6.1.1 Detailed Description

template<typename E> class decaf::util::AbstractCollection< E >

This class provides a skeletal implementation of the **Collection** (p. 1097) interface, to minimize the effort required to implement this interface. To implement an unmodifiable collection, the programmer needs only to extend this class and provide implementations for the iterator and size methods. (The iterator returned by the iterator method must implement hasNext and next.)

To implement a modifiable collection, the programmer must additionally override this class's add method (which otherwise throws an UnsupportedOperationException), and the iterator returned by the iterator method must additionally implement its remove method.

The programmer should generally provide a void (no argument) and **Collection** (p. 1097) constructor, as per the recommendation in the **Collection** (p. 1097) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Ensures that this collection contains the specified element (optional operation).

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. **Collection** (p. 1097) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

This implementation always throws an `UnsupportedOperationException`.

Parameters

value - The element that must be ensured to be in this collection.

Returns

true if the collection was changed as a result of this call.

Exceptions

UnsupportedOperationException if the add operation is not supported by this collection

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Referenced by `decaf::util::AbstractCollection< cms::Connection * >::addAll()`, `decaf::util::AbstractCollection< cms::Connection * >::copy()`, and `decaf::util::AbstractCollection< cms::Connection * >::operator=()`.

```

6.1.3.2  template<typename E> virtual bool decaf::util::AbstractCollection<
        E >::addAll ( const Collection< E > & collection )
        throw ( lang::exceptions::UnsupportedOperationException,
        lang::exceptions::IllegalArgumentException,
        lang::exceptions::IllegalStateException ) [inline,
        virtual]

```

Adds all of the elements in the specified collection to this collection (optional operation).

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

Parameters

collection - The **Collection** (p.1097) whose elements are to be added to this **Collection** (p.1097).

Returns

true if the collection was changed as a result of this call.

Exceptions

UnsupportedOperationException if the `addAll` operation is not supported by this collection

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p.1100).

Reimplemented in **decaf::util::AbstractQueue< E >** (p.160).

```

6.1.3.3  template<typename E> virtual void decaf::util::AbstractCollection< E
        >::clear ( ) throw ( lang::exceptions::UnsupportedOperationException )
        [inline, virtual]

```

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p.2014) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the `remove` method and this collection is non-empty.

Exceptions

UnsupportedOperationException if the clear operation is not supported by this collection

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

                   lang::exceptions::IllegalArgumentException ) [inline, virtual]
```

Removes all of this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

In other words, removes from this collection all of its elements that are not contained in the specified collection.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Parameters

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

6.2.1 Detailed Description

```
template<typename E> class decaf::util::AbstractList< E >
```

This class provides a skeletal implementation of the **List** (p. 2190) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array). For sequential access data (such as a linked list), **AbstractSequentialList** (p. 161) should be used in preference to this class.

To implement an unmodifiable list, the programmer needs only to extend this class and provide implementations for the `get(int)` and `size()` (p. 1106) methods.

To implement a modifiable list, the programmer must additionally override the `set(int, E)` method (which otherwise throws an `UnsupportedOperationException`). If the list is variable-size the programmer must additionally override the `add(int, E)` and `remove(int)` methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 1097) interface specification.

Unlike the other abstract collection implementations, the programmer does not have to provide an iterator implementation; the iterator and list iterator are implemented by this class, on top of the "random access" methods: `get(int)`, `set(int, E)`, `add(int, E)` and `remove(int)`.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

6.3.1 Detailed Description

`template<typename K, typename V, typename COMPARATOR> class
decaf::util::AbstractMap< K, V, COMPARATOR >`

This class provides a skeletal implementation of the **Map** (p. 2305) interface, to minimize the effort required to implement this interface. To implement an unmodifiable map, the programmer needs only to extend this class and provide an implementation for the `entrySet` method, which returns a set-view of the map's mappings. Typically, the returned set will, in turn, be implemented atop **AbstractSet** (p. 162). This set should not support the `add` or `remove` methods, and its iterator should not support the `remove` method.

To implement a modifiable map, the programmer must additionally override this class's `put` method (which otherwise throws an `UnsupportedOperationException`), and the iterator returned by `entrySet().iterator()` must additionally implement its `remove` method.

The programmer should generally provide a void (no argument) and map constructor, as per the recommendation in the **Map** (p. 2305) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the map being implemented admits a more efficient implementation.

Removes all elements of the queue.

6.4.1 Detailed Description

template<typename E> class decaf::util::AbstractQueue< E >

This class provides skeletal implementations of some **Queue** (p. 2948) operations. Methods **add**, **remove**, and **element** are based on **offer**, **poll**, and **peek**, respectively.

A **Queue** (p. 2948) implementation that extends this class must minimally define a method **Queue** (p. 2948). **offer(E)** which does not permit insertion of null elements, along with methods **Queue** (p. 2948). **peek()** (p. 2950), **Queue.poll()** (p. 2950), **Collection.size()** (p. 1106), and a **Collection.iterator()** (p. 2012) supporting **Iterator.remove()** (p. 2014). Typically, additional methods will be overridden as well. If these requirements cannot be met, consider instead subclassing **AbstractCollection** (p. 143).

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an **IllegalStateException** if no space is currently available.

This implementation returns true if **offer** succeeds, else throws an **IllegalStateException**.

Parameters

value - the element to offer to the **Queue** (p. 2948).

Returns

true if the add succeeds.

Exceptions

IllegalArgumentException if the element cannot be added.

Implements **decaf::util::Collection< E >** (p. 1099).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 2835).

References **decaf::util::Queue< E >::offer()**.

6.4.3.2  template<typename E > virtual bool decaf::util::AbstractQueue<
            E >::addAll ( const Collection< E > & collection )

                    lang::exceptions::IllegalStateException ) [inline,
                    virtual]

```

Adds all the elements of a collection to the queue.

If the collection is the queue itself, then an `IllegalArgumentException` will be thrown out. If during the process, some runtime exception is thrown out, then part of the elements in the collection that have successfully added will remain in the queue.

The result of the method is undefined if the collection is modified during the process of the method.

Parameters

collection - the collection to be added to the queue.

Returns

true if the operation succeeds.

Exceptions

IllegalArgumentException If the collection to be added to the queue is the queue itself.

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 147).

```

6.4.3.3  template<typename E > virtual void decaf::util::AbstractQueue< E >::clear
            ( ) throw ( lang::exceptions::UnsupportedOperationException ) [inline,
            virtual]

```

Removes all elements of the queue.

This implementation repeatedly invokes `poll` until it returns the empty marker.

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 147).

Reimplemented in `decaf::util::concurrent::SynchronousQueue< E >` (p. 3480), and `decaf::util::PriorityQueue< E >` (p. 2836).

            ( ) const throw ( decaf::lang::exceptions::NoSuchElementException )
            [inline, virtual]

```

Retrieves, but does not remove, the head of this queue.

This method differs from `peek` only in that it throws an exception if this queue is empty.

This implementation returns the result of `peek` unless the queue is empty.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException if the queue is empty.

Implements **decaf::util::Queue< E >** (p. 2949).

6.4.3.5 `template<typename E> virtual E decaf::util::AbstractQueue< E >::remove
() throw (decaf::lang::exceptions::NoSuchElementException) [inline,

Retrieves and removes the head of this queue.

This method differs from `poll` only in that it throws an exception if this queue is empty.

This implementation returns the result of `poll` unless the queue is empty.

Returns

a copy of the element in the head of the queue.

Exceptions

NoSuchElementException if the queue is empty.

Implements **decaf::util::Queue< E >** (p. 2950).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 2838).

6.5.1 Detailed Description

template<typename E> class decaf::util::AbstractSequentialList< E >

This class provides a skeletal implementation of the **List** (p. 2190) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list). For random access data (such as an array), **AbstractList** (p. 156) should be used in preference to this class.

This class is the opposite of the **AbstractList** (p. 156) class in the sense that it implements the "random access" methods (get(int index), set(int index, E element), add(int index, E element) and remove(int index)) on top of the list's list iterator, instead of the other way around.

To implement a list the programmer needs only to extend this class and provide implementations for the listIterator and size methods. For an unmodifiable list, the programmer need only implement the list iterator's hasNext, next, hasPrevious, previous and index methods.

For a modifiable list the programmer should additionally implement the list iterator's set method. For a variable-size list the programmer should additionally implement the list iterator's remove and add methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 1097) interface specification.

6.6.1 Detailed Description

template<typename E> class decaf::util::AbstractSet< E >

This class provides a skeletal implementation of the **Set** (p. 3220) interface to minimize the effort required to implement this interface. The process of implementing a set by extending this class is identical to that of implementing a **Collection** (p.1097) by extending **AbstractCollection** (p. 143), except that all of the methods and constructors in subclasses of this class must obey the additional constraints imposed by the **Set** (p. 3220) interface (for instance, the add method must not permit addition of multiple instances of an object to a set).

E >::removeAll (const Collection< E > & collection)
throw (lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException) [inline, virtual]

Removes from this set all of its elements that are contained in the specified collection (optional operation).

If the specified collection is also a set, this operation effectively modifies this set so that its value is the asymmetric set difference of the two sets.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method.

Parameters

collection - The **Collection** (p. 1097) whose elements are to be retained

Returns

true if the collection changed as a result of this call

Exceptions

UnsupportedOperationException

IllegalArgumentException

6.69.2.45 virtual void activemq::core::ActiveMQSession::recover () throw (cms::CMSException) [virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Asynchronous sends will be chosen if at all possible.

Parameters

Exceptions

ActiveMQException thrown if an error response was received from the broker, or if any other error occurred.

6.69.2.55 `virtual void activemq::core::ActiveMQSession::unsubscribe (const std::string & name) throw (cms::CMSException) [virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name the name used to identify this subscription

Exceptions

(unsigned char * *buffer*, int *length*) const throw (cms::MessageEOFException,
cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [virtual]

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. 6.115.1 Detailed Description

An object to which char sequences and values can be appended. The **Appendable** (p. 666) interface must be implemented by any class whose instances are intended to receive formatted output from a Formatter.

TODO The characters to be appended should be valid Unicode characters as described in Unicode **Character** (p. 1019) Representation. Note that supplementary characters may be composed of multiple 16-bit char values.

Appendables are not necessarily safe for multithreaded access. **Thread** (p. 3520) safety is the responsibility of classes that extend and implement this interface.

Since this interface may be implemented by existing classes with different styles of error handling there is no guarantee that errors will be propagated to the invoker.

6.117.1 Detailed Description

template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> class decaf::lang::ArrayPointer< T, REFCOUNTER >

Decaf's implementation of a Smart **Pointer** (p. 2756) that is a template on a Type and is **Thread** (p. 3520) Safe if the default Reference Counter is used. This **Pointer** (p. 2756) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of **ReferenceCounter**.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2756) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2756) in a STL container that requires it, **Pointer** (p. 2756) provides an implementation of std::less.

6.117.3.1 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer () [inline]`

Default Constructor.

Initialized the contained array pointer to NULL, using the subscript operator results in an exception unless reset to contain a real value.

Referenced by `decaf::lang::ArrayPointer< unsigned char >::clone()`, and `decaf::lang::ArrayPointer< unsigned char >::reset()`.

6.117.3.2 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer (int size) [inline]`

Create a new **ArrayPointer** (p. 669) instance and allocates an internal array that is sized using the passed in size value.

Parameters

size The size of the array to allocate for this **ArrayPointer** (p. 669) instance.

6.117.3.3 `template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCount> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer (const PointerType value, int size) [inline, explicit]`

Explicit Constructor, creates an **ArrayPointer** (p. 669) that contains value with a single reference. This object now has ownership until a call to release.

Parameters

value The pointer to the instance of the array we are taking ownership of.

size The size of the array this object is taking ownership of.

```
6.117.3.4  template<typename T, typename REFCOUNTER =
           decaf::util::concurrent::atomic::AtomicRefCount>
           decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer ( const
           ArrayPointer< T, REFCOUNTER > & value ) throw () [inline]
```

Copy constructor.

Copies the value contained in the **ArrayPointer** (p. 669) to the new instance and increments the reference counter.

```
6.117.3.5  template<typename T, typename REFCOUNTER =
           decaf::util::concurrent::atomic::AtomicRefCount> virtual
           decaf::lang::ArrayPointer< T, REFCOUNTER >::~~ArrayPointer ( )
           throw () [inline, virtual]
```

6.117.4 Member Function Documentation

```
6.117.4.1  template<typename T, typename REFCOUNTER =
           decaf::util::concurrent::atomic::AtomicRefCount> ArrayPointer
           decaf::lang::ArrayPointer< T, REFCOUNTER >::clone ( ) const
           [inline]
```

Creates a new **ArrayPointer** (p. 669) instance that is a clone of the value contained in this **ArrayPointer** (p. 669).

Returns

an **ArrayPointer** (p. 669) that contains a copy of the data in this **ArrayPointer** (p. 669).

```
6.117.4.2  template<typename T, typename REFCOUNTER =
           decaf::util::concurrent::atomic::AtomicRefCount> PointerType
           decaf::lang::ArrayPointer< T, REFCOUNTER >::get ( ) const
           [inline]
```

Gets the real array pointer that is contained within this **Pointer** (p. 2756).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL `auto_ptr` and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2756). Use at your own risk.

Returns

the contained pointer.

Referenced by `decaf::lang::ArrayPointer< unsigned char >::clone()`, `decaf::lang::ArrayPointerComparator< T, R >::compare()`, `decaf::lang::operator!=()`, `decaf::lang::ArrayPointer< unsigned char >::operator!=()`, `std::less< decaf::lang::ArrayPointer< T > >::operator()()`, `decaf::lang::ArrayPointerComparator< T, R >::operator()()`, `decaf::lang::operator==()`, and `decaf::lang::ArrayPointer< unsigned char >::operator==()`.

6.117.4.3 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> int
decaf::lang::ArrayPointer< T, REFCOUNTER >::length () const
[inline]`

Returns the current size of the contained array or zero if the array is NULL.

Returns

the size of the array or zero if the array is NULL

decaf::util::concurrent::atomic::AtomicRefCounter> bool

decaf::util::concurrent::atomic::AtomicRefCounter> ArrayPointer&
decaf::lang::ArrayPointer< T, REFCOUNTER >::operator= (const
ArrayPointer< T, REFCOUNTER > & right) throw () [inline]`

Assigns the value of *right* to this **Pointer** (p. 2756) and increments the reference Count.

Parameters

right - **Pointer** (p. 2756) on the right hand side of an operator= call to this.

6.117.4.8 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> template<typename

>::operator== (const ArrayPointer< T1, R1 > & right) const

6.117.4.9 `template<typename T, typename REFCOUNTER =
decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType
decaf::lang::ArrayPointer< T, REFCOUNTER >::operator[] (int index
) [inline]`

Dereference Operator, returns a reference to the Contained value.

This method throws an `NullPointerException` if the contained value is NULL.

Returns

reference to the contained pointer.

Exceptions

NullPointerException if the contained value is Null

```
6.117.4.10  template<typename T, typename REFCOUNTER
            = decaf::util::concurrent::atomic::AtomicRefCounter>
            ConstReferenceType decaf::lang::ArrayPointer< T, REFCOUNTER
            >::operator[] ( int index ) const [inline]
```

```
6.117.4.11  template<typename T, typename REFCOUNTER =
            decaf::util::concurrent::atomic::AtomicRefCounter> T*
            decaf::lang::ArrayPointer< T, REFCOUNTER >::release (    ) [inline]
```

Releases the **Pointer** (p. 2756) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 2756) is held by more than one object or this method is called from more than one thread.

Parameters

value - The new value to contain.

Returns

The pointer instance that was held by this **Pointer** (p. 2756) object, the pointer is no longer owned by this **Pointer** (p. 2756) and won't be freed when this **Pointer** (p. 2756) goes out of scope.

Referenced by decaf::lang::ArrayPointer< unsigned char >::ArrayPointer().

```
6.117.4.12  template<typename T, typename REFCOUNTER =
            decaf::util::concurrent::atomic::AtomicRefCounter> void
            decaf::lang::ArrayPointer< T, REFCOUNTER >::reset ( T * value,
            int size = 0 ) [inline]
```

Resets the **ArrayPointer** (p. 669) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 2756) to a NULL pointer.

Parameters

value The new array pointer value to contain.

size The size of the new array value this object now contains.

```
6.117.4.13  template<typename T, typename REFCOUNTER =
            decaf::util::concurrent::atomic::AtomicRefCounter> void
            decaf::lang::ArrayPointer< T, REFCOUNTER >::swap (
            ArrayPointer< T, REFCOUNTER > & value ) throw () [inline]
```

Exception (p. 1712) Safe Swap Function.

Parameters

value - the value to swap with this.

Referenced by `decaf::lang::ArrayPointer< unsigned char >::operator=()`, and `decaf::lang::ArrayPointer< unsigned char >::swap()`.

6.118.1 Detailed Description

```
template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCounter>

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 669). This allows for a basic ordering to be acheived in Decaf containers.

Custom implementations are possible where an array of some type has a logical natural ordering such as array of integers where the sum of all ints in the array is used.
