameters

cacheEnabled - true to turn flag is on

6.598.2.22 `void activemq::wireformat::openwire::OpenWireFormat::setCacheSize (int value) [inline]`

Sets the current Cache size.

Parameters

value - the value to send as the broker's cache size.

6.598.2.23 `void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration (long long value) [inline]`

Sets the MaxInactivityDuration setting.

Parameters

value - the Max inactivity duration value in milliseconds.

6.598.2.24 void ac-
tivismq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay
(long long *value*) [inline]

Sets the MaxInactivityDurationInitialDelay setting.

Parameters

value - the Max inactivity Initial Delay duration value in milliseconds.

6.598.2.25 virtual void ac-
tivismq::wireformat::openwire::OpenWireFormat::setPreferredWireFormatInfo
(const Pointer< commands::WireFormatInfo > & *info*) throw (
decaf::lang::exceptions::IllegalStateException) [virtual]

Configures this object using the provided WireFormatInfo object.

Parameters

info - a WireFormatInfo object, takes ownership.

6.598.2.26 void ac-
tivismq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled
(bool *sizePrefixDisabled*) [inline]

Sets if the sizePrefixDisabled flag is on.

Parameters

sizePrefixDisabled - true to turn flag is on

6.598.2.27 void ac-
tivismq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled
(bool *stackTraceEnabled*) [inline]

Sets if the stackTraceEnabled flag is on.

Parameters

stackTraceEnabled - true to turn flag is on

6.598.2.28 void ac-
tivismq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled
(bool *tcpNoDelayEnabled*) [inline]

Sets if the tcpNoDelayEnabled flag is on.

Parameters

tcpNoDelayEnabled - true to turn flag is on

6.598.2.29 `void activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled (bool tightEncodingEnabled) [inline]`

Sets if the `tightEncodingEnabled` flag is on.

Parameters

tightEncodingEnabled - true to turn flag is on

6.598.2.30 `void activemq::wireformat::openwire::OpenWireFormat::setVersion (int version) throw (decaf::lang::exceptions::IllegalArgumentException) [virtual]`

Set the current Wireformat Version.

Parameters

version - int that identifies the version

Implements `activemq::wireformat::WireFormat` (p. 3715).

6.598.2.31 `virtual int activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1 (commands::DataStructure * object, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Utility method for Tight Marshaling the given object to the boolean stream passed.

Parameters

object - The DataStructure to marshal

bs - the BooleanStream to write to

Returns

size of the data returned.

6.598.2.32 `void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 (commands::DataStructure * o, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) throw (decaf::io::IOException)`

Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.

Writes the data to the Data Output Stream provided.

Parameters

o - DataStructure object

ds - DataOutputSteam for writing

bs - BooleanStream

Exceptions

IOException if an error occurs.

6.598.2.33 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject (decaf::io::DataInputStream * dis, utils::BooleanStream * bs) throw (decaf::io::IOException)`

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

The DataStructure instance that is returned is now the property of the caller.

Parameters

dis - DataInputStream to read from

bs - BooleanStream to read from

Returns

Newly allocated DataStructure Object

Exceptions

IOException if an error occurs.

6.598.2.34 `virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal (const activemq::transport::Transport * transport, decaf::io::DataInputStream * in) throw (decaf::io::IOException) [virtual]`

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.

Returns a Pointer to the newly un-marshaled Command.

Parameters

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException

Implements `activemq::wireformat::WireFormat` (p. 3716).

6.598.3 Field Documentation

6.598.3.1 `const int`
`activemq::wireformat::openwire::OpenWireFormat::DEFAULT_`

6.599.1.2 virtual
activemq::wireformat::openwire::OpenWireFormatFactory::~OpenWireFormatFactory
() [inline, virtual]

6.599.2 Member Function Documentation

6.599.2.1 virtual Pointer<wireformat::WireFormat> activemq::wireformat::openwire::OpenWireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) throw (decaf::lang::exceptions::IllegalStateException) [virtual]

Creates a new **WireFormat** (p. 3712) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties - the Properties for this **WireFormat** (p. 3712)

Implements **activemq::wireformat::WireFormatFactory** (p. 3717).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/OpenWireFormatFactory.h

6.600 activemq::wireformat::openwire::OpenWireFormatNegotiator Class Reference

#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h>

Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatNegotiator:

Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** *wireFormat, const **Pointer**< **transport::Transport** > &next)

Constructor - Initializes this object around another Transport.

- virtual ~**OpenWireFormatNegotiator** ()
- virtual void **oneway** (const **Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Sends a one-way command.

- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Sends the given request to the server and waits for the response.

- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Sends the given request to the server and waits for the response.

- virtual void **onCommand** (const **Pointer**< **commands::Command** > &command)

This is called in the context of the nested transport's reading thread.

- virtual void **onTransportException** (transport::Transport *source, const **decaf::lang::Exception** &ex)

Event handler for an exception from a command transport.

- virtual void **start** () throw (decaf::io::IOException)

Starts this transport object and creates the thread for polling on the input stream for commands.

- virtual void **close** () throw (decaf::io::IOException)

Stops the polling thread and closes the streams.

6.600.1 Constructor & Destructor Documentation

6.600.1.1 activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator (OpenWireFormat * *wireFormat*, const **Pointer**< transport::Transport > & *next*)

Constructor - Initializes this object around another Transport.

Parameters

wireFormat - The **WireFormat** (p.3712) object we use to negotiate

next - The next transport in the chain

6.600.1.2 virtual activemq::wireformat::openwire::OpenWireFormatNegotiator::~~OpenWireFormatNegotiator () [virtual]

6.600.2 Member Function Documentation

6.600.2.1 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 3638).

6.600.2.2 `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand (const Pointer< commands::Command > & command) [virtual]`

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

command the received from the nested transport.

Reimplemented from `activemq::transport::TransportFilter` (p. 3640).

6.600.2.3 `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::oneway (const Pointer< commands::Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from `activemq::transport::TransportFilter` (p. 3640).

6.600.2.4 `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onTransportException (transport::Transport * source, const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

source The source of the exception

ex The exception.

6.600.2.5 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command The request to send.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from `activemq::transport::TransportFilter` (p. 3642).

6.600.2.6 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command The request to send.

timeout The time to wait for the response.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from `activemq::transport::TransportFilter` (p. 3641).

6.600.2.7 `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::start () throw (decaf::io::IOException) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

- IOException*** if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 3642).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireFormatNegotiator.h**

6.601 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h>
```

Inheritance diagram for **activemq::wireformat::openwire::OpenWireResponseBuilder**:

Public Member Functions

- OpenWireResponseBuilder** ()
- virtual **~OpenWireResponseBuilder** ()
- virtual **Pointer< commands::Response > buildResponse** (const **Pointer< commands::Command > &command**)

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const **Pointer< commands::Command > &command**, **decaf::util::StlQueue< Pointer< commands::Command > > &queue**)

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

6.601.1 Constructor & Destructor Documentation

- 6.601.1.1** `activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder () [inline]`
- 6.601.1.2** `virtual activemq::wireformat::openwire::OpenWireResponseBuilder::~~OpenWireResponseBuilder () [inline, virtual]`

6.601.2 Member Function Documentation

- 6.601.2.1** `virtual void activemq::wireformat::openwire::OpenWireResponseBuilder::buildIncomingCommands (const Pointer< commands::Command > & command, decaf::util::StlQueue< Pointer< commands::Command > > & queue) [virtual]`

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

- command* - The Command being sent to the Broker.
- queue* - Queue of Command sent back from the broker.

Implements `activemq::transport::mock::ResponseBuilder` (p. 3080).

- 6.601.2.2** `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireResponseBuilder::buildResponse (const Pointer< commands::Command > & command) [virtual]`

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters

- command* - The command to build a response for

Returns

- A Response object pointer, or NULL if no response.

Implements `activemq::transport::mock::ResponseBuilder` (p. 3081).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h`

6.602 decaf::io::OutputStream Class Reference

Base interface for any class that wants to represent an output stream of bytes.

`#include <src/main/decaf/io/OutputStream.h>`

Inheritance diagram for decaf::io::OutputStream:

Public Member Functions

- **OutputStream** ()
- virtual **~OutputStream** ()
- virtual void **close** () throw (decaf::io::IOException)

- virtual void **flush** () throw (decaf::io::IOException)

- virtual void **write** (unsigned char c) throw (decaf::io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const unsigned char *buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs.
- virtual std::string **toString** () const
Output a String representation of this object.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)=0 throw (decaf::io::IOException)
- virtual void **doWriteArray** (const unsigned char *buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual void **doWriteArrayBounded** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

6.602.1 Detailed Description

Base interface for any class that wants to represent an output stream of bytes.

Since

1.0

6.602.2 Constructor & Destructor Documentation

6.602.2.1 decaf::io::OutputStream::OutputStream ()

6.602.2.2 virtual decaf::io::OutputStream::~~OutputStream () [virtual]

6.602.3 Member Function Documentation

6.602.3.1 virtual void decaf::io::OutputStream::close () throw (decaf::io::IOException) [virtual]

The default implementation of this method does nothing.

Reimplemented in **decaf::internal::io::StandardErrorOutputStream** (p. 3352), **decaf::internal::io::StandardOutputStream** (p. 3354), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 2699), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 3510), **decaf::io::FilterOutputStream** (p. 1778), and **decaf::util::zip::DeflaterOutputStream** (p. 1607).

6.602.3.2 virtual void decaf::io::OutputStream::doWriteArray (const unsigned char * *buffer*, int *size*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [protected, virtual]

Reimplemented in decaf::io::BufferedOutputStream (p. 868), and decaf::io::FilterOutputStream (p. 1779).

6.602.3.3 virtual void decaf::io::OutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [protected, virtual]

Reimplemented in activemq::io::LoggingOutputStream (p. 2252), decaf::internal::io::StandardErrorOutputStream (p. 3352), decaf::internal::io::StandardOutputStream (p. 3355), decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream (p. 2699), decaf::internal::net::tcp::TcpSocketOutputStream (p. 3510), decaf::io::BufferedOutputStream (p. 868), decaf::io::ByteArrayOutputStream (p. 952), decaf::io::DataOutputStream (p. 1475), decaf::io::FilterOutputStream (p. 1779), decaf::util::zip::CheckedOutputStream (p. 1059), and decaf::util::zip::DeflaterOutputStream (p. 1607).

6.602.3.4 virtual void decaf::io::OutputStream::doWriteByte (unsigned char *value*) throw (decaf::io::IOException) [protected, pure virtual]

Implemented in activemq::io::LoggingOutputStream (p. 2252), decaf::internal::io::StandardErrorOutputStream (p. 3352), decaf::internal::io::StandardOutputStream (p. 3355), decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream (p. 2700), decaf::internal::net::tcp::TcpSocketOutputStream (p. 3510), decaf::io::BufferedOutputStream (p. 868), decaf::io::ByteArrayOutputStream (p. 952), decaf::io::DataOutputStream (p. 1475), decaf::io::FilterOutputStream (p. 1779), decaf::util::zip::CheckedOutputStream (p. 1059), and decaf::util::zip::DeflaterOutputStream (p. 1607).

6.602.3.5 virtual void decaf::io::OutputStream::flush () throw (decaf::io::IOException) [virtual]

The default implementation of this method does nothing.

Reimplemented in decaf::internal::io::StandardErrorOutputStream (p. 3352), decaf::internal::io::StandardOutputStream (p. 3355), decaf::io::BufferedOutputStream (p. 868), and decaf::io::FilterOutputStream (p. 1779).

6.602.3.6 virtual void decaf::io::OutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3463).

6.602.3.7 `virtual void decaf::io::OutputStream::notify ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [inline,
virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 3464).

6.602.3.8 `virtual void decaf::io::OutputStream::notifyAll ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [inline,
virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 3465).

6.602.3.9 `virtual std::string decaf::io::OutputStream::toString () const
[virtual]`

Output a String representation of this object.

The default version of this method just prints the Class Name.

Returns

a string representation of the object.

Reimplemented in `decaf::io::ByteArrayOutputStream` (p. 953), and `decaf::io::FilterOutputStream` (p. 1780).

6.602.3.10 `virtual bool decaf::io::OutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3466).

6.602.3.11 `virtual void decaf::io::OutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3467).

6.602.3.12 `virtual void decaf::io::OutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 3468).

6.602.3.13 `virtual void decaf::io::OutputStream::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3470).

6.602.3.14 `virtual void decaf::io::OutputStream::wait (long long millisecs,
int nanos) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3471).

6.602.3.15 `virtual void decaf::io::OutputStream::write (unsigned char c) throw
(decaf::io::IOException) [virtual]`

Writes a single byte to the output stream.

The default implementation of this method calls the pure virtual method doWriteByte which must be implemented by any subclass of the **OutputStream** (p. 2718).

Parameters

c The byte to write to the sink.

Exceptions

IOException (p. 2003) if an I/O error occurs.

6.602.3.16 `virtual void decaf::io::OutputStream::write (const unsigned char * buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Writes an array of bytes to the output stream.

The entire contents of the given vector are written to the output stream.

The default implementation of this method simply calls the `doWriteArray` which writes the contents of the array using the `doWriteByte` method repeatedly. It is recommended that a subclass override `doWriteArray` to provide more performant means of writing the array.

Parameters

buffer The vector of bytes to write.

size The size of the buffer passed.

Exceptions

IOException (p. 2003) if an I/O error occurs.

NullPointerException thrown if buffer is Null.

IndexOutOfBoundsException if size value is negative.

6.602.3.17 `virtual void decaf::io::OutputStream::write (const unsigned char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Writes an array of bytes to the output stream in order starting at `buffer[offset]` and proceeding until the number of bytes specified by the `length` argument are written or an error occurs.

The default implementation of this method simply calls the `doWriteArrayBounded` method which writes the contents of the array using the `doWriteByte` method repeatedly. It is recommended that a subclass override `doWriteArrayBounded` to provide more performant means of writing the array.

Parameters

buffer The array of bytes to write.

size The size of the buffer array passed.

offset The position to start writing in buffer.

length The number of bytes from the buffer to be written.

Exceptions

IOException (p. 2003) if an I/O error occurs.

NullPointerException thrown if buffer is Null.

IndexOutOfBoundsException if the offset + length > size. or one of the parameters is negative.

The documentation for this class was generated from the following file:

- src/main/decaf/io/**OutputStream.h**

6.603 decaf::io::OutputStreamWriter Class Reference

A class for turning a character stream into a byte stream.

#include <src/main/decaf/io/OutputStreamWriter.h>

Inheritance diagram for decaf::io::OutputStreamWriter:

Public Member Functions

- **OutputStreamWriter** (**OutputStream** *stream, bool own=false)
*Creates a new **OutputStreamWriter** (p. 2726).*
- virtual ~**OutputStreamWriter** ()
- virtual void **close** () throw (decaf::io::IOException)
- virtual void **flush** () throw (decaf::io::IOException)

Protected Member Functions

- virtual void **doWriteArrayBounded** (const char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)
Override this method to customize the functionality of the method write(char buffer, int size, int offset, int length).*
- virtual void **checkClosed** () const throw (decaf::io::IOException)

6.603.1 Detailed Description

A class for turning a character stream into a byte stream.

See also

InputStreamReader (p. 1919)

Since

1.0

6.603.2 Constructor & Destructor Documentation

6.603.2.1 decaf::io::OutputStreamWriter::OutputStreamWriter (*OutputStream* * *stream*, *bool own* = *false*)

Creates a new **OutputStreamWriter** (p. 2726).

Parameters

stream The **OutputStream** (p. 2718) to wrap. (cannot be NULL).

own Indicates whether this instance own the given **OutputStream** (p. 2718). If true then the **OutputStream** (p. 2718) is destroyed when this class is.

Exceptions

NullPointerException if the stream is NULL.

6.603.2.2 virtual decaf::io::OutputStreamWriter::~~OutputStreamWriter () [virtual]

6.603.3 Member Function Documentation

6.603.3.1 virtual void decaf::io::OutputStreamWriter::checkClosed () const throw (decaf::io::IOException) [protected, virtual]

6.603.3.2 virtual void decaf::io::OutputStreamWriter::close () throw (decaf::io::IOException) [virtual]

6.603.3.3 virtual void decaf::io::OutputStreamWriter::doWriteArrayBounded (const char * *buffer*, *int size*, *int offset*, *int length*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException) [protected, virtual]

Override this method to customize the functionality of the method write(char* buffer, int size, int offset, int length).

All subclasses must override this method to provide the basic **Writer** (p. 3756) functionality.

Implements **decaf::io::Writer** (p. 3759).

6.603.3.4 virtual void decaf::io::OutputStreamWriter::flush () throw (decaf::io::IOException) [virtual]

6.604.1 Constructor & Destructor Documentation

6.604.1.1 `activemq::commands::PartialCommand::PartialCommand ()`

6.604.1.2 `virtual activemq::commands::PartialCommand::~~PartialCommand ()`
[virtual]

6.604.2 Member Function Documentation

6.604.2.1 `virtual PartialCommand* activemq::commands::PartialCommand::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 2157).

6.604.2.2 `virtual void activemq::commands::PartialCommand::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1555).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 2157).

6.604.2.3 `virtual bool activemq::commands::PartialCommand::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1556).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 2157).

6.604.2.4 `virtual int activemq::commands::PartialCommand::getCommandId ()`
`const [virtual]`

6.604.2.5 `virtual std::vector<unsigned char>& ac-`
`tivemq::commands::PartialCommand::getData ()`
`[virtual]`

6.604.2.6 `virtual const std::vector<unsigned char>& ac-`
`tivemq::commands::PartialCommand::getData () const`
`[virtual]`

6.604.2.7 `virtual unsigned char ac-`
`tivemq::commands::PartialCommand::getDataStructureType () const`
`[virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2157).

6.604.2.8 `virtual void activemq::commands::PartialCommand::setCommandId (`
`int commandId) [virtual]`

6.604.2.9 `virtual void activemq::commands::PartialCommand::setData (const`
`std::vector< unsigned char > & data) [virtual]`

6.604.2.10 `virtual std::string activemq::commands::PartialCommand::toString ()`
`const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 767).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 2158).

6.604.3 Field Documentation

- 6.604.3.1 `int activemq::commands::PartialCommand::commandId` [protected]
- 6.604.3.2 `std::vector<unsigned char> activemq::commands::PartialCommand::data`
[protected]
- 6.604.3.3 `const unsigned char activemq::commands::PartialCommand::ID_ -
PARTIALCOMMAND = 60` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/PartialCommand.h`

6.605 activemq::wireformat::openwire::marshal::v6::PartialCommandMa Class Reference

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2731).

```
#include <src/main/activemq/wireformat/openwire/marshal/v6/PartialCommandMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller`:

Public Member Functions

- **PartialCommandMarshaller** ()
- virtual **~PartialCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **com-
mands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn,
utils::BooleanStream *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **com-
mands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**de-
caf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **com-
mands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut,
utils::BooleanStream *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.605.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2731). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.605.2 Constructor & Destructor Documentation

6.605.2.1 activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::PartialCommandMarshaller () [inline]

6.605.2.2 virtual activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::~~PartialCommandMarshaller () [inline, virtual]

6.605.3 Member Function Documentation

6.605.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2159).

6.605.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2160).

6.605.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1518).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2160).

6.605.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1525).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2160).

```

6.605.3.5  virtual int ac-
            tivemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, utils::BooleanStream * bs ) throw (
            decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller` (p. 2161).

```

6.605.3.6  virtual void ac-
            tivemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::tightMarshal2
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataOutputStream * dataOut,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

Reimplemented in `activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller` (p. 2161).

6.605.3.7 virtual void activemq::wireformat::openwire::marshal::v6::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Reimplemented in **activemq::wireformat::openwire::marshal::v6::LastPartialCommandMarshaller** (p. 2162).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/PartialCommandMarshaller.h

6.606 activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2735).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/PartialCommandMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller:

Public Member Functions

6.606.3 Member Function Documentation

6.606.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2167).

6.606.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2167).

6.606.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1518).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2168).

6.606.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 2168).

```
6.606.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 2169).

```
6.606.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 2169).

6.606.3.7 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2165).

6.608.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 2165).

The documentation for this class was generated from the following file:

6.609.3 Member Function Documentation

6.609.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::createObject () const** [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2175).

6.609.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::getDataStructureType () const** [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2175).

6.609.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 2176).

6.609.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 2176).

6.609.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2177).

```
6.609.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2177).

```
6.609.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 2177).

6.610.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1505).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p.2179).

6.610.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2179).

6.610.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2180).

6.610.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2180).

6.610.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2181).

6.610.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1539).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 2181).

```

6.610.3.7 virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 2181).

The documentation for this class was generated from the following file:

6.611.1 Detailed Description

```
template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> class decaf::lang::Pointer<
T, REFCOUNTER >
```

Decaf's implementation of a Smart **Pointer** (p. 2756) that is a template on a Type and is **Thread** (p. 3520) Safe if the default Reference Counter is used. This **Pointer** (p. 2756) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of **ReferenceCounter**.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2756) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2756) in a STL container that requires it, **Pointer** (p. 2756) provides an implementation of `std::less`.

Since

1.0

6.611.2 Member Typedef Documentation

6.611.2.1 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> typedef
REFCOUNTER decaf::lang::Pointer< T, REFCOUNTER
>::CounterType`

6.611.2.2 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> typedef T*
decaf::lang::Pointer< T, REFCOUNTER >::PointerType`

6.611.2.3 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> typedef T&
decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType`

6.611.3 Constructor & Destructor Documentation

6.611.3.1 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> decaf::lang::Pointer<
T, REFCOUNTER >::Pointer () [inline]`

Default Constructor.

Initialized the contained pointer to NULL, using the `->` operator results in an exception unless reset to contain a real value.

Referenced by `decaf::lang::Pointer< TransactionId >::reset()`.

6.611.3.2 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer<
T, REFCOUNTER >::Pointer (const PointerType value) [inline,
explicit]`

Explicit Constructor, creates a **Pointer** (p.2756) that contains value with a single reference.
This object now has ownership until a call to release.

Parameters

value - instance of the type we are containing here.

6.611.3.3 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer<
T, REFCOUNTER >::Pointer (const Pointer< T, REFCOUNTER > &
value) throw () [inline]`

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.611.3.4 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename
T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer
(const Pointer< T1, R1 > & value) throw () [inline]`

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.611.3.5 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename
T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer
(const Pointer< T1, R1 > & value, const STATIC_CAST_TOKEN
&) throw () [inline]`

Static Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p.2756) object.

Parameters

value - **Pointer** (p.2756) instance to cast to this type.

6.611.3.6 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> template<typename
T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer
(const Pointer< T1, R1 > & value, const DYNAMIC_CAST_TOKEN
&) throw (decaf::lang::exceptions::ClassCastException) [inline]`

Dynamic Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p. 2756) object. If the cast fails and return NULL then this method throws a `ClassCastException`.

Parameters

value - **Pointer** (p. 2756) instance to cast to this type.

Exceptions

ClassCastException if the dynamic cast returns NULL

6.611.3.7 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> virtual
decaf::lang::Pointer< T, REFCOUNTER >::~~Pointer () throw ()
[inline, virtual]`

6.611.4 Member Function Documentation

6.611.4.1 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> template<typename
T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T,
REFCOUNTER >::dynamicCast () const [inline]`

6.611.4.2 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> PointerType
decaf::lang::Pointer< T, REFCOUNTER >::get () const [inline]`

Gets the real pointer that is contained within this **Pointer** (p. 2756).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL `auto_ptr` and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2756). Use at your own risk.

Returns

the contained pointer.

Referenced by `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::equals()`, `activemq::state::ConnectionState::getTransactionState()`, `decaf::lang::operator!=()`, `decaf::lang::Pointer< TransactionId >::operator!=()`, `std::less< decaf::lang::Pointer< T > >::operator()`, `decaf::lang::operator==()`, `decaf::lang::Pointer< TransactionId >::operator==()`, and `activemq::state::ConnectionState::removeTempDestination()`.

- 6.611.4.3** `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> bool
decaf::lang::Pointer< T, REFCOUNTER >::operator! () const
[inline]`
- 6.611.4.4** `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename
T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER
>::operator!= (const Pointer< T1, R1 > & right) const [inline]`
- 6.611.4.5** `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType
decaf::lang::Pointer< T, REFCOUNTER >::operator* () const
[inline]`
- 6.611.4.6** `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType
decaf::lang::Pointer< T, REFCOUNTER >::operator* () [inline]`

Dereference Operator, returns a reference to the Contained value.

This method throws an `NullPointerException` if the contained value is `NULL`.

Returns

reference to the contained pointer.

Exceptions

NullPointerException if the contained value is `Null`

- 6.611.4.7** `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> PointerType
decaf::lang::Pointer< T, REFCOUNTER >::operator-> () [inline]`

Indirection Operator, returns a pointer to the Contained value.

This method throws an `NullPointerException` if the contained value is `NULL`.

Returns

reference to the contained pointer.

Exceptions

NullPointerException if the contained value is `Null`

- 6.611.4.8 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> PointerType
decaf::lang::Pointer< T, REFCOUNTER >::operator-> () const
[inline]`
- 6.611.4.9 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> Pointer&
decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer<
T, REFCOUNTER > & right) throw () [inline]`

Assigns the value of *right* to this **Pointer** (p. 2756) and increments the reference Count.

Parameters

right - **Pointer** (p. 2756) on the right hand side of an operator= call to this.

- 6.611.4.10 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename
T1 , typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER
>::operator= (const Pointer< T1, R1 > & right) throw () [inline]`
- 6.611.4.11 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename
T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER
>::operator== (const Pointer< T1, R1 > & right) const [inline]`
- 6.611.4.12 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> T*
decaf::lang::Pointer< T, REFCOUNTER >::release () [inline]`

Releases the **Pointer** (p. 2756) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 2756) is held by more than one object or this method is called from more than one thread.

Parameters

value - The new value to contain.

Returns

The pointer instance that was held by this **Pointer** (p. 2756) object, the pointer is no longer owned by this **Pointer** (p. 2756) and won't be freed when this **Pointer** (p. 2756) goes out of scope.

Referenced by `decaf::lang::Pointer< TransactionId >::Pointer()`.

- 6.611.4.13 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> void
decaf::lang::Pointer< T, REFCOUNTER >::reset (T * value)
[inline]`

Resets the **Pointer** (p. 2756) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p.2756) to a NULL pointer.

Parameters

value - The new value to contain.

6.611.4.14 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> template<typename
T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T,
REFCOUNTER >::staticCast () const [inline]`

6.611.4.15 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> void
decaf::lang::Pointer< T, REFCOUNTER >::swap (Pointer< T,
REFCOUNTER > & value) throw () [inline]`

Exception (p.1712) Safe Swap Function.

Parameters

value - the value to swap with this.

Referenced by decaf::lang::Pointer< TransactionId >::operator=(), and decaf::lang::Pointer< TransactionId >::swap().

6.611.5 Friends And Related Function Documentation

6.611.5.1 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> bool operator!= (
const Pointer< T, REFCOUNTER > & left, const T * right)
[friend]`

6.611.5.2 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> bool operator!= (
const T * left, const Pointer< T, REFCOUNTER > & right)
[friend]`

6.611.5.3 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> bool operator== (
const Pointer< T, REFCOUNTER > & left, const T * right)
[friend]`

6.611.5.4 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCount> bool operator== (
const T * left, const Pointer< T, REFCOUNTER > & right)
[friend]`

6.612 decaf::lang::PointerComparator< T, R > Class Template Reference

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2756) instance.

```
#include <src/main/decaf/lang/Pointer.h>
```

Inheritance diagram for decaf::lang::PointerComparator< T, R >:

Public Member Functions

- virtual bool **operator()** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const
- virtual int **compare** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const

6.612.1 Detailed Description

```
template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCounter>
class decaf::lang::PointerComparator< T, R >
```

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2756) instance. This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 2756) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

6.612.2 Member Function Documentation

6.612.2.1 `template<typename T , typename R = decaf::util::concurrent::atomic::AtomicRefCounter> virtual int decaf::lang::PointerComparator< T, R >::compare (const Pointer< T, R > & left, const Pointer< T, R > & right) const [inline, virtual]`

6.612.2.2 `template<typename T , typename R = decaf::util::concurrent::atomic::AtomicRefCounter> virtual bool decaf::lang::PointerComparator< T, R >::operator() (const Pointer< T, R > & left, const Pointer< T, R > & right) const [inline, virtual]`

6.613 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

```
#include <src/main/activemq/cmsutil/PooledSession.h>
```

Inheritance diagram for activemq::cmsutil::PooledSession:

Public Member Functions

- **PooledSession** (**SessionPool** *pool, **cms::Session** *session)
- virtual **~PooledSession** ()
Does nothing.
- virtual **cms::Session** * **getSession** ()
Returns a non-constant reference to the internal session object.
- virtual const **cms::Session** * **getSession** () const
Returns a constant reference to the internal session object.
- virtual void **close** () throw (cms::CMSEException)
Returns this session back to the pool, but does not close or destroy the internal session object.
- virtual void **commit** () throw (cms::CMSEException)
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** () throw (cms::CMSEException)
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** () throw (cms::CMSEException)
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false) throw (cms::CMSEException)

Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageConsumer** * **createCachedConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)

First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal.

- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination) throw (cms::CMSEException)

Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::MessageProducer** * **createCachedProducer** (const **cms::Destination** *destination) throw (cms::CMSEException)

First checks the internal producer cache and creates one if none exist for the given destination.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue) throw (cms::CMSEException)

Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector) throw (cms::CMSEException)

Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (const std::string &queueName) throw (cms::CMSEException)

Creates a queue identity given a Queue name.

- virtual **cms::Topic** * **createTopic** (const std::string &topicName) throw (cms::CMSEException)

Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** * **createTemporaryQueue** () throw (cms::CMSEException)

Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** * **createTemporaryTopic** () throw (cms::CMSEException)

Creates a TemporaryTopic object.

- virtual **cms::Message** * **createMessage** () throw (cms::CMSEException)

Creates a new Message.

- virtual **cms::BytesMessage** * **createBytesMessage** () throw (cms::CMSEException)

Creates a BytesMessage.

- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, int bytesSize) throw (cms::CMSEException)

Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** * **createStreamMessage** () throw (cms::CMSEException)

Creates a new StreamMessage.

- virtual **cms::TextMessage * createTextMessage** () throw (cms::CMSEException)

Creates a new TextMessage.

- virtual **cms::TextMessage * createTextMessage** (const std::string &text) throw (cms::CMSEException)

Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage * createMapMessage** () throw (cms::CMSEException)

Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode getAcknowledgeMode** () const throw (cms::CMSEException)

Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const throw (cms::CMSEException)

Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (const std::string &name) throw (cms::CMSEException)

Unsubscribes a durable subscription that has been created by a client.

Protected Member Functions

- **PooledSession** (const **PooledSession** &)
- **PooledSession & operator=** (const **PooledSession** &)

6.613.1 Detailed Description

A pooled session object that wraps around a delegate session. Calls to close this session only result in giving the session back to the pool.

6.613.2 Constructor & Destructor Documentation

6.613.2.1 **activemq::cmsutil::PooledSession::PooledSession** (const **PooledSession** &) [inline, protected]

6.613.2.2 **activemq::cmsutil::PooledSession::PooledSession** (SessionPool * *pool*, cms::Session * *session*)

6.613.2.3 virtual **activemq::cmsutil::PooledSession::~~PooledSession** () [virtual]

Does nothing.

6.613.3 Member Function Documentation

6.613.3.1 `virtual void activemq::cmsutil::PooledSession::close () throw (cms::CMSEException) [virtual]`

Returns this session back to the pool, but does not close or destroy the internal session object.
Implements `cms::Session` (p. 3152).

6.613.3.2 `virtual void activemq::cmsutil::PooledSession::commit () throw (cms::CMSEException) [inline, virtual]`

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements `cms::Session` (p. 3152).

References `cms::Session::commit()`.

6.613.3.3 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * queue, const std::string & selector) throw (cms::CMSEException) [virtual]`

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements `cms::Session` (p. 3153).

6.613.3.4 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * queue) throw (cms::CMSEException) [virtual]`

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue the Queue to browse

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 3152).

6.613.3.5 `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage () throw (cms::CMSException) [inline, virtual]`

Creates a BytesMessage.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 3153).

6.613.3.6 `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage (const unsigned char * bytes, int bytesSize) throw (cms::CMSException) [inline, virtual]`

Creates a BytesMessage and sets the payload to the passed value.

Parameters

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 3153).

6.613.3.7 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer (const cms::Destination * destination, const std::string & selector, bool noLocal) throw (cms::CMSException) [virtual]`

First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal.

If created, the consumer is added to the pool's lifecycle manager.

Parameters

destination the destination to receive on
selector the selector to use
noLocal whether or not to receive messages from the same connection

Returns

the consumer resource

Exceptions

cms::CMSEException (p. 1074) if something goes wrong.

6.613.3.8 `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer (const cms::Destination * destination) throw (cms::CMSEException)`
 [virtual]

First checks the internal producer cache and creates one if none exist for the given destination.
 If created, the producer is added to the pool's lifecycle manager.

Parameters

destination the destination to send on

Returns

the producer resource

Exceptions

cms::CMSEException (p. 1074) if something goes wrong.

6.613.3.9 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination) throw (cms::CMSEException)`
 [inline, virtual]

Creates a MessageConsumer for the specified destination.

Parameters

destination the Destination that this consumer receiving messages for.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSEException - If an internal error occurs.
InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 3154).

6.613.3.10 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination, const std::string & selector) throw (cms::CMSException) [inline, virtual]`

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 3154).

6.613.3.11 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination, const std::string & selector, bool noLocal) throw (cms::CMSException) [inline, virtual]`

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 3155).

6.613.3.12 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createDurableConsumer (const cms::Topic * destination, const std::string & name, const std::string & selector, bool noLocal = false) throw (cms::CMSEException) [inline, virtual]`

Creates a durable subscriber to the specified topic, using a Message selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSEException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements `cms::Session` (p. 3155).

6.613.3.13 `virtual cms::MapMessage* activemq::cmsutil::PooledSession::createMapMessage () throw (cms::CMSEException) [inline, virtual]`

Creates a new MapMessage.

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3156).

6.613.3.14 `virtual cms::Message* activemq::cmsutil::PooledSession::createMessage () throw (cms::CMSEException) [inline, virtual]`

Creates a new Message.

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3156).

6.613.3.15 `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer (const cms::Destination * destination) throw (cms::CMSException)`
[inline, virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters

destination the Destination to send on

Returns

New MessageProducer that is owned by the caller.

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 3156).

6.613.3.16 `virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue (const std::string & queueName) throw (cms::CMSException)`
[inline, virtual]

Creates a queue identity given a Queue name.

Parameters

queueName the name of the new Queue

Returns

new Queue pointer that is owned by the caller.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 3156).

6.613.3.17 `virtual cms::StreamMessage* activemq::cmsutil::PooledSession::createStreamMessage () throw (cms::CMSException)` [inline, virtual]

Creates a new StreamMessage.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 3157).

6.613.3.18 `virtual cms::TemporaryQueue* activemq::cmsutil::PooledSession::createTemporaryQueue () throw (cms::CMSEException) [inline, virtual]`

Creates a TemporaryQueue object.

Returns

new TemporaryQueue pointer that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3157).

6.613.3.19 `virtual cms::TemporaryTopic* activemq::cmsutil::PooledSession::createTemporaryTopic () throw (cms::CMSEException) [inline, virtual]`

Creates a TemporaryTopic object.

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3157).

6.613.3.20 `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage (const std::string & text) throw (cms::CMSEException) [inline, virtual]`

Creates a new TextMessage and set the text to the value given.

Parameters

text the initial text for the message

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3158).

6.613.3.21 `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage () throw (cms::CMSEException) [inline, virtual]`

Creates a new TextMessage.

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3158).

6.613.3.22 `virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic
(const std::string & topicName) throw (cms::CMSEException)
[inline, virtual]`

Creates a topic identity given a Queue name.

Parameters

topicName the name of the new Topic

Returns

new Topic pointer that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 3158).

6.613.3.23 `virtual cms::Session::AcknowledgeMode ac-
tivemq::cmsutil::PooledSession::getAcknowledgeMode () const throw
(cms::CMSEException) [inline, virtual]`

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 3158).

6.613.3.24 `virtual cms::Session* activemq::cmsutil::PooledSession::getSession ()
[inline, virtual]`

Returns a non-constant reference to the internal session object.

Returns

the session object.

6.613.3.25 `virtual const cms::Session* activemq::cmsutil::PooledSession::getSession
() const [inline, virtual]`

Returns a constant reference to the internal session object.

Returns

the session object.

6.613.3.26 `virtual bool activemq::cmsutil::PooledSession::isTransacted () const throw (cms::CMSEException) [inline, virtual]`

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::Session` (p. 3159).

6.613.3.27 `PooledSession& activemq::cmsutil::PooledSession::operator= (const PooledSession &) [inline, protected]`

6.613.3.28 `virtual void activemq::cmsutil::PooledSession::recover () throw (cms::CMSEException) [inline, virtual]`

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSEException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements `cms::Session` (p. 3159).

6.613.3.29 `virtual void activemq::cmsutil::PooledSession::rollback () throw (cms::CMSEException) [inline, virtual]`

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements `cms::Session` (p. 3159).

6.613.3.30 `virtual void activemq::cmsutil::PooledSession::unsubscribe (const std::string & name) throw (cms::CMSException) [inline, virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name The name used to identify this subscription

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 3160).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**PooledSession.h**

6.614 decaf::util::concurrent::PooledThread Class Reference

```
#include <src/main/decaf/util/concurrent/PooledThread.h>
```

Inheritance diagram for decaf::util::concurrent::PooledThread:

Public Member Functions

- **PooledThread** (**ThreadPool** *pool)
Constructor.
- virtual **~PooledThread** ()
- virtual void **run** ()
*Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 3531) and then grabs it and calls its run method.*
- virtual void **stop** () throw (lang::Exception)
Stops the Thread, thread will complete its task if currently running one, and then die.
- virtual bool **isBusy** ()
Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.
- virtual void **setPooledThreadListener** (**PooledThreadListener** *listener)
*Adds a listener to this **PooledThread** (p. 2777) to be notified when this thread starts and completes a task.*

- virtual **PooledThreadListener** * **getPooledThreadListener** ()

*Removes a listener for this **PooledThread** (p. 2777) to be notified when this thread starts and completes a task.*

6.614.1 Constructor & Destructor Documentation

6.614.1.1 **decaf::util::concurrent::PooledThread::PooledThread** (**ThreadPool** * *pool*)

Constructor.

Parameters

pool the parant **ThreadPool** (p. 3531) object

6.614.1.2 **virtual decaf::util::concurrent::PooledThread::~~PooledThread** () [virtual]

6.614.2 Member Function Documentation

6.614.2.1 **virtual PooledThreadListener* decaf::util::concurrent::PooledThread::getPooledThreadListener** () [inline, virtual]

Removes a listener for this **PooledThread** (p. 2777) to be notified when this thread starts and completes a task.

Returns

a pointer to this thread's listener or NULL

6.614.2.2 **virtual bool decaf::util::concurrent::PooledThread::isBusy** () [inline, virtual]

Checks to see if the thread is busy, if busy it means that this thread has taken a task from the **ThreadPool**'s queue and is processing it.

Returns

true if the Thread is busy

6.614.2.3 **virtual void decaf::util::concurrent::PooledThread::run** () [virtual]

Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 3531) and then grabs it and calls its run method.

Reimplemented from **decaf::lang::Thread** (p. 3527).

6.614.2.4 virtual void decaf::util::concurrent::PooledThread::setPooledThreadListener (PooledThreadListener * *listener*) [inline, virtual]

Adds a listener to this PooledThread (p. 2777) to be notified when this thread starts and completes a task.

Parameters

listener the listener to send notifications to.

6.614.2.5 virtual void decaf::util::concurrent::PooledThread::stop () throw (lang::Exception) [virtual]

Stops the Thread, thread will complete its task if currently running one, and then die.

Does not block.

Exceptions

Exception

The documentation for this class was generated from the following file:

6.615 decaf::util::concurrent::PooledThreadListener Class Reference

Abstract Listener Interface for users of ThreadPool (p. 3531).

```
#include <src/main/decaf/util/concurrent/PooledThreadListener.h>
```

Inheritance diagram for decaf::util::concurrent::PooledThreadListener:

Public Member Functions

- virtual ~PooledThreadListener ()
- virtual void onTaskStarted (PooledThread *thread)=0
Called by a pooled thread when it is about to begin executing a new task.
- virtual void onTaskCompleted (PooledThread *thread)=0
Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.
- virtual void onTaskException (PooledThread *thread, lang::Exception &ex)=0
*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2777) is now no longer running.*

6.615.1 Detailed Description

Abstract Listener Interface for users of `ThreadPool` (p. 3531). The implementor of this class receives events related to the execution and termination of threads running in the `ThreadPool` (p. 3531).

Since

1.0

6.615.2 Constructor & Destructor Documentation

6.615.2.1 `virtual`
`decaf::util::concurrent::PooledThreadListener::~~PooledThreadListener (`
`)` [inline, virtual]

6.615.3 Member Function Documentation

6.615.3.1 `virtual void` `de-`
`caf::util::concurrent::PooledThreadListener::onTaskCompleted (`
`PooledThread * thread)` [pure virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

Parameters

thread - Pointer the the Pooled Thread that is making this call.

Implemented in `decaf::util::concurrent::ThreadPool` (p. 3535).

6.615.3.2 `virtual void` `de-`
`caf::util::concurrent::PooledThreadListener::onTaskException (`
`PooledThread * thread, lang::Exception & ex)` [pure virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the `PooledThread` (p. 2777) is now no longer running.

Parameters

thread - Pointer to the Pooled Thread that is making this call

ex - The Exception that occurred.

Implemented in `decaf::util::concurrent::ThreadPool` (p. 3535).

6.615.3.3 `virtual void` `decaf::util::concurrent::PooledThreadListener::onTaskStarted`
`(PooledThread * thread)` [pure virtual]

Called by a pooled thread when it is about to begin executing a new task.

Parameters

thread - Pointer to the Pooled Thread that is making this call

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3535).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/PooledThreadListener.h`

6.616 decaf::net::PortUnreachableException Class Reference

```
#include <src/main/decaf/net/PortUnreachableException.h>
```

Inheritance diagram for `decaf::net::PortUnreachableException`:

Public Member Functions

- **PortUnreachableException** () throw ()
Default Constructor.
- **PortUnreachableException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **PortUnreachableException** (const **PortUnreachableException** &ex) throw ()
Copy Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **PortUnreachableException** (const std::exception *cause) throw ()
Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **PortUnreachableException** * clone () const
Clones this exception.
- virtual ~**PortUnreachableException** () throw ()

6.616.1 Constructor & Destructor Documentation

6.616.1.1 `decaf::net::PortUnreachableException::PortUnreachableException () throw () [inline]`

Default Constructor.

6.616.1.2 `decaf::net::PortUnreachableException::PortUnreachableException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.616.1.3 `decaf::net::PortUnreachableException::PortUnreachableException (const PortUnreachableException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.616.1.4 `decaf::net::PortUnreachableException::PortUnreachableException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.616.1.5 `decaf::net::PortUnreachableException::PortUnreachableException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.616.1.6 `decaf::net::PortUnreachableException::PortUnreachableException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.616.1.7 virtual
decaf::net::PortUnreachableException::~~PortUnreachableException ()
throw () [inline, virtual]

6.616.2 Member Function Documentation

6.616.2.1 virtual PortUnreachableException* decaf::net::PortUnreachableException::clone () const
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

- a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 3300).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/PortUnreachableException.h`

6.617 activemq::core::PrefetchPolicy Class Reference

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

```
#include <src/main/activemq/core/PrefetchPolicy.h>
```

Inheritance diagram for `activemq::core::PrefetchPolicy`:

Public Member Functions

- virtual **~PrefetchPolicy ()**
- virtual void **setDurableTopicPrefetch (int value)=0**
Sets the amount of prefetched messages for a Durable Topic.
- virtual int **getDurableTopicPrefetch () const =0**
Gets the amount of messages to prefetch for a Durable Topic.

- virtual void **setQueuePrefetch** (int value)=0
Sets the amount of prefetched messages for a Queue.
- virtual int **getQueuePrefetch** () const =0
Gets the amount of messages to prefetch for a Queue.
- virtual void **setQueueBrowserPrefetch** (int value)=0
Sets the amount of prefetched messages for a Queue Browser.
- virtual int **getQueueBrowserPrefetch** () const =0
Gets the amount of messages to prefetch for a Queue Browser.
- virtual void **setTopicPrefetch** (int value)=0
Sets the amount of prefetched messages for a Topic.
- virtual int **getTopicPrefetch** () const =0
Gets the amount of messages to prefetch for a Topic.
- virtual int **getMaxPrefetchLimit** (int value) const =0
Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.
- virtual **PrefetchPolicy** * **clone** () const =0
Clone the Policy and return a new pointer to that clone.
- virtual void **configure** (const **decaf::util::Properties** &properties)
Checks the supplied properties object for properties matching the configurable settings of this class.

Protected Member Functions

- **PrefetchPolicy** ()

6.617.1 Detailed Description

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

Since

3.2.0

6.617.2 Constructor & Destructor Documentation

6.617.2.1 `activemq::core::PrefetchPolicy::PrefetchPolicy ()` [protected]

6.617.2.2 `virtual activemq::core::PrefetchPolicy::~~PrefetchPolicy ()` [virtual]

6.617.3 Member Function Documentation

6.617.3.1 `virtual PrefetchPolicy* activemq::core::PrefetchPolicy::clone () const`
[pure virtual]

Clone the Policy and return a new pointer to that clone.

Returns

pointer to a new **PrefetchPolicy** (p. 2783) instance that is a clone of this one.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1567).

6.617.3.2 `virtual void activemq::core::PrefetchPolicy::configure (const decaf::util::Properties & properties)` [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix `cms.PrefetchPolicy.XXX` where XXX is the name of a property with a public setter method. For instance `cms.PrefetchPolicy.topicPrefetch` will be used to set the value of the topic prefetch limit.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters

properties The Properties object used to configure this object.

Exceptions

NumberFormatException if a property that is numeric cannot be converted

IllegalArgumentException if a property can't be converted to the correct type.

6.617.3.3 `virtual int activemq::core::PrefetchPolicy::getDurableTopicPrefetch () const`
[pure virtual]

Gets the amount of messages to prefetch for a Durable Topic.

Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1567).

6.617.3.4 `virtual int activemq::core::PrefetchPolicy::getMaxPrefetchLimit (int value) const` [pure virtual]

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

Returns

the allowable value for a prefetch limit, either requested or the max.

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1567).

6.617.3.5 `virtual int activemq::core::PrefetchPolicy::getQueueBrowserPrefetch () const` [pure virtual]

Gets the amount of messages to prefetch for a Queue Browser.

Returns

value of the number of messages to prefetch.

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1567).

6.617.3.6 `virtual int activemq::core::PrefetchPolicy::getQueuePrefetch () const` [pure virtual]

Gets the amount of messages to prefetch for a Queue.

Returns

value of the number of messages to prefetch.

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1568).

6.617.3.7 `virtual int activemq::core::PrefetchPolicy::getTopicPrefetch () const` [pure virtual]

Gets the amount of messages to prefetch for a Topic.

Returns

value of the number of messages to prefetch.

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1568).

6.617.3.8 `virtual void activemq::core::PrefetchPolicy::setDurableTopicPrefetch (int value)` [pure virtual]

Sets the amount of prefetched messages for a Durable Topic.

Parameters

value The number of messages to prefetch.

Implemented in `activemq::core::policies::DefaultPrefetchPolicy` (p. 1568).

6.617.3.9 virtual void activemq::core::PrefetchPolicy::setQueueBrowserPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Queue Browser.

Parameters

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1568).

6.617.3.10 virtual void activemq::core::PrefetchPolicy::setQueuePrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Queue.

Parameters

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1569).

6.617.3.11 virtual void activemq::core::PrefetchPolicy::setTopicPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Topic.

Parameters

value The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 1569).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/PrefetchPolicy.h`

6.618 activemq::util::PrimitiveList Class Reference

List of primitives.

```
#include <src/main/activemq/util/PrimitiveList.h>
```

Inheritance diagram for `activemq::util::PrimitiveList`:

Public Member Functions

- **PrimitiveList ()**
Default Constructor, creates an Empty list.

- virtual `~PrimitiveList ()`
- **PrimitiveList** (const `decaf::util::List< PrimitiveValueNode > &src`)
Copy Constructor.
- **PrimitiveList** (const **PrimitiveList** &src)
Copy Constructor.
- `std::string toString () const`
Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual `bool getBool (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)`
Gets the Boolean value at the specified index.
- virtual `void setBool (std::size_t index, bool value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual `unsigned char getByte (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)`
Gets the Byte value at the specified index.
- virtual `void setByte (std::size_t index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual `char getChar (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)`
Gets the Character value at the specified index.
- virtual `void setChar (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual `short getShort (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)`
Gets the Short value at the specified index.
- virtual `void setShort (std::size_t index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual int **getInt** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Integer value at the specified index.

- virtual void **setInt** (std::size_t index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual long long **getLong** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Long value at the specified index.

- virtual void **setLong** (std::size_t index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual float **getFloat** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Float value at the specified index.

- virtual void **setFloat** (std::size_t index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual double **getDouble** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the specified index.

- virtual void **setDouble** (std::size_t index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::string **getString** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the String value at the specified index.

- virtual void **setString** (std::size_t index, const std::string &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::vector< unsigned char > **getByteArray** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Byte Array value at the specified index.

- virtual void **setByteArray** (std::size_t index, const std::vector< unsigned char > &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

6.618.1 Detailed Description

List of primitives.

6.618.2 Constructor & Destructor Documentation

6.618.2.1 activemq::util::PrimitiveList::PrimitiveList ()

Default Constructor, creates an Empty list.

6.618.2.2 virtual activemq::util::PrimitiveList::~~PrimitiveList () [virtual]

6.618.2.3 activemq::util::PrimitiveList::PrimitiveList (const decaf::util::List< PrimitiveValueNode > & src)

Copy Constructor.

Parameters

src - the Decaf List of PrimitiveNodeValues to copy

6.618.2.4 activemq::util::PrimitiveList::PrimitiveList (const PrimitiveList & src)

Copy Constructor.

Parameters

src - the **PrimitiveList** (p. 2787) to copy

6.618.3 Member Function Documentation

6.618.3.1 `virtual bool activemq::util::PrimitiveList::getBool (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Boolean value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.2 `virtual unsigned char activemq::util::PrimitiveList::getBytes (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.3 `virtual std::vector<unsigned char> activemq::util::PrimitiveList::getBytesArray (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte Array value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.4 `virtual char activemq::util::PrimitiveList::getChar (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Character value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.5 `virtual double activemq::util::PrimitiveList::getDouble (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Double value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.6 virtual float activemq::util::PrimitiveList::getFloat (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Float value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > size() (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.7 virtual int activemq::util::PrimitiveList::getInt (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Integer value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > size() (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.8 virtual long long activemq::util::PrimitiveList::getLong (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Long value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.9 `virtual short activemq::util::PrimitiveList::getShort (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Short value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.10 `virtual std::string activemq::util::PrimitiveList::getString (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the String value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 3369)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.618.3.11 `virtual void activemq::util::PrimitiveList::setBool (std::size_t index, bool value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 3369).

6.618.3.12 `virtual void activemq::util::PrimitiveList::setByte (std::size_t index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 3369).

6.618.3.13 `virtual void activemq::util::PrimitiveList::setByteArray (std::size_t index, const std::vector< unsigned char > & value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 3369).

6.618.3.14 `virtual void activemq::util::PrimitiveList::setChar (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 3369).

6.618.3.15 `virtual void activemq::util::PrimitiveList::setDouble
(std::size_t index, double value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 3369).

6.618.3.16 `virtual void activemq::util::PrimitiveList::setFloat
(std::size_t index, float value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 3369).

6.618.3.17 `virtual void activemq::util::PrimitiveList::setInt (std::size_t index, int
value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 3369).

6.618.3.18 virtual void activemq::util::PrimitiveList::setLong
(std::size_t index, long long value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 3369).

6.618.3.19 virtual void activemq::util::PrimitiveList::setShort
(std::size_t index, short value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 3369).

6.618.3.20 virtual void activemq::util::PrimitiveList::setString (
std::size_t index, const std::string & value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 3369).

6.618.3.21 std::string activemq::util::PrimitiveList::toString () const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveList.h**

6.619 activemq::util::PrimitiveMap Class Reference

Map of named primitives.

```
#include <src/main/activemq/util/PrimitiveMap.h>
```

Inheritance diagram for activemq::util::PrimitiveMap:

Public Member Functions

- **PrimitiveMap ()**
Default Constructor, creates an empty map.
- virtual **~PrimitiveMap ()**
- **PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > &source)**
Copy Constructor.
- **PrimitiveMap (const PrimitiveMap &source)**
Copy Constructor.
- std::string **toString () const**
Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual bool **getBool (const std::string &key) const**
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setBool** (const std::string &key, bool value)

Sets the value at key to the specified type.

- virtual unsigned char **getByte** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setByte** (const std::string &key, unsigned char value)

Sets the value at key to the specified type.

- virtual char **getChar** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setChar** (const std::string &key, char value)

Sets the value at key to the specified type.

- virtual short **getShort** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setShort** (const std::string &key, short value)

Sets the value at key to the specified type.

- virtual int **getInt** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setInt** (const std::string &key, int value)

Sets the value at key to the specified type.

- virtual long long **getLong** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setLong** (const std::string &key, long long value)

Sets the value at key to the specified type.

- virtual float **getFloat** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setFloat** (const std::string &key, float value)

Sets the value at key to the specified type.

- virtual double **getDouble** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setDouble** (const std::string &key, double value)

Sets the value at key to the specified type.

- virtual std::string **getString** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setString** (const std::string &key, const std::string &value)

Sets the value at key to the specified type.

- virtual std::vector< unsigned char > **getByteArray** (const std::string
&key) const throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setByteArray** (const std::string &key, const std::vector< unsigned char >
&value)

Sets the value at key to the specified type.

6.619.1 Detailed Description

Map of named primitives.

6.619.2 Constructor & Destructor Documentation

6.619.2.1 activemq::util::PrimitiveMap::PrimitiveMap ()

Default Constructor, creates an empty map.

6.619.2.2 virtual `activemq::util::PrimitiveMap::~~PrimitiveMap ()` [virtual]

6.619.2.3 `activemq::util::PrimitiveMap::PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > & source)`

Copy Constructor.

Parameters

source The Decaf Library Map instance whose elements will be copied into this Map.

6.619.2.4 `activemq::util::PrimitiveMap::PrimitiveMap (const PrimitiveMap & source)`

Copy Constructor.

Parameters

source The **PrimitiveMap** (p.2798) whose elements will be copied into this Map.

6.619.3 Member Function Documentation

6.619.3.1 virtual `bool activemq::util::PrimitiveMap::getBool (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.2 virtual `unsigned char activemq::util::PrimitiveMap::getByte (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

```
6.619.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getByteArray ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]
```

Gets the Byte Array value at the given *key*, if the *key* is not in the map or cannot be returned as the requested value then an exception of type *NoSuchElementException* is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

```
6.619.3.4 virtual char activemq::util::PrimitiveMap::getChar ( const std::string & key ) const throw ( decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException ) [virtual]
```

Gets the Character value at the given *key*, if the *key* is not in the map or cannot be returned as the requested value then an exception of type *NoSuchElementException* is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.5 **virtual double** **activemq::util::PrimitiveMap::getDouble** (**const** **std::string** & *key*) **const throw** (**decaf::lang::exceptions::NoSuchElementException**, **decaf::lang::exceptions::UnsupportedOperationException**) [virtual]

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.6 **virtual float** **activemq::util::PrimitiveMap::getFloat** (**const** **std::string** & *key*) **const throw** (**decaf::lang::exceptions::NoSuchElementException**, **decaf::lang::exceptions::UnsupportedOperationException**) [virtual]

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.7 **virtual int** **activemq::util::PrimitiveMap::getInt** (**const** **std::string** & *key*) **const throw** (**decaf::lang::exceptions::NoSuchElementException**, **decaf::lang::exceptions::UnsupportedOperationException**) [virtual]

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.8 `virtual long long activemq::util::PrimitiveMap::getLong (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Long value at the given *key*, if the *key* is not in the map or cannot be returned as the requested value then an exception of type *NoSuchElementException* is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.9 `virtual short activemq::util::PrimitiveMap::getShort (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Short value at the given *key*, if the *key* is not in the map or cannot be returned as the requested value then an exception of type *NoSuchElementException* is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.10 `virtual std::string activemq::util::PrimitiveMap::getString (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.619.3.11 `virtual void activemq::util::PrimitiveMap::setBool (const std::string & key, bool value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.12 `virtual void activemq::util::PrimitiveMap::setByte (const std::string & key, unsigned char value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.13 `virtual void activemq::util::PrimitiveMap::setByteArray (const std::string & key, const std::vector< unsigned char > & value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.14 `virtual void activemq::util::PrimitiveMap::setChar (const std::string & key, char value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.15 `virtual void activemq::util::PrimitiveMap::setDouble (const std::string & key, double value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.16 `virtual void activemq::util::PrimitiveMap::setFloat (const std::string & key, float value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.17 `virtual void activemq::util::PrimitiveMap::setInt (const std::string & key, int value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.18 `virtual void activemq::util::PrimitiveMap::setLong (const std::string & key, long long value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.19 `virtual void activemq::util::PrimitiveMap::setShort (const std::string & key, short value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.20 `virtual void activemq::util::PrimitiveMap::setString (const std::string & key, const std::string & value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.619.3.21 `std::string activemq::util::PrimitiveMap::toString ()` const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns

formatted String of all elements in the map.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveMap.h`

6.620 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller Class Reference

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

```
#include <src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h>
```

Public Member Functions

- **PrimitiveTypesMarshaller** ()
- virtual **~PrimitiveTypesMarshaller** ()

Static Public Member Functions

- static void **marshal** (const **util::PrimitiveMap** *map, std::vector< unsigned char > &buffer) throw (decaf::lang::Exception)
Marshal a primitive map object to the given byte buffer.
- static void **unmarshal** (**util::PrimitiveMap** *map, const std::vector< unsigned char > &buffer) throw (decaf::lang::Exception)
Unmarshal a PrimitiveMap from the provided Byte buffer.
- static void **marshal** (const **util::PrimitiveList** *list, std::vector< unsigned char > &buffer) throw (decaf::lang::Exception)
Marshal a primitive list object to the given byte buffer.
- static void **unmarshal** (**util::PrimitiveList** *list, const std::vector< unsigned char > &buffer) throw (decaf::lang::Exception)
Unmarshal a PrimitiveList from the provided byte buffer.
- static void **marshalMap** (const **util::PrimitiveMap** *map, **decaf::io::DataOutputStream** &dataOut) throw (decaf::lang::Exception)
Marshal a primitive map object to the given DataOutputStream.
- static **util::PrimitiveMap** * **unmarshalMap** (**decaf::io::DataInputStream** &dataIn) throw (decaf::lang::Exception)
Unmarshal a PrimitiveMap from the provided DataInputStream.
- static void **marshalList** (const **util::PrimitiveList** *list, **decaf::io::DataOutputStream** &dataOut) throw (decaf::lang::Exception)
Marshal a PrimitiveList to the given DataOutputStream.
- static **util::PrimitiveList** * **unmarshalList** (**decaf::io::DataInputStream** &dataIn) throw (decaf::lang::Exception)
Unmarshal a PrimitiveList from the given DataInputStream.

Static Protected Member Functions

- static void **marshalPrimitiveMap** (decaf::io::DataOutputStream &dataOut, const decaf::util::Map< std::string, util::PrimitiveValueNode > &map) throw (decaf::io::IOException)

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **marshalPrimitiveList** (decaf::io::DataOutputStream &dataOut, const decaf::util::List< util::PrimitiveValueNode > &list) throw (decaf::io::IOException)

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

- static void **marshalPrimitive** (decaf::io::DataOutputStream &dataOut, const util::PrimitiveValueNode &value) throw (decaf::io::IOException)

Used to Marshal the Primitive types out on the Wire.

- static void **unmarshalPrimitiveMap** (decaf::io::DataInputStream &dataIn, util::PrimitiveMap &map) throw (decaf::io::IOException)

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **unmarshalPrimitiveList** (decaf::io::DataInputStream &dataIn, decaf::util::StlList< util::PrimitiveValueNode > &list) throw (decaf::io::IOException)

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

- static util::PrimitiveValueNode **unmarshalPrimitive** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

6.620.1 Detailed Description

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

6.620.2 Constructor & Destructor Documentation

6.620.2.1 `activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::PrimitiveTypesMarshaller()` [inline]

6.620.2.2 `virtual activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~~PrimitiveTypesMarshaller()` [inline, virtual]

6.620.3 Member Function Documentation

6.620.3.1 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveMap * map, std::vector< unsigned char > & buffer) throw (decaf::lang::Exception)` [static]

Marshal a primitive map object to the given byte buffer.

Parameters

map Map to Marshal.

buffer The byte buffer to write the marshaled data to.

Exceptions

Exception if an error occurs during the marshaling process.

6.620.3.2 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveList * list, std::vector< unsigned char > & buffer) throw (decaf::lang::Exception)` [static]

Marshal a primitive list object to the given byte buffer.

Parameters

map The PrimitiveList to Marshal.

buffer The byte buffer to write the marshaled data to.

Exceptions

Exception if an error occurs during the marshaling process.

6.620.3.3 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalList (const util::PrimitiveList * list, decaf::io::DataOutputStream & dataOut) throw (decaf::lang::Exception)` [static]

Marshal a PrimitiveList to the given DataOutputStream.

Parameters

list The list object to Marshal

dataOut Reference to a DataOutputStream to write the marshaled data to.

Exceptions

Exception if an error occurs during the marshaling process.

6.620.3.4 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalMap (const util::PrimitiveMap * *map*, decaf::io::DataOutputStream & *dataOut*) throw (decaf::lang::Exception) [static]

Marshal a primitive map object to the given DataOutputStream.

Parameters

map Map to Marshal.

dataOut Reference to a DataOutputStream to write the marshaled data to.

Exceptions

Exception if an error occurs during the marshaling process.

6.620.3.5 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive (decaf::io::DataOutputStream & *dataOut*, const util::PrimitiveValueNode & *value*) throw (decaf::io::IOException) [static, protected]

Used to Marshal the Primitive types out on the Wire.

Parameters

dataOut - the DataOutputStream to write to

value - the ValueNode to write.

Exceptions

IOException

6.620.3.6 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveList (decaf::io::DataOutputStream & *dataOut*, const decaf::util::List< util::PrimitiveValueNode > & *list*) throw (decaf::io::IOException) [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

dataOut - the DataOutputStream to write to

list - the ValueNode to write.

Exceptions

IOException

```
6.620.3.7 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveMap
( decaf::io::DataOutputStream & dataOut, const decaf::util::Map<
std::string, util::PrimitiveValueNode > & map ) throw (
decaf::io::IOException ) [static, protected]
```

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

dataOut - the DataOutputStream to write to

map - the ValueNode to write.

Exceptions

IOException

```
6.620.3.8 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal
( util::PrimitiveList * list, const std::vector< unsigned char > & buffer
) throw ( decaf::lang::Exception ) [static]
```

Unmarshal a PrimitiveList from the provided byte buffer.

Parameters

map The List to populate with values from the marshaled data.

buffer The byte buffer containing the marshaled Map.

Exceptions

Exception if an error occurs during the unmarshal process.

```
6.620.3.9 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal
( util::PrimitiveMap * map, const std::vector< unsigned char > &
buffer ) throw ( decaf::lang::Exception ) [static]
```

Unmarshal a PrimitiveMap from the provided Byte buffer.

Parameters

map The Map to populate with values from the marshaled data.

buffer The byte buffer containing the marshaled Map.

Exceptions

Exception if an error occurs during the unmarshal process.

6.620.3.10 static util::PrimitiveList* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalList (decaf::io::DataInputStream & *dataIn*) throw (decaf::lang::Exception) [static]

Unmarshal a PrimitiveList from the given DataInputStream.

Parameters

dataIn The DataInputStream instance to read the marshaled PrimitiveList from.

Returns

a pointer to a newly allocated PrimitiveList instnace.

Exceptions

Exception if an error occurs during the unmarshal process.

6.620.3.11 static util::PrimitiveMap* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalMap (decaf::io::DataInputStream & *dataIn*) throw (decaf::lang::Exception) [static]

Unmarshal a PrimitiveMap from the provided DataInputStream.

Parameters

dataIn The DataInputStream instance to read the marshaled PrimitiveMap from.

Returns

a pointer to a newly allocated PrimitiveMap instnace.

Exceptions

Exception if an error occurs during the unmarshal process.

6.620.3.12 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException) [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters

dataIn - DataInputStream to read from.

Returns

a PrimitiveValueNode containing the data.

Exceptions

IOException

6.620.3.13 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveList (decaf::io::DataInputStream & *dataIn*, decaf::util::StlList< util::PrimitiveValueNode > & *list*) throw (decaf::io::IOException) [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

dataIn - DataInputStream to read from.

list - the ValueNode to write.

Exceptions

IOException

6.620.3.14 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveMap (decaf::io::DataInputStream & *dataIn*, util::PrimitiveMap & *map*) throw (decaf::io::IOException) [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

dataIn - DataInputStream to read from.

map - the map to fill with data.

Exceptions

IOException

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h

6.621 activemq::util::PrimitiveValueNode::PrimitiveValue Union Reference

Define a union type comprised of the various types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

Data Fields

- bool **boolValue**
- unsigned char **byteValue**
- char **charValue**
- short **shortValue**
- int **intValue**
- long long **longValue**
- double **doubleValue**
- float **floatValue**
- std::string * **stringValue**

6.622 `activemq::util::PrimitiveValueConverter` Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2817) from one type to another.

```
#include <src/main/activemq/util/PrimitiveValueConverter.h>
```

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual **~PrimitiveValueConverter** ()
- `template<typename TO >`
`TO convert (const PrimitiveValueNode &value) const throw (decaf::lang::exceptions::UnsupportedOperationException)`

6.622.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2817) from one type to another. If the conversion is supported then calling the `convert` method will throw an `UnsupportedOperationException` to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

		boolean	byte	short	int	long	float	double	String	-----								
boolean		X X	byte		X X X X X	short		X X X X	int		X X X	long		X X	float		X X X	double
	X X	String		X X X X X X X X		-----

- union **PrimitiveValue**
Define a union type comprised of the various types.

Public Types

- enum **PrimitiveType** {
 NULL_TYPE = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3,
 SHORT_TYPE = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7,
 FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10,
 MAP_TYPE = 11,
 LIST_TYPE = 12, **BIG_STRING_TYPE** = 13 }
Enumeration for the various primitive types.

Public Member Functions

- **PrimitiveValueNode** ()
Default Constructor, creates a value of the NULL_TYPE.

- **PrimitiveValueNode** (bool value)
Boolean Value Constructor.
- **PrimitiveValueNode** (unsigned char value)
Byte Value Constructor.
- **PrimitiveValueNode** (char value)
Char Value Constructor.
- **PrimitiveValueNode** (short value)
Short Value Constructor.
- **PrimitiveValueNode** (int value)
Int Value Constructor.
- **PrimitiveValueNode** (long long value)
Long Value Constructor.
- **PrimitiveValueNode** (float value)
Float Value Constructor.
- **PrimitiveValueNode** (double value)
Double Value Constructor.
- **PrimitiveValueNode** (const char *value)
String Value Constructor.
- **PrimitiveValueNode** (const std::string &value)
String Value Constructor.
- **PrimitiveValueNode** (const std::vector< unsigned char > &value)
Byte Array Value Constructor.
- **PrimitiveValueNode** (const decaf::util::List< PrimitiveValueNode > &value)
Primitive List Constructor.
- **PrimitiveValueNode** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)
Primitive Map Value Constructor.
- **PrimitiveValueNode** (const PrimitiveValueNode &node)
Copy constructor.
- **~PrimitiveValueNode** ()
- **PrimitiveValueNode & operator=** (const PrimitiveValueNode &node)
Assignment operator, copies the data from the other node.
- bool **operator==** (const PrimitiveValueNode &node) const
Comparison Operator, compares this node to the other node.

- **PrimitiveType** **getType** () const
Gets the Value Type of this type wrapper.
- **PrimitiveValue** **getValue** () const
Gets the internal Primitive Value object from this wrapper.
- void **setValue** (const **PrimitiveValue** &value, **PrimitiveType** valueType)
Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.
- void **clear** ()
Clears the value from this wrapper converting it back to a blank NULL_ TYPE value.
- void **setBool** (bool value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- bool **getBool** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Boolean value of this Node.
- void **setByte** (unsigned char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- unsigned char **getByte** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Byte value of this Node.
- void **setChar** (char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- char **getChar** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Character value of this Node.
- void **setShort** (short value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- short **getShort** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Short value of this Node.
- void **setInt** (int value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- int **getInt** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Integer value of this Node.
- void **setLong** (long long value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- long long **getLong** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Long value of this Node.
- void **setFloat** (float value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- float **getFloat** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Float value of this Node.
- void **setDouble** (double value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- double **getDouble** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Double value of this Node.
- void **setString** (const std::string &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::string **getString** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the String value of this Node.
- void **setByteArray** (const std::vector< unsigned char > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::vector< unsigned char > **getByteArray** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Byte Array value of this Node.
- void **setList** (const decaf::util::List< PrimitiveValueNode > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- const decaf::util::List< PrimitiveValueNode > & **getList** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Primitive List value of this Node.
- void **setMap** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- const decaf::util::Map< std::string, PrimitiveValueNode > & **getMap** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Primitive Map value of this Node.

- `std::string toString () const`
Creates a string representation of this value.

6.623.1 Detailed Description

Class that wraps around a single value of one of the many types. Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.623.2 Member Enumeration Documentation

6.623.2.1 `enum activemq::util::PrimitiveValueNode::PrimitiveType`

Enumeration for the various primitive types.

Enumerator:

NULL_TYPE
BOOLEAN_TYPE
BYTE_TYPE
CHAR_TYPE
SHORT_TYPE
INTEGER_TYPE
LONG_TYPE
DOUBLE_TYPE
FLOAT_TYPE
STRING_TYPE
BYTE_ARRAY_TYPE
MAP_TYPE
LIST_TYPE
BIG_STRING_TYPE

6.623.3 Constructor & Destructor Documentation

6.623.3.1 `activemq::util::PrimitiveValueNode::PrimitiveValueNode ()`

Default Constructor, creates a value of the `NULL_TYPE`.

6.623.3.2 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool value)`

Boolean Value Constructor.

Parameters

value - the new value to store.

6.623.3.3 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char value)`

Byte Value Constructor.

Parameters

value - the new value to store.

6.623.3.4 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (char value)`

Char Value Constructor.

Parameters

value - the new value to store.

6.623.3.5 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (short value)`

Short Value Constructor.

Parameters

value - the new value to store.

6.623.3.6 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (int value)`

Int Value Constructor.

Parameters

value - the new value to store.

6.623.3.7 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long value)`

Long Value Constructor.

Parameters

value - the new value to store.

6.623.3.8 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (float value)`

Float Value Constructor.

Parameters

value - the new value to store.

6.623.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)

Double Value Constructor.

Parameters

value - the new value to store.

6.623.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)

String Value Constructor.

Parameters

value - the new value to store.

6.623.3.11 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & *value*)

String Value Constructor.

Parameters

value - the new value to store.

6.623.3.12 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::vector< unsigned char > & *value*)

Byte Array Value Constructor.

Parameters

value - the new value to store.

6.623.3.13 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::List< PrimitiveValueNode > & *value*)

Primitive List Constructor.

Parameters

value - the new value to store.

6.623.3.14 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Primitive Map Value Constructor.

Parameters

value - the new value to store.

6.623.3.15 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const PrimitiveValueNode & node)`

Copy constructor.

Parameters

node The instance of another node to copy to this one.

6.623.3.16 `activemq::util::PrimitiveValueNode::~~PrimitiveValueNode ()`
[inline]

6.623.4 Member Function Documentation

6.623.4.1 `void activemq::util::PrimitiveValueNode::clear ()`

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.623.4.2 `bool activemq::util::PrimitiveValueNode::getBool () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Boolean value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.3 `unsigned char activemq::util::PrimitiveValueNode::getBytes () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Byte value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.4 `std::vector<unsigned char> activemq::util::PrimitiveValueNode::getBytesArray () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Byte Array value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.5 `char activemq::util::PrimitiveValueNode::getChar () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Character value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.6 `double activemq::util::PrimitiveValueNode::getDouble () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Double value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.7 `float activemq::util::PrimitiveValueNode::getFloat () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Float value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.8 `int activemq::util::PrimitiveValueNode::getInt () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Integer value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

```
6.623.4.9  const decaf::util::List<PrimitiveValueNode>&
            activemq::util::PrimitiveValueNode::getList (    ) const throw (
            decaf::lang::exceptions::NoSuchElementException )
```

Gets the Primitive List value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

```
6.623.4.10 long long activemq::util::PrimitiveValueNode::getLong (    ) const throw
            ( decaf::lang::exceptions::NoSuchElementException )
```

Gets the Long value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

```
6.623.4.11 const decaf::util::Map<std::string, PrimitiveValueNode>&
            activemq::util::PrimitiveValueNode::getMap (    ) const throw (
            decaf::lang::exceptions::NoSuchElementException )
```

Gets the Primitive Map value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.12 `short activemq::util::PrimitiveValueNode::getShort () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Short value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.13 `std::string activemq::util::PrimitiveValueNode::getString () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the String value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.623.4.14 `PrimitiveType activemq::util::PrimitiveValueNode::getType () const [inline]`

Gets the Value Type of this type wrapper.

Returns

the PrimitiveType value for this wrapper.

6.623.4.15 `PrimitiveValue activemq::util::PrimitiveValueNode::getValue () const [inline]`

Gets the internal Primitive Value object from this wrapper.

Returns

a copy of the contained **PrimitiveValue** (p. 2814)

6.623.4.16 `PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator= (const PrimitiveValueNode & node)`

Assignment operator, copies the data from the other node.

Parameters

node The instance of another node to copy to this one.

6.623.4.17 `bool activemq::util::PrimitiveValueNode::operator==(const PrimitiveValueNode & node) const`

Comparison Operator, compares this node to the other node.

Returns

true if the values are the same false otherwise.

6.623.4.18 `void activemq::util::PrimitiveValueNode::setBool (bool value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.19 `void activemq::util::PrimitiveValueNode::setByte (unsigned char value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.20 `void activemq::util::PrimitiveValueNode::setByteArray (const std::vector< unsigned char > & value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.21 `void activemq::util::PrimitiveValueNode::setChar (char value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.22 void activemq::util::PrimitiveValueNode::setDouble (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.23 void activemq::util::PrimitiveValueNode::setFloat (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.24 void activemq::util::PrimitiveValueNode::setInt (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.25 void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.26 void activemq::util::PrimitiveValueNode::setLong (long long *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.27 `void activemq::util::PrimitiveValueNode::setMap (const
decaf::util::Map< std::string, PrimitiveValueNode > & value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.28 `void activemq::util::PrimitiveValueNode::setShort (short value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.29 `void activemq::util::PrimitiveValueNode::setString (const std::string &
value)`

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.623.4.30 `void activemq::util::PrimitiveValueNode::setValue (const
PrimitiveValue & value, PrimitiveType valueType)`

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters

value The value to set as the value contained in this Node.

valueType The type of the value being set into this one.

6.623.4.31 `std::string activemq::util::PrimitiveValueNode::toString () const`

Creates a string representation of this value.

Returns

string value of this type wrapper.

The documentation for this class was generated from the following file:

#include <src/main/decaf/security/Principal.h>
```

Inheritance diagram for decaf::security::Principal:

Public Member Functions

- virtual **~Principal** ()
- virtual bool **equals** (const **Principal** &another) const =0
Compares two principals to see if they are the same.
- virtual std::string **getName** () const =0
Provides the name of this principal.

6.624.1 Detailed Description

Base interface for a principal, which can represent an individual or organization.

6.624.2 Constructor & Destructor Documentation

6.624.2.1 virtual decaf::security::Principal::~~Principal () [inline, virtual]

6.624.3 Member Function Documentation

6.624.3.1 virtual bool decaf::security::Principal::equals (const **Principal** &
another) const [pure virtual]

Compares two principals to see if they are the same.

Parameters

another A principal to be tested for equality to this one.

Returns

true if the given principal is equivalent to this one.

6.624.3.2 virtual std::string decaf::security::Principal::getName () const [pure virtual]

Provides the name of this principal.

Returns

the name of this principal.

Implemented in **decaf::security::auth::x500::X500Principal** (p. 3762).

6.625.1 Detailed Description

template<typename E> class decaf::util::PriorityQueue< E >

An unbounded priority queue based on a binary heap algorithm. The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 1127) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an internal capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 1097) and **Iterator** (p. 2012) interfaces. The **Iterator** (p. 2012) provided in method **iterator()** (p. 2836) is not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort(pq.toArray())`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 2832) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe `PriorityBlockingQueue` class.

Implementation note: this implementation provides $O(\log(n))$ time for the enqueueing and dequeuing methods (`offer`, `poll`, **`remove()`** (p. 2838) and `add`); linear time for the `remove(Object)` and `contains(Object)` methods; and constant time for the retrieval methods (`peek`, `element`, and `size`).

Since

1.0

6.625.2 Constructor & Destructor Documentation

6.625.2.1 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue () [inline]`

Creates a **Priority Queue** (p. 2948) with the default initial capacity.

6.625.2.2 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (std::size_t initialCapacity) [inline]`

Creates a **Priority Queue** (p. 2948) with the capacity value supplied.

Parameters

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2832).

6.625.2.3 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (std::size_t initialCapacity, Comparator< E > * comparator) [inline]`

Creates a **Priority Queue** (p. 2948) with the default initial capacity.

This new **PriorityQueue** (p. 2832) takes ownership of the passed **Comparator** (p. 1127) instance and uses that to determine the ordering of the elements in the **Queue** (p. 2948).

Parameters

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2832).

comparator The **Comparator** (p. 1127) instance to use in sorting the elements in the **Queue** (p. 2948).

Exceptions

NullPointerException if the passed **Comparator** (p. 1127) is NULL.

6.625.2.4 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const Collection< E > & source) [inline]`

Creates a **PriorityQueue** (p. 2832) containing the elements in the specified **Collection** (p. 1097).

Parameters

source the **Collection** (p. 1097) whose elements are to be placed into this priority queue

6.625.2.5 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const PriorityQueue< E > & source) [inline]`

Creates a **PriorityQueue** (p. 2832) containing the elements in the specified priority queue.

This priority queue will be ordered according to the same ordering as the given priority queue.

Parameters

source the priority queue whose elements are to be placed into this priority queue

6.625.2.6 `template<typename E> virtual decaf::util::PriorityQueue< E >::~PriorityQueue () [inline, virtual]`

6.625.3 Member Function Documentation

6.625.3.1 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]`

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an **IllegalStateException** if no space is currently available.

This implementation returns true if offer succeeds, else throws an **IllegalStateException**.

Parameters

value - the element to offer to the **Queue** (p. 2948).

Returns

true if the add succeeds.

Exceptions

IllegalArgumentException if the element cannot be added.

Reimplemented from **decaf::util::AbstractQueue**< **E** > (p. 159).

References **DECAF_CATCH_EXCEPTION_CONVERT**, **DECAF_CATCH_RETHROW**, **DECAF_CATCHALL_THROW**, and **decaf::util::PriorityQueue**< **E** >::offer().

6.625.3.2 `template<typename E> virtual void decaf::util::PriorityQueue< E >::clear () throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes all elements of the queue.

This implementation repeatedly invokes poll until it returns the empty marker.

Reimplemented from **decaf::util::AbstractQueue**< **E** > (p. 160).

6.625.3.3 `template<typename E> decaf::lang::Pointer< Comparator<E> > decaf::util::PriorityQueue< E >::comparator () const [inline]`

obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 2832) is using to compare the elements in the queue with.

The returned value is a copy, the caller cannot change the value if the internal Pointer value.

Returns

a copy of the **Comparator** (p. 1127) Pointer being used by this **Queue** (p. 2948).

6.625.3.4 `template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () const [inline, virtual]`

6.625.3.5 `template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () [inline, virtual]`

References **decaf::util::PriorityQueue**< **E** >::PriorityQueueIterator.

6.625.3.6 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (const E & value) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) [inline, virtual]`

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the **collection.add(E)**, since the latter might throw an exception if the operation fails.

Parameters

value the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException if the **Queue** (p. 2948) implementation does not allow Null values to be inserted into the **Queue** (p. 2948).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2949).

Referenced by **decaf::util::PriorityQueue< E >::add()**.

6.625.3.7 `template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const PriorityQueue< E > & source) [inline]`

Assignment operator, assign another **PriorityQueue** (p. 2832) to this one.

Parameters

source The **PriorityQueue** (p. 2832) to copy to this one.

6.625.3.8 `template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const Collection< E > & source) [inline]`

Assignment operator, assign another **Collection** (p. 1097) to this one.

Parameters

source The **Collection** (p. 1097) to copy to this one.

6.625.3.9 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::peek (E & result) const [inline, virtual]`

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2950).

6.625.3.10 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::poll (E & result) [inline, virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 2948) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2950).

6.625.3.11 `template<typename E> virtual E decaf::util::PriorityQueue< E
>::remove () throw (decaf::lang::exceptions::NoSuchElementException
) [inline, virtual]`

Retrieves and removes the head of this queue.

This method differs from poll only in that it throws an exception if this queue is empty.

This implementation returns the result of poll unless the queue is empty.

Returns

a copy of the element in the head of the queue.

Exceptions

NoSuchElementException if the queue is empty.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 161).

6.625.3.12 `template<typename E> virtual bool decaf::util::PriorityQueue<
E >::remove (const E & value) throw (
lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1097).

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 151).

6.625.3.13 `template<typename E> virtual std::size_t decaf::util::PriorityQueue<E>::size () const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection**< **E** > (p. 1106).

6.625.4 Friends And Related Function Documentation

6.625.4.1 `template<typename E> friend class PriorityQueueIterator [friend]`

Referenced by `decaf::util::PriorityQueue< E >::iterator()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/PriorityQueue.h`

6.626 activemq::commands::ProducerAck Class Reference

```
#include <src/main/activemq/commands/ProducerAck.h>
```

Inheritance diagram for `activemq::commands::ProducerAck`:

Public Member Functions

- **ProducerAck** ()
- virtual **~ProducerAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ProducerAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1553) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &producerId)
- virtual int **getSize** () const
- virtual void **setSize** (int size)
- virtual bool **isProducerAck** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_PRODUCERACK** = 19

Protected Attributes

- **Pointer**< **ProducerId** > producerId
- int size

6.626.1 Constructor & Destructor Documentation

6.626.1.1 activemq::commands::ProducerAck::ProducerAck ()

6.626.1.2 virtual activemq::commands::ProducerAck::~~ProducerAck ()
[virtual]

6.626.2 Member Function Documentation

6.626.2.1 virtual **ProducerAck*** **activemq::commands::ProducerAck::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1554).

6.626.2.2 `virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.626.2.3 `virtual bool activemq::commands::ProducerAck::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.626.2.4 `virtual unsigned char activemq::commands::ProducerAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new `DataStructure` (p. 1553) type copy.

Implements `activemq::commands::DataStructure` (p. 1557).

6.626.2.5 `virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () const [virtual]`

6.626.2.6 `virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () [virtual]`

6.626.2.7 `virtual int activemq::commands::ProducerAck::getSize () const [virtual]`

6.626.2.8 `virtual bool activemq::commands::ProducerAck::isProducerAck () const [inline, virtual]`

Returns

an answer of true to the `isProducerAck()` (p. 2841) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 699).

6.626.2.9 `virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & producerId) [virtual]`

6.626.2.10 `virtual void activemq::commands::ProducerAck::setSize (int size) [virtual]`

6.626.2.11 `virtual std::string activemq::commands::ProducerAck::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p.700).

6.626.2.12 `virtual Pointer<Command> activemq::commands::ProducerAck::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p.3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.1112).

6.626.3 Field Documentation

6.626.3.1 `const unsigned char activemq::commands::ProducerAck::ID_-PRODUCERACK = 19 [static]`

6.626.3.2 `Pointer<ProducerId> activemq::commands::ProducerAck::producerId [protected]`

6.626.3.3 `int activemq::commands::ProducerAck::size [protected]`

The documentation for this class was generated from the following file:

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller:

Public Member Functions

- **ProducerAckMarshaller** ()
- virtual **~ProducerAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.627.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2842). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.627.2 Constructor & Destructor Documentation

6.627.2.1 `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.627.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.627.3 Member Function Documentation

6.627.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.627.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.627.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.627.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 737).

6.627.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 738).

6.627.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 739).

```
6.627.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

The documentation for this class was generated from the following file:

6.628.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2846). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.628.2 Constructor & Destructor Documentation

6.628.2.1 `activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.628.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.628.3 Member Function Documentation

6.628.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.628.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.628.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.628.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 710).

6.628.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 711).

6.628.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.628.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 713).

Write a object instance to data output stream.

6.629.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2850). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.629.2 Constructor & Destructor Documentation

6.629.2.1 `activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.629.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.629.3 Member Function Documentation

6.629.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.629.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.629.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

6.629.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 703).

6.629.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 704).

6.629.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 706).

```
6.629.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 707).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ProducerAckMarshaller.h`

6.630 `activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller` Class Reference

Marshaling code for Open Wire Format for `ProducerAckMarshaller` (p. 2854).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/ProducerAckMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller`:

Public Member Functions

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.630.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2854). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.630.2 Constructor & Destructor Documentation

6.630.2.1 `activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.630.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.630.3 Member Function Documentation

6.630.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.630.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.630.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 722).

6.630.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 723).

6.630.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 724).

6.630.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 726).

```
6.630.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 727).

The documentation for this class was generated from the following file:

6.631.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2858). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.631.2 Constructor & Destructor Documentation

6.631.2.1 `activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.631.2.2 `virtual activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.631.3 Member Function Documentation

6.631.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.631.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.631.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.631.3.4 virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 730).

6.631.3.5 virtual int activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 731).

6.631.3.6 virtual void activemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 732).

```
6.631.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 733).

6.632.3 Member Function Documentation

6.632.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.632.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.632.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

6.632.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 717).

6.632.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 718).

6.632.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

```
6.632.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 720).

The documentation for this class was generated from the following file:

tivemq::commands::ProducerId::cloneDataStructure ()
const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.635.3.2 `virtual int activemq::commands::ProducerId::compareTo (const
ProducerId & value) const [virtual]`

6.635.3.3 `virtual void activemq::commands::ProducerId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.635.3.4 `virtual bool activemq::commands::ProducerId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.635.3.5 virtual bool activemq::commands::ProducerId::equals (const ProducerId
& *value*) const [virtual]

6.635.3.6 virtual const std::string& ac-
tivismq::commands::ProducerId::getConnectionId ()
const [virtual]

6.635.3.7 virtual std::string& activemq::commands::ProducerId::getConnectionId () [virtual]

6.635.3.8 virtual unsigned char ac-
tivismq::commands::ProducerId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

- 6.635.3.9 `const Pointer<SessionId>& activemq::commands::ProducerId::getParentId () const`
- 6.635.3.10 `virtual long long activemq::commands::ProducerId::getSessionId () const [virtual]`
- 6.635.3.11 `virtual long long activemq::commands::ProducerId::getValue () const [virtual]`
- 6.635.3.12 `virtual bool activemq::commands::ProducerId::operator< (const ProducerId & value) const [virtual]`
- 6.635.3.13 `ProducerId& activemq::commands::ProducerId::operator= (const ProducerId & other)`
- 6.635.3.14 `virtual bool activemq::commands::ProducerId::operator== (const ProducerId & value) const [virtual]`
- 6.635.3.15 `virtual void activemq::commands::ProducerId::setConnectionId (const std::string & connectionId) [virtual]`
- 6.635.3.16 `void activemq::commands::ProducerId::setProducerSessionKey (std::string sessionKey)`
- 6.635.3.17 `virtual void activemq::commands::ProducerId::setSessionId (long long sessionId) [virtual]`
- 6.635.3.18 `virtual void activemq::commands::ProducerId::setValue (long long value) [virtual]`
- 6.635.3.19 `virtual std::string activemq::commands::ProducerId::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.635.4 Field Documentation

- 6.635.4.1 `std::string activemq::commands::ProducerId::connectionId [protected]`
- 6.635.4.2 `const unsigned char activemq::commands::ProducerId::ID_ - PRODUCERID = 123 [static]`

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.635.4.3 `long long activemq::commands::ProducerId::sessionId` [protected]

6.635.4.4 `long long activemq::commands::ProducerId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ProducerId.h`

6.636 `activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller` Class Reference

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2874).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ProducerIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller`:

Public Member Functions

- **ProducerIdMarshaller** ()
- virtual **~ProducerIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.636.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2874). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.636.2 Constructor & Destructor Documentation

6.636.2.1 activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::ProducerIdMarshaller () [inline]

6.636.2.2 virtual activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::~~ProducerIdMarshaller () [inline, virtual]

6.636.3 Member Function Documentation

6.636.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.636.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.636.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.636.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.636.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1532).

6.636.3.6 virtual void **activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.636.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.637.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2878). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.637.2 Constructor & Destructor Documentation

6.637.2.1 `activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::ProducerIdMarshaller()` [inline]

6.637.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::~~ProducerIdMarshaller()` [inline, virtual]

6.637.3 Member Function Documentation

6.637.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.637.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.637.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

```
6.637.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

```
6.637.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshall
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.637.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

6.637.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.638.3 Member Function Documentation

6.638.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.638.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.638.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.638.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.638.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.638.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.638.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

6.639.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2885). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.639.2 Constructor & Destructor Documentation

6.639.2.1 `activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::ProducerIdMarshaller()` [inline]

6.639.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::~~ProducerIdMarshaller()` [inline, virtual]

6.639.3 Member Function Documentation

6.639.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.639.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.639.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.639.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.639.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.639.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.639.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/ProducerIdMarshaller.h

Write a object instance to data output stream.

6.640.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2889). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.640.2 Constructor & Destructor Documentation

6.640.2.1 `activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::ProducerIdMarshaller()` [inline]

6.640.2.2 `virtual activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::~~ProducerIdMarshaller()` [inline, virtual]

6.640.3 Member Function Documentation

6.640.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.640.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.640.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.640.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.640.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.640.3.6 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.640.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

The documentation for this class was generated from the following file:

6.641.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2893). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.641.2 Constructor & Destructor Documentation

6.641.2.1 `activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::ProducerIdMarshaller()` [inline]

6.641.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::~~ProducerIdMarshaller()` [inline, virtual]

6.641.3 Member Function Documentation

6.641.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1505).

6.641.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.641.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1518).

6.641.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1525).

6.641.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1532).

6.641.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1539).

```
6.641.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1546).

- virtual void **setWindowSize** (int **windowSize**)
- virtual bool **isProducerInfo** () const
- virtual **Pointer< Command > visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_PRODUCERINFO** = 6

Protected Attributes

- **Pointer< ProducerId > producerId**
- **Pointer< ActiveMQDestination > destination**
- std::vector< **decaf::lang::Pointer< BrokerId > > brokerPath**
- bool **dispatchAsync**
- int **windowSize**

6.642.1 Constructor & Destructor Documentation

6.642.1.1 `activemq::commands::ProducerInfo::ProducerInfo ()`

6.642.1.2 `virtual activemq::commands::ProducerInfo::~~ProducerInfo ()`
[virtual]

6.642.2 Member Function Documentation

6.642.2.1 `virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1554).

6.642.2.2 `virtual void activemq::commands::ProducerInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

6.642.2.3 `Pointer<RemoveInfo> activemq::commands::ProducerInfo::createRemoveCommand () const`

6.642.2.4 `virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1553) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 696).

- 6.642.2.5 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () const [virtual]`
- 6.642.2.6 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () [virtual]`
- 6.642.2.7 `virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1553) type copy.

Implements **activemq::commands::DataStructure** (p. 1557).

- 6.642.2.8 `virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () const [virtual]`
- 6.642.2.9 `virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () [virtual]`
- 6.642.2.10 `virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () [virtual]`
- 6.642.2.11 `virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () const [virtual]`
- 6.642.2.12 `virtual int activemq::commands::ProducerInfo::getWindowSize () const [virtual]`
- 6.642.2.13 `virtual bool activemq::commands::ProducerInfo::isDispatchAsync () const [virtual]`
- 6.642.2.14 `virtual bool activemq::commands::ProducerInfo::isProducerInfo () const [inline, virtual]`

Returns

an answer of true to the **isProducerInfo()** (p. 2900) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 699).

- 6.642.2.15 `virtual void activemq::commands::ProducerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath) [virtual]`
- 6.642.2.16 `virtual void activemq::commands::ProducerInfo::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.642.2.17 `virtual void activemq::commands::ProducerInfo::setDispatchAsync (bool dispatchAsync) [virtual]`
- 6.642.2.18 `virtual void activemq::commands::ProducerInfo::setProducerId (const Pointer< ProducerId > & producerId) [virtual]`
- 6.642.2.19 `virtual void activemq::commands::ProducerInfo::setWindowSize (int windowSize) [virtual]`
- 6.642.2.20 `virtual std::string activemq::commands::ProducerInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p.1553) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 700).

- 6.642.2.21 `virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 3076) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.1112).

6.642.3 Field Documentation

6.643.2 Constructor & Destructor Documentation

6.643.2.1 `activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::ProducerInfoMarshaller ()` [inline]

6.643.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::~~ProducerInfoMarshaller ()` [inline, virtual]

6.643.3 Member Function Documentation

6.643.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::createObject () const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.643.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::getDataStructureType () const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1511).

6.643.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 709).

6.643.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 710).

6.643.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 711).

```
6.643.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 712).

```
6.643.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 713).

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2906).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ProducerInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller`:

Public Member Functions

- **ProducerInfoMarshaller** ()
- virtual **~ProducerInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshall an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.644.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2906). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.644.2 Constructor & Destructor Documentation

6.644.2.1 activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::ProducerInfoMarshaller () [inline]

6.644.2.2 virtual activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::~~ProducerInfoMarshaller () [inline, virtual]

6.644.3 Member Function Documentation

6.644.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.644.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.644.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 736).

6.644.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 737).

6.644.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 738).

```
6.644.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 739).

```
6.644.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 740).

The documentation for this class was generated from the following file:

6.645.2.2 virtual
activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::~~ProducerInfoMarshaller () [inline, virtual]

6.645.3 Member Function Documentation

6.645.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.645.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

```

6.645.3.3 virtual void ac-
tivismq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 716).

```

6.645.3.4 virtual void ac-
tivismq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 717).

```

6.645.3.5 virtual int ac-
tivismq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 718).

```
6.645.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 719).

```
6.645.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 720).

6.647.3 Member Function Documentation

6.647.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.647.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

```

6.647.3.3 virtual void ac-
tivismq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 702).

```

6.647.3.4 virtual void ac-
tivismq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 703).

```

6.647.3.5 virtual int ac-
tivismq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 704).

```
6.647.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 706).

```
6.647.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 707).

6.648.2.1 activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::ProducerInfoMarshaller () [inline]

6.648.2.2 virtual activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::~~ProducerInfoMarshaller () [inline, virtual]

6.648.3 Member Function Documentation

6.648.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1505).

6.648.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1511).

6.648.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 729).

6.648.3.4 `virtual void activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller` (p. 730).

6.648.3.5 `virtual int activemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 731).

```
6.648.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 732).

```
6.648.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v6::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v6::BaseCommandMarshaller** (p. 733).

6.650 decaf::util::Properties Class Reference

Java-like properties class for mapping string names to string values.

```
#include <src/main/decaf/util/Properties.h>
```

Public Member Functions

- **Properties** ()
- **Properties** (const **Properties** &src)
- virtual ~**Properties** ()
- **Properties** & **operator=** (const **Properties** &src)
Assignment Operator.
- bool **isEmpty** () const
Returns true if the properties object is empty.
- std::size_t **size** () const
- const char * **getProperty** (const std::string &name) const
Looks up the value for the given property.
- std::string **getProperty** (const std::string &name, const std::string &defaultValue) const
Looks up the value for the given property.
- std::string **setProperty** (const std::string &name, const std::string &value)
Sets the value for a given property.
- bool **hasProperty** (const std::string &name) const
Check to see if the Property exists in the set.
- std::string **remove** (const std::string &name)
Removes the property with the given name.
- std::vector< std::string > **propertyNames** () const
Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.
- std::vector< std::pair< std::string, std::string > > **toArray** () const
Method that serializes the contents of the property map to an array.
- void **copy** (const **Properties** &source)
*Copies the contents of the given properties object to this one, if the given **Properties** (p. 2927) instance in NULL then this **List** (p. 2190) is not modified.*
- **Properties** * **clone** () const
Clones this object.
- void **clear** ()
Clears all properties from the map.

- **bool equals** (const **Properties** &source) const
*Test whether two **Properties** (p. 2927) objects are equivalent.*
- **std::string toString** () const
*Formats the contents of the **Properties** (p. 2927) Object into a string that can be logged, etc.*
- **void load** (decaf::io::InputStream *stream) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)
Reads a property list (key and element pairs) from the input byte stream.
- **void load** (decaf::io::Reader *reader) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)
Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.
- **void store** (decaf::io::OutputStream *out, const std::string &comment) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
*Writes this property list (key and element pairs) in this **Properties** (p. 2927) table to the output stream in a format suitable for loading into a **Properties** (p. 2927) table using the load(InputStream) method.*
- **void store** (decaf::io::Writer *writer, const std::string &comments) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
*Writes this property list (key and element pairs) in this **Properties** (p. 2927) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- **decaf::lang::Pointer< Properties > defaults**
Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.650.1 Detailed Description

Java-like properties class for mapping string names to string values. The **Properties** (p. 2927) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 2927) instance can contain an internal **Properties** (p. 2927) list that contains default values for keys not found in the **Properties** (p. 2927) **List** (p. 2190).

The **Properties** (p. 2927) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since

1.0

6.650.2 Constructor & Destructor Documentation

6.650.2.1 decaf::util::Properties::Properties ()

6.650.2.2 decaf::util::Properties::Properties (const Properties & *src*)

6.650.2.3 virtual decaf::util::Properties::~~Properties () [virtual]

6.650.3 Member Function Documentation

6.650.3.1 void decaf::util::Properties::clear ()

Clears all properties from the map.

6.650.3.2 Properties* decaf::util::Properties::clone () const

Clones this object.

Returns

a replica of this object.

6.650.3.3 void decaf::util::Properties::copy (const Properties & *source*)

Copies the contents of the given properties object to this one, if the given **Properties** (p. 2927) instance is NULL then this **List** (p. 2190) is not modified.

Parameters

source The source properties object.

6.650.3.4 bool decaf::util::Properties::equals (const Properties & *source*) const

Test whether two **Properties** (p. 2927) objects are equivalent.

Two **Properties** (p. 2927) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters

source The **Properties** (p. 2927) object to compare this instance to.

Returns

true if the contents of the two **Properties** (p. 2927) objects are the same.

6.650.3.5 `const char* decaf::util::Properties::getProperty (const std::string & name) const`

Looks up the value for the given property.

Parameters

name The name of the property to be looked up.

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

6.650.3.6 `std::string decaf::util::Properties::getProperty (const std::string & name, const std::string & defaultValue) const`

Looks up the value for the given property.

Parameters

name The name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

6.650.3.7 `bool decaf::util::Properties::hasProperty (const std::string & name) const`

Check to see if the Property exists in the set.

Parameters

name The property name to check for in this properties set.

Returns

true if property exists, false otherwise.

6.650.3.8 `bool decaf::util::Properties::isEmpty () const`

Returns true if the properties object is empty.

Returns

true if empty

6.650.3.9 void decaf::util::Properties::load (decaf::io::InputStream
* *stream*) throw (decaf::io::IOException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input byte stream.

The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters

stream The stream to read the properties data from.

Exceptions

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

6.650.3.10 void decaf::util::Properties::load (decaf::io::Reader
* *reader*) throw (decaf::io::IOException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

Properties (p. 2927) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character \. Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab (""), and form feed ("") to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no effect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of 2n contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

```
\:\=
```

would be the two-character key ":\=". Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=' or ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

```
Truth = Beauty Truth:Beauty Truth :Beauty
```

As another example, the following three lines specify a single property:

```
fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango
```

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

```
cheeses
```

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those used for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.
- The method does not treat a backslash character, \, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence "\z" would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence "\b" as equivalent to the single character 'b'.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters

reader The Reader that provides an character stream as input.

Exceptions

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

6.650.3.11 Properties& decaf::util::Properties::operator= (const Properties & src)

Assignment Operator.

Parameters

src The **Properties** (p. 2927) list to copy to this **List** (p. 2190).

Returns

a reference to this **List** (p. 2190) for use in chaining.

6.650.3.12 std::vector<std::string> decaf::util::Properties::propertyNames () const

Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

Returns

a set of keys in this property list where the key and its corresponding value are strings, including the keys in the default property list.

6.650.3.13 std::string decaf::util::Properties::remove (const std::string & name)

Removes the property with the given name.

Parameters

name The name of the property to remove.

Returns

the previous value of the property if set, or empty string.

6.650.3.14 std::string decaf::util::Properties::setProperty (const std::string & name, const std::string & value)

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

name The name of the value to be written.

value The value to be written.

Returns

the old value of the property or empty string if not set.

6.650.3.15 `std::size_t decaf::util::Properties::size () const`

Returns

The number of **Properties** (p. 2927) in this **Properties** (p. 2927) Object.

6.650.3.16 `void decaf::util::Properties::store (decaf::io::OutputStream * out,
const std::string & comment) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException)`

Writes this property list (key and element pairs) in this **Properties** (p.2927) table to the output stream in a format suitable for loading into a **Properties** (p.2927) table using the load(InputStream) method.

Properties (p. 2927) from the defaults table of this **Properties** (p. 2927) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in store(Writer), with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value xxxx.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value xxxx.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

out The OutputStream instance to write the properties to.

comment A description of these properties that is written to the output stream.

Exceptions

IOException if there is an error while writing from the stream.

NullPointerException if the passed stream is Null.

6.650.3.17 `void decaf::util::Properties::store (decaf::io::Writer * writer,
const std::string & comments) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException)`

Writes this property list (key and element pairs) in this **Properties** (p. 2927) table to the output character stream in a format that can be read by the load(Reader) method.

Properties (p. 2927) from the defaults table of this **Properties** (p. 2927) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII `#` character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed (`'`

`'`), a carriage return (`"`), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character `#` or character `!` then an ASCII `#` is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII `#` character, the current date and time (as if produced by the `toString` method of **Date** (p. 1559) for the current time), and a line separator as generated by the Writer.

Then every entry in this **Properties** (p. 2927) table is written out, one per line. For each entry the key string is written, then an ASCII `=`, then the associated element string. For the key, all space characters are written with a preceding `\` character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding `\` character. The key and element characters `#`, `!`, `=`, and `:` are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

writer The Writer instance to use to output the properties.

comments A description of these properties that is written before writing the properties.

Exceptions

IOException if there is an error while writing from the stream.

NullPointerException if the passed stream is Null.

6.650.3.18 `std::vector< std::pair< std::string, std::string > >
decaf::util::Properties::toArray () const`

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

6.650.3.19 `std::string decaf::util::Properties::toString () const`

Formats the contents of the **Properties** (p. 2927) Object into a string that can be logged, etc.

Returns

string value of this object.

6.650.4 Field Documentation

6.650.4.1 `decaf::lang::Pointer<Properties> decaf::util::Properties::defaults` [protected]

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Properties.h`

6.651 `decaf::util::logging::PropertiesChangeListener` Class Reference

Defines the interface that classes can use to listen for change events on **Properties** (p. 2927).

```
#include <src/main/decaf/util/logging/PropertiesChangeListener.h>
```

Public Member Functions

- virtual `~PropertiesChangeListener ()`
- virtual void `onPropertiesReset ()=0`

*Indicates that the **Properties** (p. 2927) have all been reset and should be considered to be back to their default values.*

- virtual void `onPropertyChanged (const std::string &name, const std::string &oldValue, const std::string &newValue)=0`

Change Event, called when a property is changed, includes the name of the property that was changed along with it old and new values.

6.651.1 Detailed Description

Defines the interface that classes can use to listen for change events on **Properties** (p. 2927).

- **ProtocolException** (const std::exception *cause) throw ()

Constructor.

- **ProtocolException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **ProtocolException** * clone () const

Clones this exception.

- virtual ~**ProtocolException** () throw ()

6.652.1 Constructor & Destructor Documentation

6.652.1.1 decaf::net::ProtocolException::ProtocolException () throw () [inline]

Default Constructor.

6.652.1.2 decaf::net::ProtocolException::ProtocolException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.652.1.3 decaf::net::ProtocolException::ProtocolException (const ProtocolException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.652.1.4 decaf::net::ProtocolException::ProtocolException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.652.1.5 `decaf::net::ProtocolException::ProtocolException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.652.1.6 `decaf::net::ProtocolException::ProtocolException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.652.1.7 `virtual decaf::net::ProtocolException::~~ProtocolException () throw () [inline, virtual]`

6.652.2 Member Function Documentation

6.652.2.1 `virtual ProtocolException* decaf::net::ProtocolException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 2005).

The documentation for this class was generated from the following file:

- virtual `~PublicKey ()`

6.653.1 Detailed Description

A public key. This interface contains no methods or constants. It merely serves to group (and provide type safety for) all public key interfaces.

6.653.2 Constructor & Destructor Documentation

6.653.2.1 virtual decaf::security::PublicKey::~~PublicKey () [inline, virtual]

The documentation for this class was generated from the following file:

- `src/main/decaf/security/PublicKey.h`

6.654 decaf::io::PushbackInputStream Class Reference

A **PushbackInputStream** (p. 2940) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

```
#include <src/main/decaf/io/PushbackInputStream.h>
```

Inheritance diagram for decaf::io::PushbackInputStream:

Public Member Functions

- **PushbackInputStream** (**InputStream** *stream, bool **own**=false)
*Creates a **PushbackInputStream** (p. 2940) and saves its argument, the input stream in, for later use.*
- **PushbackInputStream** (**InputStream** *stream, int bufSize, bool **own**=false) throw (decaf::lang::exceptions::IllegalArgumentException)
*Creates a **PushbackInputStream** (p. 2940) and saves its argument, the input stream in, for later use.*
- virtual `~PushbackInputStream ()`
- void **unread** (unsigned char value) throw (decaf::io::IOException)

Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

- void **unread** (const unsigned char *buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

- void **unread** (const unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

- virtual int **available** () const throw (decaf::io::IOException)

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

***IOException** (p. 2003) if an I/O error occurs.*

- virtual long long **skip** (long long num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Skips over and discards n bytes of data from this input stream.

*The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. The skip method of **InputStream** (p. 1909) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

***IOException** (p. 2003) if an I/O error occurs.*

***UnsupportedOperationException** if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

*Does nothing except throw an **IOException** (p. 2003).*

- virtual void **reset** () throw (decaf::io::IOException)

*Does nothing except throw an **IOException** (p. 2003).*

- virtual bool **markSupported** () const

*Does nothing except throw an **IOException** (p. 2003).*

Protected Member Functions

- virtual int **doReadByte** () throw (decaf::io::IOException)
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsExpection, decaf::lang::exceptions::NullPointerException)

6.654.1 Detailed Description

A **PushbackInputStream** (p. 2940) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte. This is useful in situations where it is convenient for a fragment of code to read an indefinite number of data bytes that are delimited by a particular byte value; after reading the terminating byte, the code fragment can "unread" it, so that the next read operation on the input stream will reread the byte that was pushed back. For example, bytes representing the characters constituting an identifier might be terminated by a byte representing an operator character; a method whose job is to read just an identifier can read until it sees the operator and then push the operator back to be re-read.

Since

1.0

6.654.2 Constructor & Destructor Documentation

6.654.2.1 decaf::io::PushbackInputStream::PushbackInputStream (**InputStream** * *stream*, **bool** *own* = *false*)

Creates a **PushbackInputStream** (p. 2940) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

Parameters

stream The **InputStream** (p. 1909) instance to wrap.

Boolean value indicating if this **FilterInputStream** (p. 1771) owns the wrapped stream.

6.654.2.2 decaf::io::PushbackInputStream::PushbackInputStream (**InputStream** * *stream*, **int** *bufSize*, **bool** *own* = *false*) throw (decaf::lang::exceptions::IllegalArgumentException)

Creates a **PushbackInputStream** (p. 2940) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

Parameters

stream The **InputStream** (p. 1909) instance to wrap.

bufSize The number of byte to allocate for pushback into this stream.

Boolean value indicating if this **FilterInputStream** (p.1771) owns the wrapped stream.

Exceptions

IllegalArgumentException if the *bufSize* argument is < zero.

6.654.2.3 virtual decaf::io::PushbackInputStream::~~PushbackInputStream ()
[virtual]

6.654.3 Member Function Documentation

6.654.3.1 virtual int decaf::io::PushbackInputStream::available () const throw (decaf::io::IOException) [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data available. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Returns the sum of the number of pushed back bytes if any and the amount of bytes available in the underlying stream via a call to *available*.

Reimplemented from **decaf::io::FilterInputStream** (p.1773).

6.654.3.2 virtual int decaf::io::PushbackInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p.1774).

6.654.3.3 virtual int decaf::io::PushbackInputStream::doReadByte () throw (decaf::io::IOException) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p.1774).

6.654.3.4 **virtual void decaf::io::PushbackInputStream::mark (int *readLimit*)** [virtual]

Does nothing except throw an **IOException** (p. 2003).

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::FilterInputStream** (p. 1775).

6.654.3.5 **virtual bool decaf::io::PushbackInputStream::markSupported () const** [inline, virtual]

Does nothing except throw an **IOException** (p. 2003).

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1775).

6.654.3.6 **virtual void decaf::io::PushbackInputStream::reset () throw (decaf::io::IOException)** [virtual]

Does nothing except throw an **IOException** (p. 2003).

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 2003) might be thrown. * If such an **IOException** (p. 2003) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 2003). * If an **IOException** (p. 2003) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that

will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 2003).

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1775).

6.654.3.7 **virtual long long decaf::io::PushbackInputStream::skip**
(**long long num**) **throw (decaf::io::IOException,**
decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1909) creates a byte array and then repeatedly reads into it until *num* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException (p. 2003) if an I/O error occurs.

UnsupportedOperationException if the concrete stream class does not support skipping bytes.

This method first skips bytes in the local pushed back buffer before attempting to complete the request by calling the underlying stream skip method with the remainder of bytes that needs to be skipped.

Reimplemented from **decaf::io::FilterInputStream** (p. 1776).

6.654.3.8 **void decaf::io::PushbackInputStream::unread (const unsigned**
char * buffer, int size) throw (decaf::io::IOException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::NullPointerException)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters

buffer The bytes to copy to the front of push back buffer.

size The size of the array to be copied.

Exceptions

NullPointerException if the buffer passed is NULL.

IndexOutOfBoundsException if the size value given is negative.

IOException (p. 2003) if there is not enough space in the pushback buffer or this stream has already been closed.

6.654.3.9 `void decaf::io::PushbackInputStream::unread (const unsigned char *
buffer, int size, int offset, int length) throw (decaf::io::IOException,
decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::NullPointerException)`

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters

buffer The bytes to copy to the front of push back buffer.

size The size of the array to be copied.

offset The position in the buffer to start copying from.

length The number of bytes to push back from the passed buffer.

Exceptions

NullPointerException if the buffer passed is NULL.

IndexOutOfBoundsException if the offset + length is greater than the buffer size.

IOException (p. 2003) if there is not enough space in the pushback buffer or this stream has already been closed.

6.654.3.10 `void decaf::io::PushbackInputStream::unread (unsigned char value)
throw (decaf::io::IOException)`

Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

Parameters

value The byte that is to be placed at the front of the push back buffer.

Exceptions

IOException (p. 2003) if there is not enough space in the pushback buffer or this stream has already been closed.

The documentation for this class was generated from the following file:

6.655 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

```
#include <src/main/cms/Queue.h>
```

Inheritance diagram for cms::Queue:

Public Member Functions

- virtual `~Queue()`
- virtual `std::string getQueueName() const =0 throw (CMSEException)`
Gets the name of this queue.

6.655.1 Detailed Description

An interface encapsulating a provider-specific queue name. Messages sent to a **Queue** (p. 2947) are sent to a Single Subscriber on that **Queue** (p. 2947) **Destination** (p. 1610). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 2375) in a **Queue** (p. 2947) is not defined by the CMS API, consult your Provider documentation for this information.

Since

1.0

6.655.2 Constructor & Destructor Documentation

6.655.3 Member Function Documentation

6.655.3.1 virtual `std::string cms::Queue::getQueueName() const throw (CMSEException)` [pure virtual]

Gets the name of this queue.

Returns

The queue name.

Exceptions

CMSEException (p. 1074) - If an internal error occurs.

Implemented in `activemq::commands::ActiveMQQueue` (p. 438).

The documentation for this class was generated from the following file:

- `src/main/cms/Queue.h`

6.656 decaf::util::Queue< E > Class Template Reference

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

```
#include <src/main/decaf/util/Queue.h>
```

Inheritance diagram for decaf::util::Queue< E >:

Public Member Functions

- virtual `~Queue ()`
- virtual bool **offer** (const E &value)=0 throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)
Inserts the specified element into the queue provided that the condition allows such an operation.
- virtual bool **poll** (E &result)=0
Gets and removes the element in the head of the queue.
- virtual E **remove** ()=0 throw (decaf::lang::exceptions::NoSuchElementException)
Gets and removes the element in the head of the queue.
- virtual bool **peek** (E &result) const =0
Gets but not removes the element in the head of the queue.
- virtual E **element** () const =0 throw (decaf::lang::exceptions::NoSuchElementException)
Gets but not removes the element in the head of the queue.

6.656.1 Detailed Description

```
template<typename E> class decaf::util::Queue< E >
```

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection. Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 2948) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Unlike the Java **Queue** (p. 2948) interface the methods of this class cannot return null to indicate that a **Queue** (p. 2948) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java **Queue** (p. 2948) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 2948) must be *assignable* in order to utilize these methods.

Since

1.0

6.656.2 Constructor & Destructor Documentation

6.656.2.1 `template<typename E > virtual decaf::util::Queue< E >::~Queue ()`
[inline, virtual]

6.656.3 Member Function Documentation

6.656.3.1 `template<typename E > virtual E decaf::util::Queue< E >::element ()`
`const throw (decaf::lang::exceptions::NoSuchElementException)` [pure virtual]

Gets but not removes the element in the head of the queue.

Throws a `NoSuchElementException` if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException if there is no element in the queue.

Implemented in `decaf::util::AbstractQueue< E >` (p. 160).

6.656.3.2 `template<typename E > virtual bool decaf::util::Queue< E >::offer (`
`const E & value) throw (decaf::lang::exceptions::NullPointerException,`
`decaf::lang::exceptions::IllegalArgumentException)` [pure virtual]

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

Parameters

value the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException if the **Queue** (p. 2948) implementation does not allow Null values to be inserted into the **Queue** (p. 2948).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3483), and `decaf::util::PriorityQueue< E >` (p. 2836).

Referenced by `decaf::util::AbstractQueue< E >::add()`.

6.656.3.3 `template<typename E> virtual bool decaf::util::Queue< E>::peek (E & result) const` [pure virtual]

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in `decaf::util::PriorityQueue< E>` (p. 2837).

Referenced by `decaf::util::AbstractQueue< E>::element()`.

6.656.3.4 `template<typename E> virtual bool decaf::util::Queue< E>::poll (E & result)` [pure virtual]

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 2948) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in `decaf::util::concurrent::SynchronousQueue< E>` (p. 3484), and `decaf::util::PriorityQueue< E>` (p. 2837).

Referenced by `decaf::util::AbstractQueue< E>::clear()`, and `decaf::util::AbstractQueue< E>::remove()`.

6.656.3.5 `template<typename E> virtual E decaf::util::Queue< E>::remove ()`
`throw (decaf::lang::exceptions::NoSuchElementException)` [pure virtual]

Gets and removes the element in the head of the queue.

Throws a `NoSuchElementException` if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException if there is no element in the queue.

Implemented in `decaf::util::AbstractQueue< E >` (p. 161), and `decaf::util::PriorityQueue< E >` (p. 2838).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Queue.h`

6.657 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p. 2947) without removing them.

```
#include <src/main/cms/QueueBrowser.h>
```

Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- virtual `~QueueBrowser()`
- virtual const **Queue** * `getQueue()` const =0 throw (cms::CMSEException)
- virtual std::string `getMessageSelector()` const =0 throw (cms::CMSEException)
- virtual **cms::MessageEnumeration** * `getEnumeration()` =0 throw (cms::CMSEException)

*Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 2947) in the order that a client would receive them.*

6.657.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p. 2947) without removing them. To browse the contents of the **Queue** (p. 2947) the client calls the `getEnumeration` method to retrieve a new instance of a **Queue** (p. 2947) Enumerator. The client then calls the `hasMoreMessages` method of the Enumeration, if it returns true the client can safely call the `nextMessage` method of the Enumeration instance.

```
Enumeration* enumeration = queueBrowser->getEnumeration() (p. 2952);
```

```
while( enumeration->hasMoreMessages() ) { cms::Message (p. 2375)* message = enumeration->nextMessage();
```

```
// ... Do something with the Message (p. 2375).
```

```
delete message; }
```

6.657.2 Constructor & Destructor Documentation

6.657.2.1 `virtual cms::QueueBrowser::~~QueueBrowser () [inline, virtual]`

6.657.3 Member Function Documentation

6.657.3.1 `virtual cms::MessageEnumeration* cms::QueueBrowser::getEnumeration () throw (cms::CMSEException) [pure virtual]`

Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 2947) in the order that a client would receive them.

The pointer returned is owned by the browser and should not be deleted by the client application.

Returns

a pointer to a **Queue** (p. 2947) Enumeration, this Pointer is owned by the **QueueBrowser** (p. 2951) and should not be deleted by the client.

Exceptions

CMSEException (p. 1074) if an internal error occurs.

6.657.3.2 `virtual std::string cms::QueueBrowser::getMessageSelector () const throw (cms::CMSEException) [pure virtual]`

Returns

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions

CMSEException (p. 1074) if an internal error occurs.

6.657.3.3 `virtual const Queue* cms::QueueBrowser::getQueue () const throw (cms::CMSEException) [pure virtual]`

Returns

the **Queue** (p. 2947) that this browser is listening on.

Exceptions

CMSEException (p. 1074) if an internal error occurs.

6.658 decaf::util::Random Class Reference

Random (p. 2953) Value Generator which is used to generate a stream of pseudorandom numbers.

```
#include <src/main/decaf/util/Random.h>
```

Inheritance diagram for decaf::util::Random:

Public Member Functions

- **Random** ()
Construct a random generator with the current time of day in milliseconds as the initial state.
- **Random** (unsigned long long seed)
Construct a random generator with the given `seed` as the initial state.
- bool **nextBoolean** ()
Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.
- double **nextDouble** ()
Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.
- float **nextFloat** ()
Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.
- double **nextGaussian** ()
Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the polar method of G.
- int **nextInt** ()
Generates a uniformly distributed 32-bit `int` value from the this random number sequence.
- int **nextInt** (int n)
Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).
- long long **nextLong** ()
Generates a uniformly distributed 64-bit `int` value from the this random number sequence.
- virtual void **nextBytes** (std::vector< unsigned char > &buf)
Modifies the byte array by a random sequence of bytes generated by this random number generator.
- virtual void **nextBytes** (unsigned char *buf, int size)
Modifies the byte array by a random sequence of bytes generated by this random number generator.
- virtual void **setSeed** (unsigned long long seed)
*Modifies the seed using linear congruential formula presented in *The Art of Computer Programming*, Volume 2, Section 3.2.1.*

Protected Member Functions

- virtual int **next** (int bits)

*Answers a pseudo-random uniformly distributed **int** value of the number of bits specified by the argument **bits** as described by Donald E.*

6.658.1 Detailed Description

Random (p. 2953) Value Generator which is used to generate a stream of pseudorandom numbers. The algorithms implemented by class **Random** (p. 2953) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since

1.0

6.658.2 Constructor & Destructor Documentation

6.658.2.1 decaf::util::Random::Random ()

Construct a random generator with the current time of day in milliseconds as the initial state.

See also

setSeed (p. 2957)

6.658.2.2 decaf::util::Random::Random (unsigned long long seed)

Construct a random generator with the given **seed** as the initial state.

Parameters

seed the seed that will determine the initial state of this random number generator

See also

setSeed (p. 2957)

6.658.3 Member Function Documentation

6.658.3.1 virtual int decaf::util::Random::next (int bits) [protected, virtual]

Answers a pseudo-random uniformly distributed **int** value of the number of bits specified by the argument **bits** as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

int a pseudo-random generated int number

Parameters

bits number of bits of the returned value

See also

nextBytes (p. 2955)
nextDouble (p. 2956)
nextFloat (p. 2956)

nextInt(int) (p. 2957)
nextGaussian (p. 2956)
nextLong (p. 2957)

Reimplemented in **decaf::security::SecureRandom** (p. 3119).

6.658.3.2 bool decaf::util::Random::nextBoolean ()

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns

boolean a pseudo-random, uniformly distributed boolean value

6.658.3.3 virtual void decaf::util::Random::nextBytes (unsigned char * buf, int size) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf non-null array to contain the new random bytes

See also

next (p. 2954)

Exceptions

NullPointerException if *buff* is NULL

IllegalArgumentException if *size* is negative

Reimplemented in **decaf::security::SecureRandom** (p. 3119).

6.658.3.4 virtual void decaf::util::Random::nextBytes (std::vector< unsigned char > & buf) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf non-null array to contain the new random bytes

See also

next (p. 2954)

Reimplemented in **decaf::security::SecureRandom** (p. 3120).

6.658.3.5 double decaf::util::Random::nextDouble ()

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns

double

See also

nextFloat (p. 2956)

6.658.3.6 float decaf::util::Random::nextFloat ()

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns

float a random float number between 0.0 and 1.0

See also

nextDouble (p. 2956)

6.658.3.7 double decaf::util::Random::nextGaussian ()

Pseudo-randomly generates (approximately) a normally distributed **double** value with mean 0.0 and a standard deviation value of 1.0 using the *polar method* of G.

E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns

double

See also

nextDouble (p. 2956)

6.658.3.8 int decaf::util::Random::nextInt ()

Generates a uniformly distributed 32-bit **int** value from the this random number sequence.

Returns

int uniformly distributed **int** value

See also

next (p. 2954)

nextLong (p. 2957)

6.658.3.9 int decaf::util::Random::nextInt (int *n*)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of *n* (exclusively).

Parameters

n The int value that defines the max value of the return.

Returns

the next pseudo random int value.

Exceptions

IllegalArgumentException if *n* is less than or equal to zero.

6.658.3.10 long long decaf::util::Random::nextLong ()

Generates a uniformly distributed 64-bit int value from the this random number sequence.

Returns

64-bit int random number

See also

next (p. 2954)
nextInt() (p. 2956)
nextInt(int) (p. 2957)

6.658.3.11 virtual void decaf::util::Random::setSeed (unsigned long long *seed*)
[virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

seed the seed that alters the state of the random number generator

See also

next (p. 2954)
Random() (p. 2954)
Random(long)

Reimplemented in **decaf::security::SecureRandom** (p. 3121).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Random.h**

6.659 decaf::lang::Readable Class Reference

A **Readable** (p. 2958) is a source of characters.

```
#include <src/main/decaf/lang/Readable.h>
```

Inheritance diagram for decaf::lang::Readable:

Public Member Functions

- virtual **~Readable** ()
- virtual int **read** (**decaf::nio::CharBuffer** *charBuffer)=0 throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException)

Attempts to read characters into the specified character buffer.

6.659.1 Detailed Description

A **Readable** (p. 2958) is a source of characters. Characters from a **Readable** (p. 2958) are made available to callers of the read method via a CharBuffer.

Since

1.0

6.659.2 Constructor & Destructor Documentation

6.659.2.1 virtual decaf::lang::Readable::~~Readable () [inline, virtual]

6.659.3 Member Function Documentation

6.659.3.1 virtual int decaf::lang::Readable::read (decaf::nio::CharBuffer * *charBuffer*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException) [pure virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

charBuffer The Buffer to read Characters into.

Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions

IOException - if an I/O error occurs

NullPointerException - if buffer is NULL.

ReadOnlyBufferException - if charBuffer is a read only buffer

Implemented in **decaf::io::Reader** (p. 2964).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Readable.h**

6.660 activemq::transport::inactivity::ReadChecker Class Reference

Runnable class that is used by the {.

```
#include <src/main/activemq/transport/inactivity/ReadChecker.h>
```

Inheritance diagram for activemq::transport::inactivity::ReadChecker:

Public Member Functions

- **ReadChecker** (**InactivityMonitor** *parent)
- virtual **~ReadChecker** ()
- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.660.1 Detailed Description

Runnable class that is used by the {.

See also

InactivityMonitor (p. 1874)} class the check for timeouts related to **transport** (p. 89) reads.

Since

3.1

6.660.2 Constructor & Destructor Documentation

6.660.2.2 `virtual activemq::transport::inactivity::ReadChecker::~~ReadChecker ()` [virtual]

6.660.3 Member Function Documentation

6.660.3.1 `virtual void activemq::transport::inactivity::ReadChecker::run ()` [virtual]

Run method - called by the Thread class in the context of the thread.

Implements `decaf::lang::Runnable` (p. 3112).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/inactivity/ReadChecker.h`

6.661 decaf::io::Reader Class Reference

```
#include <src/main/decaf/io/Reader.h>
```

Inheritance diagram for `decaf::io::Reader`:

Public Member Functions

- virtual `~Reader ()`
- virtual void **mark** (int readAheadLimit) throw (decaf::io::IOException)
Marks the present position in the stream.
- virtual bool **markSupported** () const
*Tells whether this stream supports the **mark**() (p. 2962) operation.*
- virtual bool **ready** () const throw (decaf::io::IOException)
Tells whether this stream is ready to be read.
- virtual void **reset** () throw (decaf::io::IOException)
Resets the stream.
- virtual long long **skip** (long long count) throw (decaf::io::IOException)
Skips characters.
- virtual int **read** (std::vector< char > &buffer) throw (decaf::io::IOException)
Reads characters into an array.
- virtual int **read** (char *buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

Reads characters into an array, the method will attempt to read as much data as the size of the array.

- virtual int **read** (char *buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException)

Reads characters into a portion of an array.

- virtual int **read** () throw (decaf::io::IOException)

Reads a single character.

- virtual int **read** (decaf::nio::CharBuffer *charBuffer) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException)

Attempts to read characters into the specified character buffer.

Protected Member Functions

- **Reader** ()

- virtual int **doReadArrayBounded** (char *buffer, int size, int offset, int length)=0 throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException)

Override this method to customize the functionality of the method read(unsigned char buffer, int size, int offset, int length).*

- virtual int **doReadVector** (std::vector< char > &buffer) throw (decaf::io::IOException)

Override this method to customize the functionality of the method read(std::vector<char>& buffer) (p. 2965).

- virtual int **doReadArray** (char *buffer, int length) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

Override this method to customize the functionality of the method read(char buffer, std::size_t length).*

- virtual int **doReadChar** () throw (decaf::io::IOException)

Override this method to customize the functionality of the method read() (p. 2964).

- virtual int **doReadCharBuffer** (decaf::nio::CharBuffer *charBuffer) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException)

Override this method to customize the functionality of the method read(CharBuffer charBuffer).*

6.661.1 Constructor & Destructor Documentation

6.661.1.1 `decaf::io::Reader::Reader ()` [protected]

6.661.1.2 `virtual decaf::io::Reader::~~Reader ()` [virtual]

6.661.2 Member Function Documentation

6.661.2.1 `virtual int decaf::io::Reader::doReadArray (char *
buffer, int length) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException)` [protected, virtual]

Override this method to customize the functionality of the method `read(char* buffer, std::size_t length)`.

6.661.2.2 `virtual int decaf::io::Reader::doReadArrayBounded (char
* buffer, int size, int offset, int length) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IndexOutOfBoundsException)` [protected, pure virtual]

Override this method to customize the functionality of the method `read(unsigned char* buffer, int size, int offset, int length)`.

All subclasses must override this method to provide the basic **Reader** (p. 2960) functionality.

Implemented in **decaf::io::InputStreamReader** (p. 1921).

6.661.2.3 `virtual int decaf::io::Reader::doReadChar () throw (decaf::io::IOException)` [protected, virtual]

Override this method to customize the functionality of the method `read()` (p. 2964).

6.661.2.4 `virtual int decaf::io::Reader::doReadCharBuffer (decaf::nio::CharBuffer * charBuffer) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException,
decaf::nio::ReadOnlyBufferException)` [protected, virtual]

Override this method to customize the functionality of the method `read(CharBuffer* charBuffer)`.

6.661.2.5 `virtual int decaf::io::Reader::doReadVector (std::vector< char > & buffer) throw (decaf::io::IOException)` [protected, virtual]

Override this method to customize the functionality of the method `read(std::vector<char>& buffer)` (p. 2965).

6.661.2.6 `virtual void decaf::io::Reader::mark (int readAheadLimit) throw (decaf::io::IOException)` [virtual]

Marks the present position in the stream.

Subsequent calls to **reset()** (p. 2965) will attempt to reposition the stream to this point. Not all character-input streams support the **mark()** (p. 2962) operation.

Parameters

readAheadLimit Limit on the number of characters that may be read while still preserving the mark. After reading this many characters, attempting to reset the stream may fail.

Exceptions

IOException (p. 2003) if an I/O error occurs, or the stream does not support mark.

6.661.2.7 `virtual bool decaf::io::Reader::markSupported () const [inline, virtual]`

Tells whether this stream supports the **mark()** (p. 2962) operation.

The default implementation always returns false. Subclasses should override this method.

Returns

true if and only if this stream supports the mark operation.

6.661.2.8 `virtual int decaf::io::Reader::read (char * buffer, int size, int offset, int length) throw (decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::NullPointerException) [virtual]`

Reads characters into a portion of an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

buffer The target char buffer.

size The size in bytes of the target buffer.

offset The position in the buffer to start filling.

length The maximum number of bytes to read.

Returns

The number of bytes read or -1 if the end of stream is reached.

Exceptions

IOException (p. 2003) thrown if an I/O error occurs.

NullPointerException if buffer is NULL.

IndexOutOfBoundsException if the offset + length is greater than the array size.

6.661.2.9 `virtual int decaf::io::Reader::read () throw (decaf::io::IOException)`
[virtual]

Reads a single character.

This method will block until a character is available, an I/O error occurs, or the end of the stream is reached.

Subclasses that intend to support efficient single-character input should override this method.

Returns

The character read, as an integer in the range 0 to 65535 (0x00-0xffff), or -1 if the end of the stream has been reached.

Exceptions

IOException (p. 2003) thrown if an I/O error occurs.

6.661.2.10 `virtual int decaf::io::Reader::read (char * buffer, int size) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)`
[virtual]

Reads characters into an array, the method will attempt to read as much data as the size of the array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

buffer The target char buffer.

size The size in bytes of the target buffer.

Returns

The number of bytes read or -1 if the end of stream is reached.

Exceptions

IOException (p. 2003) thrown if an I/O error occurs.

NullPointerException if buffer is NULL.

6.661.2.11 `virtual int decaf::io::Reader::read (decaf::nio::CharBuffer * charBuffer) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::nio::ReadOnlyBufferException)` [virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

charBuffer The Buffer to read Characters into.

Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions

IOException (p. 2003) - if an I/O error occurs

NullPointerException - if buffer is NULL.

ReadOnlyBufferException - if charBuffer is a read only buffer

Implements **decaf::lang::Readable** (p. 2958).

6.661.2.12 `virtual int decaf::io::Reader::read (std::vector< char > & buffer)
throw (decaf::io::IOException) [virtual]`

Reads characters into an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

buffer The buffer to read characters into.

Returns

The number of characters read, or -1 if the end of the stream has been reached

Exceptions

IOException (p. 2003) thrown if an I/O error occurs.

6.661.2.13 `virtual bool decaf::io::Reader::ready () const throw (decaf::io::IOException) [virtual]`

Tells whether this stream is ready to be read.

Returns

True if the next **read()** (p. 2964) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

Exceptions

IOException (p. 2003) if an I/O error occurs.

Reimplemented in **decaf::io::InputStreamReader** (p. 1921).

6.661.2.14 `virtual void decaf::io::Reader::reset () throw (decaf::io::IOException) [virtual]`

Resets the stream.

If the stream has been marked, then attempt to reposition it at the mark. If the stream has not been marked, then attempt to reset it in some way appropriate to the particular stream, for example by repositioning it to its starting point. Not all character-input streams support the **reset()** (p. 2965) operation, and some support **reset()** (p. 2965) without supporting **mark()** (p. 2962).

Exceptions

IOException (p. 2003) if an I/O error occurs.

6.661.2.15 `virtual long long decaf::io::Reader::skip (long long count) throw (decaf::io::IOException) [virtual]`

Skips characters.

This method will block until some characters are available, an I/O error occurs, or the end of the stream is reached.

Parameters

count The number of character to skip.

Returns

the number of Character actually skipped.

Exceptions

IOException (p. 2003) if an I/O error occurs.

6.662 decaf::nio::ReadOnlyBufferException Class Reference

```
#include <src/main/decaf/nio/ReadOnlyBufferException.h>
```

Inheritance diagram for decaf::nio::ReadOnlyBufferException:

Public Member Functions

- **ReadOnlyBufferException** () throw ()
Default Constructor.
- **ReadOnlyBufferException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **ReadOnlyBufferException** (const ReadOnlyBufferException &ex) throw ()
Copy Constructor.

- **ReadOnlyBufferException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ReadOnlyBufferException** (const std::exception *cause) throw ()
Constructor.
- **ReadOnlyBufferException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **ReadOnlyBufferException * clone** () const
Clones this exception.
- virtual **~ReadOnlyBufferException** () throw ()

6.662.1 Constructor & Destructor Documentation

6.662.1.1 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException () throw () [inline]

Default Constructor.

6.662.1.2 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.662.1.3 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const ReadOnlyBufferException & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.662.1.4 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.662.1.5 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.662.1.6 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.662.1.7 `virtual decaf::nio::ReadOnlyBufferException::~~ReadOnlyBufferException () throw () [inline, virtual]`

6.662.2 Member Function Documentation

6.662.2.1 `virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from `decaf::lang::exceptions::UnsupportedOperationException` (p. 3659).

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/ReadOnlyBufferException.h`

6.663 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p. 2968) maintains a pair of associated locks, one for read-only operations and one for writing.

```
#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>
```

Public Member Functions

- virtual **~ReadWriteLock** ()
- virtual **Lock & readLock** ()=0
Returns the lock used for reading.
- virtual **Lock & writeLock** ()=0
Returns the lock used for writing.

6.663.1 Detailed Description

A **ReadWriteLock** (p. 2968) maintains a pair of associated locks, one for read-only operations and one for writing. The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 2968) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 2229) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

* Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible. * Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency. * Determining whether the locks are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant? * Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.
